

# MSC Nastran 2022.1

## Quick Reference Guide

## Americas

5161 California Ave. Suite 200  
University Research Park  
Irvine, CA 92617  
Telephone: (714) 540-8900  
Email: [americas.contact@mscsoftware.com](mailto:americas.contact@mscsoftware.com)

## Europe, Middle East, Africa

Am Moosfeld 13  
81829 Munich, Germany  
Telephone: (49) 89 431 98 70  
Email: [europe@mscsoftware.com](mailto:europe@mscsoftware.com)

## Japan

KANDA SQUARE 16F  
2-2-1 Kanda Nishikicho, Chiyoda-ku  
1-Chome, Shinjuku-Ku  
Tokyo 101-0054, Japan  
Telephone: (81)(3) 6275 0870  
Email: [MSCJ.Market@mscsoftware.com](mailto:MSCJ.Market@mscsoftware.com)

## Asia-Pacific

100 Beach Road  
#16-05 Shaw Tower  
Singapore 189702  
Telephone: 65-6272-0082  
Email: [APAC.Contact@mscsoftware.com](mailto:APAC.Contact@mscsoftware.com)

## Worldwide Web

[www.mscsoftware.com](http://www.mscsoftware.com), [www.hexagon.com](http://www.hexagon.com)

## Support

<https://simcompanion.hexagon.com>

## Disclaimer

Hexagon reserves the right to make changes in specifications and other information contained in this document without prior notice. The concepts, methods, and examples presented in this text are for illustrative and educational purposes only, and are not intended to be exhaustive or to apply to any particular engineering problem or design. Hexagon assumes no liability or responsibility to any person or company for direct or indirect damages resulting from the use of any information contained herein.

# Documentation Feedback

At Hexagon Manufacturing Intelligence, we strive to produce the highest quality documentation and welcome your feedback. If you have comments or suggestions about our documentation, write to us at: [documentation-feedback@mscsoftware.com](mailto:documentation-feedback@mscsoftware.com).

Please include the following information with your feedback:

- Document name
- Release/Version number
- Chapter/Section name
- Topic title (for Online Help)
- Brief description of the content (for example, incomplete/incorrect information, grammatical errors, information that requires clarification or more details and so on).
- Your suggestions for correcting/improving documentation

You may also provide your feedback about Hexagon Manufacturing Intelligence documentation by taking a short 5-minute survey at: <http://msc-documentation.questionpro.com>.

**Note:**

The above mentioned e-mail address is only for providing documentation specific feedback. If you have any technical problems, issues, or queries, please contact [Technical Support](#).

## List of MSC Nastran Guides

A list of some of the MSC Nastran guides is as follows:

Installation and Release Guides
■ Installation and Operations Guide
■ Release Guide
Reference Guides
■ Quick Reference Guide
■ DMAP Programmer's Guide
■ Reference Guide
■ Utilities Guide
Demonstration Guides
■ Linear Analysis
■ Implicit Nonlinear (SOL 400)
■ Explicit Nonlinear (SOL 700)
■ MSC Nastran Verification Guide
User's Guides
■ Getting Started
■ Linear Static Analysis
■ Dynamic Analysis
■ Embedded Fatigue
■ Embedded Vibration Fatigue
■ Thermal Analysis
■ Superelements and Modules
■ Design Sensitivity and Optimization
■ Rotordynamics
■ Implicit Nonlinear (SOL 400)
■ Explicit Nonlinear (SOL 700)
■ Aeroelastic Analysis
■ User Defined Services
■ Non Linear (SOL 600)
■ High Performance Computing
■ DEMATD

You may find any of these documents from Hexagon at:

<https://simcompanion.hexagon.com/customers/s/article/MSC-Nastran-Support-Home-Page>

## Technical Support

For technical support phone numbers and contact information, please visit:

<https://simcompanion.hexagon.com/customers/s/article/support-contact-information-kb8019304>

**Support Center** (<http://simcompanion.hexagon.com>)

The SimCompanion link above gives you access to the wealth of resources for Hexagon products. Here you will find product and support contact information, product documentations, knowledge base articles, product error list, knowledge base articles and SimAcademy Webinars. It is a searchable database which allows you to find articles relevant to your inquiry. Valid MSC customer entitlement and login is required to access the database and documents. It is a single sign-on that gives you access to product documentation for complete list of products from Hexagon, allows you to manage your support cases, and participate in our discussion forums.

## Training and Internet Resources

Hexagon corporate site has information on the latest events, products and services for the CAD/CAE/CAM marketplace.

<http://simcompanion.hexagon.com>

The SimCompanion link above gives you access to the wealth of resources for Hexagon products. Here you will find product and support contact information, product documentations, knowledge base articles, product error list, knowledge base articles and SimAcademy Webinars. It is a searchable database which allows you to find articles relevant to your inquiry. Valid MSC customer entitlement and login is required to access the database and documents. It is a single sign-on that gives you access to product documentation for complete list of products from Hexagon, allows you to manage your support cases, and participate in our discussion forums.

<http://www.mssoftware.com/msc-training>

The link above will point you to schedule and description of seminars. Following courses are recommended for beginning Nastran users.

### **NAS120 - Linear Static Analysis using MSC Nastran and Patran**

This seminar introduces basic finite element analysis techniques for linear static, normal modes, and buckling analysis of structures using MSC Nastran and Patran. MSC Nastran data structure, the element library, modeling practices, model validation, and guidelines for efficient solutions are discussed and illustrated with examples and workshops. Patran will be an integral part of the examples and workshops and will be used to generate and verify illustrative MSC Nastran models, manage analysis submission requests, and visualize results. This seminar provides the foundation required for intermediate and advanced MSC Nastran applications.

# 1

## Executing MSC Nastran

- Executing MSC Nastran

## Executing MSC Nastran

MSC Nastran is executed from the command line using the command `nast_ver` (where `nast_ver=nast20221`). This command sets environment variables in order for MSC Nastran to correctly execute on your system and it also has capabilities to predict memory and solvers (as of MSC Nastran 2022.1 with `solve=auto`). The basic format of the `nast_ver` command is

```
nast_ver input_data_file keywords
nast_ver input_data_file [keyword1=value1 keyword2=value2 ...]
```

where `input_data_file` is the name of the file containing the input data and `keyword=valuei` is one or more optional keyword assignment arguments. For example, to run an MSC Nastran job using the data file `example1.dat`, enter the following command:

```
nast_ver example1
```

Most keyword assignments can be specified as command line arguments and/or included in RC files. There are some exceptions which may be specified on the command line or the User RC files, but not in the system RC files (`MSC_BASE/conf/RCfile`).

There are two RC files controlled by the user:

- The user RC file is in your home (or login) directory. This file should be used to define parameters that are applied to all jobs run by the user.
  - The local RC file is `nast20221rc` on Linux and `NAST20221.rcf` on Windows, and is located in the same directory as the input data file. If the “rcf” keyword is used, this local RC file is ignored. This file should be used to define parameters that are applied to all jobs contained in the input data file directory.
1. The tilde (`-`) character is not recognized within RC files.
  2. Environment variables are only recognized when used in the context of a logical symbol (on Windows `NAST20221.rcf`) (see [Using Filenames and Logical Symbols](#) in the *MSC Nastran Installation and Operations Guide*).
  3. When a keyword is specified on the command line, embedded spaces or special characters that are significant to the shell must be properly quoted; quotes should not be used within RC files.

The keywords listed as follows are the most common for various computers, but are not available on all computers. Also, the defaults may be site-dependent. Please consult your [Keywords and Environment Variables](#) in the *MSC Nastran Installation and Operations Guide* for keyword applicability, specialized keywords, and further discussion of the keywords and their defaults. Keywords that use yes/no values accept partial specification and case-independent values. For example, “yes” may be specified as “y”, “ye”, or “yes” using uppercase or lowercase letters. The examples assume the jobs are run under a Linux operating system.

after	after = <i>time</i>	Default: <i>None</i>
(Linux)	Holds the job’s execution until the time specified by <i>time</i> . See the description of the “at” command in your system documentation for the format of <i>time</i>	
	Example:	<code>nast_ver example after=10:00</code>
	The job is held until 10:00 AM.	

**append**      `append={yes|no}`      Default: no

Combines the .f04, .f06, and .log files into a single file after the run completes. If “no” is specified, the files are not combined. If “yes” is specified, the files are combined into one file with the suffix “.out”.

Example:                      `nast_ver example append=yes`

Result: The .f04, .f06, and .log files are combined into a file named example.out.

**batch**      `batch={yes|no}`      Default: yes

(Linux)

Indicates how the job is to be run. If “yes” is specified, the job is run as a background process. If “no” is specified, the job is run in the foreground. If the “aft” or “queue” keywords are specified, the batch keyword is ignored. Jobs submitted with “batch=yes” will run under nice(1).

**Note:** If the job is already running in an NQS or NQE batch job, the default is “no”.

Example:                      `nast_ver example batch=no`

Result: The job is run in the foreground.

**bpool**      `bpool=value`      Default: *See text below.*

Specifies the number of GINO and/or executive blocks, or memory size in MB, GB, etc., that are placed in buffer pool.

The size is specified as the number of blocks (BUFFSIZE words long), a percentage of MEM, or the number of words or bytes followed by one of the modifiers: "T", "TW", "TB", "G", "GW", "GB", "M", "MW", "MB", "K", "KW", "KB", "W", "B". See Specifying Memory Sizes, 63 for a description of these modifiers.

If `mem=max` (which is the default) or/and `solve=auto` is not used, the default of `bpool` is 150 GINO blocks.

If `solve=auto` is used, `bpool` will be set automatically.

If `mem=max` is used, the default of `bpool` will be set to:

- 25% of memory for non SOL 101 or SOL 400.
- the remaining memory after memory estimate needed for the solver for SOL 101 or SOL 400.

Example:                      `nast_ver example bpool=100mb`

**buffsize**      `buffsize=value`      Default: 32769 words

Use to control the number of words per I/O record.

For large models, it is recommended to change buffsize to 65537, which is the maximum allowed.

**casi** If set to "no", this flag will disable the Casi solver as a possible option when "solve=auto" is specified.

**db**s `db=pathname` Default= . {Current directory}  
Creates database files (see [Using the NASTRAN Statement](#) in the *MSC Nastran Installation and Operations Guide*) using an alternate file prefix. If "db" is not specified, database files are created in the current directory using the basename of the input data file as the prefix. If the "db" value is a directory, database files are created in the specified directory using the basename of the input data file as the filename.

**Note:** If "db" is specified and "scratch=yes" is specified, a warning will be issued and "scratch=no" is assumed.

In the following examples, assume the current directory includes subdirectories "mydir" and "other", and that an "example.dat" exists in both the current directory and "other". That is, ./example.dat, ./mydir, ./other, and ./other/example.dat exist on Linux, and .\example.dat, .\mydir, .\other, and .\other\example.dat exist on Windows.

Example: `nast_ver example`

Result: Database files are created in the current directory with the name "example" e.g., ./example.DBALL on Linux; and .\example.DBALL on Windows.

Example: `nast_ver other/example`

Result: Database files are created in the "other" directory with the name "example", e.g., ./other/example.DBALL on Linux, and .\other\example.DBALL on Windows.

Example: `nast_ver example db=myfile`

Result: Database files are created in the current directory with the name "myfile", e.g., ./myfile.DBALL on Linux, and .\myfile.DBALL on Windows.

Example: `nast_ver example db=mydir`

Result: Database files are created in the mydir directory with the name "example", e.g., ./mydir/example.DBALL on Linux, and .\mydir\example.DBALL on Windows.

Example: `nast_ver example db=mydir/myfile`

Result: Database files are created in the mydir directory with the name "myfile", e.g., ./mydir/myfile.DBALL on Linux, and .\mydir\myfile.DBALL on Windows

Example: `nast_ver example dmp=4 host=a:b:c:d  
db=/aa:/bb:/cc:/dd`

Result: This example will set the "db" directory to "/aa" on host a, "/bb" on host b, "/cc" on host c, and finally "/dd" on host d.

**Note:** The use of distinct per-task database directories can have a significant impact on elapsed time performance of DMP jobs on SMP and NUMA systems.

dmp                    dmp=*dmparallel*                    Default: No parallelism based upon dividing the model

The dmp keyword specifies the number of processors used to efficiently obtain a solution to the simulation. These processors may be on the same node or on multiple nodes specified by the HOST command line option.

Specifying dmparallel > 1 and not including a DOMAINSOLVER Executive Command Statement has the following effects.

- The extraction of real eigenvalues using the default Lanczos method will be performed in parallel in SOL 103 and 111.
- The frequency response using SOL 111 will be performed in parallel.

Specifying dmp > 1 and using the DOMAINSOLVER provides the following addition user controlled performance gains using parallel processing

- The extraction of eigenvalues may be performed using Automated Component Modal Synthesis (ACMS) which is an approximate method that is very computational efficient when a large number of modes (high frequencies) are required.
- Design sensitivity may be performed in parallel in SOL 200
- The formation of using advanced nonlinear elements stiffness matrices may be performed in parallel for SOL 400.

It may also be necessary to define a host file if a network based distributed computing is used. See the *MSC Nastran Installation and Operators Guide*.

gpuid

gpuid=id,id or gpuid=id:id                   Default: none

id: the ID of a licensed GPU device to be used in the analysis.

GPUs are used for two types of operations: matrix factorization and matrix multiplication. In the routines that use GPUs for matrix factorization, only one GPU will be used per DMP process. So in order to use multiple GPUs, the user must also use multiple DMP processes:

```
nast_ver job gpuid=0,1,...,ngpu-1 dmp=ndmp, where ndmp≥ngpu.
```

Each DMP process will be assigned a GPU ID in round robin fashion.

In MUMPS, MPYAD and FASTFR modules, on the other hand, multiple GPUs can be used for matrix multiplication by a single process, as long as the number of SMPthreads is equal to or larger than the number of GPUs. These modules also use multiple parallel streams for data transfer between the GPU and the host system, so it is recommended to use the maximum number of available CPU cores/threads because that helps reduce the overhead of data transfer between the host and the GPUs.

So, for example, in order to achieve the best performance on a system with 20 CPU cores and 2 GPUs the user is advised to run Nastran with:

```
nast_ver job dmp=2 smp=10 gpuid=0,1
```

or

```
nast_ver job dmp=4 smp=5 gpuid=0,1.
```

Only up to 8 CUDA-compatible GPUs can be supported.

gpu\_min\_rank

gpu\_min\_rank=value                   Default: 32

The criteria for GPGPU execution during matrix factorization are the frontal matrix front size and the rank of the frontal matrix. Minimum dimensions are set via `gpu_min_front` and its companion parameter, `gpu_min_rank`. The value specified must be an integer greater or equal to 1. If the rank of the frontal matrix is smaller than `value`, the rank update of the front is processed on the CPU. Otherwise, the GPGPU device would be used for the rank update of the front. This keyword may also be set via SYSTEM cell 655.

gpu_min_front	gpu_min_front=value	Default: 2048
	The criteria for GPGPU execution during matrix factorization are the frontal matrix front size and the rank of the frontal matrix. Minimum dimensions are set via <code>gpu_min_front</code> and its companion parameter, <code>gpu_min_rank</code> . The value specified must be an integer greater or equal to 1. If the front size is smaller than value, the rank update of the front is processed on the CPU. Otherwise, the GPGPU device would be used for the rank update of the front. This keyword may also be set via SYSTEM cell 656.	
memorymax	memorymax= <i>maximum user memory</i>	Default: 0.5 x the amount of physical memory on your machine
	The user can enter the amount of memory as <i>n</i> GB or as <i>f</i> xphysical; <i>f</i> is the fraction between 0 and 1.	
	When <code>dmp</code> is used, the amount of memory per processor is <code>memorymax / dmp</code> .	
	If the machine is going to be used by a single user or a single job, it is recommended to set <code>memorymax</code> to <code>0.75xPhysical</code> .	
	If multiple Nastran jobs are running simultaneously on the same node of a computer system, it is recommended to set <code>memorymax</code> to <code>0.8*physical_memory</code> divided by the number of possible Nastran jobs running on the same node. Otherwise, one might encounter an error due to lack of memory on small models. The error can be avoided by using above setting in the system RC file or <code>mem=size</code> specified properly for the job in the command line.	
memory	memory= <i>memory_size</i>	Default=max
	Specifies the amount of memory to allocate. The <i>memory_size</i> can be specified either as a number of words, or as a number followed by one of the following modifiers:	
	G or Gw	Multiply <i>memory_size</i> by $1024^{**3}$ .
	Gb	Multiply <i>memory_size</i> by $(1024^{**3})/bytes\_per\_word$ .
	where <i>bytes_per_word</i> is 8 or you can enter a fraction of the physical memory	
	If "memory=estimate" is specified, ESTIMATE will be used to determine size. If "memory=max" is specified, then the amount of memory allocated depends on the "memorymaximum" keyword.	
	Example:	<code>nast_ver example memory=5gb</code>
	Result: The job is run using a memory size of 5 gigabytes.	
	Example:	<code>nast_ver example memory=0.5xPhysical</code>
	Result: The job is run using one-half the amount of physical RAM.	
	For a more detailed description, see the <a href="#">memory</a> in the <i>MSC Nastran Installation and Operations Guide</i> .	

**news**                    news={yes|no|auto}                    Default=yes

Displays the news file (*install\_dir*/msc20221/nast/news.txt on Linux and *install\_dir*\msc20221\nast\news.txt on Windows) in the .f06 file. If “auto” is specified, the news file is only displayed if it has been modified since the last time it was displayed for you. If “yes” is specified, the news file is displayed in the .f06 file regardless of when it was last changed. If “no” is specified, the news file is not displayed in the .f06 file.

Example:                                    `nast_ver example news=yes`

Result: The news file is displayed in the .f06 file after the title page block.

**notify**                    notify={yes|no}                    Default=yes

Sends notification when the job is completed. See the “ncmd” keyword to define an alternate notification command.

**Note:** If the job is queued using the queue keyword, or the job is already running in an NQS batch job, the default is “no”.

Example:                                    `nast_ver example notify=yes`

**old**                        old={yes|no}                        Default=yes

Saves previous copies of the .f04, .f06, .log, .op2, .out, pch, and .plt output files using sequence numbers (additional user-specified file types can be versioned with the “oldtypes” keyword). Sequence numbers are appended to the keyword filenames and are separated by a period.

If “yes” is specified, the highest sequence number of each of the output files is determined. The highest sequence number found is incremented by one to become the new sequence number. Then, all current output files that do not include sequence numbers are renamed using the new sequence number as a type.

Example:                                    `nast_ver example old=yes`

For example, assume your current working directory contains the following files:

```
v2401.dat v2401.f04.1 v2401.f06 v2401.log v2401.log.1
v2401.f04 v2401.f04.2 v2401.f06.1 v2401.log.1 v2401.log.3
```

Apparently, the user ran the job four times, but deleted some of the files; e.g.

```
v2401.f04.3
v2401.f06.3
```

When the job is run again with “old=yes”, the files are renamed as follows:

```
v2401.f04 is renamed to v2401.f04.4
v2401.f06 is renamed to v2401.f06.4
v2401.log is renamed to v2401.log.4.
```

The sequence number 4 is used because it is one greater than the highest sequence number of all of the selected files (the highest being v2401.log.3).

out                    *out=pathname*                    Default= .

Saves the output files using a different file prefix or in a different directory. If “out” is not specified, the output files are saved in the current directory using the basename of the input data file as a prefix. If the “out” value is a directory, output files are created in the specified directory using the basename of the input data file as the filename.

In the following examples, assume the current directory includes subdirectories “mydir” and “other”, and that an “example.dat” exists in both the current directory and “other”. That is, `./example.dat`, `./mydir`, `./other`, and `./other/example.dat` exist on Linux; and `.\example.dat`, `.\mydir`, `.\other`, and `.\other\example.dat` exist on Windows.

Example:                    `nast_ver example`

or:                    `nast_ver other/example`

Result: Output files are created in the current directory with the name “example”, e.g., `./example.f06` on Linux and `.\example.f06` on Windows.

Example:                    `nast_ver example out=myfile`

Result: Output files are created in the current directory with the name “myfile”, e.g., `./myfile.f06` on Linux and `.\myfile.f06` on Windows.

Example:                    `nast_ver example out=mydir`

Result: Output files are created in the mydir directory with the name “example”, e.g., `./mydir/example.f06` on Linux and `.\mydir\example.f06` on Windows.

Example:                    `nast_ver example out=mydir/myfile`

Result: Output files are created in the mydir directory with the name “myfile”, e.g., `./mydir/myfile.f06` on Linux and `.\mydir\myfile.f06` on Windows.

rcf	<p>rcf=pathname                      Default=no</p> <p>Specifies the name of the local RC file. If this keyword is not specified, the nast20221rc file on Linux and NAST20221.rcf on Windows located in the input data file's directory is used.</p> <p>Example:                              <code>nast_ver example rcf=nast.rc</code></p> <p>Result: The nastran command will process <code>./nast.rcf</code> on Linux, or <code>.\nast.rcf</code> on Windows in lieu of the default local RC file <code>./nast20221rc</code> on Linux, and <code>.\NAST20221.rcf</code> on Windows.</p>
scratch	<p>scratch={yes no mini post}      Default=no</p> <p>Deletes the database files at the end of the run. If the database files are not required, "scratch=yes" can be used to remove them, thereby preventing cluttering of the directory with unwanted files. If "mini" is specified, a reduced size database (that can only be used for data recovery restarts) will be created. See <a href="#">Database Concepts</a> in the <i>MSC Nastran Reference Guide</i> for further details on the "mini" database. If scratch=post is specified, a reduced size database intended for use by Patran or the toolkit will be created. Scratch=post also performs the actions of NASTRAN INDEX=19. But with scratch=post the resulting database is not restartable.</p> <p>Example:                              <code>nast_ver example scratch=yes</code></p> <p>All database files created by the run are deleted at the end of the job in the same way as the FMS statement INIT MASTER(S).</p>
sdirectory	<p>sdirectory=directory              Default: <i>See the description below.</i></p> <p>See <a href="#">Determining Resource Requirements</a> in the <i>MSC Nastran Installation and Operations Guide</i> for information on estimating a job's total disk space requirements.</p> <p>Specifies the directory to use for temporary scratch files created during the run. MSC Nastran can create very large scratch files; therefore, the scratch directory should contain sufficient space to store any scratch files created during a run. You must have read, write, and execute privileges to the directory.</p> <p>Linux: The default value is taken from the TMPDIR environment variable if it is set to a nonnull value. Otherwise, the computer's default temporary file directory is chosen; this is usually /tmp.</p> <p>Windows: The default value is taken from the TEMP environment variable.</p> <p>Linux Example:                      <code>nast_ver example sdir=/scratch</code></p> <p>Result: Scratch files are created in the directory /scratch.</p>

smp	smp= <i>value</i>	Default = 0
	Specifies the maximum number of processors selected for shared-memory parallel (SMP) processing in several numeric modules. In some cases SMP parallelization can be combined with DMP. In such cases, the smp keyword specifies the number of threads per process used in the simulation.	
	smp parallelization is available for mathematical kernels.	
	smp parallelization is available for the Intel MKL PARDISO solver in SOL 101, 107, 108, 111, 200, and 400; see the SPARSE SOLVER section of this document.	
	smp parallelization is available for the NLEMG modules and is disabled in the following cases:	
	<ul style="list-style-type: none"> <li>■ heat transfer and coupled analysis simulations;</li> <li>■ models that have contact between Advanced elements and Nastran elements;</li> <li>■ models that have QUADR/QUAD4 or TRIAR/TRIA3 element types arranged into the same element groups.</li> <li>■ models that have friction.</li> </ul>	
	If models have contact between Nastran and Advanced elements resulting in a SYSTEM FATAL MESSAGE (SFM) with smp > 1, then rerun the job with sys107=65536+ <i>number</i> . For example, if smp=8 is desired but an SFM results, then rerun with sys107=65544 in place of smp=8. This turns off the SMP parallelization for NLEMG.	
solve	solve={auto train}	Default (not set)
	If solve=auto then Nastran will automatically select the solver/parallel/memory. If solve=train then Pardiso memory coefficients will be updated. These options may be placed on the command line or in the User's RC files.	
spotweld	<path>/spotweld.sys	Default: <i>None</i> .
	Points to the location of the spotweld.sys file used in fatigue analysis of spotwelds to look up the diameter of the spotwelds based on the thickness of the top/bottom sheets. See the definition of PFTG bulk data for more information.	
symbol	symbol= <i>name=string</i>	Default: <i>None</i>
	Defines a symbolic (or logical) name used in ASSIGN and INCLUDE statements and in command line arguments. This keyword may be specified in initialization or RC files and on the command line. The symbol definition may include references to previously defined symbols or environment variables using the standard "\$name" or "\${name}" syntax on Linux or %name% syntax on Windows. For convenience, the character separating the "symbol" and "name" specification and the "name" and "string" specification may be either an equal sign ("=") or a hash mark ("#"). The use of a hash mark allows this keyword to be specified as an argument to a Windows .bat file.	

If "node" is specified, symbolic names defined using this keyword are not used on the local system. Instead the specified values are passed to the remote system. This means that any pathnames must be valid on the remote system. Use the "lsymbol" keyword to specify symbolic names for the local system.

If "node" is not specified, symbolic names defined using the "lsymbol" keyword are processed as if they were defined using the "symbol" keyword.

Symbolic names are processed in the order they are encountered while processing the initialization and RC files and the command line. If a duplicate symbolic name is encountered, the new value replaces the previously specified value.

Symbolic names must be 16 characters or less. The value assigned to the symbolic name must be 256 characters or less. If the symbolic name used in an ASSIGN or INCLUDE statement or in command line arguments is not defined, it is left in the filename specification as is.

For example, many of the .tpl and .demo input data files have ASSIGN statements such as the following:

```
ASSIGN 'MASTER=DBSDIR:abc.master'
```

The string "DBSDIR:" specifies a symbolic name that is to be replaced by another string. The replaced string is defined by the "symbol=" keyword (or "lsymbol=" keyword if "node" was not specified) in an initialization or RC file, on the command line, or as environment variable. For example,

(Linux) `symbol=DBSDIR=/dbs`

(Windows) `symbol=DBSDIR=d:\dbs`

When the previous ASSIGN statement is processed, the filename assigned to the logical name MASTER is /dbs/abc.master on Linux and d:\dbs\abc.master on Windows. An alternate way of defining symbolic names is through the use of environment variables. For example, typing the following command

```
export DBSDIR=/dbs
```

at a Korn shell prompt, or

```
setenv DBSDIR /dbs
```

at a C-shell prompt, or

at a Windows shell prompt, is equivalent to the "symbol" keyword definition.

**Note:** If a symbolic name is defined by both a symbol statement in an RC file and by an environment variable, the symbol statement value will be used.

The section titled [Environment Variables](#) in the *MSC Nastran Installation and Operations Guide* contains a list of environment variables that are automatically created by the nastran command. Of particular interest to the logical symbol feature are the OUTDIR and DBSDIR variables. These variables refer to the directory that will contain the output files (set using the "out" keyword) and the directory that will contain the permanent database files (set using the "dbs" keyword), respectively.

uds	uds={filename   model}	Default: None
	<p>The file name is the source file that defines user subroutines. This keyword is used to build user service at nastran job submittal time. The user subroutines implementations are from the specified file and the user service name is from the connect service statement in input file.</p> <p>On windows the UDS files being created may not be in "C:\Program Files". Please copy files to a writable directory to build.</p> <p>Example:</p> <p>If user routine is written in Fortran: <code>nast_ver example uds=mysource.F</code></p> <p>If user routine is written in C++: <code>nast_ver example uds=mysource.cpp</code></p> <p>The mysource.F includes all user defined subroutines. There may be multiple user subroutines from multiple interfaces in the file. The user subroutine names are predefined and documented in User Defined Services.</p> <p>Another option to define user subroutines is to put them in BEGIN BULK UDS section in the input file. The content in this section will be used to create source file when building user service. If this option is used, the uds keyword should be set to model.</p> <p>Example: <code>nast_ver example uds=model</code></p>	
udssave	udssave=pathname	Default: output directory
	<p>The udssave is the location to build user service. If udssave is given, the path will be used to build and save user service. If it is not given, the nastran output directory will be used and the user service will be removed after nastran job run.</p> <p>Example: <code>nast_ver example uds=mysource.F udssave=/scratch/mydir</code></p>	
xdbold	xdbold={yes no}	Default=yes
	<p>Keeps or deletes the previous copy of the .xdb.</p> <p>If "yes" is specified, the previous copy is kept and appended by the current run.</p> <p>If "no" is specified, the previous copy is deleted and a new file is created. This gives the same behavior as below FMS statement:</p> <p>ASSIGN dbc=&lt;file_name&gt;.xdb delete</p> <p>Example: <code>nast_ver example xdbold=no</code></p>	

# 2

## NASTRAN Statement

- The NASTRAN Statement

## The NASTRAN Statement

The NASTRAN statement is used to specify values for certain Executive System operational parameters. These parameters are also called system cells. The NASTRAN statement is used for exceptional circumstances and is therefore not needed in most runs. The NASTRAN statement may also be specified in the runtime configuration (RC) files at the system, user, and job level as described in the .

## NASTRAN Executive System Parameter Modification

Specifies values for certain Executive System operational parameters called system cells.

### Format:

```
NASTRAN cellnamei=expressioni, ..., cellnamen=expressionn
```

or

```
NASTRAN SYSTEM(i)=expressioni, ..., SYSTEM(n)=expressionn
```

Descriptor	Meaning
cellnamei	System cell names from <a href="#">Table 2-1</a> .
SYSTEM	Specifies the system cell number.
expression	See DEFINE statement for description.
i	System cell number from <a href="#">Table 2-1</a> or from the SYSTEM common block described in the <i>MSC Nastran User Modifiable User's Guide</i> .

### Remarks:

1. The NASTRAN statements may appear anywhere in the File Management Section. The NASTRAN statement may also be specified in runtime configuration (RC) files. See [Customizing Command Initialization and Runtime Configuration Files](#) (App. A) in the *MSC Nastran Installation and Operations Guide*.
2. System cell values and their associated cell names may also be set with the DEFINE statement. They may also be set or values returned with the DMAP PUTSYS and GETSYS functions and the PARAM module. See [PUTSYS](#), [GETSYS](#) in the *DMAP Programmer's Guide*.
3. More than one NASTRAN statement and/or DEFINE statement may be present and, if a system cell is specified more than once among these statements, then the last specification takes precedence.
4. The expression will use type conversion rules based on the type (i.e., integer, real, or logical) of the cellname, as defined on a previous DEFINE statement (see the DEFINE statement for conversion rules).
5. If expression is omitted, the system cell associated with the cellname will be assigned the value as set on a previous DEFINE statement.

### Examples:

1. Either of the following statements could be used to change the default value for block size.

```
NASTRAN SYSTEM (1) = 4097
```

or

```
NASTRAN BUFFSIZE = 4097
```

or, if a prior DEFINE statement had defined a keyword MY\_SYSBUF to the value 4097, then the following code could be used:

NASTRAN SYSTEM(1)=MY\_SYSBUF

or

NASTRAN BUFFSIZE=MY\_SYSBUF

2. [Table 2-1](#) gives a summary of the recommended system cells. System Cells

Table 2-1 System Cell Summary

System Cell Name (Number)	Function and Reference
<a href="#">BUFFSIZE (1)</a>	Specifies the number of words in a physical record. Also called block length.
<a href="#">F06 (2)</a>	Specifies FORTRAN unit number for standard output file (.f06). (Integer $\geq$ 0; a value of 0 sends the results to the log file; Default=6). This system cell may not be set for SOL 600 or SOL 700.
<a href="#">NLINES (9)</a>	Specifies the number of lines printed per page of output. <a href="#">LINE (Case)</a> .
<a href="#">MAXLINES (14)</a>	<a href="#">MAXLINES (Case)</a>
<a href="#">METIME (20)</a>	Minimum time for execution summary table message. <a href="#">Output Description</a> in the <i>MSC Nastran Reference Guide</i> .
<a href="#">APP (21)</a>	Approach Flag. See the <a href="#">APP</a> Executive Control statement. If APP HEAT is specified, then this system cell is set to 1.
<a href="#">MACHTYPE (22)</a>	Machine type
<a href="#">DIAGA (25)</a>	Alternate method to set DIAGs 1 through 32. <a href="#">DIAG</a> .
<a href="#">CONFIG (28)</a>	Machine subtype
<a href="#">ADUMi (46 - 54)</a>	Dummy element flag, i=1 through 9.
<a href="#">HEAT (56)</a>	<a href="#">APP</a>
	0 Structural analysis (Default).
	1 Heat transfer
<a href="#">DIAGB (61)</a>	Alternate method to set diagnostics 33 through 64. <a href="#">DIAG</a> .
<a href="#">PUNCH (64)</a>	Specifies FORTRAN unit number for PUNCH file (.f07). (Default=7)
<a href="#">MPYAD (66)</a>	Selects/deselects multiplication methods. <a href="#">MPYAD</a> in the <i>MSC Nastran DMAP Programmer's Guide</i> .
<a href="#">DCMPOUT(69)</a>	Controls matrix decomposition for MSCLDL and MSCLU. Same as <a href="#">DECOMP</a> in the <i>MSC Nastran DMAP Programmer's Guide</i> and the <a href="#">Option Selection</a> in the <i>MSC Nastran Numerical Methods User's Guide</i> .
	0 or -1 Print up to 50 messages for null columns and zero diagonals (Default=-1).
	1 Terminates execution when first null column is encountered.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	2	Suppress printing of message when a null column is encountered.
	4	Terminates execution when first zero diagonal term is encountered.
	16	Place 1.0 in diagonal position for all null columns and proceed with the decomposition.
	32	Terminates execution on zero diagonal term.
	64	Exit after execution of preface for symmetric decomposition.
	256	Print MAXRATIO messages (SIM 4159) from DCMF.
DELFF (77)	Deletes form feeds.	
DBSET	Database neutral file set. <a href="#">SubDMAP DBFETCH</a> in the <i>MSC Nastran DMAP Programmer's Guide</i> .	
DMAP (82)	Allows NOGO to operate. See Processing of User Errors in the <i>MSC Nastran DMAP Programmer's Guide</i> .	
F04 (86)	Specifies FORTRAN unit number for Execution Summary Table (.f04). <a href="#">Output Description</a> in the <i>MSC Nastran Reference Guide</i> (Integer $\geq 0$ ; a value of 0 sends the results to the log file; Default = 4).	
RADMTX (87)	Type of radiation exchange coefficients, <a href="#">RADMTX</a> .	
	1	Direct input of a symmetric SCRIPT-AF matrix on RADMTX and RADLST entries is allowed. Due to the symmetry, only one-half of the RADMTX may be entered.
	2	Direct input of a unsymmetric SCRIPT-AF matrix on RADMTX and RADLST entries is allowed. Due to the unsymmetry, the full matrix must be specified on the RADMTX entries.
	3	If you are running a view factor calculation in an opened enclosure, NASTRAN assumes that the radiation will be lost to space at absolute zero degrees Kelvin. You can set SYSTEM(87)=3 so that radiation will not be lost to space.
RADLST (88)	Print radiation area summary. <a href="#">RADLST</a> .	
SMP (107)	Number of processors used for Shared Memory Parallel	
NEWHESS (108)	Request complex eigenvalue method. See the <a href="#">EIGC</a> entry, <i>MSC Nastran Numerical Methods User's Guide</i> .	
(109)	Controls DMAP execution:	
	0	Do not execute DMAP instruction if all outputs are previously computed.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	1	Always execute DMAP instruction (Default).
BUFFPOOL (114)	Bufferpool size. <a href="#">Keywords and Environment Variables</a> in the <i>MSC Nastran Installation and Operations Guide</i> .	
(119)	Controls the type of bufferpool method to be used:	
	4	Use Version 2012.2 bufferpool method. Default = 4.
	Not 4	Use Version 2012.1 bufferpool method.
ATTDEL (124)	Controls the automatic assignment of the delivery database. <a href="#">Database Concepts</a> in the <i>MSC Nastran Reference Guide</i> . See also <a href="#">Creating and Attaching Alternate Delivery Databases</a> in the <i>MSC Nastran Installation and Operations Guide</i> .	
	0	Enables automatic assigning (Default).
	-1	Disables automatic assigning.
NOKEEP (125)	Controls NOKEEP option of the RESTART File Management statement.	
	0	Disable NOKEEP (Default)
	1	Enable NOKEEP
SPARSE (126)	Sparse matrix method selection for MSCLDL and MSCLU. For unsymmetric sparse matrix decomposition method selection, see cell number 209. The following values may be summed in order to select sparse matrix methods in the operations listed below:	
	0	Deactivate sparse methods
	1	Multiplication
	8	Symmetric decomposition
	16	Forward-backward substitution
	The default is 25, which is the sum of all values.	
UPDTTIM (128)	Specifies database directory update time. <a href="#">DBUPDATE, 90</a> FMS statement.	
	0	Do not update.
	>0	Time, in minutes, between database directory updates. (Default 5 min.)
SMPYAD67 (129)	Select pre-Version 67 method in the SMPYAD module. <a href="#">SMPYAD</a> in the <i>MSC Nastran DMAP Programmer's Guide</i> .	
	0	Use current method (Default).
	1	Use pre-Version 67 method.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference
MAXDBSET	The maximum number of online DBsets attached to the run.
AUTOASGN (133)	Controls autoassigning of dbsets. Sum the desired values. (Default=7). <a href="#">Database Concepts</a> in the <i>MSC Nastran Reference Guide</i> .
	0 No databases are automatically assigned.
	1 Only the primary database is automatically assigned.
	2 Only the delivery database is automatically assigned.
	4 Only located databases are automatically assigned.
TSTAMP (135)	Controls timestamp checking of DBsets.
	0 Do not check
	1 Check (Default)
	2 Same as 1 and print diagnostics
QUADINT (141)	Specifies quadratic or linear interpolation for the line search method in nonlinear analysis (SOL 106, SOL 129, and SOL 153).
	0 Quadratic interpolation (Default)
	1 Linear interpolation
SCR300 (142)	Requests creation of SCR300 partition on SCRATCH DBset. <a href="#">INIT</a> FMS statement.
	1 Do not create SCR300 partition.
	2 Create SCR300 partition (Default).
LOCBULK (143)	LOCBULK=1 or 2 specifies that Bulk Data is being obtained via the DBLOCATE FMS statement. NASTRAN LOCBULK=2 is specified when no Bulk Data entries, except for PARAM entries, are to be deleted or added. All PARAM entries must be respecified. All other entries will be ignored and, if present, may increase CPU times in XSORT and IFP. With LOCBULK=2, the XSORT and IFP modules will not reprocess the Bulk Data Section stored in the SEMAP run. Also, GP1, TASN2, SEP1 and SEP1X modules will be skipped. 0 is the default, which assumes the RESTART FMS statement. This system cell is recognized only in SOLs 101 through 200.
(144)	RESTART FMS statement existence flag. Set to 1 if RESTART statement is present.
BFGS (145)	Selects strategies of BFGS updates for the arc-length methods in nonlinear analysis. Please see the <i>MSC Nastran Nonlinear Handbook</i> .
	0 Update $\Delta u_R$ and $\Delta u_p$ at every iteration with $\gamma^*$ . (Default)
	1 Update $\Delta u_R$ only with $\gamma$

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference
	2 Update $\Delta u_R$ only with $\gamma^*$ .
FBSMEM (146)	Reserves part of Nastran open core memory for faster solution in the Lanczos method of eigenvalue extraction. Default = 0. When FBSMEM is less than or equal to 0, available memory is used to store the factor matrix for use during forward-backward substitution (FBS) operations (aka “factor caching”). System Information Message 4199 is printed in the F04 file when the factor matrix is cached. Set FBSMEM=1 to disable Lanczos factor caching.
UWM (147)	SYSTEM(147)=1 issues a User Warning Message for a DMAP parameter appearing on a CALL statement that has an inconsistent authorization in the called subDMAP. 0 is the default, which means no message is issued. A value of 1 also issues User Warning Message 1 during DMAP compilation if a module instruction is missing trailing commas for input and output data blocks.
DBVERCHK (148)	In general, databases are not compatible between major releases; therefore, a check is performed in MSC Nastran to ensure that the major version which created the database is the same as that being executed. Since specific data on the database may be compatible, SYSTEM(148) allows this check to be circumvented. However, circumventing the check may lead to problems later in the run.
	0 Check is performed (Default)
	1 Check is not performed
SCR300DEL (150)	Sets minimum number of blocks of SCR300 partition of SCRATCH DBset at which it is deleted. INIT FMS statement (Default = 100).
(151)	Requests spill or no spill of the SCR300 partition of SCRATCH DBset. INIT FMS statement (Default = 0).
DBLAMKD (155)	Differential stiffness formulation for CBEAM and CTETRA elements.
	0 Current formulation (Default)
	1 Pre-Version 67 formulation

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference		
(162)	<p>Reserves MSC Nastran executive first number for GINO for each of the tables DBTEMP, FCB, DBDICT and FIST. Default value is 6000 and is often controlled in DMAP just before and just after modules that deal with large input families. Usually a user will have no need to modify. However if the user gets the following message:</p> <p>*** SYSTEM FATAL MESSAGE 1267 (XSTORE)            NO MORE MEMORY SPACE AVAILABLE FOR EXECUTIVE TABLES.            USER ACTION: INCREASE DEFAULT NUMBER OF EXECUTIVE TABLES ENTRIES VIA SYSTEM CELL 162.  <b>SYSTEM(162) IS CURRENTLY SET TO 6000</b></p> <p>A DMAP workaround is of the form:            Just before the offending module            NP=GETSYS(NP,162) \$            NP1= value \$ value &gt; 6000            PUTSYS(NP1,162) \$            Just after offending module            PUTSYS(NP,162) \$</p>		
(166)	<p>Controls sparse symmetric decomposition. Sum the desired values (Default = 0).</p>		
	<table border="1"> <tr> <td data-bbox="601 998 689 1038">0</td> <td data-bbox="689 998 1325 1038">No action</td> </tr> </table>	0	No action

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
LDQRKD (170)	Selects the differential stiffness method for CQUAD4 and CTRIA3 elements:	
	0	Version 68, improved method (Default).
	1	Pre-Version 68 method
OLDQ4K (173)	Requests the pre-Version 68 CQUAD4 element stiffness formulation. No value is required after the keyword. Equivalent to SYSTEM(173)=1.	
	0	Default: Current QUAD4 formulation
	1	Requests pre-V68 QUAD4 formulation.
	2	Requests V68 - V70.5 QUAD4 formulation.
Q4TAPER (189)	Specifies the maximum allowable value of taper for CQUAD4 element. Taper is computed by connecting opposite grid points and computing the area of the enclosed triangles. Another way to think of taper is the ratio of the areas on the two sides of a diagonal (Real $\geq$ 0.0; Default = 0.5).	
Q4SKEW (190)	Specifies the minimum allowable value of skew for the CQUAD4 element. Skew is the angle measured in degrees between the lines that join opposite midsides (Real $\geq$ 0.0; Default = 30.0).	
TETRAAR (191)	Specifies the maximum allowable aspect ratio of the longest edge to the shortest altitude for the CTETRA element (Real $\geq$ 0.0; Default=100.0).	
SCRSAVE (196)	Lanczos high performance option: Controls reuse of scratch files in segment logic.	
	0	Do not reuse (Default)
	1	Reuse
MINFRONT (198)	Lanczos high performance option: minimum front size. (The default value is machine dependent).	
NSEGADD (200)	Number of segments in the element error table that is generated in adaptive analysis (Default = 2).	
CORDM (204)	Specifies the default value for CORDM field on the PSOLID entry (Integer $\geq$ -1; Default = 0).	
(205)	Rank to use for real symmetric sparse decomposition high rank update. Default is hardware dependent.	
DCMPSEQ (206)	Selects ordering method for sparse matrix decomposition.	
	0	Method selected automatically in symbolic factoring phase (Default).

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	1	Minimum degree ordering.
	2	Modified minimum degree ordering for indefinite matrices.
	3	No ordering (uses given sequence).
	4	Extreme ordering. (BEND)
	8	METIS ordering. Metis was developed by George Karpis and Vipin Kumar at the University of Minnesota. More information may be found at <a href="http://www.cs.umn.edu/~karypis/metis">http://www.cs.umn.edu/~karypis/metis</a> .
	9	Selects the better of METIS and MMD.
	10	Selects dof-based (rather than grid-based) modified minimum degree ordering.
	68	This option may reduce the number of nonzero factors in the sparse decomposition method.
	132	Similar to 68 but does not require the USET and SILS table as input. Uses extreme reordering.
	136	Same as 132 but performs METIS reordering.
	260	Selects dof-based (rather than grid-based) extreme ordering.
	264	Selects dof-based (rather than grid-based) METIS ordering.
	1024	Selects Minimum Degree reordering in Intel MKL Pardiso sparse solver.
	2048	Selects METIS reordering in Intel MKL Pardiso sparse solver.
	4096	Selects OpenMP (SMP) METIS reordering in Intel MKL Pardiso sparse solver.
USPARSE (209)	Unsymmetric sparse matrix method selection for the decomposition and forward-backward substitution operations.	
	0	Deactivate
	1	Select Nastran unsymmetric sparse factorization (Default).
	16	Select UMFPACK unsymmetric sparse factorization.
	64	Select LUSOL unsymmetric sparse factorization.
PUNCHTYPE (210)	Used to control punch formula.	
	0	“Old” punch, default in MSC Nastran 2001 and earlier versions.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference
	1 "New" punch, default starting in MSC Nastran 2004 and uses the NDDL.
	2 Same as 1 except the line numbers are eliminated.
DISTORT (213)	Element distortion fatal termination override. Applies to the TETRA element.
	0 Terminate run (Default)
	1 Do not terminate run.
T3SKEW (218)	Allows the user to control the minimum vertex angle for CTRIA3 elements at which USER WARNING MESSAGE 5491 is issued. See the description of CTRIA3.
(219)	Rank to use for complex symmetric sparse decomposition high rank update (Default = 1).
(220)	Rank to use for real unsymmetric sparse decomposition high rank update (Default = 1).
(221)	Rank to use for complex unsymmetric sparse decomposition high rank update (Default = 1).
(253 - 262)	SYSTEM(252) to (262) have been set aside for user DMAPS. MSC will not use these values in its code in present or future versions. The SSSAlter library may use this range.
MAXSET (263)	Controls the default number of vectors in block or set for Lanczos Eigenvalue extraction. See EIGRL. The default is 7 for most machines but it is machine dependent.
QUARTICDLM (270)	A value of 1 selects the new quartic formulation of the doublet latic kernel (N5KQ), while 0 selects the original quadratic form (Default = 0).
(273)	A value of 1 selects the old Lanczos shift logic from Version 70 and previous systems (Default = 0).
DBCFACT (274)	Option to create an xdb file with a multi-key data format and is intended for "large" xdb files.
	0 no multi-key format (default)
	2 auto-select multi-key format
	4 multi-key format
(275)	Specifies the timeout for ISHELL in seconds. Values greater than 2,678,400 (31 days) will be set to 31 days.
SPLINE_METRICS (281)	Print additional spline quality information

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	=0	Don't print (default).
	=1	Print quality information for each user-generated spline.
	=2	Print quality information for each user-generated spline and each Nastran-generated center-to-corner point spline.
	Note that if SPLINE_METRICS is defined on the NASTRAN statement without a numeric value, then a value of 1 will be used.	
MINDEF (303)	Indefinite mass matrix check, the Default = 1 does not perform the check.	
	> 0	Check is not performed
	< 0	Epsilon is set to -1.E(MINDEF)
	0	MINDEF defaults to -6
MPERTURB (304)	Perturbation factor for indefinite mass matrix. The Default = 1 does not perturb the mass.	
	> 0	The mass is not perturbed
	< 0	The mass 1.E(MPERTURB) is added to the diagonal terms of the mass matrix
	0	MPERTURB defaults to -6. The perturbed mass matrix is used in the subsequent eigenvalue analysis
(309)	If set to 1, requests the pre-Version 70.7 CHEXA8 element stiffness formulation (Default = 0).	
OLDRBE3 (310)	If set to 1, requests the pre-Version 70.7 RBE3 formulation (Default = 0).	
TBCMAG (311)	Change the stiffness to 1.0E2 if using thermal conductivity in Btu/sec/in.F. See Bulk Data entry <a href="#">TEMPBC</a> for more information. The default stiffness is 1.0E10.	
INDEX (316)	Indexes and/or saves a minimum set of data blocks to the database needed to for postprocessing in Patran or the toolkit. This cell must be used with scratch=no on the nastran command. This cell has several options which are set by adding the following values:	
	1	Index IFP data blocks.
	2	Index OFP data blocks.
	4	Save above data blocks to the MASTER dbset.
	16	Save above data blocks to the DBALL dbset.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	For example, INDEX=7 will index the IFP and OFP data blocks and save them to the MASTER dbset. (Scratch=post is equivalent to scratch=no and INDEX=19.) But with INDEX>0 the resulting database is not restartable.	
XMSG (319)	If set to 1, gives extended error messages (Default = 0).	
OLDDAREA (320)	Controls the conversion of DAREA Bulk Data entries for grid and scalar points to equivalent FORCE/MOMENT/ SLOAD Bulk Data entries as appropriate.	
	0	Perform the conversion, but do not give details of the conversion (Default).
	N	Perform the conversion and give details of the first N such conversions.
	-1	Do not perform the conversion.
RSEQCONT (357)	If system cell IFPSTAR=NO, RSEQCONT default = 0	
	1	causes all continuation fields to be ignored and treated as blank. If set to 1, the continuation entries must immediately follow the parent
	2	causes fatal message to be issued if there are orphaned continuation entries.
	System cell (357) only works when IFPSTAR=NO, it is fixed to 1 when IFPSTAR=YES	
QLHOUL (359)	0	Use the user-requested eigensolution method.
	< > 0	When LAN is requested, switch to AHOU if the number of DOFs sent to the eigensolver is $\leq$ "nswitch", an input parameter to the READ module. This parameter has an MPL default of 20. It may be set to other values in the solution sequences, depending on the context. When HOU, MHOU, or AHOU is selected, switch to the new Householder-QL solution (Default = 1).
PRTPCOMP (361)	If set to 1, then the equivalent PSHELLs and MAT2s from PCOMPs or PCOMPGs are printed to the .f06 file provided that ECHO = NONE is not set. (Default = 0, suppresses this printout).	
STRICTUAI (363)	A value of 1 accepts strict UAI/Nastran Bulk Data entries (Default = 0).	
STPFLG (366)	Selects the SUBCASE or STEP layout when there are a number of SUBCASE commands and no STEP command in a Case Control file for SOL 400 (Default = 0).	

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	0	Keep all SUBCASE commands in the Case Control file and insert a “STEP 1” for each SUBCASE.
	1	Convert all the SUBCASE IDs into STEP IDs, and then insert a “SUBCASE 1” before the first STEP.
QRMETH (370)	When the input consists of CQUADR/CTRIAR elements, QRMETH allows you to convert them to QUAD4/TRIA3 elements or when the input consists of QUAD4/TRIA3 elements to convert them to CQUADR/CTRIAR elements.	
	Some of the output requests for CQUAD4/CTRIA3 are not available for CQUADR/CTRIAR, for example, the CUBIC option on the STRESS Case Control command. In this case, the equivalent CQUADR/CTRIAR options are used.	
	0	Use the user input CQUADR/CTRIAR elements. (Default)
	3	Converts user input CQUADR/CTRIAR into CQUAD4/CTRIA3.
	5	Converts user input CQUAD4/CTRIA3 into CQUADR/CTRIAR.
PARAMCHK (372)	DMAP parameter initialization check.	
	0	Issue User Fatal Message for an input parameter that is not used in a type statement in the subDMAP argument (Default).
	1	Issue User Fatal Message for the initialized parameter.
TZEROMAX (373)	Controls time step adjustment in nonlinear transient analysis.	
	> 0	Maximum number of times to return to time zero.
	0	No initial time step adjustment (identical to V2001), default for SOL 400 with CGAP elements.
	< 0	No limit on DT adjustment.
	4	Default for SOL 400 without CGAP element or for SOL 129.
NOLIN (386)	(Real, Default = 1.0) Tolerance value for controlling adaptive time step bisection for NOLIN1 entries in SOL 129. Turned off for rotor dynamics. For NLRGAP see SYSTEM (431).	
	0.	Bisection is suppressed (same as Version 2001).
	.001	Increase accuracy slightly.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	.01	Increase accuracy a little more.
	1.0	Allow full adaptive time step bisection.
KRYLOV1 (387)	Fast direct frequency response option.	
	-1	Yes
	0	No (Default)
KRYLOV2 (388)	Options related to fast direct frequency response analysis. Selects subspace generation method.	
	1	Lanczos (Default)
	2	Arnoldi (Use for unsymmetric systems)
KRYLOV3 (389)	Options related to fast direct frequency response analysis. Defines exponent of relative accuracy.	
	-4	Error<1.0E-4 (Default)
	-6	Error<1.0E-6
KRYLOV4 (390)	Options related to fast direct frequency response analysis. Defines pole selection distance.	
	0	Next pole is next unconverged frequency (Default).
	2	2*next frequency distance.
	-2	1/2*next frequency distance.
KRYLOV5 (391)	Options related to fast direct frequency response analysis. Selects decomp/fbs tradeoff parameter determining Krylov method accuracy.	
	0	never terminate, do FBS iterations till accuracy is met
	1	terminate when FBS time > decomposition time (Default)
	2	terminate when FBS time > 2 * decomposition time
	-2	terminate when FBS time > (1/2) * decomposition time
BARMASS (398)	Allows the user to select the bar torsional mass moment of inertia. If set to 0, request the pre-MSC Nastran 2004 (Default = 0). If set to greater than 0, the torsional mass moment of inertia term is included in the mass matrix formulation of bar elements. For both values of COUPMASS, the torsional inertia is added. For COUPMASS = 1, the axial mass will be consistent rather than coupled.	
DPBLKTOL (402)	Specifies Bulk Data tolerance value for GRID, CORD2C, CORD2R, and CORD2S entries. (Default = 0). See / Control Input Stream section under Bulk Data Entries below	

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
	< 0	Do not remove duplicate entries
	0.0	Check specified Bulk Data entries for exact physical match and remove duplicates
	> 0	Then perform the DPBLKTOL=0.0 check and additionally GRID entry as duplicate if $\{ x1(i) - x2(i)  \leq DPBLKTOL ; i = 1, 2, 3 \text{ and } (cp1 \neq cp2 \text{ and } cp1 \cdot cp2 = 0) \text{ and } (cd1 \neq cd2 \text{ and } cd1 \cdot cd2 = 0) \text{ and } (ps1 = ps2) \text{ and } (seid1 = seid2)\}$ using entry with $cpi \neq 0$ and $cdi \neq 0$ if possible
OP2NEW (403)	Selects the additional version information in the OUTPUT2 file. (Default = 0)	
	0	Leave alone and unidentified, pre-2004 convention
	1	Add version major, minor, special to tape label and change IFP datablock locate code word 3
DEF_DENS (408)	Set DEFAULT value for the MODEL_CHECK Executive statement MAT_DENSITY=DEFAULT operation (Default = 0.0).	
DEF_TECO (410)	Set DEFAULT value for the MODEL_CHECK Executive statement MAT_TECO=DEFAULT operation (Default = 0.0).	
DEF_TEIJ (411)	Set DEFAULT value for the MODEL_CHECK Executive statement MAT_TEIJ=DEFAULT operation (Default = 0.0).	
DEF_DAMP (412)	Set DEFAULT value for the MODEL_CHECK Executive statement MAT_DAMP=DEFAULT operation (Default = 0.0).	
OPTCOD (413)	Specifies which optimization code to be used in SOL 200 (Default = 0; automatic selection for a better performance based on number of design variables, number of constraints, number of active/violated constraints and computer memory).	
	<b>Note:</b> Options 1 and 2 are no longer used.	
	3	MSCADS
	4	IPOPT Optimizer
(414)	Only used if COUPMASS < 0. Default = 0 Coupled Mass for CBAR and CBEAM elements.	
	> 0	Lumped Mass matrix will contain translational components only for CBAR and CBEAM elements.
OLDTDMTH (428)	If nonzero, requests the pre-version 2005 r3 method for computing thermal expansion in CHEXA, CPENTA, and CTETRA elements.	

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
NONLRGAP (431)	(Real, Default = -1.0) Sets tolerance value for controlling adaptive time step bisection for NLRGAP entries in SOL 129 and SOL 400. Time step bisection will occur if the contact force magnitude changes more than the tolerance.	
	= 0.	(Same logic as Version 2005)
	< 0.	Tolerance = 1.E+9
	> 0.	Tolerance = 1000./SYSTEM(431)
ESLNRO (443)	Flag to invoke Nonlinear Response Optimization with the concept of Equivalent Static Loads	
	0	No ESLNRO (Default)
	1	Turn on ESLNRO
(444)	0	Selects the pre Nastran 2010 release of IFP for bulk data processing.
	1	Selects the MSC Nastran 2010 release Common Data Model for data processing, do not allow an integer in a field that the only possible format is real. (Default)
	9	Selects the MSC Nastran 2010 release Common Data Model for data processing, allow an integer in a field that the only possible format is real.
IFPSTAR	YES	Selects the MSC Nastran 2010 release Common Data Model for data processing, do not allow an integer in a field that the only possible format is real. (Default)
	NO	Select the pre MSC Nastran 2010 IFP for bulk data processing.
	On command line IFPSTAR=YES or NO is able to express the value of 1 or 0 only.	
MNLQ4C (445)	Allows or disallows corner stress calculations for CQUAD4 if material nonlinear (Default = 1).	
	0	Allows material nonlinear CQUAD4 corner stress calculations if plastic deformation has occurred, results may be totally incorrect.
	1	Disallows material nonlinear CQUAD4 corner stress calculations. If corner requested and material nonlinear sensed, corner is turned off and center only is computed.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference		
(446)	Controls 4 noded CTETRA fluid mass calculations. (Default=0)		
	0	To improve the modal results for fluid mass and remove the possibility of spurious fluid modes, a four point integration method is used.	
	1	A one point integration method is used to compute the fluid mass.	
PARCHILD(449)	Bitwise control of DMP operations in SOL 400 nonlinear analysis.		
	Bit	Value	Description
	1	Default	System determines automatically at job startup. When running the job on multiple hosts, the value is set to 0; otherwise (single host), it is set to 1. <b>User setting of PARCHILD is not recommended.</b>
		0	Child processes execute the entire analysis. This value is recommended for distributed execution.
		1	Child processes only participate in parallel computational tasks. Recommended for DMP running on a single host (i.e., non-distributed DMP execution).
	2	0	DMP linear equation solver disabled.
		1	DMP linear equation solver enabled (default).
	3	0	DMP nonlinear element matrix generation disabled.
		1	DMP nonlinear element matrix generation enabled (default).
	To change defaults for this system cell, use the DOMAINSOLVER command in the <i>MSC Nastran Quick Reference Guide</i> .		
(451)	If set nonzero, requests the method to calculate transverse shear correction for elements using MID4, or “Z0” on the PCOMP to offset a shell element. The default 0 uses a new method that avoids excessive transverse shear stiffness. This is expected to have small effect on most models, unless the shell is thick and the offset is large.		

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
DIFFS(614)	Flag to control differential stiffness computation (Default=0).	
	DIFFS = -2	Enforce differential stiffness computation of RBE3 elements in linear buckling analysis regardless of the maximum number of element grids.
	DIFFS = -1	Skip differential stiffness computation of RBE3 elements in linear buckling analysis regardless of the maximum number of element grids.
	DIFFS = 0	Compute differential stiffness matrix. For nonlinear elements with geometric nonlinear analysis in SOL 400, also compute follower force stiffness. For linear buckling analysis, differential stiffness calculations for RBE3 elements will be skipped when the maximum number of grids exceeds 10000.
DIFFS > 0	Defined via Bulk Data entry MDLPRM,NLDIFF to determine whether the differential stiffness matrix and follower force stiffness are to be computed for nonlinear elements with geometric nonlinear analysis in SOL 400.	
IFPBUFF(624)	Specifies the size of IFPSTAR data base I/O transfers	
	Default value=1024 words The physical I/O size is IFPBUFF words. The maximum value of IFPBUFF is 65536 words.	
	Example: NASTRAN IFPBUFF=8192	
NONUIV (653)	Parameter to select the numeric compute kernel and pivoting methods in MSCLDL and MSCLU sparse direct solvers. Also see the bulk data entry <a href="#">MDLPRM, 2431</a> ,NONUIV.	
	0	Use the native Bunch-Kauffman threshold pivoting in MSCLDL, and the native threshold partial pivoting in MSCLU (Default).
	1	Use no numeric pivoting in MSCLDL and MSCLU. BLAS3 TRSMs are called to compute the pivot column update to improve performance. Ill-conditioned models may die of “singular matrix” during sparse factorization.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference					
	3	LAPACK SYTRFs with Bunch-Kaufman pivoting and GETRFs with partial pivoting are called to perform factorizations, and BLAS3 TRSMs are called to compute pivot column update to improve performance.				
GPU_MIN_RANK (655)	If the rank of the frontal matrix is smaller than value, the rank update of the front is processed on the CPU. Otherwise, the GPGPU device would be used for the rank update of the front. The default value for GPU_MIN_RANK is 32.					
GPU_MIN_FRONT (656)	<p>The criteria for GPGPU execution during matrix factorization are the frontal matrix front size and the rank of the frontal matrix. Minimum dimensions are set via gpu_min_front and its companion parameter, gpu_min_rank. The value specified must be an integer greater or equal to 1.</p> <p>If the front size is smaller than value, the rank update of the front is processed on the CPU. Otherwise, the GPGPU device would be used for the rank update of the front. The default value for GPU_MIN_FRONT is 2048.</p>					
(662)	<p>Controls CBUSH internal load calculation for radial dependence. (Default=0)</p> <table border="1" data-bbox="595 956 1322 1170"> <tr> <td data-bbox="595 956 692 1064">0</td> <td data-bbox="692 956 1322 1064">Radial dependence of PBUSHT entries DOES NOT depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.</td> </tr> <tr> <td data-bbox="595 1064 692 1170">1</td> <td data-bbox="692 1064 1322 1170">Radial dependence of PBUSHT entries DOES depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.</td> </tr> </table>		0	Radial dependence of PBUSHT entries DOES NOT depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.	1	Radial dependence of PBUSHT entries DOES depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.
0	Radial dependence of PBUSHT entries DOES NOT depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.					
1	Radial dependence of PBUSHT entries DOES depend on the alignment of the CBUSH element when subject to nonlinear force deflection relations.					
SEGLOG(664)	<p>Control the logic to compute the default value of PENALT in segment-to-segment contact analysis. Before v2017, Default value is 0.</p> <table border="1" data-bbox="595 1244 1322 1519"> <tr> <td data-bbox="595 1244 692 1352">0</td> <td data-bbox="692 1244 1322 1352">Use the existing/old logic where the default value is based on the average elastic stiffness of the two contact bodies and the default error tolerance.</td> </tr> <tr> <td data-bbox="595 1352 692 1519">1</td> <td data-bbox="692 1352 1322 1519">Use new logic (Default) for PENALT to avoid a too large value of PENALT, where the default value is defined by the body with the softer material and the minimum edge length of the two contact bodies. This logic is often better for thin shell structures.</td> </tr> </table>		0	Use the existing/old logic where the default value is based on the average elastic stiffness of the two contact bodies and the default error tolerance.	1	Use new logic (Default) for PENALT to avoid a too large value of PENALT, where the default value is defined by the body with the softer material and the minimum edge length of the two contact bodies. This logic is often better for thin shell structures.
0	Use the existing/old logic where the default value is based on the average elastic stiffness of the two contact bodies and the default error tolerance.					
1	Use new logic (Default) for PENALT to avoid a too large value of PENALT, where the default value is defined by the body with the softer material and the minimum edge length of the two contact bodies. This logic is often better for thin shell structures.					

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
CNTBKCMP(666)	Control the logic to compute the contact at shell corners in node-to-segment contact analysis to ensure backward compatibility.	
	0	Use the current/new contact logic for shell corners (Default). This logic uses weighted average normal vector and adjusted thickness for a better representation of the sharp corner at both top and bottom of the shell.
	1	Use old contact logic for shell corners to ensure backward compatibility. This logic uses average thickness and average normal vector even at sharp corners.
(670)	Control for Automatic Contact Generation. Used when BCONTACT=AUTO is present in case control.	
	0	Default, Nastran run to completion after generating acg file.
	3	Nastran terminates after generating acg file.
LMFBKCMP(676)	Control the logic to compute the default value of Lagrange multiplier (LMFACT and PENFN)	
	0	(Default) Use new algorithm for LMFACT/PENFN, which are two order lower than previous value used before 2013.0 Version.
	1	Use old algorithm used before 2013.0 Version.
FFOBKCMP(677)	Control the logic to compute the unloading follower force.	
	0	(Default) Use new algorithm for unloading follower force, i.e., follower force in the previous loadcase will be unloaded by follower force method but not by linear interpolation.
	1	Use old algorithm for unloading follower force, i.e., by linear interpolation (before 2013.0 Version).
OLDLCNTR(678)	Ensure backward compatibility for linear connector elements.	
	0	Use existing (after V2014.1) algorithm with RBE3 relationships for linear connectors (Default).
	1	Use old algorithm (V2014.1 or earlier) for linear connectors to ensure backward compatibility.
	PARAM,OLDWELD,YES is equivalent to a value NASTRAN OLDLCNTR=1	

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference													
(679)	Controls checking for validity of sparse matrix passed to Intel MKL Pardiso.													
	0	Disable matrix checking (Default)												
	1	Enable matrix checking for Column indices must be in increasing order within rows												
	2	Enable matrix validity checking for reusing previously computed permutation in SOL 400												
(684)	Control of matrix type for Intel MKL Pardiso. For more information, see <a href="#">Intel MKL Pardiso documentation</a>													
RDBOTH(695)	<p>Parameter to select Rayleigh damping approach for rotordynamics (compatibility with V2005) implementation, Integer. A cumulative sum can be provided in case multiple features are desired in the analysis. The parameter is allowed to take values of 1, 2, 4, 8, 16, or any combination of them except both 4 and 8 are included, such as 12, 13, 14 etc. Default value for this parameter is 0.</p> <table border="1" data-bbox="595 817 1322 1519"> <tbody> <tr> <td data-bbox="595 817 692 887">0</td> <td data-bbox="692 817 1322 887">Uses implementation for Rayleigh Damping as described in RSPINR/RSPINT entry description (Default)</td> </tr> <tr> <td data-bbox="595 887 692 1095">1</td> <td data-bbox="692 887 1322 1095">Switch to V2005 implementation of Rayleigh damping where damping coefficients specified in the model through “PARAM, ALPHA1” and “PARAM, ALPHA2” are applied to the complete model and Rayleigh damping specified through “ALPHAR1” and “ALPHAR2” in RSPINR/RSPINT are not used</td> </tr> <tr> <td data-bbox="595 1095 692 1138">2</td> <td data-bbox="692 1095 1322 1138">Ignore circulation effects in rotordynamic analysis.</td> </tr> <tr> <td data-bbox="595 1138 692 1277">4</td> <td data-bbox="692 1138 1322 1277">Include effect of stress stiffening using method = 1 (see RFORCE entry). Using RFORCE load step to include differential stiffness in SOL 400 since RDBOTH=8 is not supported in SOL 400.	16	This option treats rotor structural damping with an imaginary stiffness matrix for complex eigenvalue analysis. See RSPINR remark 10.
0	Uses implementation for Rayleigh Damping as described in RSPINR/RSPINT entry description (Default)													
1	Switch to V2005 implementation of Rayleigh damping where damping coefficients specified in the model through “PARAM, ALPHA1” and “PARAM, ALPHA2” are applied to the complete model and Rayleigh damping specified through “ALPHAR1” and “ALPHAR2” in RSPINR/RSPINT are not used													
2	Ignore circulation effects in rotordynamic analysis.													
4	Include effect of stress stiffening using method = 1 (see RFORCE entry). Using RFORCE load step to include differential stiffness in SOL 400 since RDBOTH=4 is not supported in SOL 400.													
8	Include effect of stress stiffening using method = 2 (see RFORCE entry). Using RFORCE load step to include differential stiffness in SOL 400 since RDBOTH=8 is not supported in SOL 400.													
16	This option treats rotor structural damping with an imaginary stiffness matrix for complex eigenvalue analysis. See RSPINR remark 10.													

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
S2SDEF(701)	Parameter to control backward compatibility of Seg-to-Seg contact default values.	
	0	Original Seg-to-Seg contact default values
	1	Using new Seg-to-Seg contact default values in and after 2016 version. (Default)
HDF5 (702)	Control NH5RDB database creation.	
	-1	Do not create NH5RDB database (Default).
	0	Create NH5RDB database without compression.
	1	Create NH5RDB database with compression.
	2	Create uncompressed NH5RDB database without input data.
OBEAMS (725)	Control Linear format output of Advanced Nonlinear Bar Element. Default: 0	
	0	New. Output of beam stress is separated into Bending and Axial stresses.
	1	Old. Output of beam stress combines bending and axial stresses together.
OLDCCONE (726)	The CCONEAX Force/Stress Recovery element coordinate system is inconsistent with the input RINGAX coordinate system relative to the RINGAX A/RINGAX B order. The CCONEAX Force/Stress Recovery has now been made consistent. For those who may have post processing that recognized the inconsistency and do not wish to change, the inconsistency may be restored with OLDCCONE.	
	0	Default: Force/Stress output consistent with RINGAX coordinate.
	1	Restore inconsistent RINGAX A/RINGAX B Force/Stress output.
METS2S (727)	Control Segment to Segment contact. Default: 0	
	0	Support SEGTOSEG only since 2017 BETA and later version
	1	Old. Support SEGSMALL, SEGLARGE, as well SEGTOSEG.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
DMP (728)	The number of Distributed Memory Processes used. This option is only useful for specific Solution Sequences as described in the <i>MSC Nastran HPC User's Guide</i>	
N2SDOF (729)	Control node freedom number of contact Default: 0	
	0	Depend on contact type: 3 for touching contact; 6 for glued contact
	1	Set the node freedom of contact to be 6 always
H5NORDOF(730)	To suppress output rotational components to NH5RDB database	
	0	Output both translational and rotational components to NH5RDB database (Default).
	1	Do not output rotational components to NH5DB database.  Only used when HDF5(702) is 0 or 1.
H5MTX (739)	Write matrix data in separate file	
	1	Write matrix data into a separate file
	0	Do not write matrix data into a separate file (Default)
H5MDL (740)	Write model input data in separate file	
	2	Write model input data only
	1	Write model input data into a separate file
	0	Do not write model input data into a separate file (Default)
	-1	Use OP2GM34 setting for GEOM3 and GEOM4 output
ACCSDSLZ(747)	SDL work area memory size of IFPStar, default=100000	
	> 100000, work area size in word	
H5GM34 (751)	Write GEOM3 and GEOM4 data in NH5RDB	
	-1	Use OP2GM34 setting (Default).
	1	Write GEOM3 and GEOM4 data in NH5RDB
	0	Do not write GEOM3 and GEOM4 data in NH5RDB
UDEFGRID(753)	Control whether having undefined grid points on ASET/ASET1 entries is allowed. Default=0.	
	0	Issue a User Warning Message and continue the simulation.
	1	Issue a User Fatal Message and terminate the simulation

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference
CNTBACK(758)	BIAS=0.0 on BCONPRG/BCTABLE will be used as 0.0 in analysis. Before 2018.2, BIAS=0.0 is treated as default, same as blank, which will turn to the value of BIAS on BCPARA and so the user has to put a small value to approximate absolute 0.0. Since 20190.0, segment to-segment initial stress free contact can adjust geometry to clear gap/penetration. Default=0.
	0   BIAS=0.0 on BCONPRG/BCTABLE is treated as 0.0 and will override BIAS on BCPARA. Segment-to-Segment Initial Stress Free: geometry adjustment as Node-to-Segment method, old method turn off.
	1   (backward compatible) BIAS=0.0 on BCONPRG/BCTABLE is treated as blank; BIAS on BCPARA will be used in analysis.
	2   Switch to Step Glue if Permanent Glue with LGDISP>1
	4   (back to 2018.2) Segment-to-Segment Contact Initial Stress Free: no geometry adjustment, old method turned on.
	8   Segment-to-Segment Contact Initial Stress Free: geometry adjustment plus old method turned on
	OP2IMPV(761)
	0   Use the old (till V2018.2) I8-I4 conversion method.
	1   Use the new conversion method
IGNBLN(767)	Control if ignore blank lines in an entry followed by continuation lines.
	0   (Default) Don't ignore and issue UFM when blank lines followed by continuations are found.
	1   Ignore those blank lines.
BLNMEM(768)	Memory size in bytes to store blank line numbers in input files.
	8000:   Default, 8000 bytes.
	>=800:   User specified size.
	<800:   Will be forcedly changed to 800.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
OPENFSI(776)	Type: Integer	
	OpenFSI interface option.	
	0: (Default) For implicit type, skip the putWettedNodeDisp method call when the current time is converged and no displacement update from last iteration.	
	1 Do not skip the putWettedNodeDisp call even there is no displacement update.	
	Refer to <i>MSC Nastran User Defined Services User's Guide</i> for details.	
H5INFO(789)	Write job run information in NH5RDB or not.	
	1 Yes (Default)	
	0 No	
STRNCUR(778)	In nonlinear <u>strain recovery</u> for the CQUAD4 and CTRIA3 elements, <b>especially for nonlinear composites with offsets and MDLPRM OFFDEF LROFF</b> , an addition final pass of updating midplane strain and curvature is made. In some cases, this results in strain curvature results significantly different than those used to obtain the force and stress results. STRNCUR allows the user to obtain the midplane strain and curvature, and hence the ply strains, that are identical to the midplane strain and curvature used in force and stress recovery operations.	
	STRNCUR=0	Default: geometric nonlinear midplane strain and curvature are updated for strain recovery and may not be identical to those used in force and stress recovery.
	STRNCUR=1	Geometric nonlinear midplane strain and curvature recovery values are the same values as used for element force and stress recovery when nonlinear strain recovery is requested for elements utilizing LROFF.
	STRNCUR=2	Geometric nonlinear midplane strain and curvature recovery values are the same values as used for element force and stress recovery when nonlinear strain recovery is requested.

Table 2-1 System Cell Summary (continued)

System Cell Name (Number)	Function and Reference	
CNT101(786)	Set Linear Contact (LINCNT=1) as default in SOL 101 only	
	0	(Default) Linear Contact off/on depends on LINCNT on BCPARA Note that Linear Contact is off (LINCNT=0) by default when no BCPARA entry present.
	1	Linear Contact is turned on in SOL 101, regardless of LINCNT on BCPARA.
H5XHH (790)	Write BHH, MHH and KHH matrices in NH5RDB	
	0	Do not write BHH, MHH and KHH in NH5RDB (Default)
	1	Write BHH, MHH and KHH in NH5RDB
DELTAU(800)	The CELAS1/3 force convention for linear elements is determined by the relationship $F=K(U1-U2)$ . For material nonlinear CELAS1/3 elements, initiated via the PELAST, TKNID option, the force convention is $F=K(U2-U1)$ .	
	0	(Default) Maintain the current PELAST; TKNID convention $F=K(U1-U2)$ with material nonlinear.
	1	Replace the current PELAST; TKNID convention with the linear convention $F=K(U1-U2)$ .
See Remark 7. of the PELAST entry.		

# 3

## File Management Statements

- Key to Descriptions
- The File Management Section (FMS)

## Key to Descriptions

**RESTART** Reuse Database From a Previous Run

A brief sentence about the function of the statement is given.

Requests that data stored in a previous run be used in the current run.

**Format:**

RESTART PROJECT = 'project-ID' VERSION = [version-ID] [KEEP | NOKEEP]

Describers in uppercase letters are keywords that must be specified as shown.

Describers in lower case are variables.

If the describers are stacked vertically, then only one may be specified.

**Describers:**

Brackets [] indicate that a choice of describers is optional.

Braces {} indicate that a choice of describers is mandatory.

The default describers are shaded.

Each of the describers is discussed briefly. Further details may be discussed under Remarks.

If the describer is in lower case, then it is a variable and the describer's type (e.g., Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. If no default value is given, the describer must be specified by the user.

The remarks are generally arranged in order of importance and indicate such things as the statement's relationship to other statements, restrictions and recommendations on its use, and further details regarding the describers.

**Remarks:**

- There may be only one RESTART statement in a run.
- A new version-ID is automatically assigned whenever a RESTART is performed.
- If project-ID or version-ID or both are specified and cannot be found a User Fatal Message will be issued.
- The RESTART statement is used in the following sequence: (101) RESTART, (102) PROJECT, (103) VERSION, (104) KEEP, (105) NOKEEP.
- If PROJECT is not specified, the last version under the current project-ID will be used. (See Example 2 below.)

**Examples:**

- RESTART VERSION=7  
Version number 7 will be retrieved for this run (version 8). At the end of the run version 7 will be deleted.
- PROJ='FENDER'  
RESTART  
The last version under project-ID FENDER will be used in the current run.

## The File Management Section (FMS)

The File Management Section (FMS) is primarily intended for the attachment and initialization of Database sets (DBsets) and FORTRAN files. The initialization of DBsets includes specification of their maximum size, member names, and physical filenames. The initialization of FORTRAN files includes the specification of their filenames, FORTRAN unit numbers, and FORTRAN attributes.

In most classes of problems that use MSC Nastran solution sequences (SOLs), no File Management statements are required because a default File Management Section is executed at the beginning of every run. The default File Management Section is described in the [Database Concepts in the MSC Nastran Reference Guide](#). If a restart is desired, then the RESTART statement is required. All other solutions may not be restarted. If the problem is large in terms of requiring significant amounts of memory or disk space, then the INIT, ASSIGN, and EXPAND statements may be required. If any FORTRAN files are required, then the ASSIGN statement is required; for example, the OUTPUT2 DMAP module. The ASSIGN statement is also required to assign databases for DBLOCATE, DBLOAD, and DBUNLOAD. Special database operations are performed by the DBLOCATE, DBLOAD, DBUNLOAD, DBCLEAN, ACQUIRE, DBDICT, DBFIX, DBSETDEL, DBUPDATE, and PROJECT statements.

## File Management Statement Summary

The following is a summary of all File Management statements:

\$	Comment statement.
ACQUIRE	Selects NDDL schema and MSC Nastran delivery database.
ASSIGN	Assigns physical files to DBset members or special FORTRAN files.
CONNECT	Group geometry data by evaluator and database.
DBCLEAN	Deletes selected database version(s) and/or projects.
DBDICT	Prints the database directory in user-defined format.
DBFIX	Identifies and optionally corrects errors found in the database.
DBLOAD	Loads a database previously unloaded by DBUNLOAD.
DBLOCATE	Obtains data blocks and parameters from databases.
DBSETDEL	Deletes DBsets.
DBUNLOAD	Unloads a database for compression, transfer, or archival storage.
DBUPDATE	Specifies the time between updates of the database directory.
ENDJOB	Terminates a job upon completion of FMS statements.
EXPAND	Concatenates additional DBset members to an existing DBset.
INCLUDE	Inserts an external file in the input file.
INIT	Creates a temporary or permanent DBset.
NASTRAN	Specifies values for system cells.
PROJ	Defines the current or default project identifier.

The FMS statements are executed in the following order regardless of their order of appearance in the input file:

NASTRAN, DEFINE  
RFINCLUDE, INCLUDE  
ASSIGN, INIT, EXPAND, DBUPDATE  
PROJECT  
DBCLEAN  
DBFIX  
DBDICT(1)  
DBSETDEL  
ACQUIRE  
RESTART  
DBLOCATE  
DBUNLOAD  
DBLOAD  
DBDIR (2), DBDICT(2)  
ENDJOB

If DBDICT is specified before any of the FMS statements DBSETDEL through DBLOAD, then the directory printout will reflect the processing of DBCLEAN and DBFIX only. If DBDICT is specified after DBSETDEL through DBLOAD, then the directory printout will reflect the processing of all statements in the FMS Section. We recommend that the DBDICT statements be specified last in the FMS Section. Multiple DBLOCATE, DBLOAD, or DBUNLOAD statements are processed in the order in which they appear. If the ENDJOB statement is specified, then only the File Management Section is processed and the Executive Control, Case Control, and Bulk Data Sections are ignored.

## File Management Statement Descriptions

File Management statements may be abbreviated down to the first four characters as long as the abbreviation is unique relative to all other statements. Each statement is described as follows:

### Description

A brief sentence about the function of the statement is given.

### Format

Describers in uppercase are keywords that must be specified as shown. In addition, describers in lowercase indicate that the user must provide a value.

Braces { } indicate that a choice of describers is mandatory. If the describers are stacked vertically, then only one may be specified.

Brackets [ ] indicate that a choice of describers is optional. If the describers are stacked vertically, then only one may be specified.

Describers that are shaded indicate the defaults.

If the statement line is longer than 72 columns, then it may be continued to the next line with a comma as long as the comma is preceded by one or more spaces and no keyword is split across lines. For example:

```
DBLOCATE DATABLK= (KAA)      ,
        WHERE (PROJECT='FRONT BUMPER' AND      ,
        SEID>0 AND VERSION=4)      ,
        LOGI=MASTER3
```

However, if a filename is to be continued on the next line, no space must precede the comma, and the continuation line must have no leading spaces.

### Example

```
ASSIGN      SDB='/jw/johannes/Projects/secret/Aero/Tests/wing/,
Modes/wing_modal.MASTER'
```

Note that all quote marks shown under formats and examples are right-handed single quotation marks and must be entered as such. For example:

```
PROJ=' MYJOB'
```

### Example

A typical example is given.

### Describers and Meaning

Each of the describers is briefly discussed. The describer's type (e.g., Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. The describer must be specified by the user if no default value is given.

### Remarks

The remarks are generally arranged in order of importance and indicate such things as the FMS statement's relationship to other commands, restrictions and recommendations on its use, and further descriptions of the describers.

### WHERE and CONVERT Clauses

The WHERE clause is used in the selection of items (data blocks and parameters) on the DBDICT, DBLOCATE, DBLOAD, and DBUNLOAD statements. The CONVERT clause modifies qualifier values of items selected by the WHERE clause on the DBLOCATE and DBLOAD statements.

The WHERE and CONVERT clauses specify values for PROJECT, VERSION, qualifiers, and DBSET. PROJECT specifies the project-ID that is originally defined on the PROJECT FMS statement at the time the project is created. VERSION specifies the desired version-ID under the project-ID. Qualifiers are used to uniquely identify items on the database with the same name. For example, data block KAA has SEID as one of its qualifiers, which is the superelement ID. An item may have more than one qualifier and the collection of all qualifiers assigned to an item is called a path. All data blocks and parameters with qualifiers are defined in the NDDL Sequence (NASTRAN Data Definition Language), see [MSC Nastran DMAP Programmer's Guide](#). Data blocks and parameters are defined on the DATBLK and PARAM NDDL statements. The DATBLK and PARAM statements specify the name of the data block, parameter, and also its pathname. The pathnames are defined on the PATH NDDL statement, which lists the qualifiers assigned to the path. Qualifiers are defined on the QUAL NDDL statement. DBSET specifies the desired DBset. The DBset of an item is specified after the LOCATION keyword on the DATBLK and PARAM NDDL statement.

The format of the WHERE clause is:

```
WHERE (where-expr)
```

where-expr is a logical expression that specifies the desired values of qualifiers, PROJECT, VERSION, and DBSET. If the result of the logical expression is TRUE for an item on the database then the item is selected. For example, WHERE(VERSION=4 AND SEID<>2 AND SEID>0) selects all items under version 4 for all values of SEID greater than 0 except 2.

A simple where-expr is a comparison using the following relational operators: =, >, <, ≤, ≥, >> or <<. For example, SEID>0 means if SEID is greater than zero, then the logical expression is true. Several simple where expressions may be joined into one where expression by the following logical operators: AND, OR, XOR, and EQV. The NOT operator may be used to negate a where expression. For example, NOT(SEID>0) is the same as SEID≤0. Arithmetic operations and DMAP functions may also be specified in the where expression (see the [MSC Nastran DMAP Programmer's Guide](#).)

If a qualifier in a where-expr is not a qualifier in the path of a specified item, then the where-expr is set to FALSE. If the where-expr does not contain a specification for all qualifiers in the path of an item, then the unspecified qualifiers will be wildcarded (i.e., quali=\*, all values will be selected.) The default values of qualifiers, PROJECT, VERSION, and DBSET are described under the statement in which the WHERE clause is specified.

Examples of the WHERE clause are:

1. Select all items in the database for all superelements except 10 and 30 from Version 1.  
WHERE (VERSION=1 AND SEID>=0 AND NOT (SEID=10 OR SEID=30))
2. Select all entries in database on DBSET=DBALL from all projects and versions.  
WHERE (PROJECT=PROJECT AND VERSION>0 AND DBSET='DBALL')

The CONVERT clause modifies project- and version-ID, DBset-name (see INIT statement), and qualifier values of items selected by the WHERE clause on the DBLOCATE and DBLOAD statements. It contains one or more assignment statements separated by semicolons. The format of CONVERT clause is:

```
CONVERT (PROJECT=project-expr; VERSION=version-expr; ,  
DBSET=DBset-expr; quali=qual-expr1[;...])
```

The PROJECT and VERSION statements modify the project-ID (see PROJECT FMS statement) and version-ID. The DBSET statement modifies the DBset-name. The value of quali will be replaced by qual-expri for selected items that have quali in their path. qual-expri is any valid expression (see [Expressions and Operators in the MSC Nastran DMAP Programmer's Guide](#)) containing constants or any qualifier name defined in the path of the item. If qual-expri contains names of qualifiers not in the path of the selected item, then a fatal message is issued. If project-expri and/or version-expri produces a project- or version-ID which does not exist, then one will be created. Also, all version-IDs less than version-expri that do not exist will be created; but they will be “empty.”

Examples of the CONVERT clause are:

1. Set qualifiers SEID, PEID, and SPC to constants 10, 20, 102 respectively.

```
CONVERT (SEID=10; PEID=20; SPC=102)
```

If more than one value of a qualifier is found for an item by the WHERE clause, then each value is processed in qual-expri to define the new qualifier value for each of the selected items. In the following example, if the original values of PEID were 1, 2, and 3; then the new values for the SEID qualifier will be 2, 4, and 6.

2. Set all values of qualifier SEID to be twice the value of the PEID qualifier:

```
CONVERT (SEID=2*PEID)
```

## File Management Statements

### \$ Comment

Used to insert comments into the input file. Comment statements may appear anywhere within the input file.

Format:

\$ followed by any characters out to column 80.

Example:

```
$ TEST FIXTURE-THIRD MODE
```

Remarks:

1. Comments are ignored by the program.
2. Comments will appear only in the unsorted echo of the Bulk Data.

## ACQUIRE Selects NDDL Schema

Selects the NDDL schema and MSC Nastran delivery database to be used for primary database creation.

Format:

$$\text{ACQUIRE NDDL} = \left\{ \begin{array}{l} \text{NDDL} \\ \text{nddl-name} \end{array} \right\}$$

Describer	Meaning
NDDL	MSC Nastran NDDL schema.
nddl-name	Name of a user NDDL schema specified on a COMPILE NDDL statement when the user NDDL was stored.

Remark:

This statement is used to specify the delivery database when the user wishes to create a solution sequence, yet use the subDMAP objects or NDDL schema or both from the MSC-supplied delivery database.

Example:

The following requests the MSC Nastran NDDL schema to be used when creating a new database.

```
ACQUIRE NDDL
SOL MYDMAP
COMPILE DMAP=MYDMAP, SOUOUT=USROBJ
.
.
LINK MYDMAP, SOLOUT=USROBJ
```

## ASSIGN

## Assigns Physical File

Assigns physical file names or other properties to DBset members or special FORTRAN files that are used by other FMS statements or DMAP modules. Also, assigns physical name and/or other properties to modal neutral files (.mnf) for MSC Nastran/ADAMS interface.

Format 1: Assign a DBset member name

$$\text{ASSIGN log-name} = \left[ \begin{array}{l} = \text{'filename1'} \\ = * \\ = '*\text{'} \end{array} \right] \quad [\text{TEMP}] \quad [\text{DELETE}] \quad [\text{SYS} = \text{'sys-spec'}]$$

Format 2: Assign a FORTRAN file

$$\text{ASSIGN logical-key} \left[ \begin{array}{l} = \text{'filename2'} \\ = * \\ = '*\text{'} \end{array} \right] \quad [\text{UNIT} = \text{u}]$$

$$\left[ [\text{STATUS} = ] \left\{ \begin{array}{l} \text{NEW} \\ \text{OLD} \\ \text{UNKNOWN} \end{array} \right\} \right]$$

$$\left[ [FORM = ] \left\{ \begin{array}{l} \text{FORMATTED} \\ \text{UNFORMATTED} | \text{UNFORMATTED}_{64} \\ \text{UNFORMATTED}_{32} \\ \text{UNFORMATTED}_{\text{MIXED}} \end{array} \right\} \right]$$

$$[\text{DEFER}] \left[ \begin{array}{l} \text{TEMP} \\ \text{DELZERO} \end{array} \right] \quad [\text{DELETE}] \quad [\text{SYS} = \text{'sys-spec'}]$$

$$[\text{IMPORT}]$$

Examples:

1. Assign the DBALL DBset:

```
ASSIGN DB1='filename of member DB1'
INIT DBALL LOGI=(DB1)
```

2. Assign FORTRAN file 12 to the OUTPUT4 module using the ASCII option:

```
ASSIGN OUTPUT4='filename of FORTRAN file'
UNIT=12, FORM=FORMATTED
```

3. Assign FORTRAN file to the OPCASE using the ASCII option:

```
ASSIGN OPCASE='Filename of FORTRAN file', STATUS=NEW
```

4. Define SYS parameters for the SCR300 DBset file using the default file name:

```
ASSIGN SCR300 SYS='...'
```

5. Set the default .op2 file format to UNFORMATTED\_64 and assign two .op2 files, one to unit 12 with the file name "test\_op2.12" and one to unit 35 with file name 'test\_op2.35' in ASCII mode.

```
ASSIGN OUTPUT2 UNFORMATTED_64
...
ASSIGN OUTPUT2='test_op2.12' UNIT=12
ASSIGN OUTPUT2='test_op2.35' UNIT=35 FORM=FORMATTED
```

6. Assign a Fortran unit to the Universal File (UF) containing the FRF information for a test FRF component to be used in an FRF Based Assembly (FBA) process.

```
ASSIGN UNVFILE='testcomp_unv' UNIT=25
```

Descriptor	Meaning
log-name	The name of a DBset member name. log-name may also be referenced on an INIT statement after the LOGICAL keyword.
filename1	The physical filename assigned to the DBset member. If the default filename (if there is one) is to be used, filename1 may be omitted or specified as * or '*'. See Remark 6.
logical-key	Specifies defaults for STATUS, UNIT, and FORM of FORTRAN files for other FMS statements, DMAP modules, punching, and plotting operations.
filename2	The physical file name assigned to the FORTRAN file. If the default filename is to be used, filename2 may be omitted or specified as * or '*'. See Remark 7.
UNIT=u	u is the FORTRAN unit number of the FORTRAN file. If this descriptor is omitted and if filename2 is omitted, this ASSIGN statement will update the defaults for subsequent ASSIGN statements for the same logical-key value. See Remark 7.
TEMP	Requests that the file associated with log-name or logical-key/UNIT be deleted at the end of the run. <b>Warning, using TEMP on OP2 or XDB files will result in the inability to postprocess the results.</b>
DELETE	Requests that the file associated with logical-key/UNIT, if it exists before the start of the run, be deleted.

Descriptor	Meaning
DELZERO	Requests that the file associated with logical-key/UNIT be deleted at the end of the run if it is zero-length; that is, if it does not contain any data.
STATUS	Specifies whether the FORTRAN file is being created (STATUS=NEW) or has been created prior to the run (STATUS=OLD). If its status is not known, then STATUS=UNKNOWN is specified.
FORM	Indicates whether the FORTRAN file is written in ASCII (FORM=FORMATTED) or binary (FORM=UNFORMATTED, UNFORMATTED_64, UNFORMATTED_32, UNFORMATTED_MIX) format. See Remark 10., 11., 12., 13. 18. and 21.
DEFER	Defers opening/creating the specified file. That is, the file will not be opened/created during MSC Nastran initialization. The file must be explicitly opened by the module or DMAP accessing the file using, for example, FORTIO, before it can be used.
sys-spec	System-specific, machine-dependent or application-specific controls. For DBset files, these control I/O performance. For FORTRAN files, only the PLOT and DBC Logical-Key Names use this field. For the DBC Logical-Key, these controls are for I/O performance just as for DBset files. For the PLOT Logical-Key, these controls are used for PostScript processing when FORM=FORMATTED is in effect and are ignored otherwise. See Remark 14.
RECL = l	The size of a block of input/output information specified in words. See Remark 15.
SIZE = s	The number of blocks allocated to the DBC database. See Remark 16.
IMPORT	Imports external ifpdb. When this is absent, IFPDB is for export.

#### Remarks:

1. The ASSIGN statement and its applications are discussed further in the [Database Concepts in the MSC Nastran Reference Guide](#).
2. The log-name or logical-key descriptor must be the first descriptor on the ASSIGN statement. All other descriptors may appear in any order. With the exception of log-name, logical-key, filename1, filename2, and sys-spec, descriptors and values longer than four characters may be abbreviated to four characters.
3. For FORTRAN files, the logical-key names and their default attributes are listed in [Table 3-1](#). If a logical-key name is identified as “Assignable YES”, then the defaults may be overridden on the ASSIGN statement.
4. Certain reserved names may not be used for log-names or logical-key names. These names are the logical names listed in [Table 3-1](#) that are identified as “Assignable NO”. This list includes: SEMTRN, LNKSWH, MESHFL, LOGFL, INPUT, PRINT, INCLD1, and CNTFL. If they are used, then a User Fatal Message is issued. Unit numbers 1 through 10, 14, 16, 18, 19 and 21 should not be assigned. Up to 4000 ASSIGNs are allowed. Some operating systems may have a smaller limit. To avoid that limit use “ulmit -n 4096”. Unit numbers 1234, 1235, 1236, 1133 to 2269 are not allowed.

Some operating systems may have their own limit on the number of open files as well. PUNCH and PLOT may be used, but are not recommended. Most keyword assignments can be specified as command line arguments and/or included in RC files. There are some exceptions such as solve=auto may be specified on the command line or the User RC files, but not in the system RC files (MSC\_BASE/conf/RCfile).

5. If one of the logical-key names indicated in the Remarks 3. and 4. is not specified on this statement, then it is assumed to be a DBset member name log-name as shown in Format 1.
6. If the same log-name is used on more than one DBset ASSIGN statement, the following rules apply:
  - a. If there is no current entry for the specified log-name, a new entry in the DBset tables will be created. If there is an existing entry for the specified log-name, the ASSIGN parameters will modify that entry instead of creating a new one.
  - b. If filename1 is omitted or is specified as \* or ‘\*’, the default file name or, if this is a second or subsequent ASSIGN statement for the same log-name, the previously specified file name (or default name if none was previously specified) will be used.
7. If the same logical-key is used on more than one FORTRAN file ASSIGN statement, the following rules apply:
  - a. If filename2 is omitted (or specified as \* or ‘\*’) and if the UNIT descriptor is omitted, the ASSIGN parameters will modify the system default entry for the logical-key, establishing the new defaults for any subsequent ASSIGN entry for the logical-key. Note, however, that any entries previously created with the same logical-key will not be modified by the new parameters specified on this ASSIGN statement.
  - b. If the value specified by the UNIT descriptor matches the value for an entry created by a previous ASSIGN statement with a UNIT descriptor, then:
    - If the logical-key values are different, a UFM will be generated; and
    - If the logical-key values are the same, the previous entry will be updated instead of having a new entry created.
  - c. If the value specified by the UNIT descriptor does not match the value for an entry created by a previous ASSIGN statement with a UNIT descriptor, then a new entry will be created in the FORTRAN unit tables.
  - d. If the file name is omitted or specified as \* or ‘\*’, the default file name or, if this is a second or subsequent ASSIGN statement for the same logical-key/UNIT combination, a previously specified file name (or default name if none was previously specified) will be used.
8. If you are using IFPSTAR (default), you can use below command to import IFPDAT file created by the initial run if the file is not located in the same directory as MASTER and DBALL files. ASSIGN IFPDB=first\_run\_directory/run1.IFPDAT IMPORT.
9. STATUS, UNIT, and FORM are ignored if assigning a log-name (DBset member name).
10. FORM=FORMATTED must be specified for a unit when:
  - ASCII output is desired from the OUTPUT4 DMAP modules that processes the unit. See the [MSC Nastran DMAP Programmer’s Guide](#).

- `FORMAT=NEUTRAL` is selected on the `DBUNLOAD` and `DBLOAD` FMS statements that process the unit. See the [Database Concepts in the MSC Nastran Reference Guide](#).
  - The neutral file format is desired for the `OUTPUT2` module.
  - PostScript output is desired for `PLOT` requests when “`PLOTTER NAST`” is in effect.
11. For the `DBUNLOAD` FMS statement and the `OUTPUT2` and `OUTPUT4` modules, binary format may be requested using `FORM=UNFORMATTED`, `FORM=UNFORMATTED_64`, `FORM=UNFORMATTED_32` and `FORM=UNFORMATTED_MIX`. The output formats with these keywords are as the following:

FORM	Table (bit)	Matrix (bit)	Old keyword
UNFORMATTED	64	64	UNFORMATTED
UNFORMATTED_64	64	64	LITTLEENDIAN64
UNFORMATTED_32	32	32	N/A
UNFORMATTED_MIX	32	64	LITTLEENDIAN

12. The `FORM=` descriptor is ignored for the `DBLOAD` FMS statement and `INPUTT2` and `INPUTT4` modules. MSC Nastran determines the actual file format when it accesses the specified file. If the `FORM=` descriptor is specified on an `ASSIGN` statement for these logical-keys, the syntax of the descriptor will be validated but will otherwise be ignored. However,
- For non-native binary files the `INPUTT2` modules can only process data blocks with an `NDDL` description. (See the [MSC Nastran DMAP Programmer's Guide](#) under the `DATABLK` statement.) An `NDDL` description is required for `TYPE=TABLE` and none is required for `TYPE=MATRIX`. The data block must be processed with `FORM=UNFORMATTED` if `TYPE=UNSTRUCTURED`, `KDICT`, or `KELM`.
  - Although formatted files are machine independent, if the file in unformatted `DBLOAD` can only process input files in native binary format.
13. For the `DBUNLOAD` FMS statement and `OUTPUT2` module, if `FORM` is other than `UNFORMATTED` (or equivalent, e.g., `UNFORMATTED_32` on a Linux or Windows platform), then only data blocks with an `NDDL` description are processed. (See the [MSC Nastran DMAP Programmer's Guide](#) under the `DATABLK` statement.) An `NDDL` description is required for `TYPE=TABLE` and none is required for `TYPE=MATRIX`. The data block must be processed with `FORM=UNFORMATTED` if `TYPE=UNSTRUCTURED`, `KDICT`, or `KELM`.
14. See the for further information on `sys-spec` controls and on machine-dependent aspects of the `ASSIGN` statement. Also, if there are `SYS` specifications on more than one `ASSIGN` statement specifying the same log-name or logical-key/`UNIT` combination, the second and subsequent specifications will appended to the current `SYS` specification with a comma separator.
15. Currently the `RECL` keyword is used by the `DBC` module and has a default minimum of 1024 words. The maximum allowed is 65536 words and is used to increase the database capacity.

16. The SIZE keyword is used by the DBC module and has a default of 16777215. The maximum allowed is 2147483647 and is used to increase the database capacity. Patran releases before 2001 should use the defaults for RECL and SIZE or database verification failures will occur.
17. logical-key name MNF does not utilize UNIT or FORM.
18. For logical-key DBC, if the .xdb file is new, the desired binary format may be specified in the same way as for the OUTPUT2 and OUTPUT4 modules, as described in Remark 11., except that FORM=FORMATTED is not valid. If the .xdb file is not new, the FORM= descriptor is ignored and MSC Nastran determines the format of the existing .xdb file. MSC Nastran can read and or update an .xdb file in any valid format. Note, on long-word systems (mode=i8) the effect of 64-bit output files is that ADAMS(MNF), Patran, and SimXpert may fail to process the results.
19. SOL700 reserves unit numbers 87-92 for its internal use. When using SOL700 users should not use these unit number to avoid conflicts.
20. The total length of any line in an ASSIGN statement must not exceed 72 characters. Long file names may be split across multiple lines with commas at the end of line and next to be without spaces. For example, the file: `ASSIGN SCR300='E:\brhikesh_scr300\testing\delimiter\issue\scratch.SCR300' DELETE` should be specified with the following input: `ASSIGN SCR300='E:\brhikesh_scr300\testing\delimiter\issue\scratch.SCR300' DELETE.`

**Table 3-1 FORTRAN Files and Their Default Attributes**

Logical Key Name	Physical Name	Unit No.	Form	Status	Assignable	Open	Access	Description/ Application
SEMTRN	sdir/data.f01	1	FORMATTED	NEW	NO	YES	SEQ.	Input Data Copy Unit
LNKSWH	sdir/data.f02	2	UNFORMATTED	NEW	NO	YES	SEQ.	Link Switch Unit
MESHFL	sdir/data.f03	3	FORMATTED	NEW	NO	YES	SEQ.	Input Data Copy Unit
LOGFI	out.f04	4	FORMATTED	NEW	NO	YES	SEQ.	Execution Summary Unit
INPUT	data.dat	5	FORMATTED	OLD	NO	YES	SEQ.	Input File Unit
PRINT	out.f06	6	FORMATTED	NEW	NO	YES	SEQ.	Main Print Output Unit
PUNCH	out.pch	7	FORMATTED	NEW	YES	YES	SEQ.	Default Punch Output Unit
	authorize.dat	8	FORMATTED	OLD	NO	YES	SEQ.	Authorization File
INCLD1					NO			Available for Use
CNTFL					NO			Available for Use
INPUTT2	REQ	REQ		OLD	YES	NO	SEQ.	INPUTT2 Unit
OUTPUT2+	out.op2	12	UNFORMATTED*	NEW	YES	YES	SEQ.	OUTPUT2 Unit
INPUTT4	REQ	REQ		OLD	YES	NO	SEQ.	INPUTT4 Unit
OUTPUT4	REQ	REQ	UNFORMATTED*	NEW	YES	NO	SEQ.	OUTPUT4 Unit
PLOT	out.plt	14	UNFORMATTED++	NEW	YES	YES	SEQ.	Plotter Output Unit
BULKECHO	out.becho	18	FORMATTED	NEW	YES	YES	SEQ.	Bulk EchoUnit
OUTPUT2F	out	19	UNFORMATTED	NEW	YES		SEQ.	Named OUTPUT2 Pattern
OPCASE	REQ	22	FORMATED	NEW	YES		SEQ.	Available for Use
TOPDES	out.des	21	FORMATTED	NEW	YES	YES	SEQ.	Topology Optimization

Table 3-1 FORTRAN Files and Their Default Attributes (continued)

Logical Key Name	Physical Name	Unit No.	Form	Status	Assignable	Open	Access	Description/ Application
AESO	<i>out.AESO</i>	23	FORMATTED	NEW	YES	YES	SEQ.	Optimization
DBC	<i>out.xdb</i>	40	UNFORMATTED	NEW	YES	YES	DIRECT	Database Converter Unit
DBUNLOAD	REQ	50	UNFORMATTED*	NEW	YES	NO	SEQ.	DBUNLOAD FMS statement
DBLOAD	REQ	51		OLD	YES	NO	SEQ.	DBLOAD FMS statement
MNF	<i>out.mnf</i>	none	none	NEW	YES	NO	SEQ.	Interface for ADAMS/Flex
A502LU								Available for Use
DBMIG								Available for Use
USERFILE	REQ	REQ	REQ	REQ	YES	NO	SEQ.	Any User-Defined File
UNVFILE	REQ	REQ	FORMATTED	OLD	YES	NO	SEQ.	Universal File (UF) Unit
ADFFILE	<i>out.afu</i>	none	none	NEW	YES	NO	SEQ.	Associated Data File Unit
IFPDB	<i>out.IFPDB</i>	no	no	NEW	YES	NO	SEQ.	Export or import IFPDAT file
ACG	<i>out.acg</i>	no	no	NEW	YES	NO	SEQ.	Automatic Contact Generation file
HDF5	<i>out.h5</i>	no	no	NEW	YES	NO	N/A	Nastran HDF5 result database
HDF5IN	<i>pre_run.h5</i>	REQ	no	OLD	YES	NO	SEQ.	Read displacement or eigenvector datasets from MSC Nastran hdf5 result database
IMPFIN	<i>example.impf</i>	REQ	no	OLD	YES	NO	N/A	Read imperfection file

where:

- Logical Key Name                      Specifies the logical-key NAME used on the ASSIGN statement.
- Physical Name                         Specifies the default name used to open the file; i.e., the default filename2 name.  
“REQ” means that this parameter is required in the ASSIGN statement from the user.
- Unit No.                                 Specifies the default FORTRAN unit number used by MSC Nastran.  
“REQ” means that this parameter is required in the ASSIGN statement from the user.
- Form                                      Specifies the default FORM used when the file is opened.
- Status                                    Specifies the default STATUS used when the file is opened.  
“REQ” means that this parameter is required in the ASSIGN statement from the user.

Assignable	If “YES”, the user may assign a physical file to this logical name. If “NO”, the unit (if any) and logical name are reserved by MSC Nastran.
Open	If “YES”, the file is opened by default. If “NO”, the file must be explicitly opened.
Access	If “SEQ”, the file is opened for sequential access. If “DIRECT”, the file is opened for direct access.
sdir	The scratch directory specified using the “sdirectory” keyword.
data	The name of the input data file with all directory and extensions removed.
out	The directory and file prefix specified using the “out” keyword or taken by default.

- Notes:**
- + The actual logical-key name for this is “.op2”. If you use “OUTPUT2” (even though this is still the logical-key name put out by Patran) you will get a User Fatal Message from MSC Nastran.
  - \* FORMATTED is required for neutral-format OUTPUT2 files and ASCII-format OUTPUT4 files.
  - ++ If FORM=FORMATTED is specified, the default extension is changed to “.ps” and, if PLOTTER NAST is requested (PLOTTER SC is not supported in PostScript mode), the plot data will be generated in PostScript format directly instead of having to use the PLOTPS or MSCPLOTPS utility programs. Any desired plotting options may be specified as keywords in the SYS= field of the ASSIGN statement or using the SYSFIELD command-line option, specifying PLOT (keyword=value, . . .). The valid keywords are the same as those that can be specified for the PLOTPS or MSCPLOTPS utility programs except that the “begin”, “debug”, “dump”, “end”, “format” and “output” keywords are not allowed. PostScript mode can be made the default by specifying the following ASSIGN statement in an RC file:

```
ASSIGN PLOT=*, FORM=FORMATTED
```

This ASSIGN statement may also include a SYS= specification if any special PostScript keywords are to be used for every plot.

21. Refer to Remarks 10., 11., 12., 13. and 18. above. For UNFORMATTED, the default is 64-bit machine precision. The Linux and Windows platforms, currently supported by MSC Nastran, are binary compatible. FORMATTED involves converting the binary numbers into a compressed ASCII representation, which will result in some roundoff. In a numerically stable problem, the roundoff should not cause problems. However, if the model is not numerically stable or the user is performing operations which require numeric precision, then the roundoff may come into play. See, also, IEEE 754-2008, published in August 2008 for roundoff criterion.

## CONNECT

## User Defined Service and Group Evaluator Data

Defines the newly introduced Simulation Component Architecture (SCA) User Defined Service (UDS) into MSC Nastran via a new CONNECT SERVICE statement. Bulk Data entries such as NLRSD and MATUDS refer to this new service.

External geometric or beam cross section entities, external design responses, and external splines are still defined through the old grouping also described below. These entities should belong to the same evaluator-class (set of routines that process them), and in the case of geometric data, should reside on the same database.

1. A group of external beam cross section entities. These entities should belong to the same evaluator-class (a set of routines that process them). The PBARL and PBEAML entries relate to the BEAMEVAL type.
2. A group of external spline entities. The SPLINEX Bulk Data entry relates to the SPLINEX type.
3. A group of external design response entities. The DRESP3 Bulk Data entry relates to the DRESP3 type.

### UDS Format:

```
CONNECT SERVICE <service_identifier> <service_name>
```

### Old Group Format:

```
CONNECT [
  GEOMEVAL
  BEAMEVAL
  DRESP3
  SPLINEX
] group evaluator 'path' 'data'
```

### UDS Examples:

```
CONNECT SERVICE mysub 'SCA.MDSolver.Util.Ums'
```

Creates a service identifier “mysub” which points to the “SCA.MDSolver.Util.Ums” service.

```
CONNECT SERVICE MYSUB 'ExtServ.Nlrsfd'
```

In this case, the user is requesting the NLRSD Bulk Data entry with the GRPNAME MYSUB obtain its characteristics from the externally connected service defined in the CDL file under the component keyword. The user must create an external shared object library (dynamic link library on Windows) using the SCA Scons utility and configure it to function with the MSC Nastran executable.

### Old Group Examples:

```
CONNECT BEAMEVAL HOIST, NEWBEAMS
```

In this case, the user is requesting that all calculations on PBARL and PBEAML Bulk Data entries that are grouped as HOIST use the NEWBEAMS evaluator. In this case, the user must supply the NEWBEAMS beam cross section evaluator library, and configure it to function with the Nastran executable program.

CONNECT DRESP3 TAILWING, EXTRESP

In this case, the user is requesting that all calculations on DRESP3 Bulk Data entries, that are grouped as TAILWING use the EXTRESP evaluator. Thus, the user must create the EXTRESP external response server program, and configure it to function with the MSC Nastran executable.

CONNECT SPLINEX SPLNGRP EXTSPLN

In this case, the user is requesting that all calculations on SPLINEX Bulk Data entries, that are grouped as SPLNGRP, use the EXTPLN evaluator. Thus, the user must create the EXTSPLN external spline server program and configure it to function with the Nastran executable.

Describer (UDS Format)	Meaning
group	Group name referenced by the GROUP field on the NLRSD and MATUDS Bulk Data entries.
service_identifier	service_identifier is a name tag (8 characters long) which will be used to identify the service implementation to be used for a specific bulk data entry.
service_name	service_name is the name of service

Describer (Old Group Format)	Meaning
group	Group name referenced by the GROUP field on DRESP3, PBARL, PBEAML, and SPLINEX Bulk Data entries.
evaluator	Identifies the particular class of evaluator to which the geometric, beam cross section, external response, or external spline entities belong. Entities belonging to one evaluator-class are handled by the same set of routines (either MSC-provided or user-provided). For geometry, two classes of evaluators are provided internally with MSC Nastran. They are MSCRPC (rational parametric cubic) and MSCEQN (generic equation). For beam cross sections, the class MSCBML (MSC Beam Library) is provided internally. Users may develop custom evaluator libraries for geometry, beam cross sections, external responses, or external splines and configure them for use with MSC Nastran. See Remarks 4, 5, and 7.
path	Optional pathname or filename used by evaluator. Path must be enclosed by single quotation marks if it contains lowercase characters.
data	Optional character string passed to the evaluator. Data must be enclosed by single quotation marks if it contains lowercase characters or embedded blanks.

### Remarks (UDS Format):

1. The process of enabling User Defined Services in MSC Nastran consists of the following four steps:
  - a. Creating the desired implementation for the User Defined Services in the form of dynamic-link libraries,
  - b. Defining the location of the user defined service, service catalogue, service resource directory.
  - c. Specifying the proper commands in the model to load the service,
  - d. Identifying the elements that use the user supplied implementation.
2. In order to create a dynamic-link library suitable for usage with MSC Nastran, a build environment is delivered to assist the user in building the library. Please refer to the *Simulation Component Architecture Guide* and the *User Defined Service Guide* which describe the features and capabilities of the build system.

### Remarks (Old Group Format):

1. CONNECT requests:
  - An external data base or evaluator, or
  - A user-defined grouping for beam cross section data defined by PBARL and PBEAML entries.
2. Two reserved group names, MSCGRP0 and MSCGRP1, have been predefined for geometric entities. The group MSCGRP0 corresponds to the MSCRPC (rational parametric cubic) evaluator and the group MSCGRP1 corresponds to the MSCEQN (Generic Equation) evaluator.
3. A single reserved group name, MSCBML0, has been predefined for beam cross section entities. It may be used in the PBARL and PBEAML entries without being defined explicitly by means of a CONNECT FMS statement. It corresponds to the MSCBML (MSC Beam-Library) evaluator.
4. Custom geometric evaluator libraries developed by users should comply with the *MSC Nastran Geometry Evaluator Developer's Guide*.
5. Custom beam cross section evaluator libraries developed by users should comply with the guidelines in the *MSC Nastran V69 Release Guide*, Section 3.1, Beam Cross-Section Library, and Appendix C: Adding Your Own Beam Cross-Section Library.
6. Custom responses developed by users should comply with the procedures and guidelines in "Support of External Response in SOL 200" on page 55 of the *MSC Nastran 2004 Release Guide*.
7. Once developed, an evaluator may be configured as:
  - Internal, where the evaluator routines are linked with the rest of the Nastran object modules to comprise the Nastran executable program; or
  - External, where the evaluator routines are linked with an MSC-provided server program to constitute an independent geometry server.

## **DBCLEAN**      Deletes Database Versions and/or Projects

Deletes one or more versions and/or projects from the database.

Format:

DBCLEAN VERSION = {version-ID,\*} [PROJECT={project-ID',\*}]

Describer	Meaning
version-ID	Version identifier of the database to be deleted.
*	Wildcard. All versions or projects to be deleted.
project-ID	Project identifier of the project to be deleted. (See the FMS statement, <a href="#">PROJ, 103.</a> )

Remarks:

1. There may be up to ten DBCLEAN statements in the FMS Section.
2. If no project-ID is given, the current project-ID is assumed.

Example:

```
DBCLEAN VERS = 7 PROJ = 'OUTER WING - LEFT'
```

The preceding example would delete from the database all data blocks and parameters stored under Version 7 of the project identified as OUTER WING - LEFT.

## DBDICT

## Prints Database Directory Tables

DBDICT prints the following database directory tables:

- Data blocks described by an NDDL DATABLK statement.
- Parameters described by an NDDL PARAM statement.
- All unique paths (KEYs) and their qualifier values.
- Qualifiers and their current values.
- Data blocks not described by an NDDL DATABLK statement.
- Parameters not described by an NDDL PARAM statement.
- Project and version information.

## Basic Format:

The basic format of DBDICT specifies which tables to print and prints all items (data blocks and parameters) found in the directory. Also, the attributes (colnames) to be printed, and the print format, are predefined. Note that more than one table may be specified on the same DBDICT statement.

DBDICT [DATABLK PARAM PROJVERS QUALCURR QUALIFIERS]

## Examples:

```
DBDICT
DBDICT PARAM PROJVERS
```

## Full Format:

The full format permits the selection of items by name and/or by the WHERE describer. The full format also permits the attributes to be printed using the SELECT describer. In addition, the print format can be specified with the SORT, FORMAT, and LABEL describers. Note that the full format only allows the specification of a single table on a DBDICT statement.

$$\text{DBDICT} \left[ \begin{array}{l} \left( \left[ \begin{array}{l} \text{DATABLK} \\ \text{DATABLK(LOCAL)} \end{array} \right] = \left[ \begin{array}{l} * \\ \text{(datablk-list)} \end{array} \right] \right) \\ \left( \left[ \begin{array}{l} \text{PARAM} \\ \text{PARAM(LOCAL)} \end{array} \right] = \left[ \begin{array}{l} * \\ \text{(param-list)} \end{array} \right] \right) \\ \text{PROJVERS} \\ \text{QUALCURR} \\ \text{QUALIFIERS} \end{array} \right] \text{WHERE}(\text{where-expr}),$$

SELECT(colname[- 'col-label']. . . ),

FORMAT (FWIDTH = w [.d] DWIDTH = w [.d] AWIDTH = a IWIDTH = i,  
LWIDTH = k COLSPACE = c VALUE = w,  
colname = col-width, . . .),

SORT (colname =  $\begin{bmatrix} A \\ D \end{bmatrix}$ , ...),

LABEL ('page - title'  $\begin{bmatrix} \text{RIGHT} \\ \text{CENTER} \\ \text{LEFT} \end{bmatrix}$ )

Describer	Meaning
DATABLK	Print the data blocks. datablk-list specifies a list of NDDL-defined data blocks separated by commas. If LOCAL is specified, the non-NDDL-defined data blocks are printed.
PARAM	Print the parameter table. param-list specifies a list of parameters separated by commas. If LOCAL is specified, the non-NDDL-defined parameters are printed.
PROJVERS	Print the project-version table.
QUALIFIERS	Print the qualifier table.
QUALCURR	Print the current values of the qualifiers. SORT is ignored.
where-expr	Logical expression that specifies the desired values of colnames described below. For example, WHERE(VERSION=4 AND SEID < > 2 AND SEID > 0) selects all items under version 4 for all values of SEID greater than 0 except 2. See the beginning of this section for a further description. The default for VERSION is the last version, and PROJECT is the current project. The default for qual is *, which is all qualifier values found on the database. See also Remark 12.
SELECT	Specifies a list of column names to be printed. The order of the specified colnames will be printed from left to right. If colname is not specified, then all columns will be printed.
colname	Column name. Colname specifies a particular attribute of the database item such as data block name (NAME), creation date (CDATE), number of blocks (SIZE), or qualifier name (SEID, SPC, etc.). The allowable colnames are given in the Remarks.
col-label	The label to printed above the column identified by colname. The default for col-label is the colname. col-label may not be specified for the following colnames: QUALSET, QUALALL, and TRAILER.

Describer	Meaning
FWIDTH=w.d	Specifies the default width for single-precision real numbers in real and complex qualifiers (Integers: w>0 and d>0; Default=12.5).
DWIDTH=w.d	Specifies the default width for double-precision real numbers in real and complex qualifiers (Integers: w>0 and d>0; Default=17.10).
AWIDTH=a	Specifies the default width for character string qualifiers. Character strings are printed with enclosing single quotation marks, even if the string is blank (Integer>0; Default=8).
IWIDTH=i	Specifies the default width for integer qualifiers (Integer>0; see Remarks for defaults).
LWIDTH=k	Specifies the default width for logical qualifiers. Logical values are printed as either "T" for TRUE or "F" for FALSE (Integer>0; Default=1).
COLSPACE=c	Specifies the default number of spaces between columns (Integer>0; see Remarks for defaults).
VALUE=w	Specifies the default width for parameter values. The values are printed as character strings with left justification (Integer>0; Default=40)
col-width	The print width of the data under colname or qual-name. For real numbers, specify w.d where w is the width of the field and d is the number of digits in the mantissa. For integers and character strings, specify w, where w is the width of the field. col-width may not be specified for colnames QUALSET, QUALALL, and TRAILER.
SORT	Specifies how the rows are sorted. The sort is performed in order according to each colname specified in the list. A "D" following the colname causes the sort to be in descending order. An "A" following the colname causes the sort to be in ascending order. Colnames QUALSET, QUALALL, and TRAILER may not be specified under SORT. Each colname specified in SORT must be separated by commas.
page-title	A title to be printed on each page of the directory output.
RIGHT, CENTER, LEFT	Print justification of the page title.

## Remarks:

1. DBDICT prints seven different tables according to a default or a user-defined format. The tables are:

Table 1 DBDICT Tables

Describer	Description	Default Page-Title	See Remark
DATABLK	Data blocks described by a NDDL DATABLK statement.	NDDL DATABLOCKS	2.
PARAM	Parameters described by a NDDL PARAM statement.	NDDL PARAMETERS	3.
QUALCURR	Current qualifiers and their values.	CURRENT QUALIFIERS	4.
QUALIFIERS	Qualifiers and their values for each key number.	QUALIFIERS	5.
DATABLK(LOCAL)	Data blocks not described by a NDDL DATABLK statement.	LOCAL DATABLOCKS	6.
PARAM(LOCAL)	Parameters not described by a NDDL PARAM statement.	LOCAL PARAMETERS	7.
PROJVERS	Project-Version.	PROJECT-VERSION	8.

If DBDICT is specified without any describers, then the NDDL Data blocks Table will be printed. See Remark 2.

DATABLK(LOCAL) and PARAM(LOCAL) produce no output, and QUALCURR produces the default values specified on the NDDL QUAL statement.

The defaults and allowable colnames for SELECT, FORMAT, SORT, and LABEL depend on the table. The defaults are described in the following remarks and tables.

2. The default print of the NDDL Data Blocks Table is obtained by

```
DBDICT
```

or

```
DBDICT DATABLK
```

and is equivalent to

```
DBDICT DATABLK ,
  SELECT (NAME, DATABASE, DBSET, PROJ, VERS, CDATE, CTIME,
    SIZE, KEY, PURGED=' PU', EQUIVD=' EQ',
    POINTER=' FILE', QUALSET) ,
  FORMAT (NAME=8, DBSET=8, CDATE=6, CTIME=6, SIZE=5,
    KEY=4 , PURGED=4, EQUIVD=4, POINTER=8,
    IWIDTH=5, COLSPACE=1) ,
  SORT (PROJ=A, VERS=A, DBSET=A, NAME=A) ,
  LABEL (' NDDL DATABLOCKS' CENTER)
```

and looks like:

```

Figure 3-1 DBDICT DATABLE Example

Table 2 gives the allowable colnames and a description that may be specified in the FORMAT, SELECT, and SORT descriptors.

Table 2 DBDICT DATABLE Colnames

colname	Default col-width	Default col-label	Description
PROJECT	40	PROJECT NAME	Project name defined by PROJECT statement.
PROJ	4	PROJ NO	Project number associated with PROJECT.
VERS	4	VERSION	Version number.
CDATE	6	CDATE	Creation date.
CTIME	6	CTIME	Creation time.
NAME	8	NAME	Parameter name.
DATABASE	8	DATABASE	MASTER DBset name.
DBSET	8	DBSET	DBset name.
RDATE	6	RDATE	Revision date.
RTIME	6	RTIME	Revision time.
SIZE	5	SIZE	Number of blocks.
qual-name	See Note.	qualifier name	Qualifier name.
KEY	4	KEY	Key number.
TRLi	8	TRLi	i-th word in the trailer.
TRAILER	8	TRLi	All 10 trailer words.
EXTNAME	8	EXTNAME	Extended name.
EQUIVD	4	EQ	Equivalenced flag.

Table 2 DBDICT DATBLK Colnames (continued)

colname	Default col-width	Default col-label	Description
PURGED	4	PU	Purged flag.
EQFLAG	4	EF	Scratch equivalenced flag.
SCRFLAG	4	SF	Scratch DBSET flag.
POINTER	8	POINTER	Directory pointer.
DBENTRY	8	DBENTRY	Database entry pointer.
FEQCHAIN	8	FEQCHAIN	Forward equivalence chain.
BEQCHAIN	8	BEQCHAIN	Backward equivalence chain.
DBDIR20	9	DBDIR(20)	Directory word 20.
QUALALL	See Note.	qualifier name	All qualifiers.
QUALSET	See Note.	qualifier name	Predefined subset of all qualifiers.

**Note:** Default widths for qualifiers are DWIDTH=17.10, IWIDTH=5, LWIDTH=1, AWIDTH=8, and FWIDTH=12.5.

3. The default print of the NDDL Parameter Table is obtained by

```
DBDICT PARAM
```

and is equivalent to

```
DBDICT PARAM,
  SELECT (NAME, DATABASE, DBSET, PROJ, VERS, CDATE, CTIME,
    KEY, VALUE, QUALSET) ,
  FORMAT (NAME=8, DATABASE=8, DBSET=8, CDATE=6, CTIME=6,
    KEY=4, VALUE=40, IWIDTH=5, COLSPACE=1) ,
  SORT (PROJ=A, VERS=A, DBSET=A, NAME=A) ,
  LABEL ('NDDL PARAMETERS' CENTER)
```

and looks like:

```

```

Figure 3-2 DBDICT PARAM Example

Table 3 gives the allowable colnames along with a description that may be specified in the FORMAT, SELECT, and SORT descriptors.

Table 3 DBDICT PARAM Colnames

colname	Default col-width	Default col-label	Description
PROJECT	40	PROJECT NAME	Project name defined by PROJECT statement.
PROJ	5	PROJ	Project number associated with PROJECT.
VERS	4	VERS	Version number.
CDATE	6	CDATE	Creation date.
CTIME	6	CTIME	Creation time.
NAME	8	NAME	Parameter name.
DATABASE	8	DATABASE	MASTER DBset name.
DBSET	8	DBSET	DBset name.
RDATE	6	RDATE	Revision date.
RTIME	6	RTIME	Revision time.
POINTER	8	POINTER	Directory pointer.
VALUE	40	VALUE	Parameter value.
KEY	4	KEY	Key number.
qual-name	See Note.	qualifier name	Qualifier name.
QUALALL	See Note.	qualifier name	All qualifiers.
QUALSET	See Note.	qualifier name	Predefined subset of all qualifiers.

Table 5 DBDICT QUALCURR Colnames

colname	Default col-width	Default col-label	Description
qual-name	See Note.	qualifier name	Qualifier name.
QUALALL	See Note.	qualifier name	All qualifiers.
QUALSET	See Note.	qualifier name	Predefined subset of all qualifiers.

**Note:** Default widths for qualifiers are DWIDTH=17.10, IWIDTH=5, LWIDTH=1, and FWIDTH=12.5. AWIDTH defaults to the length specified on the QUAL statement in the NDDL sequence.

6. The default print of the Local Data Block Table is obtained by

```
DBDICT DATABLK (LOCAL)
```

and is equivalent to

```
DBDICT DATABLK (LOCAL) ,
  SELECT (NAME, SUBDMAP, SIZE='BLOCKS', PURGED='PU',
    EQUIVD='EQ', POINTER, TRL1, TRL2, TRL3, TRL4,
    TRL5, TRL6, TRL7) ,
  FORMAT (NAME=8, SUBDMAP=8, IWIDTH=8, COLSPACE=2) ,
  SORT (NAME=A) LABEL ('LOCAL DATABLOCKS' CENTER)
```

and looks like:

```

***** DICTIONARY PRINT *****
EXECUTION OF DMAP STATEMENT NUMBER      23
MODULE NAME = DBDICT , SUBDMAP SEKRRS , OSCAR RECORD NUMBER      19
LOCAL DATABLOCKS
NAME  SUBDMAP  BLOCKS  PU  EQ  POINTER  TRL1  TRL2  TRL3  TRL4  TRL5  TRL6  TRL7
-----
CASEW PHASE1DR      1    0  0  131780    201    4    0   308    0    0    0

```

Figure 3-5 DBDICT DATABLK(LOCAL) Example

TRL<sub>i</sub> specifies the data block trailer word *i* where  $1 \leq i \leq 10$ . TRAILER selects all 10 data block trailer words.

Table 6 gives the allowable colnames and a description that may be specified in the FORMAT, SELECT, and SORT descriptors.

Table 6 DBDICT DATBLK(LOCAL) Colnames

colname	Default col-width	Default col-label	Description
NAME	8	NAME	Parameter name.
SUBDMAP	8	SUBDMAP	SubDMAP name.
SIZE	8	BLOCKS	Number of blocks.
EQUIVD	8	EQ	Equivalenced flag.
PURGED	8	PU	Scratch flag.
POINTER	8	POINTER	Directory pointer.
TRLi	8	TRLi	i-th word in the trailer.
TRAILER	8	TRLi	All 10 trailer words.
EXTNAME	8	EXTNAME	Extended name.

7. The default print of the local parameter table is obtained by

```
DBDICT PARAM(LOCAL)
```

and is equivalent to

```
DBDICT PARAM(LOCAL) SELECT (NAME, SUBDMAP, VALUE),
    FORMAT(COLSPACE=4, VALUE=40, AWIDTH=8),
    SORT(NAME=A) LABEL(' LOCAL PARAMETERS' CENTER)
```

and looks like:

```

* * * * D I C T I O N A R Y   P R I N T   * * * *
EXECUTION OF DMAP STATEMENT NUMBER      24
  MODULE NAME = DBDICT   , SUBDMAP SEKRRS   , OSCAR RECORD NUMBER      20
                                LOCAL PARAMETERS
NAME      SUBDMAP      VALUE
-----
AERO      SESTATIC     FALSE
AERO      PHASE1DR     FALSE
ALTRED    SESTATIC     NO
ALTRED    PHASE1DR     NO

ALWAYS    PHASE1C     -1
ALWAYS    SEKRRS      -1
ALWAYS    SESTATIC     -1
APP       PHASE1DR     STATICS
APP       PHASE1C     STATICS
APP       SESTATIC     STATICS
APRCH     SESTATIC
ASING     PHASE1DR     0
ASING     SEKRRS      0
ASING     PHASE1C     0
ASING     SESTATIC     0

```

Figure 3-6 DBDICT PARAM(LOCAL) Example

Table 7 gives the allowable colnames and a description that may be specified in the FORMAT, SELECT, and SORT descriptors.

Table 7 DBDICT PARAM(LOCAL) Colnames

colname	Default col-width	Default col-label	Description
NAME	8	NAME	Parameter name.
SUBDMAP	8	SUBDMAP	SubDMAP name.
VALUE	40	VALUE	Parameter name.

8. The default print of Project-Version Table is obtained by

DBDICT PROJVERS

and is equivalent to

```
DBDICT PROJVERS ,
  SELECT (PROJECT=' PROJECT NAME' , PROJ=' PROJ NO.' ,
    VERS=' VERSION' , DELFLG=' DELETED' ,
    CDATE=' CREATION DATE' CTIME=' CREATION
    TIME' ) ,
  FORMAT (PROJECT=40 , PROJ=10 , VERS=10 , DELFLG=7 ,
    COLSPACE=1 , CDATE=13 , CTIME=13) ,
  LABEL (' PROJECT-VERSION' , CENTER) ,
  SORT (PROJ=A , VERS=A)
```

and looks like:

```
***** DICTIONARY PRINT *****
EXECUTION OF DMAP STATEMENT NUMBER      19
MODULE NAME = DBDICT , SUBDMAP SEKRRS , OSCAR RECORD NUMBER      15
PROJECT-VERSION
PROJECT NAME          PROJ NO.   VERSION DELETED  CREATION DATE  CREATION TIME
-----
'LEFT FENDER          '          1           1           930805           72319
```

Figure 3-7 DBDICT PROJVERS Example

Table 8 gives the allowable colnames and a description that may be specified in the FORMAT, SELECT, and SORT descriptors.

Table 8 DBDICT PROJVERS Colnames

colname	Default col-width	Default col-label	Description
PROJECT	40	PROJECT NAME	Project name defined by PROJECT statement.
PROJ	10	PROJ NO	Project number associated with PROJECT.

Table 8 DBDICT PROJVERS Colnames

colname	Default col-width	Default col-label	Description
VERS	10	VERSION	Version number.
DELFLG	7	DELETED	Flag indicating whether this project/version has been deleted by the RESTART NOKEEP or DBCLEAN statements.
CDATE	13	CREATION DATE	Creation date.
CTIME	13	CREATION TIME	Creation time.

CDATE is printed as YYMMDD where YY, MM, and DD are the year, month, and date, respectively. CTIME is HHMMSS where HH, MM, and SS are the hour, minute, and second, respectively.

9. If a parameter or qualifier value is defined to be character string, then the value will be printed with enclosing single quotation marks. Blank strings will also be printed with single quotation marks.
10. If a given qualifier is not in the path of a given data block or parameter, then blank spaces will be printed.
11. A line will wrap if additional columns need to be printed and not enough space is available on the output (assumed to be 132). The first column of each additional line is to be indented by the width of the first column printed for the entry.
12. The where-expr has the following rules:
  - If the where-expr specifies a colname that is not assigned to the data block or parameter, then no directory information will be printed for that data block or parameter. For example, given that SPC is not a qualifier for KGG, the following DBDICT statement will produce no output:
 

```
DBDICT DATABLK=KGG WHERE (SPC=10)
```
  - If the where-expr does not specify a colname that is assigned to the data block (or parameter), then the qualifier is wildcarded. For example, given that SEID is a qualifier for KAA, the following DBDICT statements are equivalent:
 

```
DBDICT DATABLK=KAA
DBDICT DATABLK=KAA WHERE (SEID = *)
```
13. A colname specified in the where-expr must be specified in the SELECT clause if the SELECT clause is also specified.

#### Examples:

1. Print the project version table with a title.

```
DBDICT PROJVERS SORT (PROJ, VERSION) LABEL (' PROJECT
VERSION TABLE' LEFT)
```

2. Print a directory of all data blocks qualified with PEID=10 or SEID=10. Print columns for the NAME and DBSET, and the qualifiers SPC, MPC, and LOAD.

```
DBDICT DATABLK SELECT (NAME, SPC, MPC, LOAD, DBSET, SIZE,
```

```
SEID, PEID) ,  
SORT (NAME, SIZE=D) WHERE ( SEID=10 OR PEID=10)
```

**DBDIR**

## Prints Database Directory Tables

Obsolete. See the DBDICT statement.

## DBFIX Database Directory Error Detection

Detects and optionally corrects errors in the database directory.

```
DBFIX { LIST } { CORRECT }
      { NOLIST } { NOCORRECT }
```

Example:

```
DBFIX LIST, NOCORRECT
```

The preceding example requests a printout of the directory pointers and any errors, but not the corrections.

Describer	Meaning
LIST	Requests a debug listing of the database directory pointers.
NOLIST	Suppresses a debug listing of the database directory.
CORRECT	Corrects the database if any errors are found.
NOCORRECT	Suppresses the correction of the database.

Remarks:

1. It is recommended that a backup copy of the database be made before this statement is used, since corrections of the database are achieved through the deletion of data. Data blocks and parameters are deleted from the database if they have (1) incorrect paths (different than listed in the NDDL); (2) incorrect names (two or more names that are not equivalenced and reference the same data), or (3) incorrect directory pointers.
2. NOLIST does not suppress the listing of any corrections made to the database.

## DBLOAD Loads a Database from a FORTRAN File

Recovers data blocks or parameters from a database created by the DBUNLOAD statement.

Format:

$$\text{DBLOAD} \left[ \text{DATABLK} = \left[ \begin{array}{c} * \\ \text{(datablk-list)} \end{array} \right] \text{PARAM} = \left[ \begin{array}{c} * \\ \text{(param-list)} \end{array} \right] \text{WHERE}(\text{where-expr}) ,$$

$$\text{CONVERT}(\text{convert-expr}) \text{UNIT} = \text{unit} \text{FORMAT} \left\{ \begin{array}{l} \text{BINARY} \\ \text{NEUTRAL} \end{array} \right\} \left\{ \begin{array}{l} \text{OVRWRT} \\ \text{NOOVRWRT} \end{array} \right\}$$

Example:

1. Load the database stored in ASCII format on FORTRAN unit 12.

```
DBLOAD      UNIT=12  FORMAT=NEUTRAL
ASSIGN      DBLOAD='physical file name of unloaded database'
            UNIT=12  FORMATTED
```

2. Load version 1 of KAA under project FRONT BUMPER and store it on the primary database under version 5 and project BUMPER. Overwrite duplicates found on the primary database.

```
DBLOAD      DATABLK=(KAA)  WHERE (PROJECT='FRONT BUMPER'
            AND, SEID=10 AND VERSION=1)  CONVERT (VERSION=5; ,
            PROJECT='BUMPER')  OVRWRT
ASSIGN      DBLOAD='physical file name of unloaded database'
```

Describer	Meaning
datablk-list	Specifies a list of data blocks separated by commas. The default is * which selects all data blocks. The loaded data block may be renamed in the primary database by specifying a slash after the old name, followed by the new name. For example, if KLL is to be renamed to KLL1, then DATABLK=(KLL/KLL1) is specified.
param-list	Specifies a list of parameters separated by commas. The default is *, which selects all parameters. The loaded parameter may be renamed in the primary database by specifying a slash after the old name followed by the new name. For example, if LUSETS is to be renamed to LUSET, then PARAM=(LUSETS/LUSET) is specified.

Describer	Meaning
where-expr	<p>A logical expression that specifies the desired values of qualifiers PROJECT, VERSION, and DBSET. For example, WHERE(VERSION=4 AND SEID&lt;&gt;2 AND SEID&gt;0) selects all items under version 4 for all values of SEID greater than 0 except 2. See the beginning of this section for more information on WHERE and CONVERT clauses.</p> <p>The default for VERSION is * for all versions; PROJECT is * for all projects; and DBSET is* for all DBsets. The default for qual is *, which is all qualifier values found on the loaded database. See also Remark 8.</p>
convert-expr	<p>Modifies the values for PROJECT, VERSION, DBSET, and qualifiers selected by the where-expr. The format of convert-expr is:</p> <p>PROJECT=project-expr; VERSION=version-expr; DBSET=DBset-name; quali=qual-expr[;..]</p> <p>For example, CONVERT (SEID=100 + SEID; SPC=102). See the beginning of this section for more information on WHERE and CONVERT clauses.</p> <p>The default action for VERSION and PROJECT is to use the same version IDs and project IDs; i.e., CONVERT(PROJECT=PROJECT; VERSION=VERSION). But if either PROJECT or VERSION is specified in the convert-expr, then both must be specified. The default action for qualifiers and DBSET is to use the same values as long as they are defined in both databases. If not, see Remark 8.</p>
unit	<p>Specifies the FORTRAN unit number of the database to be loaded. The unit must be specified on an ASSIGN statement that references the physical filename of the loaded database. The default is 51.</p>
OVRWRT NOOVRWRT	<p>By default, if duplicate data blocks or parameters exist on the loaded and primary databases, then a fatal message is issued. A duplicate means that a data block or parameter has not only the same name but also the same qualifier values, PROJECT, VERSION, and DBSET as a data block or parameter on the primary database.</p>
NEUTRAL BINARY	<p>The database to be loaded may be in BINARY or NEUTRAL format. BINARY indicates the database to be loaded is in binary or FORTRAN unformatted format. NEUTRAL indicates the database to be loaded is in ASCII format. The default is BINARY.</p>

#### Remarks:

1. The DBLOAD statement and its applications are discussed further in [Database Concepts in the MSC Nastran Reference Guide](#).
2. If the DATBLK keyword is specified and PARAM is not specified, then only data blocks may be loaded. If the PARAM keyword is specified and DATBLK is not specified, then only parameters may be loaded. If neither DATBLK nor PARAM is specified, then all data blocks and parameters may be loaded.

3. The DB keyword is equivalent to DATABLK, and the PARM keyword is equivalent to PARAM.
4. The database to be loaded is attached as read-only. In other words, items can only be fetched and not stored on this database.
5. If more than one DBLOAD statement is specified, then they will be processed in the order in which they appear. If a duplicate data block or parameter is found on two or more different DBLOAD statements, then the last duplicate will be used.
6. If NEUTRAL is specified, then the FORMATTED keyword must be specified on the corresponding ASSIGN statement.
7. If a data block or parameter is being renamed, then the new name must be defined in the NDDL of the primary database.
8. If the database to be loaded and the primary database have different NDDL schemes and CONVERT is not used, then the following is performed:
  - If a qualifier in the NDDL of the database to be loaded is not in the NDDL of the primary database, then all of its values are converted to the null value corresponding to its type. For example, if the qualifier is integer, real, double-precision, complex, or character, then the value is converted to 0, 0., 0.D0, (0.,0.), or blank, respectively. If this conversion results in a duplicate data block(s) or parameter(s), then a User Warning Message is printed and the duplicates are not loaded.
  - If a DBset-name in the NDDL of the database to be loaded is not in the NDDL of the primary database, then its values will be converted to the PARAM default value in the NDDL of the database to be loaded.
9. Data blocks that are equivalenced on the database to be loaded remain equivalenced as long as they are loaded in the same DBLOAD statement or in consecutive DBLOAD statements with the same unit number. Otherwise, a separate copy for the secondary data block is produced.
10. It is not possible to restart from a database created by DBLOAD in the same run.
11. SOL 190 (or DBTRANS) is also required with DBLOAD if:
  - The database to be loaded has a different BUFFSIZE.
  - The database to be loaded is in neutral format or is being transferred between different machine types.

See also the [Database Concepts](#) in the *MSC Nastran Reference Guide*.

## DBLOCATE Attaches Secondary Databases

Obtains data blocks or parameters from prior versions of the primary database, or other databases. DBLOCATE may also be used to compress the primary database and to migrate databases created in prior MSC Nastran versions.

Format:

```
DBLOCATE [ DATABLK= [ * ] (datablk-list) PARAM= [ * ] (param-list) WHERE(where-expr) ,
```

```
CONVERT(convert-expr) LOGICAL = dbname [ OVRWRT ] [ NOOVRWRT ] COPY ]
```

Example:

1. Locate in version 4 of MASTER3 all data blocks named KAA for all superelements with IDs greater than 0.

```
DBLOCATE      DATABLK=(KAA) WHERE (PROJECT='FRONT BUMPER' , AND
              SEID>0 AND VERSION=4) LOGI=MASTER3
ASSIGN        MASTER3='physical file name of master DBset'
```

2. Copy all data blocks and parameters from the last version of MASTER3 to the primary database. For all items with the qualifier SEID, change the SEID to twice the old ID number.

```
DBLOCATE      CONVERT (SEID=2 *SEID) COPY LOGI=MASTER3
ASSIGN        MASTER3='physical file name of master DBset'
```

3. Compress a database with multiple versions. All versions under the current project-ID (see PROJ statement) will be copied from the database OLDDDB to NEWDB.

```
ASSIGN        MASTER3=' physical filename of new master DBset'
ASSIGN        OLDDDB='physical filename of old master DBset'
DBLOCATE      LOGI=OLDDDB COPY WHERE (VERSION=*) ,
              CONVERT (VERSION=VERSION ; PROJECT=PROJECT)
```

Describer	Meaning
datablk-list	Specifies a list of data blocks separated by commas. The default is *, which selects all data blocks. The located data block may be renamed in the primary database by specifying a slash after the old name followed by the new name. For example, if KLL is to be renamed to KLL1, then DATABLK=(KLL/KLL1) is specified.
param-list	Specifies a list of parameters separated by commas. The default is *, which selects all parameters. The located parameter may be renamed in the primary database by specifying a slash after the old name followed by the new name. For example, if LUSSETS is to be renamed to LUSET, then PARAM=(LUSSETS/LUSET) is specified.
where-expr	A logical expression that specifies the desired values of qualifiers PROJECT, VERSION, and DBSET. For example, WHERE(VERSION= 4 AND SEID <> 2 AND SEID > 0) selects all items under version 4 for all values of SEID greater than 0 except 2. See the beginning of this section for more information on WHERE and CONVERT clauses.  The default for VERSION is the last version-ID and PROJECT is the current project-ID. The default for qual is *, which is all qualifier values found on the located database. See also Remark 9.
convert-expr	Modifies the values for PROJECT, VERSION, DBSET, and qualifiers selected by the where-expr. The format of convert-expr is:  PROJECT=project-expr; VERSION=version-expr; DBSET=DBset-name; quali=qual-expr1[;...]  For example, CONVERT (SEID=100+SEID; SPC=102)  See the beginning of this section for more information on WHERE and CONVERT clauses.  The default action for VERSION and PROJECT is to convert to the current version-ID and current project-ID. But if either PROJECT or VERSION is specified in the convert-expr, then both must be specified. See Example 3. The default action for qualifiers and DBSET is to use the same values as long both databases have the same NDDL scheme. If not, see Remark 9.
dbname	Specifies the logical name of the master directory DBset of the located database. dbname must be specified on an ASSIGN statement, which references the physical file name. By default, the located database is also the primary database. (If dbname is specified for the primary database, then dbname must be MASTER.)
OVRWRT NOOVRWRT	By default, duplicate data blocks or parameters on the located database will take precedence over those on the primary database. A duplicate means that a data block or parameter has not only the same name but also the same qualifier values, PROJECT, VERSION, and DBSET as the data block or parameter on the primary database. If NOOVRWRT is specified, then a fatal message is issued.
COPY	Requests that the located data blocks or parameters be copied to the primary database.

**Remarks:**

1. The DBLOCATE statement and its applications are discussed further in the [Database Concepts in the MSC Nastran Reference Guide](#).
2. If the DATABLE keyword is specified and PARAM is not specified, then only data blocks may be located. If the PARAM keyword is specified and DATABLE is not specified, then only parameters may be located. If neither DATABLE nor PARAM is specified, then all data blocks and parameters may be located.
3. The DB keyword is equivalent to DATABLE, and the PARM keyword is equivalent to PARAM.
4. If more than one DBLOCATE statement is specified, then they will be processed in the order in which they appear. If a duplicate data block or parameter is found on two or more different DBLOCATE statements, then the last duplicate will be used.
5. If the located database is not the primary database, then it is attached for read-only purposes. In other words, items can only be fetched and not stored on the located database.
6. If the RESTART FMS statement is also specified, then located data blocks and parameters are treated as if they exist in the restart version. In other words, restart equivalences will be made on located items at the beginning of the run and can be subsequently broken as a result of regeneration and/or NDDL dependencies.
7. If a data block or parameter is being renamed, then the new name must be defined in the NDDL of the primary database.
8. If LOGICAL refers to the primary database and one version is to be copied to another, then the items are equivalenced.
9. If the located database and the primary database have different NDDL schemes and CONVERT is not used, then the following is performed:
  - If a qualifier in the NDDL of the located database is not in the NDDL of the primary database, then all of its values are converted to the null value corresponding to its type. For example, if the qualifier is integer, real, double precision, complex or character then the value is converted to 0, 0., 0.D0, (0.,0.), or blank, respectively. If this conversion results in a duplicate data block(s) or parameter(s), then a User Warning Message is printed and the duplicates are not located.
  - If a dbset-name in the NDDL of the located database is not in the NDDL of the primary database, then its values will be converted to the PARAM default value in the NDDL of the located database.

## DBSETDEL Deletes a DBset

Deletes a DBset, all of its members, and associated physical files.

### Format:

```
DBSETDEL dbsetnamei
```

### Example:

Delete DBset DBUP20 from the database.

```
DBSETDEL DBUP20
```

Describer	Meaning
dbsetnamei	Specifies the name(s) of DBset(s) to be deleted. The DBset names MASTER, OBJSCR, or SCRATCH may not be specified.

### Remarks:

1. The DBSETDEL statement and its applications are discussed further in [Database Concepts in the MSC Nastran Reference Guide](#).
2. If dbsetnamei does not exist, then no action is taken.
3. After a DBset has been deleted with this statement, it may be recreated with the INIT statement in a subsequent run.

## DBUNLOAD

Unloads a Database to a FORTRAN File

Stores data blocks or parameters from the primary database onto a FORTRAN file in a binary or neutral format, for purposes of database compression or database transfer between different computers.

Format:

$$\text{DBUNLOAD} \left[ \text{DATBLK} = \left[ \begin{array}{c} * \\ \text{(datblk-list)} \end{array} \right] \text{PARAM} = \left[ \begin{array}{c} * \\ \text{(param-list)} \end{array} \right] \text{WHERE}(\text{where-expr}) \right]$$

$$\text{UNIT} = \text{unit} \text{FORMAT} = \left\{ \begin{array}{l} \text{BINARY} \\ \text{NEUTRAL} \end{array} \right\} \left\{ \begin{array}{l} \text{REWIND} \\ \text{NOREWIND} \end{array} \right\}$$

Example:

1. Unload the database in ASCII format onto FORTRAN unit 12.

```
DBUNLOAD      UNIT=12  FORMAT=NEUTRAL
ASSIGN        DBUNLOAD='physical file name of FORTRAN unit 12' ,
              UNIT=12  FORMATTED
```

2. Unload version 1 of KAA under project FRONT BUMPER.

```
DBUNLOAD      DATBLK=(KAA) WHERE(PROJECT='FRONT BUMPER' ,AND
              SEID=10 AND VERSION=1)
ASSIGN        DBUNLOAD=' physical file name of FORTRAN unit 50'
```

Describer	Meaning
datblk-list	Specifies a list of data blocks separated by commas. The default is *, which selects all data blocks.
param-list	Specifies a list parameters separated by commas. The default is *, which selects all parameters.
where-expr	Logical expression that specifies the desired values of qualifiers PROJECT, VERSION, and DBSET. For example, WHERE (VERSION=4 AND SEID<>2 AND SEID>0) selects all items under version 4 for all values of SEID greater than 0 except 2. See the beginning of this section on WHERE and CONVERT Clauses.

Describer	Meaning
	The default for VERSION is * for all versions; PROJECT is* for all projects; and DBSET is * for all DBsets. The default for qual is*, which is all qualifier values found on the primary database.
unit	Specifies the FORTRAN unit number to unload the database. The unit must be specified on an ASSIGN statement, which references its physical filename. The default is 50.
NEUTRAL BINARY	The database may be unloaded in BINARY or NEUTRAL format. BINARY indicates the database is to be unloaded in binary or FORTRAN unformatted. NEUTRAL indicates the database is to be unloaded in ASCII format. The default is BINARY.
NOREWIND REWIND	By default, if DBUNLOAD is executed more than once for the same unit, then the unit is not rewound. REWIND requests that the unit be rewound prior to unloading.

Remarks:

1. The DBUNLOAD statement and its applications are discussed further in [Database Concepts in the MSC Nastran Reference Guide](#).
2. If the DATABLE keyword is specified and PARAM is not specified, then only data blocks may be unloaded. If the PARAM keyword is specified and DATABLE is not specified, then only parameters may be unloaded. If neither DATABLE nor PARAM is specified, then all data blocks and parameters may be unloaded.
3. The DB keyword is equivalent to DATABLE, and the PARM keyword is equivalent to PARAM.
4. If more than one DBUNLOAD statement is specified, then they will be processed in the order in which they appear.
5. If NEUTRAL is specified, then the FORMATTED keyword must be specified on the corresponding ASSIGN statement.
6. If NEUTRAL is specified, then only data blocks with an NDDL description are unloaded. (See the [MSC Nastran DMAP Programmer's Guide](#) under the DATABLE statement.) An NDDL description is required for TYPE=TABLE and none is required for TYPE=MATRIX. The data block must be unloaded in BINARY if TYPE=UNSTRUCTURED, KDICT, or KELM.
7. Data blocks that are equivalenced on the primary database remain equivalenced as long as they are unloaded in the same DBUNLOAD statement or in consecutive DBUNLOAD statements with the same unit number. Otherwise, a separate copy for the secondary data block is produced.

**DBUPDATE** Specifies Database Directory Update Interval

Specifies the maximum length of CPU time between database directory updates to the MASTER DBset. This statement is intended to be used if the INIT MASTER(RAM=r) option is specified.

**Format:**

DBUPDATE [=] update-time

**Example:**

DBUPDATE = 5.5

The preceding example would call for a database directory update at the end of a DMAP module execution after five and one-half minutes of CPU time have elapsed from the last update.

Describer	Meaning
update-time	CPU time interval in minutes (real or integer) between database directory updates.

**Remarks:**

1. The difference in CPU time from the last update is checked after the execution of each DMAP instruction. The database directory is updated if this difference is greater than update-time. Update-time and CPU time is accurate to the nearest whole second only.
2. If update-time < 0, then database directory updates are only performed at the end of the run.
3. Defaults for update-time are machine dependent and may be found in the *MSC Nastran Installation and Operations Guide*.
4. Periodic updates of the directory tables to MASTER DBset increases the integrity of the database during system crashes (for example, crashes due to insufficient time or space).
5. Directory updates are performed automatically at various points in the execution of the DMAP in addition to those specified by DBUPDATE. An asterisk appears after the word "BEGN" in the executive summary table whenever an update occurs. See the [Output Description](#) in the *MSC Nastran Reference Guide*. These updates occur whenever a permanent data block, parameter DMAP equivalence, or restart equivalence is broken. Updates also occur upon deletions. Additions to the database do not automatically cause a directory update to take place.
6. This statement is in effect only when INIT MASTER(RAM=r) is being used. INIT MASTER(S) and INIT MASTER(NORAM) disable periodic and automatic updates.
7. Update-time may also be changed with the DMAP instruction PUTSYS(update-time, 128) or the NASTRAN SYSTEM(128)=update-time statement. (The update-time must be a real, single-precision value specified in minutes.)

## DEFINE Parameter Definition

Assigns user-defined keywords (or cellnames) to a NASTRAN system cell. (See the NASTRAN statement for a description of “cellname”). In addition, the DEFINE statement provides a mechanism to set default values for system cells.

### Format:

DEFINE keyword [ =expression ] [ LOCATION=SYSTEM(i) ] [ TYPE=type ]

Describer	Meaning
keyword	User-defined name, 1 through 24 characters in length. The first character must be alphabetic. The following characters can be used for keywords: A through Z, _, and 0 through 9. Any other characters are invalid.
expression	Expression produces a single value from a set of constant and/or variable parameters separated by operators. The value is assigned to the “keyword” and is also used to set the value for the NASTRAN system cell specified by “LOCATION”. TYPE determines both the type of the result and the type conversions that will be applied to the constants and variables within the expression--mixed mode expressions are allowed (see Remark 6.). The parentheses can be used to change the order of precedence. Operations within parentheses are performed first, with the usual order of precedence being maintained within the parentheses. The variable parameters within the expression must be keywords previously defined on a DEFINE statement. The following operations are allowed:

Parameter Type	Operator	Operation
Integer or Real	+	Addition
	-	Subtraction
	*	Multiplication
	/	Division
Logical	+	Bit-wise OR
Logical	-	Bit clear. For example, the result of $a-b$ is equal to the value of $a$ with the bits associated with $b$ set to 0.

Describer	Meaning
SYSTEM(I) type	Specifies the NASTRAN system cell number to be associated with the keyword. The type of expression result, and the type of conversions that will be applied to the constants and variables within the expression. Allowable data types are as follows:

Description	Type
Integer (default)	I
Real	R
Logical	LOGICAL

#### Remarks:

1. If TYPE, LOCATION, and EXPRESSION are omitted, the default data type is Integer and the default value is zero.
2. If EXPRESSION is omitted, an internal default will be assigned to the keyword/cellname based on the LOCATION (See [The NASTRAN Statement](#) for a list of internal default values).
3. A DEFINE statement that specifies a LOCATION is actually setting the default for a NASTRAN system cell, I and therefore it is not necessary to also set the system cell value on a subsequent NASTRAN statement unless the user wishes to override the previous DEFINE statement setting. Also, since more than one DEFINE statement may be present for the same “keyword”, the last specification takes precedence. “Keywords” referenced on a NASTRAN statement, or in an expression on the DEFINE statement, are automatically substituted by the last specification of the “keyword” prior to the current statement being processed.
4. DEFINE statements may also be specified in runtime configuration (RC) files. See the .
5. System cells may also be set with the NASTRAN statement. In addition, they may be set or values returned with the DMAP PUTSYS and GETSYS functions and the PARAM module. See the [MSC Nastran DMAP Programmer's Guide](#).
6. Each operand within the expression will be converted to the result type prior to the arithmetic operation. For example: the statement “DEFINE JJ=2.5 + 3.6 TYPE=I” would result in 2.5 and 3.6 being converted to 2 and 3, respectively, and the result of 5 would be assigned to JJ.

#### Examples:

1. Change the default value for block size:  
`DEFINE BUFFSIZE=4097 LOCATION=SYSTEM(1)`
2. Set the sparse matrix selection to forward-backward substitution only:  
`DEFINE SPARSE=16 LOCATION=SYSTEM(126)`

3. Define the system cell keyword and default value for the maximum output line count and then reset it to another value on a NASTRAN statement. Note: The DEFINE statement would typically be placed in an RC file and the NASTRAN statement would be placed in the File Management Section whenever the user wants to override the DEFINE statement default setting.

```
DEFINE      MAXLINES=999999999  LOCATION=SYSTEM (9)
NASTRAN     MAXLINES=100000
```

4. Define system cells that behave like “toggles,” turning some feature on or off:

```
DEFINE      MESH=2  LOCATION= (31)
DEFINE      NOMESH=0  LOCATION= (31)
NASTRAN     MESH
```

**Note:** Since each subsequent DEFINE statement redefines the default value, the second DEFINE of system cell location 31 sets the default value to 0. A NASTRAN statement can then be inserted in the input file to reset the MESH system cell back to a value of 2. This same technique can be used with any system cell where the user wishes to refer to the system cell keyword and have the system cell set to a previous DEFINE statement default.

5. Invalid usage of the DEFINE and NASTRAN statement:

```
DEFINE      BUFFSIZE=4097
NASTRAN     BUFFSIZE=2048
```

Valid usage:

```
DEFINE      BUFFSIZE=4097  LOCATION=SYSTEM (1)
NASTRAN     BUFFSIZE=2048
```

## **ENDJOB** Terminates Job

Terminates the job at a user-specified location in the FMS Section.

Format:

```
ENDJOB
```

Example:

```
DBDICT  
ENDJOB
```

Remark:

ENDJOB is normally used after a DBDICT statement, or after database initialization.

**EXPAND****Concatenates New DBset Members**

Concatenates additional DBset members on an existing permanent DBset previously defined with an INIT statement.

**Format:**

```
EXPAND dbset-name LOGICAL=( log-namei [(max-sizei)]...)
```

**Example:**

```
ASSIGN          DBMEM02='physical file name'
EXPAND          DBALL LOGICAL=(DBMEM02)
```

This would create and add the DBset member DBMEM02 to the existing DBset DBALL.

Describer	Meaning
dbset-name	The name of a DBset previously defined with an INIT statement.
log-namei	Specifies the logical name of a DBset member. log-namei may also be referenced on an ASSIGN statement which refers to the physical file name of the DBset member.

Describer	Meaning
max-sizei	Specifies the maximum size in blocks, words or bytes of a DBset member. For storage units specified in words or bytes, the size must be followed by one of the following unit keywords:

Unit Keyword	Storage Unit
W	Words
B	Bytes
KW, K	Kilowords (1024 words)
KB	Kilobytes (1024 bytes)
MW, M	Megawords (1024 <sup>2</sup> words)
MB	Megabytes (1024 <sup>2</sup> bytes)
GW, G	Gigawords (1024 <sup>3</sup> words)
GB	Gigabytes (1024 <sup>3</sup> bytes)
TW, T	Terawords (1024 <sup>4</sup> words)
TB	Terabytes (1024 <sup>4</sup> bytes)

For example, 100MB = 100 megabytes, 1.5GB = 1.2 gigabytes = 1536 megabytes, and 2.5M = 2.5 megawords = 2560 kilowords. The size of a block in words is defined by BUFFSIZE.

**Remark:**

1. On all computers with dynamic file allocation, the physical filename of a DBset member may be specified on an ASSIGN statement:

ASSIGN log-name='physical filename'

If an ASSIGN statement is not specified for the member, then a name is automatically assigned. The naming convention is described in [Database Concepts in the MSC Nastran Reference Guide](#).

## INCLUDE Inserts External File

Inserts an external file into the input file. The INCLUDE statement may appear anywhere within the input data file.

Format:

```
INCLUDE 'filename'
```

Example:

The following INCLUDE statement is used to obtain the bulk data from another file called MYBULK.DATA:

```
SOL 101
CEND
TITLE = STATIC ANALYSIS
LOAD = 100
BEGIN BULK
INCLUDE 'MYBULK.DATA'
ENDDATA
```

Descriptor	Meaning
filename	Physical filename of the external file to be inserted. The user must supply the name according to installation or machine requirements. It is recommended that the filename be enclosed by single right-hand quotation marks ( ' ).

Remarks:

1. INCLUDE statements may be nested; that is, INCLUDE statements may appear inside the external file. The nested depth level must not be greater than 10.
2. The total length of any line in an INCLUDE statement must not exceed 72 characters. Long file names may be split across multiple lines. For example, the file:

```
/dir123/dir456/dir789/filename.dat
```

may be included with the following input:

```
INCLUDE '/dir123
/dir456
/dir789/filename.dat'
```

3. See the for more examples.

**INIT**                      Creates a DBset

Creates a temporary or permanent DBset. For the SCRATCH and MASTER DBsets, all or some of their space may be allocated to real memory.

Format 1: Initialize any DBset except MASTER and SCRATCH:

```
INIT DBset-name [LOGICAL=(log-namei(max-sizei),...) BUFFSIZE=b CLUSTER=c]
```

Format 2: Initialize the MASTER DBset:

```
INIT MASTER [ [ ( RAM = r , S ) LOGICAL = (log-name(max-sizei), ...),
               ( NORAM )
             ]
            BUFFSIZE = b CLUSTER = c ]
```

Format 3: Initialize the SCRATCH DBset:

```
INIT SCRATCH [ [ ( MEM = m ) LOGICAL = (log-name(max-sizei), ...),
                ( NOMEM )
              ]
             SCR300 = (log-namei(max-sizei),...) BUFFSIZE = b CLUSTER=c ]
```

Example:

1. Modify the default allocation of the DBALL DBset to 50000 blocks:  
INIT DBALL LOGI=(DBALL(50000))
2. Do not allocate any real memory for the MASTER and SCRATCH DBsets:

```
INIT          MASTER (NORAM)
INIT          SCRATCH (NOMEM)
```

3. Create a new DBset called DBUP with two members DBUP1 and DBUP2:

```
INIT          DBUP LOGI=(DBUP1, DBUP2)
ASSIGN        DBUP1 ='physical filename 1'
ASSIGN        DBUP2 ='physical filename 2'
```

Describer	Meaning
-----------	---------

dbset-name  
MASTER  
SCRATCH

The name of a temporary or permanent DBset.

log-namei

Specifies the logical name of a DBset member. log-namei may also be referenced on an ASSIGN statement, which refers to the physical file name of the DBset member. If no log-namei is specified, then the DBset will have one member and the log-name will be the same as the DBset-name. A maximum of twenty log-names may be specified. For the SCRATCH DBset, see also Remark 8. SCR300 is a special keyword that indicates that the log-names are members reserved for DMAP module internal scratch files.

max-sizei

Specifies the maximum size, in blocks, words, or bytes, of a DBset member. For storage units specified in words or bytes, the size must be followed by one of the following unit keywords:

Unit Keyword	Storage Unit
W	Words
B	Bytes
KW, K	Kilowords (1024 words)
KB	Kilobytes (1024 bytes)
MW, M	Megawords (1024 <sup>2</sup> words)
MB	Megabytes (1024 <sup>2</sup> bytes)
GW, G	Gigawords (1024 <sup>3</sup> words)
GB	Gigabytes (1024 <sup>3</sup> bytes)
TW, T	Terawords (1024 <sup>4</sup> words)
TB	Terabytes (1024 <sup>4</sup> bytes)

For example, 100MB = 100 megabytes, 1.5GB = 1.5 gigabytes = 1536 megabytes, and 2.5M = 2.5 megawords = 2560 kilowords. The size of a block in words is defined by BUFFSIZE. The default for DBALL and SCRATCH may be found in the and ranges from 250,000 blocks to 4,000,000 blocks.

RAM  
NORAM

RAM=r requests that r words of real memory are to be allocated for the MASTER DBset. See the [nast20214 Command](#) in the *MSC Nastran Reference Guide*. The default is RAM or RAM=30000. NORAM or RAM=0 specifies that no real memory is to be allocated.

Describer	Meaning
S	If the primary database is being created in the run, this option requests that all DBsets in the primary database will be automatically deleted at the end of the run. INIT MASTER(S) is equivalent to specifying <code>scr=yes</code> on the “nastran” statement. See <a href="#">Executing MSC Nastran, 1</a> . If the run is a restart, then this option is ignored.
MEM NOMEM	MEM=m specifies that m blocks of real memory are to be allocated for the SCRATCH DBset. See <a href="#">The NASTRAN Statement (Optional)</a> (p. 13) in the <i>MSC Nastran Reference Guide</i> . The default m is machine dependent and may be found in the . NOMEM or MEM=0 requests that no real memory is to be allocated.
BUFSIZE	BUFSIZE=b specifies the number of words per block in the DBset and will override the value specified by the BUFSIZE keyword on the NASTRAN statement. The default for b is obtained from the NASTRAN BUFSIZE statement. See the .
CLUSTER	CLUSTER=c specifies the number of blocks per cluster in the DBset. The default is 1, and any other value is not recommended.

#### Remarks:

1. The INIT statement and its applications are further discussed in [Database Concepts in the MSC Nastran Reference Guide](#).
2. Four DBsets are predefined and automatically allocated by the program. Their DBset-names are MASTER, DBALL, SCRATCH, and OBJSCR, and they are described in [Database Concepts in the MSC Nastran Reference Guide](#).
3. On all computers with dynamic file allocation, the physical filename of a DBset member may specified on an ASSIGN statement:
 

```
ASSIGN log-name='physical filename'
```

 If an ASSIGN statement is not specified for the member, then a name is automatically assigned. The naming convention is described in [Database Concepts in the MSC Nastran Reference Guide](#).
4. It is recommended that there be sufficient physical space to hold a DBset member should it reach its maximum size (max-sizei). The max-sizei may be converted to words by multiplying by b. A summary of space usage and allocation is printed at the end of the execution summary table.
5. In restart runs, the INIT statement is ignored for preexisting permanent DBsets. The INIT statement is intended to be specified only in the run in which the DBset is being created. If more DBset members need to be added to the DBset, then the EXPAND statement is used.
6. If RAM or RAM=r is specified and the run terminates because the computer operating system detects insufficient space or time, or the computer halts due to a power outage or operator interruption, then it may not be possible to restart from the database. See the DBUPDATE FMS statement.

7. BUFFSIZE=b and CLUSTER=c must satisfy the following inequality:

$$b \leq \frac{64000}{c} + 5$$

8. By default, the SCRATCH DBset is divided into two partitions: LOGICAL and SCR300. The LOGICAL partition, log-names after the LOGICAL keyword, are reserved for DMAP scratch data blocks, and the SCR300 partition for DMAP module internal scratch files.
- The maximum total number of log-names for LOGICAL and SCR300 is 20. For example, if LOGICAL has 8 log-names, then SCR300 can have no more than 12 log-names.
  - If NASTRAN SYSTEM(142)=1 is specified, then the SCR300 partition is not created and internal scratch files, along with DMAP scratch data blocks, will reside on the LOGICAL partition. The default is SYSTEM(142)=2.
  - If NASTRAN SYSTEM(151)=1 is specified and the LOGICAL partition has reached its maximum size, then the SCR300 partition will be used. The default is SYSTEM(151)=0.
  - By default, the space specified for the SCR300 partition is released to the operating system after each DMAP module is executed if the module used more than 100 blocks for internal scratch files. If 100 blocks is not a desirable threshold, then it may be changed by specifying NASTRAN SYSTEM(150)=t, where t is the number of blocks for the threshold.
9. BUFFSIZE=b is predefined for DBset-names MSCOBJ, OBJSCR, and USROBJ and may not be changed by BUFFSIZE on this statement or if the NASTRAN BUFFSIZE=bmax statement (see [The NASTRAN Statement \(Optional\)](#) (p. 13) in the *MSC Nastran Reference Guide*). The default for b is recommended for all except very large problems. bmax must reflect the maximum of b specified for all DBsets attached to the run, including the delivery database. See for the defaults of b and bmax.
10. If INIT MASTER(RAM=r) and INIT SCRATCH(MEM=m) are specified, then BUFFSIZE for these DBsets must be the same. If not, a warning message is issued, and the BUFFSIZE for the SCRATCH DBset is reset to that of the MASTER DBset.
11. Only one INIT statement per dbset-name may be specified in the File Management Section.

## MEMLIST Specify Datablocks Eligible for SMEM

Specifies a list of scratch datablocks that may reside in scratch memory (SMEM).

Format:

MEMLIST DATABLK = (DBname1, DBname2, ..., DBnamei)

Example:

MEMLIST DATABLK = (KOO, MOO, KQQ, MQQ)

If generated, datablocks KOO, MOO, KQQ, and MQQ will reside in scratch memory. All other datablocks will be excluded from scratch memory.

Describer	Meaning
DBnamei	Name of a Nastran datablock.

Remarks:

1. Only NDDL and local scratch datablocks may be included in MEMLIST specification.
2. Datablocks specified will reside in SMEM on a first-come, first-served basis.
3. Datablocks not specified by this statement will not reside in SMEM.
4. Database directories for the SCRATCH DBset reside in SMEM and are not affected by any MEMLIST specification.
5. Continuation lines are allowed.
6. Multiple MEMLIST statements are honored.
7. Scratch I/O activity is reported in the .f04 file by including DIAG 42 in the Executive Control Section.

**PROJ** Defines Database Project-Identifier

Defines the current or default project identifier, project-ID.

Format:

PROJ [=] 'project-ID'

Examples:

1. PROJ = 'MY JOB'
2. The following project-ID will be truncated to 40 characters:  
 PROJ 'CAR MODEL 1999 BODY FRAME SYM - PROTYP B RUN'  
 and all subsequent restarts must have the statement.  
 PROJ 'CAR MODEL 1999 BODY FRAME SYM - PROTYP B'

Describer	Meaning
project-ID	Project identifier. Must be enclosed in single quotes. (Character string, maximum of 40 characters; Default=blank)

Remarks:

1. There may be only one PROJECT statement in the File Management Section. The PROJECT statement must be specified before all DBCLEAN, DBDICT, RESTART, DBLOCATE, and DBLOAD statements where project-ID is not specified by the user.
2. This statement is optional and specifies that all data blocks and parameters to be stored on or accessed from the database in the current run shall also be identified by project-ID. Therefore, in subsequent runs that may access this data through other FMS statements such as RESTART, the project-ID must be specified.
3. Project-ID is the default on DBCLEAN, DBDICT, and RESTART FMS statements and in the WHERE and CONVERT clause of the DBLOCATE statement.
4. Leading blanks and trailing blanks enclosed within the single quotes are ignored. All other blanks are considered part of the project-ID.
5. Project-ID is saved with only the first 40 characters specified.

## RESTART Reuses Database From a Previous Run

Requests that data stored in a previous run be used in the current run.

Format:

```
RESTART [PROJECT='project' VERSION = [version-ID] [KEEP | LAST | NOKEEP] LOGICAL = dbname]
```

Examples:

1. RESTART VERSION=7

Version number 7 will be retrieved for this run (version 8). At the end of the run, version 7 will be deleted.

2. PROJ='FENDER'  
RESTART

The last version under project-ID FENDER will be used in the current run.

3. ASSIGN RUN1='run1.MASTER'  
RESTART LOGICAL=RUN1

The run1.MASTER and its associated database will be used (read only) for restart purposes.

Describer	Meaning
project-ID	Project identifier. See description of the PROJ FMS statement. Must be enclosed in single right-hand quotation marks (') (Character string, maximum of 40 characters; default is the project-ID specified on the PROJ FMS statement).
version-ID	Version number (Integer > 0).
LAST	Specifies the last version under project-ID.
KEEP	Data stored under VERSION will remain on the database after the run is completed.
NOKEEP	Data stored under VERSION will be deleted from the database after the run is completed.
dbname	Specifies the logical name of an existing MASTER (master directory) DBset to be used for restart purposes. This MASTER and its associated database will be opened in a read-only mode to perform the restart; any new data will be written to the database for the current run. For read-only restart (NOKEEP), the logical name MASTER should not be used and UFM 10626 will be issued.

Remarks:

1. There may only be one RESTART statement in the File Management Section.

2. A new version-ID is automatically assigned whenever a restart is performed.
3. If project-ID or version-ID or both are specified and cannot be found, then a fatal message will be issued.
4. The RESTART statement is required to perform restarts in solution sequences 4, and 101 through 200 and SOL 400.
5. If PROJECT is not specified, then the run will restart from the project-ID specified on the PROJ statement (See Example 2).
6. Databases created in one version typically cannot be directly restarted into a different version. Restrictions are typically documented in the current release guide; however, a DBLOCATE type restart might work.
7. Restarts do not work with DMP. Restarts do not work with ACMS for versions released before 2018.
8. If NASTRAN IFPSTAR=YES (default) and scr=no then the Bulk Data images will be stored on the IFPDAT file; for example, if the input file name is run1 then run1.IFPDAT will be created along with run1.MASTER and run1.DBALL. Please note the following when performing a restart.
  - a. If run1.IFPDAT, run1.MASTER and run1.DBALL are in the same folder then only the MASTER file needs to be specified on an ASSIGN statement. For example, ASSI cold='run1.MASTER' RESTART LOGI=cold
  - b. If run1.IFPDAT is in a different folder than that of run1.MASTER and run1.DBALL (or IFPDAT has been renamed in the same folder) then both the MASTER and IFPDAT must be specified on ASSIGN statements and the IMPORT keyword must be specified on the ASSIGN IFPDB statement:  
 ASSI cold='run1.MASTER'  
 RESTART LOGI=cold  
 ASSI IFPDB='other\_folder/run1.IFPDAT' IMPORT
9. For SOL 400 one must also use [NLRESTART \(Case\)](#).
10. The database is not suitable for restart if any of the following was specified in the cold start. If a restart is attempted then the program will issue User Fatal Message 9061.
  - a. EXTSEOUT(DMIGDB or MATDB or MATRIXDB) without defining DBEXT.
  - b. scr=post
  - c. scr=no and "NASTRAN SYSTEM(316)>0".
11. Restarts of SOL 112 fatigue analyses also require case control FATIGUE(STROUT=-1). Please see [Ap. A: Restarts](#) in *MSC.Nastran Embedded Fatigue User's Guide* for restarts for fatigue analyses.

# 4

## Executive Control Statements

- Key to Descriptions
- Executive Control Statement Descriptions

## Key to Descriptions

Braces { } indicate that a choice of descriptors is mandatory.

A brief sentence about the function of the statement is given.

Brackets [ ] indicate that a choice of descriptors is optional.

**LINK** Link a Main SubDMAP. The default descriptors are shaded.

Links a main subDMAP to form a solution sequence.

**Format:**

```
LINK {subDMAP-name} [SOLO = SOLOUT-DBset EXEOUT = exeout-DBset
INCLUDE = incl-DBset [MAP], SOLNAME = newname]
```

Describers in uppercase letters are keywords that must be specified as shown.

Describers in lower case are variables.

If the descriptors are stacked vertically, then only one may be specified.

**Descriptors:**

*n* The solution number of the member description for the list of valid numbers. (Integer > 0).

*subDMAP-name* The name of a main subDMAP. See the *MD Nastran DMAP Programmer's Guide*.

*solout-DBset* The name of a DBset solution sequence map.

*exeout-DBset* The name of an alternate only the OSCAR map.

*incl-DBset* The name of a DBset. See Remark 2.

*newname* A new name assigned to the OSCAR. The default is

**MAP** Each of the descriptors is discussed briefly. Further details may be discussed under Remarks. Give the name of all the subDMAPs in a sequence.

**NOMAP** Suppresses printing of the link map.

**Remarks:**

- All DBsets specified on this statement must have the same BUFSIZE. See the INIT FMS statement.
- SubDMAP objects are created with the COMPILE statement in the current run or obtained from previous runs. The following order:
  - Objects created with the COMPILE statement in the current run.
  - Objects residing on the DBset-name specified by the INCLUDE keyword. The default is MSCOBJ.

The remarks are generally arranged in order of importance and indicate such things as the statement's relationship to other statements, restrictions and recommendations on its use, and further details regarding the descriptors.

## Executive Control Section

This section describes the Executive Control statements. These statements select a solution sequence and various diagnostics.

Most Executive Control statements are order independent. The exceptions are the COMPILE, COMPILER, ALTER, ENDALTER, and LINK statements. If used, the LINK statement must appear after all COMPILE statements. The COMPILER statement (or equivalent DIAGs) must appear before all COMPILE statements. The COMPILER statement also sets the defaults for subsequent COMPILE statements.

## Executive Control Statement Summary

The Executive Control statements are summarized as follows:

ALTER	Specifies deletion and/or insertion of the DMAP statements that follow.
APP	Specifies an approach in a solution sequence.
CEND	Designates the end of the Executive Control statements.
COMPILE	Requests compilation of specified subDMAPs or the NDDL file.
COMPILER	Specifies DMAP compilation diagnostics.
DIAG	Requests diagnostic output or modifies operational parameters.
DOMAINSOLVER	Selects domain decomposition solution methods.
ECHO	Controls the echo of Executive Control statements.
ENDALTER	Designates the end of a DMAP sequence headed by an ALTER.
GEOMCHECK	Specifies tolerance values and options for optional finite element geometry tests.
ID	Specifies a comment.
LINK	Requests the link of a main subDMAP.
MALTER	Inserts and/or deletes DMAP statements in solution sequences
MODEL_CHECK	Specifies model checkout run options.
SOL	Requests execution of a solution sequence or DMAP program.
SOL 600,ID	Creates Marc input and optionally executes Marc from SOL 600
SOL 700,ID	Executes MSC Nastran Explicit Nonlinear (SOL 700)
SPARSEsolver	Specifies various options used in sparse solution if equations operations.
TIME	Sets the maximum allowable execution time.

## Executive Control Statement Descriptions

Executive Control statements may be abbreviated down to the first four characters as long as the abbreviation is unique relative to all other statements. Each statement is described as follows:

### Description

A brief sentence about the function of the statement is given.

### Format

Describers in uppercase are keywords that must be specified as shown. In addition, describers in lowercase indicate that the user must provide a value.

Braces { } indicate that a choice of describers is mandatory. If the describers are stacked vertically, then only one may be specified.

Brackets [ ] indicate that a choice of describers is optional. If the describers are stacked vertically, then only one may be specified.

Describers that are shaded indicate the defaults.

If the statement line is longer than 72 columns, then it may be continued to the next line with a comma. For example:

```
    COMPiLE  SEDRCVR  SOUIN=MSCSOU,  
    NOREF    NOLIST
```

### Example

A typical example is given.

### Describers and Meaning

Each of the describers is briefly discussed. The describer's type (e.g., Integer, Real, or Character), its allowable range, and its default value are enclosed in parentheses. The describer must be specified by the user if no default value is given.

### Remarks

The remarks in the remarks section are generally arranged in order of importance and indicate such things as the Executive Control statement's relationship to other statements, restrictions and recommendations on its use, and further descriptions of the describers.

## \$ Comment

Used to insert comments into the input file. Comment statements may appear anywhere within the input file.

### Format:

\$ followed by any characters out to column 80.

### Example:

```
$ TEST FIXTURE-THIRD MODE
```

### Remarks:

1. Comments are ignored by the program.
2. Comments will appear only in the unsorted echo of the bulk data.

## ALTER Inserts and/or Deletes DMAP Statements

Inserts and/or deletes DMAP statements in a subDMAP.

### Format:

```
ALTER k1 [,k2]
```

or

```
ALTER 'string1' [(occurrence,offset)] ,['string2' [(occurrence,offset) ] ]
```

or

```
ALTER k1 , ['string2' [(occurrence,offset) ] ]
```

or

```
ALTER 'string1' [(occurrence,offset)] , [k2]
```

### Examples:

1. The following alter will insert a MATPRN DMAP statement after the first occurrence of the string 'SDR2' in subDMAP DSASTAT:

```
SOL 101
COMPILE DSASTAT $
ALTER 'SDR2' $
MATPRN OESDS1//$
CEND
```

2. The following alter will delete the second occurrence of the OUTPUT4 DMAP statement in subDMAP DSASTAT and replace it with a MATPRN DMAP statement:

```
SOL 101
COMPILE DSASTAT $
ALTER 'OUTPUT4' (2) , 'OUTPUT4' (2) $
$ OR
$ ALTER 'OUTPUT4' (2) , '' $
MATPRN OESDS1//$
CEND
```

Describer	Meaning
k1	If k2 or 'string2' is not specified, the subsequent DMAP statements will be inserted after either the statement number k1 or the 'string1', [(occurrence,offset)] reference point.
k1, k2	DMAP statements numbered k1 through k2 will be deleted and may be replaced with subsequent DMAP statements.
'string1'	if 'string2' or k2 is not specified, the subsequent DMAP statements will be inserted after the first occurrence of 'string1'.

Describer	Meaning
'string1','string2'	DMAP statements beginning with the first occurrence of 'string1' through DMAP statements containing the first occurrence of 'string2' will be deleted and may be replaced with subsequent DMAP statements.
occurrence	This flag indicates which occurrence of the preceding string is to be used, starting at the beginning of the subDMAP (Integer > 0; Default = 1).
offset	This flag indicates the offset from the reference DMAP statement. Depending on the sign the specific DMAP statement may be above (-offset) or below (+offset) the referenced DMAP statement (Integer; Default = 0).

**Remarks:**

1. The ALTER statement must be used in conjunction with the COMPILE Executive Control statement. Note: ALTER statements cannot be used in conjunction with an MALTER statement, and therefore should never immediately follow this statement.
2. If an MALTER statement is used in conjunction with the ALTER statement, then the MALTER should be placed above the COMPILE statements. Failure to place the MALTER in this position may cause ALTER statements to be ignored.
3. The ALTERs can reference the DMAP statements in any order within a subDMAP. Two restrictions on ordering are:
  - K2 or 'string2'(occurrence, offset) references must refer to a DMAP statement number that is greater than or equal to the k1 or 'string1'(occurrence,offset) reference within a single ALTER statement.
  - K1 or 'string1' and k2 or 'string2' cannot overlap DMAP line positions with another ALTER that references the same subDMAP.
4. The 'string1' or 'string2' used as a search pattern will apply to one complete DMAP statement; i.e., a multiline DMAP statement will be searched for a pattern match as if each 72 character line of the DMAP statement were concatenated together into one string—all blanks and comments either embedded or immediately preceding the DMAP statement, will be retained. However, comments are ignored for the following type of alter:
 

```
alter ^^ *gp0'
```
5. Within a SUBDMAP, both 'string1' and 'string2' will be used to search for a pattern match starting at the beginning of the subDMAP—not at the current position of the last string match.
6. The special characters (metacharacters) used for string searching are described in Remark 9. The characters <, >, and \$, which are common DMAP characters, are also special metacharacters. If they are to be used in the search string as regular characters, then they must be preceded by a backward slash (\). For example, to find the string
 

```
IF (DDRMM >=-1)
```

the command is

```
ALTER 'IF (DDRMM \>=-1)' $
```
7. The ALTER statement must not exceed 72 characters (no continuations are allowed).

8. 'string2' (r2,02) can be defaulted to 'string1' (r1,01) by using a null string (''). For example, the alter statement

```
ALTER 'string1' (r1,01),''
```

is equivalent to

```
ALTER 'string1' (r1,01),'string1' (r1,01)
```

The defaults for (r2,02) using the null string can be overridden by specifying (r2,02).

As another example, the alter statement

```
ALTER 'string1' (r1,01),'' (r2,02)
```

is equivalent to

```
ALTER 'string1' (r1,01),'string1' (r2,02)
```

9. Metacharacters\*:

- . Matches any single character except newline.
  - \* Matches any number (including zero) of the single character (including a character specified by a regular expression) that immediately precedes it. For example, since "." (dot) means any character, ".\*" means "match any number of characters".
  - [...] Matches any one of the characters enclosed between the brackets. For example, "[AB]" matches either "A" or "B". A range of consecutive characters can be specified by separating the first and last characters in the range with a hyphen. For example "[A-Z]" will match any uppercase letter from A to Z and "[0-9]" will match any digit from 0 to 9. Some metacharacters lose special meaning inside brackets. A circumflex (^) as the first character in the bracket tries to match any one character not in the list.
  - ^ or ! Requires that the following regular expression be found at the beginning of the line. Note that these metacharacters may lead to User Fatal Message 802 if the preceding line is a comment.
  - \$ Requires that the preceding regular expression be found at the end of the line.
  - \ Treats the following special character as an ordinary character. For example, "\." stands for a period and "\\*" for an asterisk. Also, to search for a tic ('), the search string must be single quotes.
  - ' Marks the beginning and end of a pattern to be matched.
- Note: Nonportable characters such as [ ] and ^ should be replaced (e.g., ^ ->! and [ ] -><>) if portability is required. However, all the preceding characters are recognized by MSC Nastran.

10. If a string-based alter uses the "!" in the expression (find occurrence at the beginning of line), it is possible MSC Nastran will fail with User Fatal Message 802.

## APP Specifies Solution Sequence Approach

Selects heat transfer analysis in the linear static solution sequence SOL 101, or a coupled analysis combining heat transfer and structural analysis in SOL 153.

Format:

APP approach

Example:

The following requests a heat transfer rather than a structural analysis in SOL 101.

```
SOL 101
APP HEAT
```

Describer	Meaning
approach	Specifies one of the following:
	HEAT                      Indicates that heat transfer is to be performed in SOL 101.
	COUPLED                Indicates that a coupled analysis combining heat transfer and structural analysis is to be performed in SOL 153.

Remarks:

1. The APP statement is optional.
2. The APP HEAT statement applies only to linear static SOL 101. The APP HEAT statement is not required in SOLs 153 and 159, or in SOL 101 if PARAM,HEATSTAT,YES is specified.
3. The NASTRAN HEAT=1 statement is an alternate specification of APP HEAT. See [Executing MSC Nastran, 1](#).

**CEND**                      End of Executive Control Section Delimiter

Designates the end of the Executive Control Section.

Format:

CEND

Remark:

1. CEND is an optional statement. If CEND is not specified, then the program will automatically insert one.

## COMPILE Compiles DMAP Statements

Requests the compilation of a subDMAP, subDMAP alter, or NDDL sequence.

Format 1: Compiles a subDMAP or subDMAP alter sequence

COMPILE 

SUBDMAP
DMAP

 subDMAP-name [SOUIN = souin-DBset SOUOUT = souout-DBset,

OBJOUT = objout-DBset 

LIST
NOLIST

REF
NOREF

DECK
NODECK

 ]

Format 2: Compiles an NDDL sequence

COMPILE NDDL = nddl-name { { SOUIN = souin-dbset } { SOUOUT = souout-dbset } { LIST } { NOLIST } { REF } { NOREF } { DECK } { NODECK } }

Examples:

1. The following compiles an alter in subDMAP PHASEIDR:

```
COMPILE PHASE1DR
ALTER 'CALL PHASE1A'
CEND
```

2. The following compiles a subDMAP called MYDMAP. (SUBDMAP and END are DMAP statements; see the [MSC Nastran DMAP Programmer's Guide](#)):

```
COMPILE MYDMAP LIST REF
SUBDMAP MYDMAP $
.
.
.
END $
CEND
```

3. The following obtains a listing of the NDDL:

```
ACQUIRE NDDL
COMPILE NDDL=NDDL LIST
CEND
```

Describer	Meaning
subDMAP-name	The name of a subDMAP sequence. SubDMAP-name must be 1 to 8 alphanumeric characters in length and the first character must be alphabetic. The keywords DMAP and SUBDMAP are optional and do not have to be specified.
nddl-name	The name of an NDDL sequence (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic). The keyword NDDL must be specified.
souin-DBset	The name of a DBset from which the subDMAP or NDDL source statements will be retrieved (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic). The default is MSCSOU if the next statement is not a subDMAP statement.
souout-DBset	The name of a DBset on which the subDMAP or NDDL source statements will be stored (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic). The default is the SCRATCH DBset.
objout-DBset	The name of a DBset on which the subDMAP object code will be stored (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic). The default is the OBJSCR DBset.
LIST,NOLIST	LIST requests a compiled listing of the subDMAP or NDDL sequence. NOLIST suppresses the listing. NOLIST is the default.
REF,NOREF	REF requests a compiled cross reference of the subDMAP or NDDL sequence. NOREF suppresses the cross reference. NOREF is the default.
DECK,NODECK	DECK requests the subDMAP or NDDL source statements to be written to the PUNCH file. NODECK suppresses the writing to the PUNCH file. NODECK is the default.

#### Remarks:

1. SubDMAP names for MSC Nastran solution sequences are given in the SOL statement description. The “COMPILER LIST REF” statement may be used to determine the appropriate subDMAP-name.
2. If a subDMAP is being compiled and SOUIN=souin-DBset is specified, then an ALTER Executive Control statement, or an INCLUDE statement which contains an ALTER statement as the first non-comment line, must appear immediately after this statement. If not, then the SUBDMAP DMAP statement must appear immediately after this statement. See the [MSC Nastran DMAP Programmer's Guide](#).
3. Starting in MSC/Nastran Version 69, DBsets USRSOU and USROBJ were no longer automatically created. They must be initialized by the INIT FMS statement and then may be specified for souin-dbset (or souout-dbset) and objout-dbset, respectively. They may be used to store the subDMAP source statements and object code on the primary database for reexecution in a subsequent run. Consider the following example:

In the first run, the following COMPILER statement compiles and stores a subDMAP called MYDMAP:

```
COMPILE MYDMAP SOUOUT=USRSOU OBJOUT=USROBJ
SUBDMAP MYDMAP $
.
.
END $
CEND
```

In the second run, the SOL statement is used to execute the MYDMAP stored in the previous run. The LINK statement is required to retrieve the object code from the USROBJ DBset:

```
SOL MYDMAP
LINK MYDMAP INCL=USROBJ
CEND
```

In the third run, the COMPILE statement is used to alter MYDMAP and execute:

```
SOL MYDMAP
COMPILE MYDMAP SOUIN=USRSOU
ALTER...
.
.
.
CEND
```

4. If SOUOUT or OBJOUT is specified and a subDMAP with the same name as subDMAP-name already exists on the database, then its source statements or object code will be replaced.
5. A COMPILE statement is required for each subDMAP to be compiled. If two or more COMPILE statements reference the same subDMAP name, then only the last is used in the linking of the object code. If the COMPILE statement is being used only to alter a subDMAP and two or more COMPILE statements reference the same subDMAP name, then the multiple alters are assembled and the subDMAP is compiled only once.
6. Only one COMPILE statement for an NDDL sequence may be specified in the input file.
  - SOUIN=souin-DBset requests only a compilation of the NDDL sequence stored on souin-DBset for purposes of obtaining a listing or a cross reference, and it cannot be modified with the ALTER statement. See Remark 3. COMPILE NDDL=NDDL SOUIN=MSCSOU LIST requests a listing of the MSC Nastran NDDL sequence. The ACQUIRE FMS statement or the SOL statement must be specified in order to attach the corresponding delivery database.
  - To alter the MSC Nastran NDDL sequences, the entire modified NDDL sequence is included after the COMPILE statement, and SOUIN=souin-DBset is not specified.
  - SOUOUT=souout-DBset requests the storage of the NDDL source statements on the souout-DBset, and may not be specified with SOUIN=souin-DBset.
7. The COMPILER statement may be used to override the defaults of NOLIST, NOREF, and NODECK. In other words, if LIST or NOLIST, REF or NOREF, or DECK or NODECK is not specified, then the corresponding option on the COMPILER statement will be used. In the following example, REF on the COMPILER statement will override the default of NOREF on the COMPILE statement:

```
COMPILER REF
```

COMPILE MYDMAP

8. MSCSOU and MSCOBJ, specified with SOUOUT and OBJOUT, are special DBsets similar to USRSOU and USROBJ except that they are used in the creation or modification of a delivery database. For an example application, see the .

## COMPILER DMAP Compiler Output Options

Requests compilation of a DMAP sequence and/or overrides defaults on the COMPILE statement.

Format:

```
COMPILER[=] [ LIST ] [ DECK ] [ REF ] [ GO ] [ SORT ]
             [ NOLIST ] [ NODECK ] [ NOREF ] [ NOGO ] [ NOSORT ]
```

Example:

```
COMPILER=LIST
```

Describer	Meaning
LIST, NOLIST	LIST requests the compilation listing of the solution sequence. NOLIST suppresses the listing.
DECK, NODECK	DECK requests that the DMAP source statements of the solution sequence be written to the PUNCH file. NODECK suppresses the DECK option.
REF, NOREF	REF requests a compilation cross reference. NOREF suppresses a compilation cross reference.
GO, NOGO	GO requests the execution of the solution sequence following compilation. NOGO requests termination following compilation.
SORT, NOSORT	SORT compiles subDMAPs in alphabetical order. NOSORT compiles subDMAPs in calling sequence order.

Remarks:

1. REF is equivalent to DIAG 4. LIST is equivalent to DIAG 14. DECK is equivalent to DIAG 17.
2. NOGO is an alternative to NOEXE on the SOL statement.
3. This statement provides a means of obtaining a compilation or source listing, or both, of a complete solution sequence, including all the component subDMAPs.
4. See the COMPILE statement to compile a single subDMAP.
5. This statement also requests the automatic link of the solution sequence. Therefore, all objects must be created in the current run or obtained from the DBset such as USROBJ. See the COMPILE statement for how to create and store objects.
6. The COMPILER statement may be used to override the defaults of NOLIST, NOREF, NODECK on the COMPILE entry when they are not explicitly specified. However, COMPILER LIST produces a list of the entire solution sequence. If a listing of only specific subdmeps is desired, then COMPILER LIST should not be specified and the LIST request should be made on the COMPILE entry.

```
COMPILER REF
COMPILER MYDMAP
```

**DIAG****Requests Diagnostic Output**

Requests diagnostic output or special options.

Format:

DIAG [=] k1[k2, ..., kn]

Examples:

DIAG 8, 53

or

DIAG 8  
DIAG 53

Describer	Meaning
ki	A list separated by commas and/or spaces of desired diagnostics.

Remarks:

1. The DIAG statement is optional.
2. Multiple DIAG statements are allowed.
3. The following table lists the possible values for ki and their corresponding actions:

k=1	Dumps memory when a nonpreface fatal message is generated.
k=2	Prints database directory information before and after each DMAP statement. Prints bufferpooling information.
k=3	Prints “DATABASE USAGE STATISTICS” after execution of each functional module. This message is the same as the output that appears after the run terminates. See the <a href="#">Output Description in the MSC Nastran Reference Guide</a> .
k=4	Prints cross-reference tables for compiled sequences. Equivalent to the COMPILER REF statement.
k=5	Prints the BEGIN time on the operator’s console for each functional module. See the <a href="#">Output Description in the MSC Nastran Reference Guide</a> .
k=6	Prints the END time for each functional module in the log file or day file, and on the operator’s console. Modules that consume less time than the threshold set by SYSTEM(20) do not create a message. See the <a href="#">Output Description in the MSC Nastran Reference Guide</a> .
k=7	Prints eigenvalue extraction diagnostics for the complex determinate method.
k=8	Prints matrix trailers as the matrices are generated in the execution summary table. See the <a href="#">Output Description in the MSC Nastran Reference Guide</a> .

- k=9 Prints a message in the .f04 file when EQUIV and EQUIVX perform a successful equivalence; in other words, both the input and output exists.
- k=10 Selects an alternate option for averaging nonlinear loading (NOLINi Bulk Data entry) in linear transient analysis. Replaces  $N_{n+1}$  with  $(N_{n+1} + N_n + N_{n-1})/3$ .
- k=11 DBLOAD, DBUNLOAD, and DBLOCATE diagnostics.
- k=12 Prints eigenvalue extraction diagnostics for complex inverse power and complex Lanczos methods.
- k=13 Prints the open core length (the value of REAL). See the [Output Description in the MSC Nastran Reference Guide](#).
- k=14 Prints solution sequence. Equivalent to the COMPILER LIST statement.
- k=15 Prints table trailers.
- k=16 Traces real inverse power eigenvalue extraction operations
- k=17 Punches solution sequences. Equivalent to the COMPILER DECK statement.
- k=18 In aeroelastic analysis, prints internal grid points specified on SET2 Bulk Data entries.
- k=19 Prints data for MPYAD and FBS method selection in the execution summary table.
- k=20 Similar to DIAG 2 except the output appears in the execution summary table and has a briefer and more user-friendly format. However, the .f04 file will be quite large if DIAG 20 is specified with an MSC Nastran solution sequence. A DMAP alter with DIAGON(20) and DIAGOFF(20) is recommended. DIAG 20 also prints DBMGR, DBFETCH, and DBSTORE subDMAP diagnostics. See the [MSC Nastran DMAP Programmer's Guide](#).
- k=21 Prints diagnostics of DBDICT and DBENTRY table.
- k=22 EQUIV and EQUIVX module diagnostics.
- k=23 Not used.
- k=24 Prints files that are left open at the end of a module execution. Also prints DBVIEW diagnostics.
- k=25 Outputs internal plot diagnostics.
- k=27 Prints Input File Processor (IFP) table. See the *MSC Nastran Programmer's Manual*, Section 4.5.9.
- k=28 Punches the link specification table (XBSBD). The Bulk Data and Case Control Sections are ignored, and no analysis is performed.
- k=29 Process link specification table update. The Bulk Data and Case Control Sections are ignored, and no analysis is performed.

- k=30 In link 1, punches the XSEMii data (i.e., sets ii via DIAG 1 through 15). The Bulk Data and Case Control Sections are ignored, and no analysis is performed. After link 1, this turns on BUG output. Used also by MATPRN module. See also Remark 5 on the [TSTEP, 3282](#) Bulk Data entry.
- k=31 Prints link specification table and module properties list (MPL) data. The Bulk Data and Case Control Sections are ignored, and no analysis is performed.
- k=32 Prints diagnostics for XSTORE and PVA expansion.
- k=33 Not used.
- k=34 Turns off plot line optimization.
- k=35 Prints diagnostics for 2-D slideline contact analysis in SOLs 106 and 129.
- k=37 Disables the superelement congruence test option and ignores User Fatal Messages 4277 and 4278. A better alternative is available with PARAM,CONFAC. See [Parameters, 793](#).
- k=38 Prints material angles for CQUAD4, CQUAD8, CTRIA3, and CTRIA6 elements. The angle is printed only for elements that use the MCID option of the connection entry.
- k=39 Traces module FA1 operations and aerodynamic splining in SOLs 145 and 146.
- k=41 Traces GINO OPEN/CLOSE operations.
- k=42 Prints output on .f04 file the usage statistic for datablock defined in the FMS command, MEMLIST.
- k=43 Print output for Buffer Pool Diagnostics.
- k=44 Prints a mini-dump for fatal errors and suppresses user message exit.
- k=45 Prints the same database directory information as DIAG 2 except that it prints only after each DMAP statement.
- k=46 Used by MSC Nastran development for GINO printout.
- k=47 Prints DBMGR, DBFETCH, and DBSTORE subDMAP diagnostics.
- k=48 Used by MSC Nastran development for GINO printout.
- k=49 DIAG 49 is obsolete and should not be used. The utility f04rprt should be used to summarize the .f04 execution summary instead.
- k=50 Traces the nonlinear solution in SOLs 106, 129, 153, and 159. Prints subcase status; echoes NLPARM, NLPCI, and entry fields; and prints initial arc-length. Prints iteration summary only in SOLs 129, and 159.  
In static aeroelastic analysis (SOL 144), prints transformation information associated with the generation of the DJX matrix in the ADG module and intermediate solutions information in the ASG module.
- k=51 Prints intermediate displacement, load error vectors, and additional iteration information helpful in debugging in SOLs 106, 129, 153, and 159.
- k=52 Disables the printing of errors at each time step in SOLs 129 and 159.

- k=53 MESSAGE module output will also be printed in the execution summary table. See the [Output Description in the MSC Nastran Reference Guide](#).
- k=54 Linker debug print.
- k=55 Performance timing.
- k=56 Extended print of execution summary table (prints all DMAP statements and RESTART deletions). See the [Output Description in the MSC Nastran Reference Guide](#).
- k=57 Executive table (XDIRLD) performance timing and last-time-used (LTU) diagnostics.
- k=58 Data block deletion debug and timing constants echo.
- k=59 Buffpool debug printout.
- k=60 Prints diagnostics for data block cleanup at the end of each module execution in subroutines DBCLN, DBEADD, and DBERPL.
- k=61 GINO block allocator diagnostics.
- k=62 GINO block manager diagnostics.
- k=63 Prints each item checked by the RESTART module and its NDDL description.
- k=64 Requests upward compatibility DMAP conversion from Version 65 only. Ignored in Version 70.5 and later systems.

## DOMAINSOLVER

## Domain Decomposition Solution Method

Selects domain decomposition solution methods.

Format:

$$DOMAINSOLVER \begin{bmatrix} STAT \\ MODES \\ FREQ \\ ACMS \\ DSA \\ NLSOLV \end{bmatrix} \left[ \left[ PARTOPT = \begin{bmatrix} DOF \\ GRID \\ FREQ \\ ELEM \end{bmatrix} \right] \right] NUMDOM = int$$

$$UPFACT = real, PRINT = \begin{bmatrix} YES \\ NO \end{bmatrix}, NCLUST = int, CLUSTSZ = int, COMPMETH = \begin{bmatrix} SUPER \\ GRID \\ NONE \end{bmatrix},$$

$$MODEL = \begin{bmatrix} FLUID \\ STRUCT \\ BOTH \end{bmatrix}, RUNOPT = \begin{bmatrix} PARCHILD \\ MULTIPAR \end{bmatrix}, PARTMETH = \begin{bmatrix} BEND \\ MSCMLV \\ METISG \\ METISO \end{bmatrix}, TIPSIZE = int,$$

$$VERSION = \begin{bmatrix} NEW \\ OLD \end{bmatrix}, SCHED = \begin{bmatrix} STATIC \\ DYNAMIC \end{bmatrix}, GRPSIZ = \begin{bmatrix} 0 \\ N \\ -1 \end{bmatrix}$$

MINDOF=int, XFACT=real, XFACTX=real

Examples:

```
DOMAINSOLVER STAT (PARTOPT=DOF)
DOMAINSOLVER ACMS (UPFACT=3.0, NUMDOM=128)
DOMAINSOLVER DSA
DOMAINSOLVER STAT, NLSOLV
DOMAINSOLVER ACMS (PARTMETH=BEND, NUMDOM=128)
DOMAINSOLVER ACMS (PARTMETH=METISO, TIPSIZE=500)
DOMAINSOLVER STAT (PARTMETH=MSCMLV)
DOMAINSOLVER ACMS (VERSION=NEW) - default
DOMAINSOLVER ACMS (VERSION=OLD)
DOMAINSOLVER ACMS (MODEL=STRUCT, UPFACT=5.0)
```

The keywords function as follows:

STAT	Linear statics.
MODES	Normal modes.
FREQ	Frequency response.
ACMS	Automated component modal synthesis.
DSA	Design sensitivity analysis. (See Remark 2.)
NLSOLV	Nonlinear analysis

The descriptions of the parameters are as follows:

PARTOPT	Partitioning option. Selects which domain is to be decomposed.
DOF	Degree of freedom domain.
GRID	Grid point (geometric) domain.
FREQ	Frequency domain.
ELEM	Finite element domain.

The default is dependent upon solution sequence. See [Table 4-1](#) for further descriptions.

Note that ACMS (VERSION=NEW) requires PARTOPT=DOF. If it is not set by the user, ACMS will use it automatically. However, if the user specifies a different value for PARTOPT, for example, ACMS (VERSION=NEW, PARTOPT=GRID), then MSC Nastran will execute old ACMS rather than new ACMS.

NUMDOM (ACMS)	Selects the number of domains as follows: If NUMDOM = 0 or 1, then the model will not be split. Default depends on the model size and the value of PARTOPT.
------------------	--

NUMDOM will be ignored for ACMS (VERSION=NEW); instead of the number of domains, new ACMS uses the size of the tip domains being specified via TIPSIZE (see below).

NUMDOM (STAT)	Default = <i>dmp</i> ; if NUMDOM has any other value, it will automatically be set to <i>dmp</i> (equal to the number of processors used for the run). The model will be divided into NUMDOM domains in either the geometric (grid-based) or DOF domains, depending on the value of PARTOPT.
NUMDOM (MODES)	Default = <i>dmp</i> ; if NUMDOM has any other value, it will be reset to <i>dmp</i> (equal to the number of processors used for the run). The model will be divided into NUMDOM domains in either the frequency, geometric (grid-based) or DOF domains, depending on the value of PARTOPT.
NUMDOM (FREQ)	Default = <i>dmp</i> ; if NUMDOM has any other value, it will automatically be set to <i>dmp</i> (equal to the number of processors used for the run). The frequency range will be divided into NUMDOM regions which are then solved independently.

UPFACT (ACMS)	By default, the frequency range used for upstream component modes is two times larger than the desired range on the EIGR/L entry. To modify this factor, specify the UPFACT parameter (Real; Default=2.0 for STRUCT and 5.0 for FLUID).
PRINT (ACMS)	Controls intermediate print of upstream and data recovery processing in .f06 and .f04 files. Default='NO'. If PRINT=NO and an error occurs upstream, the intermediate output is placed in a separate output file named "jid.acms_out" for examination.
NCLUST (MODES)	Specifies the number of frequency segments for hierarchic parallel Lanczos. The frequency range is divided into NLCUST segments and, if PARTOPT=DOF, the stiffness and mass matrices are partitioned into dmp/NCLUST matrix domains. If PARTOPT = GRID, or if PARTOPT is not specified, the model geometry is partitioned into dmp/NCLUST domains.
CLUSTSZ (MODES)	Specifies the number of matrix or geometric domains for hierarchic parallel Lanczos. If PARTOPT=DOF, the stiffness and mass matrices are partitioned into CLUSTSZ matrix domains. If PARTOPT = GRID, or if PARTOPT is not specified, the model geometry is partitioned into CLUSTSZ domains. In either case, the frequency range is divided into dmp/CLUSTSZ frequency segments.
MODEL (ACMS)	Default=BOTH. Model specification to which ACMS parameters are applied. MODEL can be STRUCT or FLUID, or BOTH. For MODEL=BOTH (default), the specified options apply to both structure and fluid models
MINDOF (ACMS)	Default for STRUCT is 65. Default for FLUID is 250,000. MINDOF is the minimum number of degrees of freedom below which ACMS will not execute. If the number of DOF in the structural model is less than MINDOF (MODEL=STRUCT), a Fatal error is issued. If the number of fluid DOF is less than MINDOF. (MODEL=FLUID), a Warning message is issued, and the fluid eigensolution is computed with Lanczos. PARAM,MDMINDOF applies only to the structural model and will override this DOMAINSOLVER entry. PARAM,MDMINDOF will be deprecated in a future release.
XFACT (ACMS)	Default=0.5 for both STRUCT and FLUID. XFACT is used in the ACMS1 module to determine a threshold for reorthogonalization of component eigenvectors. Valid values are from 0.1 to 1.0. This option should be used only for very special conditions.
XFACTX (ACMS)	Default=1.0 for both STRUCT and FLUID. XFACTX is used in the ACMS1 module to define the maximum frequency range for internal reorthogonalization operations. Valid values are from 0.1 to 1.0. This options should be used only for very special conditions.
COMP METH	Specifies the compression method used before domain decomposition. COMP METH is considered only for keywords STAT, MODES and ACMS with PARTOPT = DOF, for all other settings of the keyword and parameter PARTOPT, COMP METH will be ignored. The following are valid options for COMP METH:
SUPER	Specifies the SUPER compression method. (Default)

	GRID	Specifies the GRID compression method.
	NONE	Specifies that no compression should be done.
RUNOPT		Specifies the DMP run option. The following are valid options for RUNOPT:
	PARCHILD	Specifies "parent-child" DMP execution mode. Only the Parent DMP process executes the full Nastran solution. This is optimal for single-host DMP execution.
	MULTIPAR	Specifies "multiple-parent" DMP execution mode. All DMP processes execute the full Nastran solution. This is optimal for multiple-host DMP execution.
		Nastran detects single- and multiple-host DMP execution and sets the default run option accordingly.
PARTMETH		Partitioning option (character string). PARTMETH selects which method is used for domain decomposition.
	BEND	Specifies the Extreme/BEND partitioning method
	MSCMLV	Specifies the MSCMLV partitioning method
	METISG	Specifies the METIS partitioning method based on number of tip domains requested (see NUMDOM above)
	METISO	Specifies the METIS partitioning method based on the desired tip size (see TIPSIZE below). Available for ACMS only.
		<b>Note:</b> NUMDOM (see above) will be ignored for PARTMETH=METISO.
		<b>Note:</b> ACMS (VERSION=NEW) requires PARTMETH=METISO. If this is not set by the user, ACMS will use it automatically. If the user sets a different value for PARTMETH when ACMS (VERSION=NEW) is also specified, then the MSC Nastran will automatically re-set PARTMETH to METISO and run with new ACMS.
TIPSIZE		Specifies a desired number of nodes in the tip domains (integer). ACMS only. This is used only when PARTMETH=METISO; otherwise, it is ignored.
	Default:	1000 (ACMS Version=OLD); 200 (ACMS Version=NEW)
VERSION		Selects new ACMS (MSC Nastran Version 2017 +) or old ACMS (prior to MSC Nastran Version 2017). The default value of VERSION is 'NEW'.
SCHED		For ACMS parallel scheduling with VERSION=NEW. Default is DYNAMIC, which is generally more efficient. Select STATIC for static parallel scheduling. See Remark 7.

GRPSIZ Specifies parallel group size for ACMS Dynamic scheduling. Integer:

- 0 Default
- N Set parallel group size to “N” SMP threads.
- 1 Use single parallel group; number of threads in the group is NSMP (Number of SMP).

Table 4-1 Analysis Types vs Supported Partitioning Methods

Solution Sequence	DMP Method	Partitioning Methods Available				
		GRID	DOF	FREQ	DOF+FREQ	ELEM
101	STAT	*	*			
103	MODES	*	*	*		
	ACMS(OLD)	*	*			
	ACMS(NEW)		*			
108	FREQ			*		
110	MODES			*		
	ACMS		*			
111	MODES		*	*		
	ACMS(OLD)	*	*	*	*	
	ACMS(NEW)		*			
	FREQ			*		
112	MODES		*			
	ACMS		*			
200	MODES		*	*	*	
	ACMS		*	*	*	
	FREQ			*		
	DSA					
400	STAT		*			
	NLSOLV					*
	ACMS		*			

\* - means "supported".

The DOMAINSOLVER command is optional. If “dmp=” is specified on the command without a DOMAINSOLVER command in the Executive Control Section, the actions shown in [Table 4-2](#) will result based on solution sequence.

Table 4-2      **DOMAINSOLVER Defaults with “dmp=” on command line**

Solution Sequence	Default DOMAINSOLVER Options	
	DMP Method	Partitioning Option
101	STAT	DOF
103	MODES	DOF
108	FREQ	FREQ
110	MODES	FREQ
111	MODES	FREQ
	FREQ	FREQ
112	MODES	FREQ
200	MODES	DOF
	FREQ	FREQ
400	STAT	DOF
	NLSOLV	ELEM

Note that DOMAINSOLVER ACMS is not the default for the relevant solution sequences, but it is the recommended option for larger models for SOL 103, 111, 112, and 200 to obtain the best performance.

**Remarks:**

1. Grid Point Weight Generator output selected by PARAM,GRDPNT or the WEIGHTCHECK Case Control command is not available when PARTOPT=GRID.
2. In SOL 200, design sensitivity calculations may be performed in a distributed parallel environment in SOL 200 with the DSA keyword. It is a coarse parallel implementation that divides the sensitivity task across a number of processors so that each processes a subset of the total number of design variables. Following the sensitivity analysis and before optimization, the separate sensitivity data are appended into a global sensitivity set. Also,
  - a. The dmp=n keyword must be specified on the Nastran submittal command where n is the number of available processors.
  - b. The ACMS keyword may also be specified or modified along with DSA. For example,  
DOMAINSOLVER DSA, ACMS
3. In SOL 400, the STAT method is used for DMP parallelism of matrix factorization and the NLSOLV method is used for DMP parallelism of the NLEMG process. The NLSOLV method is intended for nonlinear analysis using advanced nonlinear methods. To only use the STAT method or to change its option to use, for example, a different compression method, specify the following DOMAINSOLVER command:

DOMAINSOLVER STAT(COMPMETH=GRID)

Note that if STAT is changed as specified above, then the DMP parallelism for NLEMG will be turned off. If you want to change the STAT as described above and also keep NLSOLV for NLEMG parallelism, then use the following DOMAINSOLVER command:

```
DOMAINSOLVER NLSOLV,STAT(COMPETH=GRID)
```

Note that this can equivalently be written as follows:

```
DOMAINSOLVER NLSOLV
```

```
DOMAINSOLVER STAT(COMPETH=GRID)
```

Lastly, to only use the NLSOLV method for NLEMG parallelism, specify the following option:

```
DOMAINSOLVER NLSOLV
```

4. In SOL 400, the DOMAINSOLVER NLSOLV (RUNOPT=MULTIPAR) is not supported in combination with Intel MKL Pardiso Solver option, i.e., SPARSE\_SOLVER NLSOLV(FACTMETH=PRDLDL).
5. In SOL 111, the MODES or ACMS option is used for DMP parallelism of the modal calculations and the FREQ option is used for the DMP parallelism of the frequency response calculations. The DOMAINSOLVER FREQ is always turned on for SOL 111. To use the ACMS option for the modal calculation, use the following DOMAINSOLVER command:

```
DOMAINSOLVER ACMS
```

Furthermore, if the MODES option needs to be changed for SOL 111, then the correct approach is to include the following DOMAINSOLVER option:

```
DOMAINSOLVER MODES(PARTOPT=GRID).
```

6. Residual vectors are not available when PARTOPT=GRID.
7. Dynamic parallel scheduling is available for ACMS and VERSION=NEW. Dynamic scheduling provides better parallel speedup for larger numbers of threads. For NSMP less than or equal to 2, static scheduling is used regardless of the setting of SCHED.

## ECHO

### Controls Printed Echo

Controls the echo (printout) of the Executive Control Section.

#### Formats:

ECHOOFF  
ECHOON

#### Remarks:

1. The ECHO statement is optional.
2. ECHOOFF suppresses the echo of subsequent Executive Control statements. ECHOON reactivates the echo after an ECHOOFF statement.

**ENDALTER**      End of DMAP Alter

Designates the end of an alter.

Format:

ENDALTER

Remark:

1. The ENDALTER statement is required when using an alter unless the alter package ends with a CEND, COMPILE, or LINK statement.

## GEOMCHECK

### Specifies Geometry Check Options

Specifies tolerance values and options for optional finite element geometry tests.

Format:

GEOMCHECK test\_keyword [= tol\_value], [MSGLIMIT = n], [MSGTYPE = INFORM],  
FATAL  
WARN

[SUMMARY], [ADVNLLELM], [NONE]

Examples:

1. Set the tolerance for the CQUAD4 element skew angle test to 15.0 degrees and limit messages to 50:  
 GEOMCHECK Q4\_SKEW=15.0,MSGLIMIT=50
2. Limit messages to 500 for each element type:  
 GEOMCHECK MSGLIMIT=500
3. Set the message type to fatal for CQUAD4 element taper tests:  
 GEOMCHECK Q4\_TAPER,MSGTYPE=FATAL
4. Request summary table output only using default tolerance values:  
 GEOMCHECK SUMMARY
5. Request advanced and conventional element geometry check output using default tolerance values:  
 GEOMCHECK ADVNLLELM

Describer	Meaning
test_keyword	A keyword associated with the particular element geometry test. See Remark 2. for a list of acceptable selections.
tol_value	Tolerance value to be used for the specified test. See Remark 2. for default values of the test tolerances.
n	The minimum number of messages that will be produced. The default is 100 messages for each element type. See Remark 3.
FATAL	Geometry tests that exceed tolerance values produce fatal messages. See Remark 4.
INFORM	Geometry tests that exceed tolerance values produce informative messages. See Remark 4.
WARN	Geometry tests that exceed tolerance values produce warning messages. See Remark 4.
SUMMARY	A summary table of the geometry tests performed is produced. No individual element information messages are output.
ADVNLLELM	Geometry check performed on Advanced and conventional elements. If no ADVNLLELM, geometry check only performed on conventional element.
NONE	None of the optional element geometry tests will be performed.

Remarks:

1. The GEOMCHECK statement controls the number and severity of certain informational and warning messages produced by element matrix generation geometry checking operations. Controls are currently available for the CQUAD4, CQUADR, CTRIA3, CTRIAR, CHEXA, CPENTA, CTETRA, CPYRAM, CBAR, and CBEAM elements only. Multiple GEOMCHECK statement may be present. Continuations are acceptable.
2. The following table summarizes the acceptable specifications for test\_keyword.

Name	Value Type	Default	Comment
Q4_SKEW	Real $\geq 0.0$	30.0	Skew angle in degrees.
Q4_TAPER	Real $\geq 0.0$	0.50	Taper ratio.
Q4_WARP	Real $\geq 0.0$	0.05	Surface warping factor.
Q4_IAMIN	Real $\geq 0.0$	30.0	Minimum interior angle in degrees.
Q4_IAMAX	Real $\geq 0.0$	150.0	Maximum interior angle in degrees.
T3_SKEW	Real $\geq 0.0$	10.0	Skew angle in degrees.
T3_IAMAX	Real $\geq 0.0$	160.0	Maximum interior angle in degrees.
TET_AR	Real $\geq 0.0$	100.0	Longest edge to shortest edge aspect ratio.
TET_EPLR	Real $\geq 0.0$	0.50	Edge point length ratio.
TET_EPIA	Real $\geq 0.0$	150.0	Edge point included angle in degrees.
TET_DETJ	Real	0.0	J  minimum value.
TET_DETG	Real	0.0	J  minimum value at vertex point.
HEX_AR	Real $\geq 0.0$	100.0	Longest edge to shortest edge aspect ratio.
HEX_EPLR	Real $\geq 0.0$	0.50	Edge point length ratio.
HEX_EPIA	Real $\geq 0.0$	150.0	Edge Point Included Angle in degrees.
HEX_DETJ	Real	0.0	J  minimum value.
HEX_WARP	Real $\geq 0.0$	0.707	Face warp coefficient.
PEN_AR	Real $\geq 0.0$	100.0	Longest edge to shortest edge aspect ratio.
PEN_EPLR	Real $\geq 0.0$	0.50	Edge point length ratio.
PEN_EPIA	Real $\geq 0.0$	150.0	Edge point included angle in degrees.
PEN_DETJ	Real	0.0	J  minimum value.
PEN_WARP	Real $\geq 0.0$	0.707	Quadrilateral face warp coefficient.
PYR_AR	Real $\geq 0.0$	100.0	Longest edge to shortest edge aspect ratio.
PYR_EPLR	Real $\geq 0.0$	0.50	Edge point length ratio.
PYR_EPIA	Real $\geq 0.0$	150.0	Edge point included angle in degrees.

Name	Value Type	Default	Comment
PYR_DETJ	Real	0.0	J  minimum value.
PYR_WARP	Real $\geq 0.0$	0.707	Quadrilateral face warp coefficient.
BEAM_OFF	Real $\geq 0.0$	0.15	CBEAM element offset length ratio.
BAR_OFF	Real $\geq 0.0$	0.15	CBAR element offset length ratio.

where:

- Test\_keyword names starting with the characters Q4 are applicable to CQUAD4 and CQUADR elements. Test\_keyword names starting with the characters T3 are applicable to CTRIA3 and CTRIAR elements. Test\_keyword names starting with the characters TET\_ are applicable to CTETRA elements. Test\_keyword names starting with the characters HEX\_ are applicable to CHEXA elements. Test\_keyword names starting with the characters PEN\_ are applicable to CPENTA elements. Test\_keyword names starting with the characters PYR\_ are applicable to CPYRAM elements.
- Skew angle for the quadrilateral element is defined to be the angle between the lines that join midpoints of the opposite sides of the quadrilateral. Skew angle for the triangular element is defined to be the smallest angle at any of the three vertices.
- Interior angles are defined to be the angles formed by the edges that meet at the corner node of an element. There are four for quadrilateral shapes and three for triangular shapes.
- Taper ratio for the quadrilateral element is defined to be the absolute value of [the ratio of the area of the triangle formed at each corner grid point to one half the area of the quadrilateral minus 1.0]. The largest of the four ratios is compared against the tolerance value. Note that as the ratio approaches 0.0, the shape approaches a rectangle.
- Surface warping factor for a quadrilateral is defined to be the distance of the corner points of the element to the mean plane of the grid points divided by the average of the element diagonal lengths. For flat elements (such that all of the grid points lie in a plane), this factor is zero.
- The edge point length ratio and edge point included angle tests are only performed for the solid elements when edge node points exist. The length ratio test evaluates the relative position of the edge node point along a straight line connecting the two vertex nodes of that edge. Ideally, the edge point should be located on this line at a point midway between the two end points. The default tolerance allows the edge node to be positioned anywhere between the two quarter points on this line. In addition, the angle between the lines joining the edge node and the end points is determined. If the angle is less than the tolerance (default is  $150^\circ$ ), then the interior angle test is considered violated and a diagnostic message will be generated if appropriate.
- The face warp coefficient test tolerance is the cosine of the angle formed between the normal vectors located at diagonally opposite corner points on each face surface. This value is 1.0 for a face where all four corners lie in a plane. The default tolerance allows angles of up to  $45^\circ$  before a message is generated.

3. A single line of output summarizing the results of all tests for an element will be output if any of the geometry tests exceeds the test tolerance. Only the first *n* of these messages will be produced. A summary of the test results indicating the number of tolerances exceeded, as well as the element producing the worst violation, is also output. If the SUMMARY keyword has been specified, only the summary table is produced and none of the single line element messages will be output.
4. When SUMMARY is not specified, each geometry test that exceeds the tolerance will be identified in the single line output summary by an indicator based on the specification for MSGTYPE. For the FATAL option, the indicator is "FAIL"; for the INFORM option, it is "xxxx"; for the WARN option, it is "WARN". If the FATAL option is specified and any test fails, the run is terminated.

**ID**                      **Comment**

Specifies a comment.

Format:

ID [=] i1, i2

Describer	Meaning
i1, i2	Character strings (1 to 8 characters in length and the first character must be alphabetic).

Remark:

1. The ID statement is optional and not used by the program.

## INCLUDE Inserts External File

Inserts an external file into the input file. The INCLUDE statement may appear anywhere within the input data file.

### Format:

INCLUDE 'filename'

### Example:

The following INCLUDE statement is used to obtain the bulk data from another file called MYEXEC.DATA:

```
SOL 101
INCLUDE 'MYEXEC.DATA'
CEND
TITLE = STATIC ANALYSIS
LOAD = 100
BEGIN BULK
ENDDATA
```

Descriptor	Meaning
filename	Physical filename of the external file to be inserted. The user must supply the name according to installation or machine requirements. It is recommended that the filename be enclosed by single right-hand quotation marks (').

### Remarks:

1. INCLUDE statements may be nested; that is, INCLUDE statements may appear inside the external file. The nested depth level must not be greater than 10.
2. The total length of any line in an INCLUDE statement must not exceed 72 characters. Long file names may be split across multiple lines. For example, the file

```
/dir123/dir456/dir789/filename.dat
```

may be included with the following input:

```
INCLUDE '/dir123
           /dir456
           /dir789/filename.dat'
```

3. See the for more examples.

## LINK Links a Main SubDMAP

Links a main subDMAP to form a solution sequence.

Format:

LINK  $\left\{ \begin{array}{c} n \\ \text{subDMAP-name} \end{array} \right\} [\text{SOLOUT} = \text{solout-DBset} \text{ EXECOUT} - \text{exeout-DBset},$

INCLUDE - incl-DBset  $\left[ \begin{array}{c} \text{MAP} \\ \text{NOMAP} \end{array} \right] \text{SOLNAME} = \text{newname} ]$

Examples:

1. LINK STATICS

Links the STATICS main subDMAP. The program links any subDMAPs compiled in this run, with any other subDMAP objects called in STATICS and stored on the MSCOBJ DBset.

2. LINK MYDMAP, SOLNAM=STATICS, SOLOUT=USROBJ, NOMAP, INCLUDE=USROBJ

Links MYDMAP and renames the solution sequence executable to STATICS. The executable will be saved on the USROBJ DBset. The order of search for subDMAP objects is:

- Compiled subDMAP in this run.
- USROBJ DBset.

Describer	Meaning
n	The solution number of the main subDMAP. See the SOL statement description for the list of valid numbers (Integer > 0).
subDMAP-name	The name of a main subDMAP. See the <a href="#">MSC Nastran DMAP Programmer's Guide</a> (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).
solout-DBset	The name of a DBset where the solution sequence executable and the link table of the solution sequence may be stored. See Remark 6. (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).
exeout-DBset	The name of an alternate DBset different than solout-DBset where only the solution sequence executable may be stored. See Remark 6. (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).
incl-DBset	The name of a DBset where other subDMAP objects are obtained. See Remark 2. (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).

Describer	Meaning
newname	A new name which is referenced by the SOL statement. (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic; default is subDMAP-name.)
MAP	Prints the link map. A link map will give the name of all the subDMAPs that make up the solution sequence.
NOMAP	Suppresses printing of the link map.

#### Remarks:

1. All DBsets specified on this statement must have the same BUFFSIZE. See the [INIT, 98 FMS](#) statement.
2. SubDMAP objects are created with the COMPILE statement either in the current run or obtained from previous runs. The LINK statement collects objects in the following order:
  - Objects created with the COMPILE statement in the current run.
  - Objects residing on the DBset-name specified by the INCLUDE keyword. The default is MSCOBJ.
3. Upon successful linking of a subDMAP, the subDMAP may be executed with the SOL statement.
4. The LINK statement must appear after all the COMPILE packages, if any. A compile package begins with the COMPILE statement and is delimited by the ENDALTER, CEND, LINK, or another COMPILE statement.
5. The link table is necessary for COMPILER (or DIAG 4, 14, 17) Executive Control statement requests and the automatic link process.
6. EXEOUT is useful in building delivery databases where executables are not to be saved. EXEOUT will be defaulted to the same DBset as specified by SOLOUT.

## MALTER Inserts and/or Deletes DMAP Statements in Solution Sequences

Inserts or deletes DMAP statements by allowing a global “string” search across all subDMAPs within the current solution sequence.

Format:

MALTER ‘string1’[(occurrence,offset)] , [‘string2’[(occurrence,offset)] ]

or

MALTER ‘string1’[(occurrence,offset)] , [k2]

Examples:

1. The following MALTER will insert a MATPRN DMAP statement to print the KJJ matrix for each superelement.

```
SOL 101
MALTER 'MALTER:AFTER SUPERELEMENT STIFFNESS .* GENERATION'
MESSAGE //' SEID=' /SEID $
MATPRN KJJZ/ $
```

2. The following MALTER will add a user DMAP after the PREFACE modules in SOL 100 (USERDMAP).

```
SOL 101
MALTER 'AFTER CALL PREFACE'
.
.
.
```

Descriptor	Meaning
'string1'	If 'string2' or k2 is not specified, the subsequent DMAP statements will be inserted after the first occurrence of 'string1'.
'string1','string2'	DMAP statements beginning with the first occurrence of 'string1' through DMAP statements containing the first occurrence of 'string2' will be deleted and may be replaced with subsequent DMAP statements.
k2	If k2 is specified, it is applied to the subDMAP in which 'string1' was found (Integer > 0).
occurrence	This flag indicates which occurrence of the preceding string is to be used, starting at the beginning of the subDMAP (Integer > 0; Default=1).
offset	This flag indicates the offset from the referenced DMAP statement. Depending on the sign, the specific DMAP statement may be above (-offset) or below (+offset) the referenced DMAP statement (Integer; Default = 0).

## Remarks:

1. If an MALTER statement is used in conjunction with the ALTER statement, then the MALTER should be placed above the COMPILE statements. Failure to place the MALTER in this position may cause ALTER statements to be ignored.
2. The MALTER statement can reference the DMAP statements in any order within a subDMAP. Two restrictions on ordering are:
  - K2 or 'string2'(occurrence,offset) references must refer to a DMAP line number that is greater than or equal to the k1 or 'string1'(occurrence,offset) reference within a single MALTER statement.
  - 'string1' and k2 or 'string2' cannot overlap DMAP line positions with another MALTER that references the same subDMAP.
3. The 'string1' or 'string2' used as a search pattern will apply to one complete DMAP statement; i.e., a multiline DMAP statement will be searched for a pattern match as if each 72 character line of the DMAP statement were concatenated together into one string; all blanks and comments (either embedded or immediately preceding the DMAP statement) will be retained.
4. The special characters used for string searching are described in Remark 9. The characters <, >, and \$, which are common DMAP characters, are also special metacharacters. If they are to be used in the search string as regular characters, then they must be preceded by a backward slash (\). For example, to find the string

```
IF (DDRMM >=-1)
```

the command is

```
ALTER 'IF (DDRMM \>=-1)' $
```

5. 'string2' (r2,02) can be defaulted to 'string1' (r1,01) by using a null string (''). For example, the alter statement

```
MALTER 'string1' (r1,01) , ''
```

is equivalent to

```
MALTER 'string1' (r1,01) , 'string1' (r1,01)
```

The defaults for (r2,02) using the null string can be overridden by specifying (r2,02).

As another example, the alter statement

```
MALTER 'string1' (r1,01) , '' (r2,02)
```

is equivalent to

```
MALTER 'string1' (r1,01) , 'string1' (r2,02)
```

6. The existing COMPILE statement options, such as LIST, XREF, SOUIN, etc., cannot be directly specified on the new MALTER statement. They are obtained as follows:
  - If a COMPILE statement exists for the subDMAP referenced by the MALTER, then options from this COMPILE statement will be used.

Otherwise, they will be taken from the COMPILER statement, with the exception that the LIST, and SORT option is always on.

7. The MALTER string search order is as follows:
  - All COMPILE statement references that are part of the existing solution sequence (i.e., SOL=) are searched first.
  - Then, all remaining subDMAPs in the solution sequence are searched in ascending alphabetical order.
  - Within a subDMAP, both 'string1' and 'string2' will be used to search for a pattern match starting at the beginning of the subDMAP (not at the current position of the last string match).
8. The MALTER statement must not exceed 72 characters (no continuations are allowed).
9. Metacharacters:

.	Matches any <i>single</i> character except <i>newline</i> .
*	Matches any number (including zero) of the single character (including a character specified by a regular expression) that immediately precedes it. For example, since "." (dot) means any character, ".*" means "match any number of characters."
[...] or < >	Matches any one of the characters enclosed between the brackets. For example, "[AB]" matches either "A" or "B". A range of consecutive characters can be specified by separating the first and last characters in the range with a hyphen. For example "[A-Z]" will match any uppercase letter from A to Z and "[0-9]" will match any digit from 0 to 9. Some metacharacters lose special meaning inside brackets. A circumflex (^) as the first character in the bracket tries to match any one character not in the list.
^ or ! or .	Requires that the following regular expression be found at the beginning of the line.
\$	Requires that the preceding regular expression be found at the end of the line.
\	Treats the following special character as an ordinary character. For example "\." stands for a period and "\*" for an asterisk. Also, to search for a tic ('), the search string must be "\'".
'	Marks the beginning and end of a pattern to be matched.
Note:	Nonportable characters such as [ ] and ^ should be replaced (e.g., ^ → ! and [ ] → < >) if portability is required. However, all the preceding characters are recognized by MSC Nastran.

10. Labels for use with the MALTER have been included in the solution sequences. See [Table 1](#). These labels will be maintained in future versions and it is strongly suggested that alters which use the MALTER command take advantage of the unique MALTER labels. Use of the MALTER labels will significantly reduce the time required to convert alters between versions.

Table 1 DMAP Labels and Corresponding SubDMAP Positions

DMAP MALTER Labels
\$MALTER:AFTER PREFACE MODULES
\$MALTER:TOP OF PHASE 1 SUPERELEMENT LOOP, AFTER PARAMETERS AND QUALIFIERS SET
\$MALTER:AFTER SUPERELEMENT STIFFNESS, VISCOUS DAMPING, MASS, AND ELEMENT STRUCTURAL DAMPING GENERATION (KJJZ, BJJZ, MJJZ, K4JJ)
\$MALTER:AFTER X2JJ MATRICES READ (K2JJ, M2JJ, B2JJ)
\$MALTER:AFTER TOTAL SUPERELEMENT STIFFNESS, VISCOUS DAMPING, AND MASS FORMULATED, STRUCTURAL + DIRECT INPUT
\$MALTER:AFTER SUPERELEMENT LOAD GENERATION (PJ)
\$MALTER:AFTER UPSTREAM SUPERELEMENT MATRIX AND LOAD ASSEMBLY (KGG, BGG, MGG, K4GG, PG)
\$MALTER:AFTER SUPERELEMENT MATRIX AND LOAD REDUCTION TO A-SET, STATIC AND DYNAMIC (KAA, KLAA, MAA, MLAA, BAA, K4AA, PA)
\$MALTER:BOTTOM OF PHASE 1 SUPERELEMENT LOOP
\$MALTER:AFTER X2PP MATRICES READ (K2PP, M2PP, B2PP)
\$MALTER:AFTER SUPERELEMENT DISPLACEMENT RECOVERY (UG)
\$MALTER:AFTER ELEMENT STRESS, STRAIN, ETC. DATA RECOVERY, SORT1 (OUGV1, OES1, OEF1, ETC.)
\$MALTER:AFTER ELEMENT STRESS, STRAIN, ETC. DATA RECOVERY, SORT2 (OUGV2, OES2, OEF2, ETC.)
\$MALTER:BOTTOM OF SUPERELEMENT DATA RECOVERY LOOP
\$MALTER:USERDMAP - AFTER CALL PREFACE

## MODEL\_CHECK

### Specifies Model Check Options

Specifies model checkout run and specifies options to be used.

Format:

$$\text{MODEL\_CHECK} \left[ \text{MAT\_DENSITY} = \left\{ \begin{array}{c} \text{OFF} \\ \rho \\ \text{DEFAULT} \end{array} \right\} \right] \left[ \text{MAT\_TECO} = \left\{ \begin{array}{c} \text{OFF} \\ \alpha \\ \text{DEFAULT} \end{array} \right\} \right],$$

$$\left[ \text{MAT\_TEIJ} = \left\{ \begin{array}{c} \text{OFF} \\ \alpha_{ij} \\ \text{DEFAULT} \end{array} \right\} \right] \left[ \text{MAT\_DAMPING} = \left\{ \begin{array}{c} \text{OFF} \\ g_e \\ \text{DEFAULT} \end{array} \right\} \right],$$

[CHECKOUT][PRINT = item\_list]

Examples:

1. Execute a basic model checkout run. No special output is required.  
MODEL\_CHECK CHECKOUT
2. Execute a model checkout run. Print coordinate system and basic grid point data.  
MODEL\_CHECK CHECKOUT PRINT=(CSTM,BGPDT)
3. Execute a full solution. Modify the material density temporarily to a value of 0.0.  
MODEL\_CHECK MAT\_DENSITY=OFF  
or  
MODEL\_CHECK MAT\_DENSITY=0.0
4. Execute a full solution. Temporarily modify the values for material density and thermal expansion coefficient.  
MODEL\_CHECK MAT\_DENSITY=0.001 MAT\_TECO=1.0 MAT\_TEIJ=0.0

Descriptor	Meaning
MAT_DENSITY	Selects material density processing option.
$\rho$	Value to be used for the density.
MAT_TECO	Selects material thermal expansion direct coefficient processing option.
$\alpha$	Value to be used for the thermal expansion direct coefficients.
MAT_TEIJ	Selects material thermal expansion shear coefficient processing option.
$\alpha_{ij}$	Value to be used for the thermal expansion shear coefficients.

Describer	Meaning
MAT_DAMPING	Selects material structural element damping processing option.
$g_e$	Value to be used for the structural element damping coefficient.
OFF	Sets material property value to zero.
DEFAULT	Material property value is set to system default value. See Remark 3.
CHECKOUT	Selects model checkout solution option. See Remark 5.
PRINT	Selects items to be printed during model checkout solution.
item_list	List of model data items to be printed during model checkout run. If more than one item is specified, enclose the list in parenthesis. See Remark 6.

**Remarks:**

1. The MODEL\_CHECK statement is ignored in RESTART runs.
2. The values specified for material properties using the MODEL\_CHECK statement will be used to temporarily update data for all MAT1, MAT2, MAT3, MAT8, and MAT9 Bulk Data entries only for the duration of the run. These values do not replace data specified on the MATi Bulk Data entries. Caution should be used when postprocessing results via the PARAM POST options since operations using inconsistent data could be performed. Furthermore, when layered composite element properties and materials (PSHELL and MAT2 MID1/MID2/MID3/MID4) are generated, these equivalent MAT2 property entries are not considered to be original input data and the effects of the MODEL\_CHECK directives are permanently reflected in these MAT2 properties. Restarts should not be attempted in this case.
3. System default values of 0.0 have been defined for each of the properties. The defaults can be changed using the following Nastran statement keywords: DEF\_DENS for MAT\_DENSITY, DEF\_TECO for MAT\_TECO, DEF\_TEIJ for MAT\_TEIJ, and DEF\_DAMP for MAT\_DAMPING.
4. The MAT\_TECO describer causes the direct components of the thermal expansion coefficient to be modified. The MAT\_TEIJ describer causes the shear components of the thermal expansion coefficient to be modified.
5. The CHECKOUT option has the same effect as a PARAM,CHECKOUT,YES Bulk Data entry.
6. The following table summarizes the acceptable specifications for the PRINT item\_list.

Value	Output Generated	Parameter
CSTM	Coordinate systems	PRTCSTM
BGPDT	Basic grid point data	PRTBGPDT
GPTT	Grid point temperature data	PRTGPTT
MGG	G-set mass matrix	PRTMGG
PG	G-set load vectors	PRTPG

See the DMAP parameter descriptions in Section 5 for a discussion of the parameter name in the last column of the table and the output generated. The specification of a print item has the effect of adding a PARAM,parameter,YES entry to the Case Control Section of the file.

## SOL Executes a Solution Sequence

Specifies the solution sequence or main subDMAP to be executed.

Format:

$$\text{SOL } \left\{ \begin{array}{c} n \\ \text{subDMAP-name} \end{array} \right\} [\text{SOLIN} = \text{obj-DBset} \quad \text{NOEXE}]$$

Examples:

1. In the following example, SOL 103 is executed from MSCOBJ.

```
SOL 103
```

2. In the following example, the PHASE0 subDMAP is altered, SOL 103 is relinked onto the OBJSCR DBset (which is the default for SOLOUT), and SOL 103 is executed.

```
SOL 103
COMPILE PHASE1
ALTER 'DTIIN'
TABPT SETREE,,,,// $
.
.
.
ENDALTER $
```

3. In the following example, the solution sequence called DYNAMICS is executed from the USROBJ DBset.

```
SOL DYNAMICS SOLIN = USROBJ
```

Descriptor	Meaning
n	Solution number. See Remark 6. for the list of valid numbers (Integer > 0).
subDMAP-name	The name of a main subDMAP. See the <a href="#">MSC Nastran DMAP Programmer's Guide</a> (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).
obj-DBset	The character name of a DBset where the OSCAR is stored. See Remarks 1. and 2. (Character; 1 to 8 alphanumeric characters in length and the first character must be alphabetic).
NOEXE	Suppresses execution after compilation and/or linkage of the solution is complete. Also, the Bulk Data Section and Case Control Section are not read or processed.

Remarks:

1. If SOLIN keyword is not given and if there are no LINK statements within the input data, the program will perform an automatic link. The program will first collect the objects created in the current run by the COMPILE statement and the remaining objects stored in the MSCOBJ DBset. The program will then perform an automatic link of the collected objects.
2. If the SOLIN keyword is not given but a LINK statement is provided, the SOLIN default will be obtained from the SOLOUT keyword on the LINK statement.
3. The operation sequence control array (OSCAR) defines the problem solution sequence. The OSCAR consists of a sequence of entries with each entry containing all of the information needed to execute one step of the problem solution. The OSCAR is generated from information supplied by the user's entries in the Executive Control Section.
4. The SOLIN keyword will skip the automatic link and execute the OSCAR on the specified DBset.
5. The DOMAINSOLVER may be used in conjunction with solution sequences 101, 103, 108, and 111 to select domain decomposition solution methods.
6. The following Solution Sequences are currently available in MSC Nastran:

Table 2 Solution Sequences

SOL Number	SOL Name	Description
101	SESTATIC	Statics with options: Linear steady state heat transfer. Alternate reduction. Inertia relief.
103	SEMODES	Normal modes.
105	SEBUCKL	Buckling with options: Static analysis. Alternate reduction. Inertia relief.
106	NLSTATIC	Nonlinear or linear statics.
107	SEDCEIG	Direct complex eigenvalues.
108	SEDFREQ	Direct frequency response.
109	SEDTRAN	Direct transient response.
110	SEMCEIG	Modal complex eigenvalues.
111	SEMFREQ	Modal frequency response.
112	SEMTRAN	Modal transient response.
114	CYCSTATX	Cyclic statics with option: Alternate reduction.
115	CYCMODE	Cyclic normal modes.
116	CYCBUCKL	Cyclic buckling.

Table 2 Solution Sequences

SOL Number	SOL Name	Description
118	CYCFREQ	Cyclic direct frequency response.
128	SENLHARM	Nonlinear Harmonic Response
129	NLTRAN	Nonlinear or linear transient response.
144	AESTAT	Static aeroelastic response.
145	SEFLUTTR	Aerodynamic flutter.
146	SEAERO	Aeroelastic response.
153	NLSCSH	Static structural and/or steady state heat Transfer analysis with options: Linear or nonlinear analysis.
159	NLTCSH	Transient structural and/or transient heat Transfer analysis with options: Linear or nonlinear analysis.
200	DESOPT	Design optimization.
400	NONLIN	Nonlinear Static and Implicit Transient Analysis and all linear sequences from statics, modes, frequency, and transient inclusive with perturbation analysis based on previous nonlinear analysis
600	SESTATIC ( See <a href="#">SOL 600, ID, 154</a> )	MSC Nastran API into MSC MARC nonlinear
700	NLTRAN ( See <a href="#">SOL 700, ID, 173</a> )	Nonlinear Explicit Transient Analysis

## SOL 600,ID

## Executes Marc from Inside Nastran

Creates Marc input and optionally executes Marc from inside SOL 600.

## Format:

```
SOL 600, ID PATH= COPYR= NOERROR MARCEXE=SOLVE NOEXIT
OUTR=op2,xdb,pch,f06,eig,dmap,beam, sdrc,pst,cdb=(0, 1, 2, or 3) STOP= CONTINUE=
S67OPT= SCRATCH= TSOLVE= SMEAR PREMGLUE MRENUCLE= MRENUGRD=
MRENUMBR= SYSabc= S6NEWS=
```

## Examples:

```
SOL 600,106 STOP=1
SOL 600,106 OUTR=OP2,F06
SOL 600,106 PATH=/progs/marc2003/tools OUTR=op2,f06
SOL 600,129 PATH=1 STOP=1
SOL 600,129 PATH=1 OUTR=OP2,CDB=0
SOL 600,106 PATH=1 CONTINUE=1
SOL 600,106 PATH=1 MARCEXE=SOLVE OUTR=OP2
SOL 600,153 PATH=1 STOP=1 TSOLVE=M
SOL 600,106 OUTR=OP2,F06 SMEAR
SOL 600,106 OUTR=OP2 PERMGLUE
SOL 600,106 PATH=1 STOP=1 MRENUCLE=2
SOL 600,106 PATH=1 STOP=1 MRENUGRDD=2
SOL 600,106 PATH=1 STOP=1 MRENUMBR=2
SOL 600,106 STOP=1 SYS001=8193 SYS9=6000
SOL 600,106 STOP=1 S6NEWS=YES
```

SOL 600,ID is an Executive Control statement similar to SOL. The difference between SOL and SOL 600,ID is that the computations (element matrix formulations, matrix decomposition, etc.) will be performed by Marc rather than by Nastran. Inputs and outputs as much as possible will be the same as (or similar to) the familiar Nastran inputs and outputs, however standard Marc inputs and outputs are also available. SOL 600 is primarily intended for nonlinear static and dynamic analysis of 3D structures that have already been manufactured and assembled. Although it has capabilities for 2D structures and for certain manufacturing processes, those capabilities should only be used for “simple” cases. For more complex 2D and manufacturing analyses either a standalone version of Marc or SOL 400 is recommended.

The SOL 600,ID statement should normally be used only for nonlinear analysis, but it may also be used for certain classes of linear static or dynamic analyses. The recommended form of this command is shown with the options provided above. If entered with “SOL 600,ID” only, it acts just like SOL except a Marc input data file “jid.marc.dat” will be generated (“jid” is the name of the Nastran input file without the extension.) For example, if the Nastran input file is named abcd.dat, (or abcd.bdf) then “jid”=abcd.

The required ID represents many valid solution sequence integer or names shown in [Table 2](#) for the SOL statement. Examples are 106, 129, NLSTATIC, NLTRAN. The following solutions are not available: 107, 108, 110, 111, 112, 114, 115, 116, 118, 144, 145, 146, 190, 200, and 400 (and their equivalent names). Solutions specified in [Table 2](#) of the SOL statement may be used. If the model has contact, ID must be 106, 129, 153, 159 or their equivalent names unless PERMGLUE is used.

Although SOL 600 supports 2D analyses (axisymmetric and plane strain), the support is not complete. It is strongly recommended that 2D analyses use some other solution sequence.

Most items on the SOL 600,ID after ID itself may be specified in environmental variables. This may be done any way environmental variables can be set. They may be set by the Nastran user at run time or by the system administrator when Nastran is installed. Any values specified on the SOL statement override those in the environment. Environmental variables are fully described in the . A keywords file is available to describe the format of each variable. The variable is normally set in the system-wide rc file, a user's rc file, a local rc file or in a script used to submit Nastran. Any string or value listed on the SOL 600,ID statement is also valid as an environmental variable. If the environmental variables are placed in the system-wide rc file, they may be used by a company for all Nastran users and even hide the fact that Marc is being spawned if so desired.

The following environmental variables are available:

Environmental Variable	Item on SOL Statement
NASM_PATH	PATH
NASM_COPYR	COPYR
NASM_OUTR	OUTR
NASM_STOP	STOP
NASM_NOERROR	NOERROR
NASM_STRFILE	Path and name of marcfilt.txt file (see below)

## PATH

PATH is an optional item which determines the location of the version of Marc to be executed. If PATH is omitted, the version of Marc included with Nastran will be used if it can be located. In this case, the run script for Marc (run\_marc or run\_marc.bat) will be expected to be in a directory under /MSC\_BASE. MSC\_BASE is an environmental variable set when Nastran first starts execution that defines the base installation directory for Nastran. If for some reason MSC\_BASE cannot be determined, the commands to spawn Marc will fail and the user must re-run Nastran with one of the PATH options set or the NASM\_PATH environmental option set to the desired location of Marc's tools directory.

## PATH=1

If PATH=1 is specified, Nastran will determine the proper command to execute the companion program. To aid Nastran in determining the program's location, a file named marcrun.pth must be available in the same directory where the Nastran input file resides. The marcrun.pth file must contain one line providing the location (complete path) of the run\_marc script. A typical example of the line in the file marcrun.pth would be

```
/mycomputer/marc200x/tools
```

To this path is appended the string `"/run_marc -jid name.marc -v no"` and possibly other items to form the complete string used to execute Marc. This complete string looks like the string shown in the following PATH=3 example. Note that on Windows systems, substitute a back slash for the forward slashes shown. Do not terminate the line with a forward slash or back slash.

### PATH=2

If PATH=2 is specified, it is expected that the directory with the run\_marc script is on the PATH. If PATH=2 is specified, Marc will be executed from inside Nastran using the command:

```
run_marc -jid jid.marc.dat -v no
```

### PATH=3

When PATH=3 is specified, the complete command to execute Marc must be contained in a file named marc.pth (lowercase). This file should typically contain one line of the form:

```
/mycomputer/marc200x/tools/run_marc -jid name.marc -v no
```

### COPYR

COPYR is an optional item. If COPYR is specified, Marc output files will be copied to Nastran output files and/or deleted according to the options shown in the following table:

COPYR Option	Copy Marc Output Files to Nastran Output Files	Delete Marc Input & Output Files
0 (default)	No	No
1 or -1 (see below)	Yes	Yes
2 or -2 (see below)	Yes	No
3	No	Yes

If COPYR is 1 or 2, Marc's out and log files will be copied exactly as produced by Marc.

If COPYR is -1 or -2 the actions as shown above for +1 or +2 will occur, and Marc-type text will be converted to Nastran-type text (or any other desired text) using an ASCII file named marcfilt.txt. This file must be located in the same directory where the Nastran input resides or in the same directory where the Marc executable resides. The marcfilt.txt file can contain as many lines as desired like the one shown below:

```
"Marc string 1" "Replacement String 1"  
"Marc string 2" "Replacement String 2"
```

That is, each line contains two strings. Each string starts and ends with a double quote sign ("). The Marc string must match the exact content and case as found in the Marc .out or .log files. The replacement string may be any string desired and can be the same length, shorter or longer than the Marc string. The two strings must be separated by at least one space, but more spaces are acceptable. Line lengths for marcfilt.txt, as well as Marc's .out and .log files are limited to 200 characters for the text replacement option.

The following Marc files are potentially affected by the COPYR option:

Marc Output File	Nastran Output Copied to	COPYR
name.marc.out	name.f06	1, 2, -1, -2
name.marc.log	name.log	1, 2, -1, -2
name.marc.t16	Not copied, will remain if produced	
name.op2, fort.11 or ftn11	Not copied, will remain if produced	

### MARCEX=SOLVE

MARCEX=SOLVE is an optional item. If MARCEX is entered, an existing input file named jid.marc.dat is assumed to exist in the directory where the run was submitted. Nastran will execute Marc using the existing jid.marc.dat file. A new Marc file will not be created. Other options available when MARCEX is used are PATH and OTR. Options not available with MARCEX are COPYR, STOP, NOEXIT, NOERROR and CONTINUE. Beware that the original jid.marc.dat will be renamed to jid.marc.dat.1 automatically by Nastran just like an existing jid.f06 is renamed to jid.f06.1

### NOERROR

NOERROR is an optional item. If NOERROR is specified, errors due to features that are available in Nastran but not available in Marc, and/or features not yet supported by the translator will be ignored (see Restrictions and Limitations). If NOERROR is entered and STOP=2 (or 3) is not specified, Marc will be executed even though the complete Nastran model may not have been completely translated. We recommend that NOERROR only be used by experienced analysts and then only with extreme caution.

### NOEXIT

NOEXIT is an optional item. If entered, the DMAP generated “on the fly” to process the OTR options will not contain EXIT and Nastran will proceed. This means in most cases, the Nastran solution as well as the Marc solution will occur. If .f06 is specified as one of the OTR options, this could cause confusing output as both the Marc and Nastran results will be in the .f06 file. Confusion could also result from both outputs being in .op2, .xdb and/or .pch files. Therefore, this option should only be used with great care.

Listing of the DMAP generated on the fly for SOL 600 can be suppressed by placing ECHOFF just after the SOL 600 entry.

### Restrictions:

- OTR options may not be used with restart jobs.
- OTR options are not available for SOL 600 2D analysis such as axisymmetric or plane strain.
- OTR options are not available for SOL 600 heat transfer.
- Spaces in the list of OTR items are not allowed.

## OUTR

OUTR is an optional item. If OUTR is specified, Marc output results will be converted to various types of Nastran formats. The OUT option on the Nastran command should not be used with any OUTR options. The type of output to be produced depends on the OUTR options entered as well as any DMAP entered in the executive control. If OUTR is omitted, no Marc output will be brought back into Nastran, but standard Marc .out, .t16 and/or .t19 as well as an op2 file will be available depending on the options selected with PARAM, MARCT16, PARAM, MARCT19 and other options. OUTR options may not be used with restart jobs.

The following options are available:

### Option 1 -- Specify a String of Desired Output Types (Preferred Method)

OUTR=OP2,F11,F06,PCH,XDB,T16,T19,PST

Use any or all of the above to request the following options except that both OP2 and XDB should not be entered:

- |      |  |
|------|--|
| OP2  | Create output2 file named jid.op2 consisting of input model and output results datablocks. This option requires PARAM,POST,-1 or PARAM,POST,-2 in the Bulk Data.   |
| F11  | Create output file fort.11 or ftn11 (depending on the computer system) consisting of output results datablocks only.   |
| F06  | Put Marc output results (displacements, stresses, strains) in Nastran's jid.f06 file using OFP. The resulting output will look just like any standard Nastran run.   |
| PCH  | Create punch file named jid.pch with Marc's output in standard Nastran punch format.   |
| XDB  | Create .xdb database file named jid.xdb with input model and output results. This option requires PARAM,POST,0 in the Bulk Data. XDB is not available with the eig option and if entered will switch to the OP2 option.  |
| eig  | The eig option must be specified if .op2, .xdb, .pch, or .f06 options are specified and Marc performs natural frequency or buckling eigenvalue analysis. The reason it must be provided on the SOL entry is to enable Nastran to create DMAP on the fly which include the LAMA data block. If the eig option is omitted, eigenvectors will be present in the Nastran output but no eigenvalues will be available. The beam and eig options are mutually exclusive (you cannot specify both). |
| BEAM | The BEAM option must be specified if .op2, .xdb, .pch, or .f06 options are specified and you want to place internal loads in any of these files. The BEAM option is not available for Windows systems.   |
| SDRC | An SDRC op2 file will be produced. PARAM,POST,-2 is also necessary in the Bulk Data for this option. Note: The datablocks might be in a different order than for other solution sequences.   |
| T16  | Marc's results will be saved during the Marc execution on a binary (or unformatted) file named jid.marc.t16 (this happens by default and does not need to be specified on the SOL 600 line).   |

- T19 Marc's results will be saved during the Marc execution on an ASCII file named `jid.marc.t19`. The `t19` file will normally be saved if `param,maract19,1` is entered.
- PST Nastran will be run to output a previous Marc run's results contained on `t16` file in the desired forms (`OP2,F11,F06,PCH` and/or `XDB`). The appropriate `OUTR T16` options must be selected in addition to `PST` (specify one or more of `OP2,F11,F06,PCH` and/or `XDB`.) Nastran will not be run past `IFP` and is used only to perform the desired output results conversions. A previous Marc `t16` file must be copied to the new `jid.marc.t16.1` (you may not process `XDB` and `OP2` in the same run.)
- DMAP The user will enter his own DMAP to create whatever type of output that is desired, such as `.op2`, `.xdb`, `.pch`, or `.f06`. For all other options, DMAP as needed is generated internally by Nastran.
- cdb 3D Contact will be output in one of the datablocks described below:
- 0 Store output in `OESNLBR` and `OESNLXR` (`OESNLXR` will be empty like SOL 106)
  - 1 Store output in `OESNLBR`
  - 2 Store output in `OESNLBD`
  - 3 Store output in `OESNLXD`

- Note:**
1. SOL 106 outputs both `OESNLBR` and `OESNLXR` but `OESNLXR` is empty.
  2. SOL 129 only outputs the `OESNLXD` datablock and it is empty.
  3. Case Control `BOUTPUT` is also required to obtain this type of output.
  4. The default is 0 if contact is present in the model and `OUTR=op2` (or `.xdb`, `punch` and/or `.f06`).
  5. This option is specified like the example shown:  
`OUTR=OP2,F06,CDB=0`
  6. The datablocks have the same names and type of information whether executing SOL 600,106 or SOL 600,129.

### Option 2 -- Specify an Integer to Select Certain Options (Not Recommended)

`OUTR=1` or `2` and an `op2` file named `fort.11` or `ftn11` will be produced and DMAP as shown below is required to bring the Marc output results back into the Nastran database.

```
COMPILE NLSTATIC
ALTER 'SUPER1' $
INPUTT2 /OUGV1,OES1,OSTR1,TOL,/-1/11 $
OFFP OUGV1,OES1,OSTR1//0/1 $
EXIT $
```

The 1 at the end of the `OFFP` statement produces output in the `.f06` file. If a punch file is also needed, change the 1 to a 5. If an `XDB` file is also needed, add the following lines just after the `OFFP` line:

```
DBC TOL,CASECC,,,,,,,,,,,,,,,,,,,,,///
'OL''CASECC'/////////////////////////////////
-1/DBCPTH/S,N,CP/'TRAN' '//GEOMU/LOADU/POSTU/
DBC DIAG/DBC CONV/DBC OVWRT $
```

```

DBC OUGV1, OES1, //
' OUG ' / ' OES ' //
-1 / DBCPATH / S, N, CP / ' ' TRAN ' ' // GEOMU / LOADU / POSTU /
DBC DIAG / DBC CONV / DBC OVWRT $
DBC OSTR1, //
' OES ' //
-1 / DBCPATH / S, N, CP / ' ' TRAN ' ' // GEOMU / LOADU / POSTU /
DBC DIAG / DBC CONV / DBC OVWRT $

```

OUTR can be set to one of the following values to automatically produce the output in Nastran form without entering any DMAP. In fact, no DMAP should be entered for the options greater than 2 shown:

Table 4-3 Integer Options Available Using SOL 600 OUTR Option --  
Nastran Output Results Produced When Marc Exits

OUTR (IO)	OP2 with Input Datablocks	fort.11 or ftn11 Output Datablocks Only	.f06 (Print)	.pch (Punch)	.xdb	Marc File Used
1	N	Y	N	N	N	.t19
2	N	Y	N	N	N	.t16
16	Y	Y	N	N	Y	.t16
166	Y	Y	Y	N	Y	.t16
266	Y	Y	N	Y	Y	.t16
366	Y	Y	Y	Y	Y	.t16
19	Y	Y	N	N	Y	.t19
199	Y	Y	Y	N	Y	.t19
299	Y	Y	N	Y	Y	.t19
399	Y	Y	Y	Y	Y	.t19

If OUTR = -1, -2, -16, -166, -266, -366, -19, -199, -299 or -399 only the output conversion process takes place. An Marc input file is not produced, Marc is not spawned from Nastran, but .op2, .xdb, .pch and/or .f06 results can be produced. For such cases, the Case Control and Bulk Data files can be dummies (for example, they can contain several nodes and one element) or a full file could be used. These options are handy if Marc is run by modifying the Marc input file (jid.marc.dat) with an editor or for someone who creates Marc input and runs Marc outside the Nastran environment, but wants output in one of the Nastran formats (see Remark 6.)

### STOP

STOP is an optional item. STOP is used to prevent execution of Marc or exit Nastran after IFP, if so desired. DO NOT ENTER any of the STOP options if any of the OUTR options are entered as the DMAP generated automatically by Nastran will put an EXIT in the proper place. The various options are as follows:

## STOP=0

If STOP=0 Nastran will not be stopped after Marc exits. Nastran will attempt to obtain its own solution to the problem if possible. Use of this option can lead to confusion because results from both Marc and Nastran will be available. If the Marc results are placed in the .f06 file and if the Nastran results are also available in the .f06 file, it will be difficult to tell which results came from Nastran and which results came from Marc. This also applies to .op2 files and .xdb files. It is suggested the STOP=0 option be used by extremely experienced SOL 600 users and even then with great care.

## STOP=1

If STOP=1 Nastran will be gracefully stopped after IFP. This option is used to prevent Nastran from performing its own solution (normally used when the solution is performed by the Marc). STOP=1 should be normally used if OUTR is not specified. STOP=1 is the default if no STOP, CONTINUE or OUTR options are entered.

## STOP=2

For STOP=2 Marc will not be executed. This option is used if you wish to examine the Marc input file and make changes prior to running Marc. However, if STOP=2 is entered, the OUTR options will not be available.

## STOP=3

STOP=3 is a combination of STOP=1 and STOP=2. Nastran is stopped after IFP and Marc is not executed. This would be the normal STOP option if you want to examine a Marc input file, then execute Marc manually. The STOP=2 option is normally used if you want to obtain comparative results between standard Nastran solutions and Marc solutions (in which case, all input options must be fully supported by both programs). If STOP=3 is entered, the OUTR options will not be available.

## CONTINUE=

CONTINUE= specifies an option as to how Nastran will continue its analysis after Marc finishes. For this to happen, do not enter any STOP or OUTR options. It is not usually possible to perform more than one of these operations if necessary.

- |   |  |
|---|--|
| 0 | Nastran will continue the current solution sequence as normal. For example if SOL 600,106 is entered, SOL 106 will continue as normal after Marc finishes. Of course, no 3D contact or materials not supported by SOL 106 may be used.   |
| 1 | Nastran will switch to SOL 107 to compute complex eigenvalues. Marc will generate DMIG matrices for friction stiffness (and possibly damping) on a file specified by param,marcfil1,name and time specified by param,marcstif,time. This is accomplished by making a complete copy of the original Nastran input file and spawning off a new job with the SOL entry changed and an include entry for the DMIG file. The user must put CMETHOD and CEIG in the original Nastran input file. |

- 2 (Option not presently available.) Nastran will switch to SOL 107 to compute complex eigenvalues. Marc will generate OUTPUT4 matrices for friction stiffness (and possibly damping) on a file specified by `pram,marcfil2,name` and time specified by `param,marcstif,time`. This is accomplished by making a complete copy of the original Nastran input file and spawning off a new job with the SOL entry changed and an include entry for the DMIG file.

The original Nastran file should include `CMETHOD=id` in the Case Control command and a matching `EIGC` entry in the Bulk Data.

In addition, the DMIG entries specified by `MDMIOUT` will be included in a separate Nastran execution spawned from the original execution. Case Control and Bulk Data will be added to the original input to properly handle these matrices in the spawned Nastran execution.

- 6 Same as option 1 except SOL 110 is run. For this option, the original Nastran input file must contain `METHOD=ID1` and `CMETHOD=ID2` in the Case Control as well as matching `EIGRL` (or `EIGR`) and `EIGC` entries in the Bulk Data.

- 7 Same as option 1 except SOL 103 is run for real eigenvalues/eigenvectors. The database can be saved to restart into SOL 110 if desired. This should be done on the command line or in a rc file with `scratch=no`. For this situation, the original Nastran input file must include `METHOD=id` in the Case Control command and a matching `EIGRL` or `EIGR` entry in the Bulk Data. (`CMETHOD` and `EIGC` can also be included.) The actual restart from SOL 103 to 110 must be performed manually at the present time.

- 101+ Continue options 101 to 400 are used to convert Marc's initial contact tying constraints to MPC's and then continue in SOL 101 to 112 as a standard Nastran execution. For example, if `CONTINUE=101`, a SOL 101 run with all the geometry load cases, etc. from the original run would be conducted with the addition of the initial contact MPC determined from Marc. The `continue=101+` options are frequency used to model dissimilar meshes as well as glued contact which does not change throughout the analysis. This option can be used for any standard Nastran sequence where the initial contact condition does not change. In order for initial contact to work, the surfaces must be initially touching. If they are separated by a gap, the MPC's will be zero until the gap closes and thus the initial MPC's are zero. This option automatically sets `BCPARAM INITCON=1`.

### S67OPT=NO

If `S67OPT=NO` is entered the following action will be taken for SOL 600 or SOL 700: `TA1MCK` and `EMGPRO` will not be disabled (when these routines are disabled, materials used only by SOL 600 or SOL 700 such as `MATG`, `MATE`, `MATHP`, etc. may be in the model and the `t16op2` conversion will take place, otherwise the job will fail with a `FATAL ERROR`). Also, Case Control `FATAL` error termination will occur at the same place as other Nastran Solution Sequences. If `S67OPT=YES` or `S67OPT` is omitted entirely, `TA1MCK` and `EMGPRO` will be disabled and Case Control `FATAL ERRORS` will cause job termination immediately. `S67OPT=YES` is the default.

## SCRATCH=

Determines what will happen when a SOL 600 job is initiated with SOL 600 database files (\*.3dc, \*.prp) present in the run directory (this usually means another job is running and conflicts can occur.) The default is SCRATCH=WAIT01. Options are as follows:

SCRATCH=DELETE	Attempt to delete all *.3dc and *.prp files, continue with present job. If the attempt to delete them fails, the job will terminate with an appropriate message.
SCRATCH=ABORT	If any *.3dc or *.prp files are found, abort the present job with an appropriate message.
SCRATCH=WAIT	If any *.3dc or *.prp files are found, wait until they disappear, then begin current run. This option will wait an “indefinite” amount of time.
SCRATCH=WAITxx	If any *.3dc or *.prp files are found, wait for xx minutes or until they disappear, then begin current job. If they do not disappear within xx minutes, abort the current job with an appropriate message. Examples, to wait up to 1 minute, enter SCRATCH=WAIT01, to wait up to 15 minutes, enter SCRATCH=WAIT15. Note: xx can range from 01 to 99.

## SCRATCH= Remarks:

1. For the WAIT options, if no \*.3dc or \*.prp files are found, the job will start immediately.
2. No spaces are allowed.

## TSOLVE

Determines which “solver” (Nastran or Marc) is used to solve a heat transfer analysis. The default is Nastran.

TSOLVE=M	Marc is used as the thermal solver.
TSOLVE=MS	Marc is used as the thermal solver followed by a structural analysis using the temperatures from the end of thermal analysis.
TSOLVE=N	Nastran is used as the thermal solver (default).

## TSOLVE Remarks:

1. If the default is used and thermal contact is present, SOL 600 spawns Marc to calculate initial thermal contact variables which are then read by Nastran, turned into Nastran CELAS and other variables. A second Nastran run is spawned for the primary Nastran run to complete the heat transfer calculations.
2. If OUT or OUTDIR are used with thermal contact in SOL 600 they must both reference the same directory.
3. This option should be entered for heat transfer analysis only.

## SMEAR

The term SMEAR, as used by SOL 600, is different than that used on the PCOMP Bulk Data entry. For SOL 600, SMEAR is the same as LAM=BLANK on the PCOMP entry. Other LAM options are not available using SOL 600, however complete integration and fast integration methods are available, see the PCOMP Bulk Data entry.

If the string SMEAR is entered on the SOL 600,ID command line, composite shell entries using PCOMP will use the smeared approach. If SMEAR is not entered, the through-the-thickness integration approach will be used. The smeared approach is identical to other Nastran solution sequences where PCOMP entries are converted to PSHEL and MAT2 entries. The through-the-thickness integration approach is more accurate for post-buckling and nonlinear analyses but takes more computer time. OP2.f06 and punch outputs are available and are controlled by the OUTR options OUTR=xxx where xxx is .op2, .f06 and/or .pch. If any OUTR options are specified, .op2 must be included. In addition, standard Case Control requests are required.

### SMEAR Option Restrictions

1. The SMEAR option may only be used if all composite materials in the model are made of shell elements (if there are any composite solid elements, this option may not be used.)
2. Case Control requests for DISP(options)=ALL, the STRESS(options)=ALL must be entered. STRAIN(options)=ALL is optional. (options) consist of any combination of (print,plot,punch)
3. The SMEAR output options may not be controlled using sets.
4. It is suggested that the Marc t16 file be limited to only those output “items” absolutely necessary as composite output can be large and take significant computer time.
5. If OUT or OUTDIR are used with this option, they must reference the same directory.

## PERMGLUE

Specify PERMGLUE if permanent glued contact is to be used. Permanent glued contact is glued contact where the glued condition is determined using initial contact. This glued condition will remain throughout the analysis. The MPC's produced by the PERMGLUE option are identical to those formed in SOL 101 or SOL 103 when the permanent glue option is specified. When this option is used, set BCONTACT=ALLGLUP. For SOL 600, the PERMGLUE option is the only way contact can be used with SOL600,101 or SOL 600,103 or other “linear” analyses.

## MRENUCLE

Determines if SOL 600 elements will be renumbered or not. (Default = 0)

- |   |  |
|---|--|
| 0 | No renumbering will occur (suggested for models with largest element number less than approximately 20000)   |
| 1 | All elements will be renumbered and the new numbers will be used in the Marc analysis. An equivalence list will be output on file elenum.txt               |
| 2 | All elements will be renumbered internally during translation, however the original element numbers will be used in the Marc input file and Marc analysis. |

Remarks concerning MRENULE:

1. MRENULE must be set on the SOL 600 entry if the maximum element number is greater than 9,999,999.
2. The "=" and an integer of "0" "1" or "2" must follow "MRENULE" with no spaces when MRENULE is entered on the SOL 600 entry.
3. If the maximum element is 9,999,999 or smaller MRENULE may be set as a parameter in the bulk data or placed in a rc file.
4. MRENULE should not be set on the SOL 600 and as a parameter.
5. For MRENULE=1 an equivalence list of original and re-numbered element numbers is output on file elenum.txt

## MRENUGRD

Determines if SOL 600 grid ID's will be renumbered or not. (Default = 0)

- |   |   |
|---|---|
| 0 | No renumbering will occur (suggested for models with largest grid ID less than approximately 20000)   |
| 1 | All grid ID's will be renumbered and the new numbers will be used in the Marc analysis. An equivalence list will be output on file grdid.txt                |
| 2 | All grid ID's will be renumbered internally during translation, however the original element numbers will be used in the Marc input file and Marc analysis. |

Remarks concerning MREUGRD:

1. MREUGRD must be set on the SOL 600 entry if the maximum element number is greater than 9,999,999.
2. The "=" and an integer of "0" "1" or "2" must follow "MRENULE" with no spaces when MREUGRD is entered on the SOL 600 entry.
3. If the maximum grid ID is 9,999,999 or smaller MREUGRD may be set as a parameter in the bulk data or placed in a rc file.
4. MREUGRD should not be set on the SOL 600 and as a parameter.
5. For MREUGRD=1 an equivalence list of original and re-numbered grid id's is output on file gridnum.txt

## MRENUMBR

Determines both grid and element ID's for SOL 600 will be renumbered or not. (Default = 0)

- |   |   |
|---|---|
| 0 | No renumbering will occur (suggested for models with largest grid ID less than approximately 20000) |
|---|---|

- 1 All grid and element ID's will be renumbered and the new numbers will be used in the Marc analysis. An equivalence list will be output on file grdid.txt
- 2 All grid and element ID's will be renumbered internally during translation, however the original element numbers will be used in the Marc input file and Marc analysis.

Remark concerning MREUMBR: All remarks for MRENUCLE and MRENUGRD apply.

### S6news

S6news can be set to YES or NO. If set to YES, a list of new features currently considered to be in beta tests are output complete with the Case Control and/or Bulk Data descriptions anticipated once these features are released.

### SYSabc

Allows Nastran system cells to be set on the SOL 600 Executive Control statement if desired. Abc must be an integer ranging from 1 to 500 and be a valid system number. INTT must be an integer with 1-8 digits. More than one SYSabc=INTT statement may be made if so desired, however abc may not be repeated. Note that the limit on the integer following the equal sign is 8 digits.

### Running SOL 600 in Steps -- Modification of the SOL 600 Statement Using Environmental Variables:

It is possible to run the main portions of SOL 600 in single steps without changing the Nastran input file. This is accomplished using one of the two environmental variables discussed below. A user can set these variables in a script that runs Nastran, from the command line or for Windows using the control panel. Note that on Linux systems, the name of the environmental variable must be in upper case. The string to which it is set can be in upper or lower case and will be converted to upper case.

### To Run SOL 600 in Three Steps Without Changing the SOL 600 Statement in the Input File:

First, make sure that your SOL 600 input file has a SOL 600 statement that contains all of the features you would want if all steps were done in a single run. For example, if you wish to make an op2 file and place the results in the .f06 file, a typical SOL 600 statement would be as follows:

```
SOL 600,NLSTATIC PATH=1 OTR=OP2,F06
```

or

```
SOL 600,NLSTATIC OTR=OP2,F06
```

(if the default path to Marc is to be used).

It is important to have the OTR options specified at the end of the SOL 600 statement. The following environmental variable can be set as shown to run the three steps (a Linux shell example is shown):

1. export MARC\_RUN="stop"

This will tell Nastran to run the internal Nastran-to-Marc translator only. The first SOL 600 statement shown would be changed internally just for this run above to the following:

```
SOL 600,NLSTATIC PATH=1 OTR=OP2,F06 STOP=3
```

This change will be shown in the .f06 file.

2. export MARC\_RUN="solv"

This will tell Nastran to run Marc from inside Nastran. The first SOL 600 statement shown would be changed internally just for this run above to the following:

```
SOL 600,NLSTATIC PATH=1 OUTF=OP2,F06 MARCEXE=SOLVE
```

For this run, it is assumed that a file named jid.marc.dat resides in the input file directory created from a previous translator-only run. The Nastran script will automatically rename jid.marc.dat to jid.marc.dat.1, but the Nastran executive processing will name it back to jid.marc.dat

3. export MARC\_RUN="pst" This will tell Nastran to run the t16 to op2 translator inside Nastran. The first SOL 600 statement shown would be changed internally just for this run above to the following:

```
SOL 600,NLSTATIC PATH=1 OUTF=OP2,F06,PST
```

For this run, it is assumed that a file named jid.marc.t16 as well as the original Nastran input file jid.dat resides in the input file. The "t16" file should have been created from a previous Marc execution using the same computer system (cross-platform support is not available for this step). The Nastran script will automatically rename jid.marc.t16 to jid.marc.t16.1, and the Nastran t16op2 conversion routines will look for files with names jid.marc.t16, jid.marc.t16.1, jid.marc.t16.2 up to jid.marc.t16.5 in that order. If no such files are found, the t16op2 job will exit with a message.

### Method to Completely Modify the SOL 600 Statement:

For maximum versatility without having to modify the Nastran input file, the SOL 600 statement can be modified completely using the environmental variable SOL600\_CMD. Assuming that the original SOL 600 statement in jid.dat contains the string:

```
SOL 600,NLSTATIC OUTF=OP2,F06
```

and the environmental variable is set as follows:

```
export SOL600_CMD="SOL 600,NLSTATIC PATH=1 MARCEXE=SOLVE"
```

the new SOL command line internal to Nastran will be

```
SOL 600,NLSTATIC PATH=1 MARCEXE=SOLVE
```

and Nastran will stop after creating the Marc input file. This would be the same as if the following SOL 600 statement was entered:

```
SOL 600,NLSTATIC PATH=1 STOP=3
```

Any valid SOL 600 statement can be issued using the SOL600\_CMD environmental variable without changing the original Nastran input file at all.

### Remarks:

1. Only one SOL 600,ID job may be run in a directory at any given time. However, if a previous run was made and output files such as name.marc.t16 were produced, they will be renamed name.marc.t16.1, etc. following the Nastran re-naming convention.
2. If OUTF is specified, STOP must not be specified.

3. The COPYR option can be used to delete all files directly created by Marc if the output desired are Nastran files only.
4. When OUTR is specified, the Marc files such as jid.marc.out, jid.marc.t16 will be renamed to jid.marc.out.1 and jid.marc.t16.1 at the start of the run. This renaming is accounted for when opening the files
5. To generate .xdb files, PARAM,POST,0 must be included in the Bulk Data Section. To generate OP2 files with geometry, PARAM,POST,-1 (for Patran and Femap) or PARAM,POST,-2 (for SDRC) should be included in the Bulk Data.
6. Although SOL 600,ID supports linear analysis (ID=101, 103, 105), not all features are available. For example, Case Control commands, STATSUB, SUBCOM, SUBSEQ, SYMCOM, AUXMODEL, AXISYMMETRIC, CLOAD, DEFORM, HARMONICS, MFLUID, NSM, and REPCASE are not available. For nonlinear analyses (ID=106, 129) Case Control commands, NNLOAD and NONLINEAR are not available.
7. To output displacements in the jid.marc.out file, do the following:  
In the Case Control, set DISP(PRINT)=ALL or DISP(PRINT,PLOT)=ALL  
In the Bulk Data, include the following two parameters:

PARAM,MARCPRNR,1  
PARAM,MARCND99,-1

8. All SOL 600 character variable parameters, such as MRAFFLOW, must be left justified in the starting in field 3.
9. Fixed load stepping (or time stepping) is controlled primarily by PARAM,MARCITER and PARAM,MARCAUTO rather than NLPARM or NLAUTO.
10. 2D and 3D contact and elements may not be mixed in the same model.
11. For the OUTR options, the only stress tensor available is Cauchy stress (E341). If some other stress tensor is selected using MARCOUT, and E341 is not selected, no stresses will be available in the .op2, .xdb, .pch, or .f06 files.
12. For multi-layer composites, stresses in the preferred direction (E391), also known as the layer direction, are usually necessary. The default Cauchy stresses (E341) will be automatically changed to E391 for composites.
13. SOL 600 supports a new field on RFORCE (2nd line 4th field) to allow different portions of the structure to have different rotation accelerations.
14. 2D Plain stress is available and this type of analysis is achieved by setting MID=-1 on all PSHELL entries and adding the following parameters to the bulk data.

PARAM,MRALIAS,011003  
PARAM,MALIAS02,006003

SOL 600 will use the alias commands to convert plain strain elements that normally are introduced with MID2=-1 into the input into plain stress. Although MALIAS02 specifies that Marc element 3 be used for CTRIAi, the new Marc element 201 plain stress triangle will be used instead of a degenerate element 6 plain stress quad. By default, the CTRIAi node numbers will not be reversed, however if the user wants to reverse them enter PARAM,MREVPLST,1 in the bulk data. Any contact entered into the file needs to specify 2D on all BCBODY entries. 2D plain stress analysis for SOL 600 is available through Patran which will generate the above alias parameters automatically.

### Restrictions and Limitations of SOL 600

Certain features are available in Nastran that are not available in Marc, and vice versa, the following restrictions/limitations are imposed on Nastran. Those restrictions indicated by (\*) will be removed as soon as possible. Items with (\*\*) will issue a FATAL error (for the Nastran-to-Marc translator internal to Nastran) and Marc will not be “spawned” from Nastran unless NOERROR is entered on the SOL 600 statement.

- External superelements are supported. Other types of superelements are not currently supported.
- Scalar points are not supported.
- PBCOMP is not supported.
- CCONEAX is not supported.
- CBARAO is not supported.
- Output set definitions that contain grid or element numbers greater than the largest grid or element in the model will produce errors in Marc.
- Output set definitions may include the word BY as in output plot set definitions for use by Marc only. Nastran must be stopped using STOP=1 or one of the OUTR options since BY is a FATAL ERROR to Nastran.
- Nastran’s CREEP entry must be changed to the MATVP entry.
- For orthotropic materials using MATORT, all shear moduli must be entered.
- SPOINTs are mapped to GRIDs with x, y, z coordinates at (0., 0., 0.)
- SLOAD and other scalar features are not supported.
- CELAS3 and CELAS4 are not supported.
- CLOAD is not supported.
- Fracture Mechanics is available.
- Aerodynamics is not supported.
- Bulk data entries with + or \* in column 73 must have an actual continuation card for most entries. Nastran does not require this, but the internal Marc translator does. (\*)
- Slideline contact is not supported (BLSEG, BWIDTH, BFRIC, BCONP, and BOUTPUT, if entered will cause FATAL ERRORS in Nastran).

- Offsets are available for CBAR, CBEAM, CQUAD4 and CTRIA3 in all types of structural analysis (linear or nonlinear). The offsets must be specified in the global coordinate system (displacement output coordinate system) unless PARAM,MAROFSET is 1 (2 or 3, see description in [Parameter Descriptions, 794](#)). Offsets are available for CQUAD8 and CTRIA6 but only if all 8 or 6 grids are defined for these elements, respectively. If PARAM,MAROFSET,1 (2 or 3) is included in the bulk data, the offsets will be incorporated using a new Marc feature that does not need extra grids or elements.
- For SOL 600, it is required that a Case Control LOAD or DLOAD entry be made for each subcase. If there are no subcases, one LOAD or DLOAD entry must be made.
- For SOL 600, it is required that all enforced displacements (other than motion of rigid contact surfaces applied using fields on the BCBODY entry) be applied using SPCD rather than SPC. The ID's of the SPCD must correlate with the Case Control LOAD or DLOAD entries.
- MPCs must be the same for all load cases.
- MAT10 is not presently supported.
- The following Solution Sequences are not presently supported: 107, 108, 110, 111, 114-116, 118, 144-146, 190, 200, 400 and 700 and will cause Severe Warnings (FATAL ERRORS) in the internal translator.
- DOMAINSOLVER is not supported. If this Executive Control statement is entered, and Nastran Implicit Nonlinear is requested by the SOL 600, ID statement, the DOMAINSOLVER request will be commented out internally by Nastran.
- IDs Grids, elements, properties, materials, etc. are limited to 9,999,999 unless one of the MRENUxxx items is specified in which case the limit is 10 digits.
- CGAP does not completely map to Marc's gap element. The user should change all Nastran gaps to contact before running SOL 600. If the gaps are not changed to contact, some options will fail to translate as indicated by warning messages. Certain simple gaps translate as expected and will produce nearly the same results as standard Nastran solution sequences, but the user is responsible for ensuring that any model with gaps gives the behavior he expects when using SOL 600.
- Nastran MATS1 Mohr-Coulomb is mapped to Marc's Linear Mohr Coulomb option.
- Nastran MATS1 Drucker-Prager is mapped to Marc's Parabolic Mohr Coulomb option.
- Solid element composite output is not presently available using the OUTF options, It must be postprocessed directly using the t16 file - Patran is recommended.
- If layered output for Composite Structures is desired, the following bulk data parameters or bulk data entry, MARCOUT with LAYCODE of 1 or 2 should be included in the Bulk Data. If output for all layers is desired, set LAYCODE to zero and enter the following parameters:

```
param,mroutlay,N
param,marcslht,N
```

where N is the maximum number of layers in any composite PCOMP description. The preferred option is MARCOUT with LAYCODE=1.

- The rotational acceleration portion of RFORCE (RACC) is not supported and if entered will generate a Severe Warning and Marc will not be spawned.

- The following Case Control option for displacement/velocity/acceleration/spcforce/ mpcforce are not supported and will be ignored if entered:
  - SORT2, REAL, IMAG, PHASE, PSDF, ATOC, CRMS, RALL, RPRINT, RPUNCH, NORPRINT, CID, TM, RM
- Elements with mid-side nodes must have all mid-side nodes. For example CTETRA must either have 4 or 10 nodes.
- For PC systems, if SOL 600 is run from a command prompt (DOS box), if any old DOS programs are used prior to running SOL 600 the path where the job is being run is usually adjusted such that any names longer than 8 characters will be shortened (for example brake-squeal becomes BRAKE-~3). The continue options including brake squeal jobs will not work when this happens. Open a new command prompt and run SOL 600 before any old DOS programs are run in that window.
- The CID field on the RFORCE entry is not completely supported. If entered with a positive integer, the job will abort with a Severe Warning unless PARAM,MARCRCID is entered. PARAM,MARCRCID,1 may be used to ignore this field in which case R1,R2,R3 define the direction cosines of the rotation vector (see Marc Volume C, ROTATION A description) and the magnitude is given by  $A*\sqrt{R1**2+R2**2+R3**2}$  [see RFORCE description for definitions of CID, A, R1, R2, R3 as well as Remark 16].
- Filenames entered on SOL 600 Bulk Data entries must be entered in small field fixed format, must be left-justified in the first applicable field and must be entered in lower case unless otherwise noted.
- For any jobs using the CONTINUE option or brake squeal, the jobid must be entirely in lower case for Linux systems.
- Ixy of PBAR/PBEAM is ignored, if entered, for SOL 600.
- PARAM,MRDISCMB=1 must be used for models with multiple subcases with the same pressure loadings in each subcase. The program will automatically attempt to reset the default (mrdiscmb=0 to mrdiscmb=1 in such circumstances, however, it is recommended that the user does this himself.
- Some Bulk Data input entries are not checked as completely for SOL 600 as they are for other solution sequences, particularly those that apply only to SOL 600. In addition, certain checks for all types of entries, even those that can be used in other solution sequences may be made after Marc is spawned or the error messages not output until after Marc is spawned. For those cases, the error message, if any, will not be visible until Marc has finished and may not even be output unless one or more of the OUTR options is selected. Users should take special care that the SOL 600 input is free from errors and that no duplicates occur prior to running SOL 600. One way to do this which is highly recommended is to run a preliminary SOL 101 job with as much of the same input file as possible.
- For SOL 600, it is required that all enforced displacements (other than motion of rigid contact surfaces described by fields in BCBODY entries) be applied using SPCD rather than SPC. The ID's of the SPCD must correlate with the Case Control LOAD or DLOAD entries.
- If an .op2, .xdb, .f06, and/or punch file is requested using the OUTR option, static analyses must have "times" ranging from 0.0-1.0 for the first subcase, 1.0-2.0 for the second subcase, etc. If NLAUTO is used to change these times, the job will fail with an appropriate message. This means that if NLAUTO is used TFINAL (field 4) must always be 1.0.
- Concentrated masses are not considered in gravity loading for linear or nonlinear static analyses.

- Non-structural mass is ignored by SOL 600.

## SOL 700,ID

## Executes MSC Nastran Explicit Nonlinear (SOL 700)

### Format:

SOL 700,ID PATH= STOP= NP(or DMP700)= FSIDMP= INTELMP=

### Examples:

SOL 700,129 PATH=3 NP=4

(700,129 request nonlinear transient dynamics, path=3 requests use of the SOL 700 script called out in file sol700.pth, np=4 requests that 4 processors be used)

### Summary:

SOL 700 is an Executive Control statement like SOL that activates an explicit nonlinear transient analysis integration scheme. The calculations will not be performed directly within MSC Nastran. Instead, SOL 700 will use a separate solver spawned from MSC Nastran. This client-server approach is similar to SOL 600, using Marc.

The SOL 700 statement will spawn an executable which is a 3D, explicit nonlinear analyses code DMP (distributed memory parallel processing domain decomposition) capabilities.

For ID=129 or NLTRAN, SOL 700 will generate an intermediate input data file, `jid.dytr.dat`, where “jid” is the name of the MSC Nastran input file without the extension). For example, if the MSC Nastran input file is named `abcd.dat`, (or `abcd.bdf`) then “jid”=abcd).

Unless specified differently using the **STOP=3** option, the executable will be executed from MSC Nastran on any computer system capable of doing so (which includes most Linux systems and Windows systems). For it to run, it must be installed, properly licensed, and accessible from the directory where the MSC Nastran input data resides, `MSC_BASE` must be provided in the environment.

### Nastran SOL 700 Update:

Starting in MSC Nastran 2019.0 there is a change in the execution of MSC Nastran SOL 700. SOL 700 with LS-Dyna is no longer supported by MSC Nastran. Instead, a new explicit solver is introduced in MSC Nastran 2019.0. This version can be activated by adding `VERSION = PRIMARY` to SOL 700 in the input file or simply by leaving it blank as this will be the default. A new license feature will be needed to run this new version: `NA_Explicit_Dytran`.

The new SOL 700 will support both DMP and SMP parallelization. For this, the solver will pull licenses from the following license feature: `NA_Parallel`.

Customers that have a lease agreement will no longer be able to run MSC Nastran SOL 700 jobs from version of MSC Nastran before 2018.0. The binaries needed were in the prior version located in `msc20221/dytran` directory of the MSC Nastran installation. However, this directory will be missing after the installation of MSC Nastran 2022.1.

Paid-up customers of MSC Nastran before 2018.0 can continue to use MSC Nastran SOL 700 jobs from version of MSC Nastran before 2018.0. For those customers, there will be no change in the FlexLM License features.

### Executive Control Parameters:

The required ID may be one of several valid solution sequence integers or names shown in [Table 2](#) for the SOL statement. Examples are 129 and NLTRAN.

The following solutions are available: 101, 106, 109, 129 (and their equivalent names).

All items on the SOL 700,ID after ID itself may be specified by environmental variables. This may be done any way environmental variables can be set. They may be set by the MSC Nastran user at run time or by the system administrator when MSC Nastran is installed. Any values specified on the SOL statement override those in the environment. Environmental variables are fully described in the . A keywords file is available to describe the format of each variable. The variable is normally set in the system-wide rc file, a user's rc file, a local rc file or in a script used to submit MSC Nastran.

The following describes the various options for PATH. We suggest that PATH=3 for all computer systems.

#### PATH=1 (Windows Only)

If PATH=1 is specified, MSC Nastran will determine the proper command to execute a **serial run**. To aid MSC Nastran in determining where Dytran is located, the **dynrun.pth** file must be located in the same directory where the MSC Nastran input file resides. The dynrun.pth file must contain one line providing the location (complete path) of the SOL 700 run script. A typical example of the line in the file dynrun.pth follows.

```
Windows          c:\sol700\
```

A string is appended to this path to form the complete command used to execute the SOL 700 executable. "dytran jid=name.dytr.dat"

For Windows, MSC Nastran will spawn the external executable using the following command assuming the MSC Nastran input data is named enf2e.dat. (Although the example appears like it is on multiple lines, it is actually on a single line.)

```
c:\sol700/dytran jid=enf2e.dytr.dat
```

#### PATH=3 (All Systems)

If PATH=3 is specified, a script or batch file located in the same directory as the SOL 700 executable will be executed. The name of the executable is dytran (linux) or dytran.exe (Windows). This directory and name of the script is determined by the first line in a file named sol700.pth which must be in the same directory as the Nastran input file. Options are specified on subsequent lines of the sol700.pth file. For example, if Nastran is installed in C:\Program Files\MSC.Software\MSC\_Nastran\20221, the dytran.exe location is C:\Program Files\MSC.Software\MSC\_Nastran\2022.1\msc20221\dytran\win64\bin\dytran. To use sol700.pth file, the first line must be C:\Program Files\MSC.Software\MSC\_Nastran\20221\msc20221\dytran\win64\bin\dytran

Available PATH=3 options for Windows PC systems are as follows:

exe=	The full path to the executable that is to be used.  Optional -- If exe= is omitted, the directory where the script or batch file resides (first line of sol700.pth) will be used and dytran for Linux and dytran.exe for windows will be appended. If exe= is used, it must be the second line in the sol700.pth file.
nproc	Number of processors. (only for DMP run)  (Default is to used NP on the SOL 700 line. If NP and nproc are omitted, the default is 1). For parallel execution, the directory where the MSC Nastran input file exists must be shared with read/write privileges. If wdir is used, it must also be shared (see below). The directory where the Dytran executable resides must also be shared for parallel execution.
ncpus	Number of processors. (only for SMP)  (Default is not used.) If ncpus is greater than 1 in sol700.pth, Nastran SOL 700 automatically uses SMP capability.
bat	Run in background or foreground (Default).
hlist	Host file name. Name of a hostfile containing the same information as “machine” The format of hostfile is as follows for the example for machine: machine1 2 machine1 4
intelmpi	To activate the Intel MPI set intelmpi equal to yes. Default is no. If intelmpi=yes is placed directly on the command line (not in sol700.pth) Intel MPI will be activated too.
atb	the name of atb file.
imm	the name of imm file.

A Windows example of the file sol700.pth for the PATH=3 case follows.

```
C:\MSC.Software\MSC_Nastran\20221\msc20221\dytran\win64\bin\dytran nastran
nproc=4
```

For the above example, MSC Nastran will create the following command to spawn the SOL 700 executable assuming your input file is named abcd.dat. (Although the example appears like it is on multiple lines, it is actually on a single line.)

```
C:\Program Files\MSC.Software\MSC_Nastran\20221\msc20221\dytran\win64\bin\dytran
nastran nproc=6
```

Available PATH=3 options for Linux systems follows:

debug	Specifying debug=yes indicates if you want to keep scratch files and other debug information to investigate when a job fails to run. Default is no.
exe	The full path to the executable for Dytran that is to be used. (Optional)
fsidmp	Specifying fsidmp=yes indicates to run the FSI Distributed Memory Parallel version. Default is no. If FSIIDMP=YES is placed directly on the command line (not in sol700.pth) FSI Distributed Memory Parallel will be activated too.

hlist	The (local) filename containing the hosts list. If this file is not given or not found, a default local hosts list is used. Note that the MPI universe in which the selected nodes and CPUs reside is expected to exist and be accessible (i.e., be booted).
nproc	Number of processors. (only for DMP run)  (Default is to use NP on the SOL 700 line. If NP and nproc are omitted, the default is 1.) NOTE: The number of requested processes must be a power of 2.
ncpus	Number of processors. (only for SMP)  (Default is not used.) If ncpus is greater than 1 in sol700.pth, Nastran SOL 700 automatically uses SMP capability.
atb	the name of atb file.
imm	the name of imm file.

A Linux example of the file sol700.pth for the PATH=3 case is as follows:

```
/app/msc/msc20221/dytran/linux64/bin/dytran nastran nproc=4
```

For the above example, MSC Nastran will create the a command similar to the following to spawn the SOL 700 executable assuming your input file is named abcd.dat

```
/app/msc/msc20221/dytran/linux64/bin/dytran nastran nproc=4
```

If PATH is not specified, the default search path will be used to locate the dytran executable. This version will be located in a subdirectory named dytran/machine below the MSC Nastran base directory (MSC\_BASE). Not all PATH=3 options are available using this default path option.

## STOP

STOP is an optional item. STOP is used to prevent execution of Dytran or prevent execution of MSC Nastran after IFP if so desired. The various options are as follows:

### STOP=1

If STOP=1 MSC Nastran will gracefully stop after IFP. This option is used to prevent MSC Nastran from performing its own solution (normally used when the solution is performed with ID=129).

### STOP=3

STOP=3 MSC Nastran is stopped after IFP and Dytran is not executed. This would be the normal STOP option if the user wants to examine the intermediate input file, make some changes and then execute Dytran manually.

The following files are potentially affected by the COPYR option:

NP(or DMP700)=the Number of Processors

NP(or DMP700)=the number of processors (domains) for parallel processing. The default is one. In order to use more than one domain, MPI, Lam, POE, or whatever parallel program is needed must be properly installed on all computers involved and a hostfile designating which computers are to be used for each domain

must have been setup prior to running the job. If NP>1, PATH=3 is used and a file named sol700.pth is located in the same directory as the MSC Nastran input data. The sol700.pth file should contain all commands necessary to run in parallel. This file must have execute permissions.

## SPARSOLVER

## Sparse Solver Options

Specifies options used in sparse solution of equations operations.

Format:

SPARSOLVER {target} ([COMPMETH = {cmeth}][ORDMETH = {ometh}],

$$[FACTMETH = \{fmeth\}]MDTRATIO = \left( \left[ [NO]CHART \left\{ \begin{array}{l} T \\ R \end{array} \right\} [= nsegs] \right], \right.$$

$$\left. \left[ [NO]TABLE \left\{ \begin{array}{l} T \\ R \end{array} \right\} \right] \left[ NMAXRAT \left\{ \begin{array}{l} T \\ R \end{array} \right\} = nratio \right] \left[ MAXRAT \left\{ \begin{array}{l} T \\ R \end{array} \right\} = maxratio \right],$$

$$\left[ SORT = \left\{ \begin{array}{l} GRID \\ VALUE \\ BOTH \end{array} \right\} \right],$$

$$MDTSTATS = \left( \left[ [NO]CHART \left\{ \begin{array}{l} T \\ R \end{array} \right\} [= nsegs] \right], \right.$$

$$\left. \left[ [NO]TABLE \left\{ \begin{array}{l} T \\ R \end{array} \right\} \right] \left[ NMAXVAL \left\{ \begin{array}{l} T \\ R \end{array} \right\} = nmax \right] \left[ NMINVAL \left\{ \begin{array}{l} T \\ R \end{array} \right\} = nmin \right],$$

$$\left[ MAXVAL \left\{ \begin{array}{l} T \\ R \end{array} \right\} = vmax \right] \left[ MINVAL \left\{ \begin{array}{l} T \\ R \end{array} \right\} = vmin \right],$$

$$\left[ SORT = \left\{ \begin{array}{l} GRID \\ VALUE \\ BOTH \end{array} \right\} \right] )$$

Examples:

1. For the READ module, specify METIS reordering, and for the FRRD1 module, specify the UMFLU factorization method:

```
SPARSOLVER READ (ORDMETH=METIS)
SPARSOLVER FRRD1 (FACTMETH=UMFLU)
```

2. Request matrix diagonal term ratio output:

```
SPARSOLVER DCMP ( MDTRATIO )
```

- Request matrix diagonal term ratio output in chart format for translational DOFs, and limit the number of printed diagonal ratios to 50:

```
SPARSE Solver DCMP ( MDTRATIO=( CHART, TABLET, NMAXRATT=50) )
```

- Request Matrix Diagonal Term statistics output for:

- Chart format for translational and rotational DOF
- Table format for translational dof limited to largest 10 terms greater than 1.0E+08
- Table format for translational dof limited to smallest 20 terms smaller than 1.0
- Table format for rotational dof limited to smallest 30 terms smaller than 100.0

```
SPARSE Solver DCMP ( MDTSTATS=( CHART, TABLET, NMAXVALT=10,
MAXVALT=1.0E+08, NMINVALT=20, MINVALT=1.0, TABLER, NMINVALR=30,
MINVALR=100.00) )
```

Descriptor	Meaning
target	The target application for the options. The target application choices are: CEAD, DCMP, DECOMP, MDSTAT, NLSOLVE, READ, SOLVE, FRRD1, and TRD1.
cmeth	Compression method to be used (Default = GRID). The choices for compression method are: GRID, SUPER, GRDSUPER and NONE.
ometh	Ordering method to be used (Default = Automatic). The choices for ordering method are: AMF, BEND, MD, METIS, MMD, PRDMD, PRDMETIS, PRDSMPMS, and NONE. The default automatically selects among METIS, MMD and BEND
fmeth	Factorization method to be used (MSCLDL). The choices for factorization method are: MSCLDL, MSCLU, UMFLU, NUMFLU, PRDLDL, PRDLU and MUMPS. For default factorization methods, see Remarks 19.-24. below.
NO	No output is to be produced for the keyword.
T	The keyword applies to translational DOF only.
R	The keyword applies to rotational DOF only.
nsegs	Number of bars to be used in chart (Default = 0).
nratios	Number of diagonal term ratios to be included in table (Default = 25).
maxratio	Diagonal term ratio above which ratios are included in the table (Default = 1.0E+5).
GRID	Table output is sorted on GRID ID and component code.
VALUE	Sort table output on term values.
BOTH	Table is output once sorted on GRID ID and once on term value.
nmax	Number of largest values to print (Default = 25).

Describer	Meaning
nmin	Number of smallest values to print (Default = 25).
vmax	All terms larger than vmax are printed (Default = 1.0E+10).
vmin	All terms smaller than vmin are printed (Default = 1.0).

Remarks:

1. All of the keywords for the target application must be enclosed in parentheses.
2. The following table correlates target applications with available factorization methods.

Module	MSCLDL	MSCLU	UMFLU	NUMFLU	PRDLDL	PRDLU	MUMPS
CEAD	Yes	Yes	No	Yes	No	Yes	No
DCMP	Yes	Yes	No	No	Yes	No	Yes
DECOMP	Yes	Yes	No	No	No	No	No
FRRD1	Yes	Yes	Yes	No	No	Yes	No
MDSTAT	Yes	Yes	No	No	No	No	No
NLSOLV	Yes	Yes	No	No	Yes	No	Yes
READ	Yes	No	No	No	No	No	No
SOLVE	Yes	Yes	No	No	No	No	No
TRD1	Yes	Yes	Yes	No	No	No	No

3. More than one SPARSE Solver entry may be used, so that one may specify different options for different target modules.
4. System cell 206 can specify both a reordering method and a compression method by adding the respective values. For example, to specify GRDSUPER compression method with BEND reordering, SYSTEM(206) would be set to 68 (since 64+4=68). Or, to specify SUPER compression with METIS reordering, SYSTEM(206) would be set to 136 (since 128+8=136).
5. Note that SYSTEM(166), SYSTEM(206) and SYSTEM(209) have precedence over the SPARSE Solver command, whether set on the submittal line or in DMAP.
6. System cell 166 can also be used to turn on extra diagnostic output from the sparse factorization by setting SYSTEM(166)=2.
7. The choices for ordering method are: AMF, BEND, MD, METIS, MMD, PRDMD, PRDMETIS, PRDSMPMS, and NONE. The default automatically selects among METIS, MMD and BEND.
8. The UMFLU factorization method ignores COMPmeth and ORDMeth since it contains its own compression/reordering method.
9. The matrix diagonal term ratio (MDTRATIO) and value (MDTSTATS) keywords and options are used only by the DCMP target application. They will be ignored by other target applications.

10. The MDTRATIO and MDTSTATS keywords apply to both translational and rotational degrees of freedom unless modified by the T or R describer. Separate output is produced for each of the translational and rotational degrees of freedom in the matrix.
11. The MDTRATIO and MDTSTATS CHART option default produces a chart of values contained in powers of ten bandwidths. A specification for the nsegs describer causes the bandwidth to be internally computed to produce nsegs bars. Bars are produced for the bandwidths only if they contain terms.
12. MDTRATIO and MDTSTATS keywords are processed in the order given. It is possible for a keyword to modify the effects of a previously processed keyword. For example, the combination CHART, CHARTR=5 produces different outputs compared to CHARTR=5, CHART.
13. The MDTRATIO NMAXRAT describer limits the content of the TABLE output to the specified highest number of diagonal ratios that exceed the value of the MAXRAT describer.
14. MDTSTATS generates output for matrix diagonal term values. For the TABLE option, it produces a table containing the NMINVAL=nmin smallest terms smaller than MINVAL=vmin as well as the NMAXVAL=nmax largest terms larger than MAXVAL=vmax.
15. The ORDMETH option must be one of PRDMD, PRDMETIS, or PRDSMPMS for PRDLDL and PRDLU.
16. The COMPMETH option is ignored for PRDLDL and PRDLU.
17. The DOMAINSOLVER (RUNOPT=MULTIPAR) option is not supported with PRDLDL or PRDLU.
18. For PRDLDL and PRDLU, if there is not sufficient memory for an in-core solver, then an out-of-core solver will be attempted and performance will be negatively affected.
19. The following special rules apply for PRDLDL for NLSOLV:
  - a. The maximum number of threads used is given by DMP\*SMP, and PRDLDL will choose a number of threads, up to this maximum, most suitable to the problem size.
  - b. PRDLDL is supported only when FNT or PFNT method is used for nonlinear iteration (KMETHOD of NLPARM or NLSTEP).
  - c. If the problem fails to converge with PRDLDL, then add MDLPRM,LMT2MPC,1 to the bulk data section in order to convert Lagrange multipliers to MPCs.
20. The following special rules apply for PRDLDL for DCMP:
  - a. DMP is not supported for PRDLDL for DCMP as it only gets parallelism from SMP
  - b. PRDLDL automatically provides parallelization over multiple RHSs with SMP.
  - c. If PRDLDL encounters a zero pivot issue (SFM 11332), the user should rerun with bulk data entry MDLPRM,PRDMTYPE,-2 to have Intel MKL Pardiso regard the matrix as indefinite, and entry MDLPRM,PRDWMATCH,0 in order to turn off weighted matching.
21. The following special rules apply for PRDLU for CEAD:
  - a. PRDLU is only supported for the CLAN option within CEAD (refer to CMETHOD option).
22. The following special rules apply for PRDLU for FRRD1:
  - a. The Krylov solver is not supported with PRDLU for FRRD1.

- b. DMP is supported for PRDLU for FRRD1.
  - c. MKL Pardiso is not supported in the uncoupled solution algorithm for FRRD1.
  - d. MKL Pardiso is the default solver for FRRD1 except for the following cases:
    - SOL 111 symmetric solution without frequency dependence, in which case MSCDDL is used.
    - Iterative solver specified by user.
23. For CEAD, the default solver for unsymmetric matrices is UMFPACK while for Hermitian matrices the default is MSCLU.
  24. User specified factorization method (fmeth) via SPARSESolver entry or SYSTEM(209) may be overwritten automatically due to matrix type or symmetry by MSC Nastran.
  25. Several options for Intel MKL Pardiso are controlled using the [MDLPRM](#) bulk data entry. See the PRD\* parameters detailed in the MDLPRM section.
  26. Mumps sparse direct solver with DCMP and NLSOLV module is currently supported in SOL 101 only.

## **TIME**                      Sets Maximum CPU and I/O Time

Sets the maximum CPU and I/O time.

Format:

TIME[=]t1[,t2]

Examples:

1. The following example designates a runtime of 8 hours:  
TIME 480
2. The following example designates 90 seconds:  
TIME 1.5

Describer	Meaning
t1	Maximum allowable execution time in CPU minutes (Real or Integer>0; Default=1.89E9 seconds).
t2	Maximum allowable I/O limit in minutes (Real or Integer>0; Default is infinity, which is machine dependent).

Remarks:

1. The TIME statement is optional.
2. If t2 is specified then t1 must be specified.

# 5

## Case Control Commands

- Key to Descriptions
- The Case Control Section
- Case Control Command Summary
- Case Control Commands
- Case Control Applicability Tables
- OUTPUT(PLOT) Commands
- X-Y PLOT Commands
- OUTPUT(POST) Commands

## Key to Descriptions

Brackets [ ] indicate that a choice of descriptors is optional.

A brief description of the command is given.

Describes in uppercase letters are keywords that must be specified as shown.

Describes in lower case are variables.

Braces { } indicate that a choice of descriptors is mandatory.

If the descriptors are stacked vertically, then only one may be specified.

The default descriptors are shaded.

Requests the form and type of applied load vector output.

**Format:**

$$OLOAD \left( \left( \left[ \begin{matrix} \text{SORT1} \\ \text{SORT2} \end{matrix} \right] \right), \text{PUNCH}, \left[ \text{PHASE} \right] \right) = \left\{ \begin{matrix} \text{ALL} \\ n \\ \text{NONE} \end{matrix} \right\}$$

**Examples:**

OLOAD = ALL  
OLOAD(SORT1,PH)

Descriptors	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency value, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.
PRINT	The printer will be the output medium.
PUNCH	The punch card will be the output medium.
REAL or IMAG	Requests real or imaginary components of the load. If both are specified, either REAL or IMAG yields the same output.
PHASE	Requests polar angle of the load. If the descriptor is in lower case, then it is a variable and the descriptor's type (e.g., Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. If no default value is given, the descriptor must be specified by the user.
ALL	Applied loads from all cases.
NONE	Applied load from no cases.
n	Set identification of a previously appearing SET command. Only loads on points whose identification numbers appear on this SET command will be output. (Integer > 0).

**Remarks:**

- Both PRINT and PUNCH may be specified.
  - See the MSC Nastran User Manual for details on SORT1 and SORT2 formats and their default output.
  - In a statics problem, a request for output (frequency and/or time) is required (nonzero) to be output.
- The remarks are generally arranged in order of importance and indicate such things as which Bulk Data entries are selected by the Case Control command, the command's relationship to other commands, restrictions and recommendations on its use, and further details regarding the descriptors.

## The Case Control Section

The Case Control Section has several basic functions. Specifically, it:

- Selects loads and constraints.
- Requests printing, plotting, and/or punching of input and out data (plotter commands are described in [Plotting](#) in the *MSC Nastran Reference Guide*).
- Defines the subcase structure for the analysis.

[Table 5-3](#) through [Table 5-8](#) at the end of this section indicate the applicability of each command in all solution sequences.

## Case Control Command Descriptions

Case Control commands may be abbreviated down to the first four characters if the abbreviation is unique relative to all other commands. If not, the full name of the command (or at least the first eight characters if the name exceeds eight characters) must be specified in order to avoid errors. Each command is described as follows:

### Description

A brief sentence about the function of the command is given.

### Format

Describers in uppercase are keywords that must be specified as shown. In addition, describers in lowercase indicate that the user must provide a value.

Braces { } indicate that a choice of describers is mandatory. If the describers are stacked vertically, then only one may be specified.

Brackets [ ] indicate that a choice of describers is optional. If the describers are stacked vertically, then only one may be specified.

Describers that are shaded indicate the defaults.

If the command line is longer than 72 columns, then it may be continued to the next line with a comma. For example:

```
SET 1 = 5, 6, 7, 8, 9,  
10 THRU 55
```

### Example

A typical example is given.

### Describers and Meaning

Each of the describers is briefly discussed. The describer's type (e.g., Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. The describer must be specified by the user if no default value is given.

### Remarks

The remarks are generally arranged in order of importance and indicate such things as which Bulk Data entries are selected by the Case Control command; the command's relationship to other commands, restrictions and recommendations on the command's use; and further descriptions of the describers.

## Case Control Command Summary

This section contains a summary of all Case Control commands under the following headings:

### Subcase Definition

#### 1. Output Request Delimiters

<a href="#">OUTPUT (Case)</a>		Delimits the various types of commands for the structure plotter, curve plotter and grid point stress.
OUTPUT(PLOT)		Beginning of structure plotter output request.
OUTPUT(POST)	}	Indicates beginning of grid point stress output requests.
or SETS DEFINITION		
OUTPUT(XYOUT)	}	Indicates beginning of curve plotter output request.
or OUTPUT(XYPLOT)		

#### 2. Subcase Delimiters

<a href="#">REPCASE (Case)</a>	Delimits and identifies a repeated output request subcase.
<a href="#">SUBCASE (Case)</a>	Delimits and identifies a subcase.
<a href="#">SUBCOM (Case)</a>	Delimits and identifies a combination subcase.
<a href="#">SYM (Case)</a>	Delimits and identifies a symmetry subcase.
<a href="#">SYMCOM (Case)</a>	Delimits and identifies a symmetry combination subcase.

#### 3. Subcase Control

<a href="#">MASTER (Case)</a>	Allows the redefinition of a MASTER subcase.
<a href="#">MODES (Case)</a>	Repeats a subcase.

<a href="#">SUBSEQ (Case)</a>	Gives the coefficients for forming a linear combination of the previous subcases.
<a href="#">SYMSEQ (Case)</a>	Gives the coefficients for combining the symmetry subcases into the total structure.

## Data Selection

### 1. Static Load Selection

<a href="#">DEFORM (Case)</a>	Selects the element deformation set.
<a href="#">CLOAD (Case)</a>	Requests a CLOAD Bulk Data entry that defines a list of superelement loads and their scale factors in nonlinear static analysis only.
<a href="#">LOAD (Case)</a>	Selects an external static loading set.
<a href="#">LOADNAME (Case)</a>	Provides a name to be associated with a loading condition.

### 2. Dynamic Load Selection

<a href="#">DLOAD (Case)</a>	Selects a dynamic load or an acoustic source to be applied in a transient or frequency response problem.
<a href="#">LOADSET (Case)</a>	Selects a sequence of static load sets to be applied to the structural model. The load sets may be referenced by dynamic load commands.
<a href="#">NONLINEAR (Case)</a>	Selects nonlinear dynamic load set for transient problems.

### 3. Constraint Selection

<a href="#">AXISYMMETRIC (Case)</a>	Selects boundary conditions for an axisymmetric shell problem or specifies the existence of fluid harmonics for hydroelastic problems.
<a href="#">AUTOSPC (Case)</a>	Requests that stiffness singularities and near singularities be automatically constrained via single or multipoint constraints.
<a href="#">BC (Case)</a>	Identifies multiple boundary conditions for normal modes, buckling, and flutter analysis in SOLs 103, 105, 145, and 200.
<a href="#">DSYM (Case)</a>	Provides for either one or two planes of overall symmetry in DIH-type cyclic symmetry problems.
<a href="#">MPC (Case)</a>	Selects a multipoint constraint set.
<a href="#">SPC (Case)</a>	Selects a single-point constraint set to be applied.

**STATSUB (Case)** Selects the static solution to use in forming the differential stiffness for buckling, normal modes, complex eigenvalue, frequency response, and transient response analysis.

**SUPPORT1 (Case)** Selects the fictitious support set (SUPPORT1 entries only) to be applied to the model.

#### 4. Thermal Field Selection

**TEMPERATURE (Case)** Selects the temperature set to be used in either material property calculations, or thermal loading in heat transfer and structural analysis.

**TEMPERATURE (Case) (INITIAL)** Selects initial temperature distribution for temperature-dependent material properties and heat transfer problems.

**TEMPERATURE (Case) (LOAD)** Selects temperature set for static thermal load.

**TEMPERATURE (Case) (MATERIAL)** Selects temperature set for temperature-dependent material properties.

**TSTRU (Case)** Defines a temperature set ID for a structures run based on a heat transfer subcase.

#### 5. Static Solution Conditions

**SMETHOD (Case)** Selects iterative solver parameters.

#### 6. Dynamic Solution Conditions

**CMETHOD (Case)** Selects complex eigenvalue extraction parameters.

**FREQUENCY (Case)** Selects the set of forcing frequencies to be solved in frequency response problems.

**FRF (Case)** Specifies data for Frequency Response Function (FRF) generation or for the FRF Based Assembly (FBA) process.

**IC (Case)** Selects the initial conditions for direct transient analysis (SOLs 109, 129, and 159).

**METHOD (Case)** Selects the real eigenvalue extraction parameters.

**MODESELECT (Case)** Requests a set of computed mode shapes for inclusion in dynamic analysis.

**NSM (Case)** Selects nonstructural mass set.

<a href="#">RANDOM (Case)</a>	Selects the RANDPS and RANDT1 Bulk Data entries to be used in random analysis.
<a href="#">RESVEC (Case)</a>	Specifies options for and the calculation of residual vectors.
<a href="#">RGYRO (Case)</a>	Activates gyroscopic effects and selects RGRYO or UNBALNC entries.
<a href="#">SDAMPING (Case)</a>	Requests modal damping as a function of natural frequency in modal solutions, or viscoelastic materials as a function of frequency in direct frequency response analysis.
<a href="#">SMETHOD (Case)</a>	Selects iterative solver override options in frequency response analysis.
<a href="#">TSTEP (Case)</a>	Selects integration and output time steps for linear or nonlinear transient analysis.

## 7. Direct Input Matrix Selection

<a href="#">A2GG (Case)</a>	Selects direct input fluid-structure coupling matrix.
<a href="#">B2GG (Case)</a>	Selects direct input damping matrices.
<a href="#">B2PP (Case)</a>	Selects direct input damping matrices.
<a href="#">K2GG (Case)</a>	Selects direct input stiffness matrices.
<a href="#">K2PP (Case)</a>	Selects direct input stiffness matrices, which are not included in normal modes.
<a href="#">K42GG (Case)</a>	Selects direct input structural damping matrices.
<a href="#">M2GG (Case)</a>	Selects direct input mass matrices.
<a href="#">M2PP (Case)</a>	Selects direct input mass matrices, which are not included in normal modes.
<a href="#">MFLUID (Case)</a>	Selects the MFLUID Bulk Data entries to be used to specify the fluid-structure interface.
<a href="#">P2G (Case)</a>	Selects direct input load matrices.
<a href="#">TFL (Case)</a>	Selects the transfer function set(s) to be added to the direct input matrices.

## 8. Nonlinear Analysis

<a href="#">ENDSTEP (Case)</a>	Specifies final analysis step for SOL 700.
<a href="#">ENDTIME (Case)</a>	Specifies final analysis time for SOL 700.
<a href="#">NLBUCK (Case)</a>	Perform a nonlinear buckling analysis in SOL 400.
<a href="#">NLHARM (Case)</a>	Selects the parameters used for nonlinear harmonic response analysis.

NLOPRM (Case)	Controls MSC Nastran nonlinear output, debug printout and debug POST.
NLPARM (Case)	Selects the parameters used for nonlinear static analysis.
NLSTEP (Case)	Selects integration and output time steps for static and transient nonlinear analysis in SOL 400.
STEP (Case)	Defines and identifies a nonlinear analysis for SOL 400.
SUBSTEP (Case)	Delineates and identifies a nonlinear analysis SUBSTEP for COUPLED analysis in SOL 400.
TSTEPNL (Case)	Defines parametric controls and data for nonlinear transient structural or heat transfer analysis. is intended for SOLs 129, 159, 600 and SOLs 400 and 700.

## 9. Aerodynamic Analysis

AECONFIG (Case)	Assigns the aerodynamic configuration parameter used to locate the associated datablocks on the aerodynamic and aeroelastic databases.
AESYMX Y (Case)	Aerodynamic XY plane of symmetry flag.
AESYMXZ (Case)	Aerodynamic XZ plane of symmetry flag.
AEUXREF (Case)	Define the reference aerodynamic extra point (controller) vector
CSSCHD (Case)	Aerodynamic control surface schedule.
DIVERG (Case)	Selects the divergence parameters in a static aeroelastic divergence problem.
FMETHOD (Case)	Selects the parameters to be used in the aerodynamic flutter analysis.
GUST (Case)	Selects the field in an aerodynamic response problem.
TRIM (Case)	Selects trim variable constraints in static aeroelastic response.

## 10. Design Sensitivity and Optimization (SOL 200)

ANALYSIS (Case)	Specifies the type of analysis being performed for the current subcase.
AUXCASE (Case)	Delimits Case Control commands for an auxiliary model in SOL 200.
AUXMODEL (Case)	References an auxiliary model for generation of boundary shapes in shape optimization.
DESGLB (Case)	Selects the design constraints to be applied at the global level in a design optimization task.
DESMOD (Case)	Assigns the design model parameter used to locate the associated datablocks for merging of two or more SOL 200 using the MultiOpt toolkit application.

<a href="#">DESOBJ (Case)</a>	Selects the DRESP1 or DRESP2 entry to be used as the design objective.
<a href="#">DESSUB (Case)</a>	Selects the design constraints to be used in a design optimization task for the current subcase.
<a href="#">DESVAR (Case)</a>	Selects a set of DESVAR entries for the design set to be used.
<a href="#">DRSPAN (Case)</a>	Selects a set of DRESP1 entries for the current subcase that are to be used in a DRESP2 or DRESP3 response that spans subcase.
<a href="#">DSAPRT (Case)</a>	Specifies design sensitivity output parameters.
<a href="#">MODTRAK (Case)</a>	Selects mode tracking options in design optimization (SOL 200).

### 11. Adaptive Meshing

<a href="#">HADAPT (Case)</a>	Specifies Mesh adaptivity control parameters.
-------------------------------	---

### 12. Fluid-Structure Analysis

<a href="#">A2GG (Case)</a>	Selects a direct input fluid-structure coupling matrix.
<a href="#">ACFPMRESULT (Case)</a>	Requests output of acoustic field point mesh results.
<a href="#">ACPOWER (Case)</a>	Request output of the power radiated from the wetted surface.
<a href="#">FLSFSEL (Case)</a>	Fluid-structure parameter collector for frequency and fluid superelement selection.
<a href="#">FLSPOUT (Case)</a>	Fluid-structure parameter collector for mode participation.
<a href="#">FLSTCNT (Case)</a>	Fluid-structure parameter collector for symmetry and force request.
<a href="#">INTENSITY (Case)</a>	Requests output of acoustic intensity on wetted surface.
<a href="#">TRIMGRP (Case)</a>	Selection of Trim Component(s)

### 13. Nastran/ADAMS Interface

<a href="#">ADAMSMNF* (Case)</a>	Control for Nastran/ADAMS interface modal neutral file (MNF).  For MSC Nastran 2004, to ensure compatibility with the Adams msc2mnf tool kit, if the ADAMSMNF Case Control command has the keyword ADMOUT=YES, the Nastran SYSTEM word OP2NEW is automatically set to OP2NEW=0. This means that any output2 files generated will have a pre-MS Nastran 2004 format.
----------------------------------	---

### 14. Contact

<a href="#">BCHANGE (Case)</a>	Selects the change of the definition contact bodies in contact analysis.
<a href="#">BCMOVE (Case)</a>	Contact body movement selection in contact analysis.
<a href="#">BCONCHK (Case)</a>	Requests contact model check.
<a href="#">BCONTACT (Case)</a>	Requests contact analysis.
<a href="#">BOUTPUT (Case)</a>	Requests output for contact analysis.
<a href="#">BSQUEAL (Case)</a>	Selects data for brake squeal analysis
<a href="#">UNGLUE (Case)</a>	Selects the grids should use standard contact instead of glued contact in glued bodies.

## 15. Monte-Carlo simulation

<a href="#">MONCARL (Case)</a>	Control for Monte-Carlo simulation.
--------------------------------	-------------------------------------

## Output Selection

### 1. Output Control

<a href="#">ECHO (Case)</a>	Controls echo (i.e., printout) of the Bulk Data.
<a href="#">ECHOOFF</a>	Suppresses echo of Case Control.
<a href="#">ECHOON</a>	Reactivates echo of Case Control.
<a href="#">LABEL (Case)</a>	Defines a character string that will appear on the third heading line of each page of printer output.
<a href="#">LINE (Case)</a>	Defines the maximum number of output lines per printed page.
<a href="#">MAXLINES (Case)</a>	Sets the maximum number of output lines.
<a href="#">PAGE (Case)</a>	Causes a page eject in the echo of the Case Control Section.
<a href="#">PLOTID (Case)</a>	Defines a character string that will appear on the first frame of any plotter output.
<a href="#">POST (Case)</a>	Activates postprocessor operations for selected output data.
<a href="#">SKIP (Case)</a>	Activates or deactivates the execution of subsequent commands in the Case Control Section (including plot commands).
<a href="#">SKIPON</a>	Defines commands in the Case Control Section that are not to be processed.
<a href="#">SKIPOFF</a>	Resumes processing of commands in the Case Control Section.

<a href="#">SUBTITLE (Case)</a>	Defines a subtitle that will appear on the second heading line of each page of printer output.
<a href="#">TITLE (Case)</a>	Defines a character string that will appear on the first heading line of each page of MSC Nastran printer output.

## 2. Set Definition

<a href="#">MAXMIN (Case)</a>	Specifies options for max/min surveys of certain output data associated with grid points.
<a href="#">OFREQUENCY (Case)</a>	Selects a set of frequencies for output requests.
<a href="#">OMODES (Case)</a>	Selects a set of modes for output requests.
<a href="#">OTIME (Case)</a>	Selects a set of times for output requests.
<a href="#">PARTN (Case)</a>	Specifies a list of grid point identification numbers that will be partitioned with the DMAP module MATMOD (Option 17). In SOLs 111 and 200, the PARTN Case Control command specifies the points at which modal participation factors are to be computed.
<a href="#">SET (Case)</a>	Defines a set of element or grid point numbers to be plotted.
<a href="#">SURFACE</a>	Defines a surface for the calculation of grid point stresses, strains, or mesh stress discontinuities.
<a href="#">VOLUME</a>	Defines a volume for the calculation of grid point stresses, strains, or mesh stress discontinuities.

### 3. Physical Set Output Requests

ACCELERATION (Case)	Requests the form and type of acceleration vector output.
BOUTPUT (Case)	Requests line or 3D (SOLs 101, 106, 129, 153, 159, 400, and SOL 600) contact output.
CMSENRGY (Case)	Requests the output of component (superelement) modal strain, kinetic, and damping energies.
DISPLACEMENT (Case), VECTOR (Case), or PRESSURE (Case)	Requests the form and type of displacement or pressure vector output. Note: PRESSURE and VECTOR are equivalent commands.
EDE (Case)	Requests the output of the energy loss per cycle in selected elements.
EKE (Case)	Requests the output of the kinetic energy in selected elements.
ELSDCON (Case)	Requests mesh stress discontinuities based on element stresses (see STRESS).
ENTHALPY (Case)	Requests form of enthalpy vector output in transient heat transfer analysis (SOL 159).
ESE (Case)	Requests the output of the strain energy in selected elements.
EQUILIBRIUM (Case)	Requests equilibrium force balance output.
FATIGUE (Case)	Request a fatigue analysis with life/damage output in SOLs 101, 103, 108, 111, or 112.
FLUX (Case)	Requests the form and type of gradient and flux output in heat transfer analysis.
FORCE (Case) or ELFORCE	Requests the form and type of element force output or particle velocity output in coupled fluid-structural analysis. Note: ELFORCE is an equivalent command.
GPFORCE (Case)	Requests grid point force balance at selected grid points.
GPKE (Case)	Requests the output of the kinetic energy at selected grid points in normal modes analysis only.
GPSDCON (Case)	Requests mesh stress discontinuities based on grid point stresses (see GPSTRESS).
GPSTRAIN (Case)	Requests grid points strains for printing only.
GPSTRESS (Case)	Requests grid point stresses for printing only.
GVECTOR (Case)	Requests the form and type of g-set eigenvector output in SOLs 200 and 400.
HDOT (Case)	Requests form of rate of change of enthalpy vector output in transient heat transfer analysis (SOL 159).
MCFRACTION (Case)	Requests modal contribution fractions output.

MODALKE (Case)	Requests modal kinetic energy output.
MODALSE (Case)	Requests modal strain energy output.
MEFFMASS (Case)	Requests the output of the modal effective mass, participation factors, and modal effective mass fractions in normal modes analysis.
MPCFORCES (Case)	Requests the form and type of multipoint force of constraint vector output.
NLSTRESS (Case)	Requests the form and type of nonlinear element stress output in SOL 106.
NOUTPUT (Case)	Requests physical output in cyclic symmetry problems.
OLOAD (Case)	Requests the form and type of applied load vector output.
RCROSS (Case)	Requests computation and output of cross-power spectral density and cross-correlation functions in random analysis.
ROTSEKE (Case)	Request rotor modal strain and kinetic energies in complex eigenvalue analysis for selected rotor IDs.
SPCFORCES (Case)	Requests the form and type of single-point force of constraint vector output.
STRAIN (Case)	Requests the form and type of strain output.
STRESS (Case) or ELSTRESS	Requests the form and type of element stress output. Note: ELSTRESS is an equivalent command.
STRFIELD (Case)	Requests the computation of grid point stresses for graphical postprocessing and mesh stress discontinuities.
THERMAL (Case)	Requests the form and type of temperature output.
VELOCITY (Case)	Requests the form and type of velocity vector output.

#### 4. Solution Set Output Requests

AEROF (Case)	Requests the aerodynamic loads on aerodynamic control points.
APRESSURE (Case)	Requests the aerodynamic pressures in static aeroelastic response.
HARMONICS (Case)	Controls the number of harmonics output in axisymmetric shell or axisymmetric fluid problems; controls the number of harmonics to be used for analysis in cyclic symmetry problems.
HOUTPUT (Case)	Requests harmonic output in cyclic symmetry problems.
MPRES (Case)	Requests the pressure for selected wetted surface elements when virtual mass (MFLUID) is used.
NLOAD (Case)	Requests the form and type of nonlinear load output for transient problems.

<b>SACCELERATION (Case)</b>	Requests the form and type of solution set acceleration output.
<b>SDISPLACEMENT (Case)</b>	Requests the form and type of solution set displacement output.
<b>SVECTOR (Case)</b>	Requests the form and type of solution set eigenvector output.
<b>SVELOCITY (Case)</b>	Requests the form and type of solution set velocity output.
<b>TRIMF (Case)</b>	Specifies options for the output of trim loads from a static aeroelastic analysis as FORCE/MOMENT Bulk Data entries.

## 5. Model Checkout

<b>ELSUM (Case)</b>	Requests a summary of element properties for output.
<b>GROUNDCHECK (Case)</b>	Requests grounding check analysis on stiffness matrix to expose unintentional constraints by moving the model rigidly.
<b>WEIGHTCHECK (Case)</b>	At each stage of the mass matrix reduction, computes rigid body mass and compares with the rigid body mass t the g-set.

## Superelement Control

<b>EXTDRIN (Case)</b>	Requests the job to perform an external superelement data recovery restart. Also specifies the storage media of the boundary solution data.
<b>EXTDROUT (Case)</b>	Requests the job to store external superelement boundary displacements and column labels; e.g., eigenvalues, forcing frequencies, time steps. Also specifies the storage media of the boundary solution data.
<b>EXTSEOUT (Case)</b>	Specifies the data to be saved for an external superelement, and the medium on which the data is to be saved.
<b>LDLABEL (Case)</b>	Assigns a character string to an external superelement creation run's subcase in order to identify the static load in the assembly run.
<b>SEALL (Case)</b>	Specifies the superelement identification numbers of phase 1 processing wherein all matrices and loads are generated and assembled. Controls execution of the solution sequence.
<b>SEDR (Case)</b>	Specifies the superelement identification numbers for which data recovery will be performed.
<b>SEDV (Case)</b>	Specifies the superelement identification numbers for which the design variables will be processed.
<b>SEEXCLUDE (Case)</b>	Specifies the superelement identification numbers for which all matrices and loads will not be assembled into the downstream superelement.

SEFINAL (Case)	Specifies the superelement identification number of the final superelement to be assembled.
SEKREDUCE (Case)	Specifies the superelement identification numbers for which stiffness matrices are assembled and reduced.
SELGENERATE (Case)	Specifies the superelement identification numbers for which static loads will be generated.
SELREDUCE (Case)	Specifies the superelement identification numbers for which the static load matrices will be assembled and reduced.
SEMGENERATE (Case)	Specifies the superelement identification numbers for which stiffness, mass, and damping matrices will be generated.
SEMREDUCE (Case)	Specifies the superelement identification numbers for which the mass and damping matrices will be assembled and reduced. In buckling analysis, the differential stiffness matrices are assembled and reduced.
SERESP (Case)	Specifies the superelement identification numbers for which the design sensitivity matrices will be generated.
SOLUTION (Case)	Selects the solution ID for a 3 <sup>rd</sup> step external superelement data recovery restart in SOL 400.
SUPER (Case)	Assigns a subcase(s) to a superelement or set of superelements.

## Miscellaneous

\$	Used to insert comments into the input file. Comment statements may appear anywhere within the input file.
BEGIN BULK (Case)	Designates the end of the Case Control Section and/or the beginning of a Bulk Data Section.
INCLUDE (Case)	Inserts an external file into the input file. The INCLUDE statement may appear anywhere within the input data file.
NSM (Case)	Request nonstructural mass distribution selection.
OUTPUT (Case)	Delimits the various types of commands for the structure plotter, curve plotter, grid point stress, and MSGSTRESS.
PARAM (Case)	Specifies values for parameters.
POST (Case)	Controls selection of data to be output for postprocessing.
RIGID (Case)	Selects type of rigid element formulations to be used.

## Case Control Commands

### \$ Comment

Used to insert comments into the input file. Comment statements may appear anywhere within the input file.

For SOL 700 only, the string '\$S700' (starting in column 1 with a blank in column 6) may be used to transfer any Case Control string directly to Dytran. For example:

`$S700 ELOUT (TEST1) =XVEL, YVEL, ZVEL, DENSITY, SIE, PRESSURE, fmat`  
will become

`ELOUT (TEST1) =XVEL, YVEL, ZVEL, DENSITY, SIE, PRESSURE, fmat`

in the Case Control Section of the Dytran input (jid.dytr.dat) file. Please see descriptions of '\$S700' Case Control entries elsewhere in this section.

#### **Format:**

\$ followed by any characters out to column 80.

#### **Example:**

```
$ TEST FIXTURE-THIRD MODE
```

#### **Remarks:**

1. Comments are ignored by the program.
2. Comments will appear only in the unsorted echo of the Bulk Data.

**\$\$700**

## Direct Case Control Command for SOL 700

All entries which start with \$\$700 in the Case Control Section will be passed directly to the SOL 700 solver. Import of Euler results and the control of output generation are using this entry:

**Output Control:**

No need to use the Nastran classical case control output (STRESS,DISP,...). This option controls ARC (state file) and THS (time history file) output files.

You need to specify the following for a complete output specification:

1. Type of the file
2. What entities (e.g., grid points, elements, rigid bodies, etc.)
3. What results are output
4. How often it is saved
5. How often data is written

**Format:**

```

$$700 TYPE(logical_file) = ARCHIVE
$$700 Entity Type(logical_file) = setid
$$700 SET setid = idi
$$700 Entity Var(logical_file) = var
$$700 TIMES(logical_file) = ti
$$700 STEPS(logical_file) = stepi
$$700 SAVE(logical_file) = n

```

**Example:**

```

$$700 TYPE (elements) = ARCHIVE
$$700 ELEMENTS (elements) = 1
$$700 SET 1 = 16805 THRU 16875 16877 THRU 16947 16949 THRU 18080 ,
$$700          59 THRU 945 1067 1068 1069 1070 1181 THRU 1412 ,
$$700          1423 THRU 2965 3076 THRU 3930 4041 THRU 4895 ,
$$700          5006 THRU 5860 5971 THRU 7744 10855 THRU 12025 ,
$$700          12138 THRU 12990 13103 THRU 13955 14068 THRU 14920 ,
$$700          15033 THRU 15885 15998 THRU 16875 16877 THRU 16947 ,
$$700          16949 THRU 18080 16805 THRU 16875 16877 THRU 16947 ,
$$700          17005 THRU 18080 16949 THRU 17004 BY 1
$$700 ELOUT (elements) = EFFSTS, PRESSURE, FMAT, YMOM ,
$$700          QDIS,
$$700          MASST
$$700 TIMES (elements) = 0,THRU,END,BY,4e-4
$$700 SAVE (elements) = 1

```

Describer	Meaning
logical_file	The logical name of the file to which the user output is written. The logical name may not contain any spaces or special characters and must be restricted to 8 characters or less. (Characters; Required)
setid	Number of a SET command. Only data for elements that appear in the set are output. (Integer > 0; Required)
Idi	Identification numbers at which the output is requested. “THRU” and “BY”; for the “THRU” and “BY” options, respectively. See Remark 2. (Integer > 0 or characters; Required)
Var	Variable name to be output. See Remark 5. (Characters; Required)
Ti	Times at which output is required. “THRU” and “BY”; for the “THRU” and “BY” options, respectively. “END” indicates the end time of analysis. See Remarks 3. and 4. (Real $\geq 0.0$ or characters; Required)
stepi	Steps at which output is required. “THRU” and “BY”; for the “THRU” and “BY” options, respectively. See Remarks 3. and 4. (Integer $\geq 0$ or characters; Required)
N	The number of times an output file is written before it is closed and saved. (Integer > 0; Required)

### Remarks:

1. Default of ARC output control is set to the ARC file generation of all Eulerian elements with all available variables.
2. Continuation lines are supported for SET, ELOUT, TIMES and STEPS. The continuation lines must start with at least two spaces after the \$\$S700 string. A comma (,) at the end of a line signifies that the next line is a continuation.
3. Either STEPS or TIMES must be specified. STEPS and TIMES can not be used for the same logical\_file.
4. A list of times or steps should be in ascending order.
5. Check [Chapter 11: Outputting Results](#) in *MSC Nastran SOL700 User's Guide*. It includes all Entity types, Entity variables and Variable names.

### Import Euler results:

Specifies an Euler archive that was created during a previous simulation and is used as input for a transient analysis. The Euler archive is mapped onto a set of Euler elements that can equal in size or either finer or coarser.

### Format:

```
$$S700 EULINIT, filename,CYCLE,MESH-ID
```

### Example:

```
$$S700 EULINIT,AXISYM_ALLEULER_0.ARC,60
```

Describer	Meaning
filename	The filename of the ARC file to be used.
CYCLE	Cycle number.
MESH-ID	The MESH ID of the target elements.

### Remarks:

1. The target elements are the elements defined in the follow-up run and are the elements that will be initialized using the import archive.
2. Both defined and imported Euler elements need to be orthogonal in the global system.
3. MESH-ID enables support for multiple Euler domains. If MESH-ID is not set the import archive will be mapped onto all Euler elements.
4. For multi-material Euler analyses with multiple Eulerian materials all material variables in the import archive require the material number. These material variables are MASS, DENSITY, SIE, FMAT. The required list of variables for a MMHYDRO run are: MASSXX, SIEXX, FMATXX, XVEL, YVEL, ZVEL. Here XX denotes the material number. FOR MMSTREN the variables TXX, TYY, TZZ, TXY, TYZ, TZX, EFFPLS have to be added. If the multi-material run uses only one Eulerian material then the material numbers can be left out.
5. For multi-material Euler analyses with EOSIG, the following has to be added for the IG materials: MASS-EXX, MASS-PXX, RHO-EXX, RHO-PXX, IGBURNXX, FMAT-PXX, FMAT-PXX, SIE-EXX, and SIE-PXX. Here XX denotes the material number
6. For the single-material Hydro Euler solver the required list is MASS, DENSITY, SIE, FMAT, and FVUNC.
7. IF FVUNC is not included in the Import archive it is assumed that all elements in this archive are fully uncovered. It is allowed to import such an archive in a simulation with a coupling surface. In this follow up simulation the target elements can have uncover fractions different from one. In this case conservative quantities of imported elements are reduced by the uncover fraction of the target element. This is to avoid unwanted pressure increases. It simply means that any mass of the import archive that is located in the covered part of the target elements is thrown away. As a result not all mass in the import archive is mapped to the target elements. How much of the mass of the import archive is mapped is shown in the out file.
8. In the OUT file, a summary is shown of all variables that are mapped.
9. In the follow-up run, the cycle and time are taken from the import archive. The results of the first cycle of the follow-up run are determined from remapping only and has not gone through an equation of state yet. This will happen in the next cycle
10. If needed the remapping can be checked by doing only one additional cycle in the follow-up run with a quite small time step. Then, the follow-up OUT file shows two cycles and the results should be almost identical to the results of the import archive. Also, material summaries in the OUT file between first run and follow-up run should be identical. The only exceptions are the summaries of momentum, kinetic energy, and total energy per material. For these three quantities, only the total amounts will remain constant between first and follow-up run.

11. To remap a spherical symmetric or an axial symmetric Euler archive, the DYPARAMs [DYPARAM,SPREMAP](#) and [DYPARAM,AXREMAP](#) have to be used. Also, the remapping of a spherical symmetric Euler domain onto a 2-D axial symmetric Euler domain is supported.

**A2GG****Selects a Direct Input Fluid-Structure Coupling Matrix**

Selects a direct input fluid-structure coupling matrix.

**Format:**

A2GG = name

**Example:**

A2GG = AGG0

Descriptor	Meaning
name	Name of a fluid-structure coupling matrix that is input on the DMIG Bulk Data entry.

**Remarks:**

1. DMIG entries will not be used unless selected by the A2GG Case Control command.
2. This entry must be above subcase level or in the first subcase.
3. If the A2GG Case Control command selects a DMIG entry, then Nastran will add the selected fluid-structure coupling matrix to the computed coupling matrix. To replace the computed coupling matrix with the selected A2GG matrix, set PARAM,ASCOUP,NO. The user may still define panels with the panel selection procedure.
4. When filling out the DMIG entries: IFO = 1, NCOL = g-size, GJ-column index corresponds to fluid points, CJ = 0, Gi-row index corresponds to structural points, Ci-corresponds to DOF, Ai-the area values.
5. A2GG is supported in dynamic solutions with fluid-structure coupling.
6. Only one A2GG command should be used. It must appear above any subcase structure or in the first subcase only.

## ACCELERATION

### Acceleration Output Request

Requests form and type of acceleration vector output.

#### Format:

$$\text{ACCELERATION} \left[ \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \begin{array}{l} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{array} \right] \right), \right. \\
 \left. \left[ \begin{array}{l} \text{RPRINT} \\ \text{NORPRINT} \end{array} \right], \text{RPUNCH}, \text{CID} \right) \\
 = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

#### Examples:

```

ACCELERATION=5
ACCELERATION (SORT2, PHASE)=ALL
ACCELERATION (SORT1, PRINT, PUNCH, PHASE)=17
ACCELERATION (SORT2, PRINT, PSDF, CRMS, RPUNCH)=20
ACCELERATION (PRINT, RALL, NORPRINT)=ALL
    
```

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.
PRINT or (blank)	Printer File (.f06)
PUNCH	Punch File (.pch)
PLOT	Plot File (.op2/.h5)

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

Describer	Meaning
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests the power spectral density function be calculated for random analysis postprocessing. Request must be made above the subcase level and RANDOM must be selected in the Case Control Section. See Remark 5.
ATOC	Requests the autocorrelation function be calculated for random analysis postprocessing. Request must be made above the subcase level and RANDOM must be selected in the Case Control Section. See Remark 5.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level and RANDOM must be selected in the Case Control Section. See Remark 5.
RALL	Requests all of PSDF, ATOC and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level and RANDOM must be selected in the Case Control Section. See Remark 5.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
CID	Requests printing of output coordinate system ID in printed output file (.f06).
ALL	Accelerations at all points will be output.
n	Set identification of a previously appearing SET command. Only accelerations of points with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	No results will be output (Default).

### Remarks:

1. Acceleration output is only available for transient and frequency response problems. Acceleration is only available for transient and frequency response problems and when response spectra is requested in eigenvalue analysis.
2. See Remark 1 under [DISPLACEMENT \(Case\), 296](#) for a discussion of SORT1 and SORT2.
3. ACCELERATION=NONE allows overriding an overall output request.
4. Acceleration results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
5. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
6. Note that the CID keyword affects only grid point related output, such as displacement (DISP), velocity (VELO), acceleration (ACCEL), OLOAD, SPCforce (SPCF), and MPCforce (MPCF). In addition, the CID keyword needs to appear only once in a grid-related output request anywhere in the Case Control Section to turn on the printing algorithm.

## ACFPMRESULT

## Acoustic Field Point Mesh Results Output Request

Requests output of field point mesh results. This Case Control command can be used in SOL 108 and SOL 111 only.

### Format:

$$\text{ACFPMRESULT} \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT,PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \text{VELOCITY} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right] \right. \\ \left. \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \text{POWER} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right] \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

Descriptor	Meaning
------------	---------

SORT1	Output will be presented as tabular listing of grid points for each excitation frequency (Default).
SORT2	Output will be presented as a tabular listing of excitation frequencies for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

VELOCITY	Requests output of particle velocities (Default = NO).
REAL or IMAG	Requests rectangular format (real or imaginary) of complex output. Use of either REAL or IMAG yields the same output.
ALL	Radiated power will be processed for the wetted surface and all panels.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
POWER	Requests output of power through field point mesh (Default = YES).

Describer	Meaning
ALL	Results of all field point meshes, AFPMIDs, will be processed.
n	Set identification of a previously defined set of field point mesh identifiers, AFPMIDs, Results will be processed for the field point meshes in this set only.
NONE	Field point mesh results will not be processed. ACFPMRESULT = NONE overrides an overall request.

**Remark:**

1. If the acoustic model references multiple PACINF entries that do not have coincident pole locations and if the acoustic field point meshes contain element data, then a PACINFID parameter entry is required in the bulk data for each mesh to identify the PACINF bulk data entry that is used to define the location of the pole. Data recovery operations require that the element surface normal vector point away from the pole location.
2. The member of set for ACFPMRESULT must be the IDs of 'BEGIN AFPM='; not GRID IDs or element IDs under a 'BEGIN AFPM='.

## ACPOWER

## Acoustic Power Output Request

Requests output of the power radiated from the wetted surface.  
This Case Control command can be used in SOL 108 and SOL 111 only.

### Format:

$$\text{ACPOWER} \left[ \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], [\text{CSV} = \text{unit}] \right) \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

Describer	Meaning
SORT1	Output will be presented as a tabular listing of panels for each excitation frequency.
SORT2	Output will be presented as a tabular listing of excitation frequencies for each panel (Default).

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

CSV	Results will be written to a .CSV file. See Remark 1.
unit	Unit of the .csv file as used on the ASSIGN statement.
ALL	Radiated power will be processed for the wetted surface and all panels.
n	Set identification of a previously defined set of panels. Radiated power will be processed for the wetted surface and all panels in the referenced set.
NONE	Radiated power will not be processed. ACPOWER = NONE overrides an overall request.

### Remarks:

1. If output to an .CSV file is requested, the file must be assigned with logical key “USERFILE” and FORM=FORMATTED, e.g.,

```
ASSIGN USERFILE = 'myfile.csv' UNIT=50 FORM=FORMATTED STATUS=NEW
```

2. The mean radiated acoustic power per period ( $P_A$ ) is computed as:

$$P_A = \frac{1}{2} \text{REAL}(\{v\}^* [A] \{p\})$$

where,  $\{v\}^*$  is the complex conjugate transpose of the complex velocity of the wetted surface,  $[A]$  is the coupling matrix, and  $\{p\}$  is the acoustic pressure.

## ACTIVAT

### Elements to be Reactivated in SOL 600

Indicates which Bulk Data ACTIVAT entry is used to control the elements to be activated in this subcase. This entry may only be used in SOL 600.

#### Format:

ACTIVAT=N

#### Example:

ACTIVAT=3

Describer	Meaning
N	ID of a matching Bulk Data ACTIVAT entry specifying the elements to be reactivated for this subcase.

#### Remarks:

1. Different sets of elements can be reactivated during different subcases using this Case Control command.
2. The elements specified in the matching ACTIVAT Bulk Data entry must currently be in a deactivated state.

## ACTRIM

## ACTRAN Trimmed Material Matrices for SOL 108/111

Select ACTRAN trimmed material matrices.

### Format:

ACTRIM = name1, name2, ... namen

### Example:

```
ACTRIM = FLOOR_F, FLOOR_R, DASH
SET 10 = FR_LH, RR_LH
ACTRIM = 10
```

Describer	Meaning
namei	Name of the ACTRAN trimmed material matrices that is input on the ACTRIM bulk data entry, or name list.

### Remarks:

1. This entry must be above subcase level or in the first subcase.
2. If the ACTRIM Case Control command selects ACTRIM bulk data entries, Nastran will add the selected ACTRAN matrices to fluid-structure coupling problem in all subcases.
3. ACTRIM is supported in frequency response analysis for fluid-structure coupling problem and the frequency dependent algorithm will be adopted automatically.
4. PARAM, ACSYM, YES should be set for ACTRIM (default).
5. The effect of ACTRIM will be considered in standard frequency response analysis and participation factor analysis by PFMODE, PFPANEL and PFGRID.

## ADAMSMNF\*

## Control for Nastran/ADAMS Interface

Control for Nastran/ADAMS Interface modal neutral file (.mnf)

### Format:

$$\begin{aligned}
 \text{ADAMSMNF} & \left[ \text{FLEXBODY} = \left\{ \begin{array}{c} \text{NO} \\ \text{YES} \end{array} \right\} \right], \left[ \text{FLEXONLY} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right], \\
 & \left[ \text{ADMCHECK} = \left\{ \begin{array}{c} \text{NO} \\ \text{YES} \end{array} \right\} \right], \left[ \text{ADMOUT} = \left\{ \begin{array}{c} \text{NO} \\ \text{YES} \end{array} \right\} \right], \\
 & \left[ \text{OUTGSTRS} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right], \left[ \text{OUTGSTRN} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right], \\
 & \left[ \text{OUTSTRS} = \left\{ \begin{array}{c} \text{NO} \\ \text{YES} \end{array} \right\} \right], \left[ \text{OUTSTRN} = \left\{ \begin{array}{c} \text{NO} \\ \text{YES} \end{array} \right\} \right] \\
 & \left[ \text{V1ORTHO} = \left\{ \begin{array}{c} -1.0 \\ \text{value1} \end{array} \right\} \right], \left[ \text{V2ORTHO} = \left\{ \begin{array}{c} 1.0e8 \\ \text{value2} \end{array} \right\} \right], \\
 & \left[ \text{MINVAR} = \left\{ \begin{array}{c} \text{PARTIAL} \\ \text{CONSTANT} \\ \text{FULL} \\ \text{NONE} \\ \text{RIGID} \end{array} \right\} \right] \\
 & \left[ \text{PSETID} = \left\{ \begin{array}{c} \text{NONE} \\ \text{setid}_{\text{plotel}} \\ \text{ALL} \end{array} \right\} \right] \left[ \text{EXPORT} = \left\{ \begin{array}{c} \text{MNF} \\ \text{DB} \\ \text{BOTH} \end{array} \right\} \right] \left[ \text{MONITOR} = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\} \right]
 \end{aligned}$$

### Example(s):

ADAMSMNF FLEXBODY = YES

**Note:** \*Nastran/ADAMS modal stress recovery (MSR) interface is also available. See Remark 19. CAUTION: Do not use mode=i8 (64 bit integer, 64 bit float) option when submitting the Nastran job if the ADAMSMNF EXPORT option specifies DB or BOTH and your intent is to use the DB in ADAMS. ADAMS does not currently support i8 DB files. If you use mode=i8, you must use the MNF in ADAMS.

NASTRAN/ADAMS MNF can be used with SOL 400 as described in Remark 21.

ADAMSMNF cannot be run in linear solution sequences with RIGID=LAGRANGE. A fatal will be issued. The main reason is that the Lagrange multipliers are in the wrong set for the boundary solution and resulting orthonormal modes will in general not be correct.

Describer	Meaning
FLEXBODY	Requests that the Nastran/ADAMS interface be executed.
NO	Executes standard Nastran.
YES	Executes Nastran/ADAMS interface.
FLEXONLY	Requests standard DMAP solution and data recovery following Nastran/Adams interface execution.
YES	Executes only the Nastran/ADAMS interface.
NO	Executes Nastran/ADAMS interface and standard DMAP solution and data recovery.
ADMCHECK	Requests Nastran/ADAMS diagnostic output.
YES	Prints diagnostic output.
NO	Suppresses diagnostic output.
ADMOUT	Requests that the Nastran/ADAMS interface outputs Nastran .op2 files.
YES	.op2 files are generated.
NO	Requests that .op2 files are not generated.
OUTGSTRS	Controls grid point stress output to .op2 file or .mnf or both.
YES	Grid point stress is output to .op2 file or .mnf or both.
NO	Grid point stress is not output to .op2 file, or .mnf file.
OUTGSTRN	Controls grid point strain output to .op2 file, or .mnf or both.
YES	Grid point strain is output to .op2 file or .mnf or both.
NO	Grid point strain is not output to .op2 file or .mnf.
OUTSTRS	Controls element stress output to .op2 file.
YES	Element stress is output to .op2 file.
NO	Element stress is not output to .op2 file.

Describer	Meaning
OUTSTRN	Controls element strain output to .op2 file.
YES	Element strain is output to .op2 file.
NO	Element strain is not output to .op2 file.
V1ORTHO	Lower frequency bound of the Craig-Bampton modes in cycles/unit time.
value1	Value of lower bound.
V2ORTHO	Higher frequency bound of the Craig-Bampton modes in cycles/unit time.
value2	Value of higher bound.
MINVAR	Requests the type of mass invariants to be computed. See Remark 3.
FULL	All nine mass invariants will be calculated.
CONSTANT	Only mass invariants (5-1), (5-2), (5-6), and (5-7) will be calculated.
PARTIAL	All mass invariants except (5-5) and (5-9) will be calculated.
NONE	No mass invariants are computed. (This option is invalid for structure/fluid coupled system. )
RIGID	No modal information is output to the .mnf file. Only units, grid point coordinates, element connectivity, interface nodes, and invariant (5-1), (5-2), and (5-7) data are shared in the .mnf file.
EXPORT	Controls modal output.
MNF	output to MNF file
DB	output to Nastran database
BOTH	output to Nastran database and MNF file
PSETID	Selects a set of elements (including PLOTEL) whose grids are retained in the MNF, and whose connectivity defines face geometry for ADAMS display.
setid <sub>plotel</sub>	Specified in the OUTPUT(PLOT) Section of Nastran.
ALL	Select all the sets defined in the OUTPUT(PLOT) Section of Nastran.
MONITOR	Request or suppress output of monitor point data to Adams MNF. Default is output (Yes). Specify No to suppress output.

### Remarks:

1. This entry represents a collection of PARAM,name,value entries. A license is required for the Nastran/ADAMS interface.
2. ADAMSMNF FLEXBODY = YES is required to execute the Nastran/ADAMS interface, all other ADAMSMNF items are optional. The ADAMSMNF FLEXBODY = YES must occur above subcase level.

If you want standard Nastran data recovery in addition to that produced for ADAMS, you need to run with FLEXONLY=NO. The orthonormal modes produced for ADAMS and the modes produced by the standard MSC Nastran run may be viewed in Patran if run with PARAM,POST,0.

3. The nine mass invariants are defined by Eqs. (5-1) through (5-9):

$${}^1_I = \sum_{p=1}^N m_p \quad (5-1)$$

$${}^2_I = \sum_{p=1}^N m_p \mathbf{s}_p \quad (5-2)$$

$${}^3_{I_j} = \sum_{p=1}^N m_p \Phi_p \quad j = 1, \dots, M \quad (5-3)$$

$${}^4_I = \sum_{p=1}^N m_p \tilde{\mathbf{s}}_p \Phi_p + \mathbf{I}_p \Phi_p^* \quad (5-4)$$

$${}^5_{I_j} = \sum_{p=1}^N m_p \tilde{\phi}_{pj} \Phi_p \quad j = 1, \dots, M \quad (5-5)$$

$${}^6_I = \sum_{p=1}^N m_p \Phi_p^T \Phi_p + \Phi_p^{*T} \mathbf{I}_p \Phi_p^* \quad (5-6)$$

$${}^7_I = \sum_{p=1}^N m_p \tilde{\mathbf{s}}_p^T \tilde{\mathbf{s}}_p + \mathbf{I}_p \quad (5-7)$$

$${}^8_{I_j} = \sum_{p=1}^N m_p \tilde{\mathbf{s}}_p \tilde{\phi}_{pj} \quad j = 1, \dots, M \quad (5-8)$$

$${}^9_{I_{jk}} = \sum_{p=1}^N m_p \tilde{\phi}_{pj} \tilde{\phi}_{pk} \quad j, k = 1, \dots, M \quad (5-9)$$

where  $\mathbf{s}_p = [xyz]^T$  are the coordinates of grid point  $p$  in the basic coordinate system;

$$\tilde{\mathbf{s}}_p = \begin{bmatrix} 0 & -z & y \\ z & 0 & -x \\ -y & x & 0 \end{bmatrix}$$

is the skew-symmetric vector cross product operator;  $\Phi_p$  is the partitioned orthogonal modal matrix that corresponds to the translational degrees-of-freedom of grid  $p$ ;  $\mathbf{I}_p$  is the inertia tensor;  $\Phi_p^*$  is the partitioned orthogonal modal matrix that corresponds to the rotational degrees-of-freedom of grid  $p$ ;  $\tilde{\Phi}_{pf}$  is the skew-symmetric matrix formed for each grid translational degree-of-freedom for each mode;  $M$  is the number of modes; and  $N$  is the number of grid points.

4. The preceding mass invariant calculation currently depends on a lumped mass formulation. The parameter PARAM,COUPMASS should not be specified when executing the Nastran/ADAMS interface.
5. If the CONM1 is used, M21, M31, and M32 entries should be left blank.
6. If PARAM,GRDPNT,value specified, mass invariants  $^1I$ ,  $^2I$ , and  $^7I$  will be obtained from an Nastran grid point weight generator execution in the basic system.
7. The following DTI,UNITS Bulk Data entry is required for a FLEXBODY=YES run:

Since ADAMS is not a unitless code (as is Nastran), units must be specified. A DTI Bulk Data entry provides 'UNITS' (a unique identifier) input as the following example illustrates. Once identified, the units will apply to all superelements in the model. Acceptable character input strings are listed in the following table.

Format:

DTI UNITS 1 MASS FORCE LENGTH TIME

Example:

DTI UNITS 1 KG N M S

Mass:

kg - kilogram  
 lbm - pound-mass  
 slug - slug  
 gram - gram  
 ozm - ounce-mass  
 klbm - kilo pound-mass (1000.lbm)  
 mgg - megagram  
 slinch - 12 slugs  
 ug - microgram  
 ng - nanogram  
 uston - US ton

Length:

km - kilometer  
 m - meter  
 cm - centimeter  
 mm - millimeter  
 mi - mile  
 ft - foot  
 in - inch  
 um- micrometer  
 nm - nanometer  
 ang - angstrom  
 yd - yard  
 mil - milli-inch  
 uin - micro-inch

Force:

n - newton  
 lbf - pounds-force  
 kgf - kilograms-force  
 ozf - ounce-force  
 dyne - dyne  
 kn - kilonewton  
 klbf - kilo pound-force (1000.lbf)  
 mn - millinewton  
 un - micronewton  
 nn - nanonewton

Time:

h - hour  
 min - minute  
 s - sec  
 ms - millisecond  
 us - microsecond  
 nanosec - nanosecond  
 d - day

A note of clarification about UNITS and its relation to Nastran's WTMASS parameter: WTMASS, though necessary to achieve units consistency in Nastran, is ignored in the output for ADAMS. Units data for ADAMS is supplied on the UNITS DTI entry. For example, consider a model with mass in grams, force in Newtons, length in meters, and time in seconds. A WTMASS parameter equal to 0.001 would ensure that Nastran works with a consistent set of units (kg, N, and m). The units reported to ADAMS should then be: "DTI, UNITS, 1, GRAM, N, M, S."

8. OUTSTRS or OUTSTRN entries require the use of the standard Nastran STRESS= or STRAIN= Case Control commands to produce element stress or strain. STRESS(PLOT)= or STRAIN(PLOT)= will suppress stress or strain output to the Nastran .f06 file. The OUTSTRS or OUTSTRN entries are required for importing ADAMS results into MSC Fatigue. See the Nastran/ADAMS/durability documentation for more information.

9. OUTGSTRS or OUTGSTRN entries require the use of the standard Nastran STRESS= or STRAIN= Case Control commands used in conjunction with GPSTRESS= or GPSTRAIN= Case Control commands to produce grid point stress or strain. GPSTRESS(PLOT)= or GPSTRAIN(PLOT)= will suppress grid stress or strain output to the Nastran .f06 file.
10. To reduce the finite element mesh detail for dynamic simulations, PSETID=set\_entry is used to define a set of PLOTELS or other elements used to display the component in ADAMS. If a mass invariant computation is requested, this option can significantly reduce the size of the .mnf without compromising accuracy in the ADAMS simulation.

If PSETID specifies an existing set from the OUTPUT(PLOT) Section of Nastran, this single set is used explicitly to define elements to display in ADAMS. Otherwise, the Nastran Case Control Section will be searched for a matching set ID. This matching set ID list then represents a list of OUTPUT(PLOT) defined elements sets, the union of which will be used to define a set of PLOTELS or other elements used to display the component in ADAMS. If the user wishes to select all of the sets in the OUTPUT(PLOT) Section, then use PSETID=ALL.

The elements defined may include rigid element IDs. When defining these sets, do not use EXCLUDE and EXCEPT descriptions.

If a superelement analysis is being executed, any element defined on the PSETID=set\_entry that lies entirely on the superelement boundary (i.e., all of its grids are a-set or exterior to the superelement) must also be specified on a SEELT Bulk Data entry. The SEELT entry would not be required for part superelements, as boundary elements stay with their component.

```
OUTPUT (PLOT)
SET 7722 = 10001 THRU 10010
```

11. The ADMOUT=YES option is intended for users who plan to import ADAMS results into MSC Fatigue. This option requires the following assignment command in the File Management Section of the Nastran file:

```
ASSIGN OUTPUT2='name.out' STATUS=UNKNOWN UNIT=20 FORM=UNFORM
```

It causes .op2 files with an .out extension to be generated for input into MSC Fatigue. FLEXBODY=YES is required with its use. The files' outputs are: DTI-units, SE-number of superelements (9999 if residual), SEIDX-superelement id, ASETX-size of a-set, BGPPTS-grid location table, GEOM2S-element connections, GEOM4S-constraints and sets, MGGEW-physical mass external sort with weight mass removed, VAEXT-a-set partition vector, VGEXT-g-set partition vector, VAPEXT-eigenvalue size partition vector, MAAEW-modal mass, KAAE-modal stiffness, BAAE-modal damping, RAE-modal preload, PAE-modal loads, CMODEXT-component modes, OES1-element stress shapes, OSTR1-element strain shapes, OGS1-grid point stress shapes, OGSTR1-grid point strain shapes, OGS1PL-grid point physical preload stress, OGTR1PL-grid point physical preload strain. The files are output for each superelement and their generation depends on the loading and output requests.

To ensure compatibility with the ADAMS .op2-to-.mnf translator, if the ADAMSMNF Case Control command has the keyword ADMOUT=YES, the Nastran SYSTEM word OP2NEW is automatically set to OP2NEW=0. This means that any .op2 files generated will have a pre-MSC Nastran 2004 format.

12. Environment variables controlling .mnf generation can be set before submitting the Nastran job, or by using the Nastran keyword 'MNFWRITEOPTIONS' which can be abbreviated to any short unique string such as 'MNFW'. The Nastran keyword can be entered on the NASTRAN submittal command line or in a user .nastran rc file. For example, interior grids and elements can be removed in the .mnf by entering, prior to the Nastran submittal, with Korn shell:

```
export MDI_MNFWRITE_OPTIONS=strip_face
```

with C shell:

```
setenv MDI_MNFWRITE_OPTIONS=strip_face
```

Or, at the time of Nastran submittal:

```
nastran_submittal_command jid MNFW=strip_face
```

Consult the ADAMS/Flex documentation for more information on the use of environment variables during .mnf generation.

The command

```
nastran_submittal_command help mnfw
```

will generate the description of the symbol keyword.

The command

```
nastran_submittal_command help all
```

will generate a complete set of Nastran submittal keywords.

13. .mnf naming convention is as follows: for a single superelement run, 'jid.mnf'; for a residual only or multiple superelement run 'jid\_seid.mnf', etc.; where seid1 and seid2 are the integer numbers of the superelement. The default location of these files is the same directory as the jid.f06 file. See the ASSIGN .mnf command to change directory location.
14. When supplying SPOINT/QSET combinations, there should be a sufficient number of combinations to correctly capture the modal shapes. If  $n$  is the number of modes specified on the EIGR or EIGRL Bulk Data entries and  $p$  is the number of loadcases specified, then the number of SPOINTs( $ns$ ) should be at least  $ns = n + (6 + p)$  assuming that residual flexibility is on. In general, there cannot be too many SPOINTS, as excess ones will simply be truncated with no performance penalty.
15. The user can have Nastran automatically specify the SPOINT/QSET by including, above the Case Control Section the parameter PARAM,AUTOQSET,YES. In this case no SPOINT/QSET can appear in the Bulk Data. See the PARAM,AUTOQSET description for detailed requirements or limitations.
16. By default, MSC Nastran 2005 will create a version 6.0 MNF. ADAMS 2005 is able to read the version 6.0 .mnf file. Earlier ADAMS versions are not able to read a 6.0 .mnf file. Nastran can be instructed to write a backward-compatible .mnf file by submitting the Nastran job with MNFWRITEOPTIONS=full\_str. Alternatively, the user may set the environment variable MDI\_MNFWRITE\_OPTIONS to 'full\_str'. See Remark 12. for more information on controlling the .mnf format.

17. In addition to modal stiffness and modal mass matrices, the modal damping matrix may also be output to the .mnf. The damping allowed is the standard Nastran damping matrix consisting of  $[B_{gg}]$  viscous damping,  $(1/w4) [K4_{gg}]$  structural damping,  $(g/(w3) + \alpha2)[K_{gg}]$  structural and Rayleigh damping, and  $(\alpha1)[M_{gg}]$  Rayleigh damping. Where g is set by PARAM,G,value, w3 is set by PARAM,W3,value; w4 is set by PARAM,W4,value;  $\alpha1$  is set by PARAM,ALPHA1,value,0.;and  $\alpha2$  is set by PARAM,ALPHA2,value,0.

Additionally,  $[B2H]$  modal damping can be included by use of the Case Control command SDAMP=n. For part superelement or superelement analyses, modal damping for each individual part or superelement can be controlled by PARAM,SESDAMP,YES (PARAM,SESDAMP,NO is the default).

SESDAMP		
sesdamp = no	Modal damping for each superelement using the free boundary modes.	SDAMP $\Rightarrow$ TABDMP1 SDAMP above subcase.
sesdamp = yes	Modal damping for each superelement using the fixed boundary CMS modes.	SDAMP $\Rightarrow$ TABDMP1 SDAMP in superelement subcase.
For part superelements each part may have a PARAM,SESDAMP		

The Nastran/ADAMS interface does not allow for adding modal damping to structural damping using PARAM,KDAMP,-1.

Direct input damping may also be included with the Case Control command B2GG=n. For part superelement or superelement analyses, use of this command with the Nastran/ADAMS interface requires fully expanded case control.

18. If preload is present in the model, physical gridpoint stress and strain for the preload may be output to the .mnf using standard GPSTRESS= or GPSTRAIN= commands.  
If preload is generated in a SOL 106 run for a SOL 103 restart, and the physical grid point stresses for the preload are desired for the SOL 103 MNF run, then PARAM,FLEXNLS,YES is required above the subcase level in the SOL 106 run.  
For preload generated in a SOL 106 run for a SOL 103 restart, the preload subcase must be replicated in the first subcase of the SOL 103 run.
19. After using the Nastran/ADAMS interface to produce an .mnf file and after performing an ADAMS solution, it is possible to bring the ADAMS results into Nastran for modal data recovery. ADAMS produces .op2 files for input to Nastran SOL 111 and SOL 112. The files are binary format with an .mdf extension. The File Management Section requires an assign command for each file:  
ASSIGN INPUTT2=' name .mdf' UNIT=ni  
with a DLOAD = ni in the appropriate subcase.

Also, in the Bulk Data Section, the parameter PARAM,ADMPOST = m (m = 0, by default no MSR performed) is required. If m = 1, rigid body motion is not considered in the structural deformation. If m = 2, rigid body motion is considered in the structural deformation.

Full details of the generation of the .mdf files and their use with Nastran are to be found in the Nastran/ADAMS durability documentation.

20. In order to obtain consistent ADAMS results in Nastran data recovery run, when ADAMS data brought back into Nastran SOL 111 or SOL 112, Nastran must be restarted from either of the following two options:
  - a. From the original Nastran database that was produced during SOL103 MNF creation run (created MNF is used in ADAMS run).
  - b. From the external SE (\*.op2) that was produced during SOL103 MNF creation run (created MNF is used in ADAMS run). The File Management section requires to assign command for external SE op2.

```
ASSIGN INPUTT2='EXTSE100.OP2' UNIT=ni
```

with following PARAM entries

```
PARAM ADMPOST,1 or 2 $
```

```
PARAM ADMEXTU , ni $ Where ni = unit # of external SE op2.
```

21. Typically SOL 400 is used to produce a preload for an ADAMS flexbody MNF run.
  - a. In the preload run the structure should be statically supported and follower loading must be applied as a self-equilibrating load set (not with SPC relationships!). In the ANALYSIS=MODES step the structure must be a free-free structure as the resulting orthonormalization requires that six rigid body modes be present.

In order to produce modal amplitudes and mode shapes and to ensure residual vector calculations, SPOINTs and Q-sets are required. The SPOINTs must be included in the MAIN Bulk Data as they are included in the overall matrix size.

A new BULK data section labeled BEGIN FLXBDY =id must be included with the run. This new bulk section must contain the Q-set associate with the SPOINTs (in main bulk!) for modal amplitudes and the A-set required for attachment point designation.

The example below is a typical SOL400 problem setup:

```
SOL 400
CEND
$ Case Control Section
$ Output ADAMSMNF REQUIRED ABOVE SUBCASE
ADAMSMNF flexbody=yes, psetid=all, outgstrs=yes, outgstrn=yes
SUBCASE 1
  $ Preload
  STEP 10
      $ Static load and support for preload
      SUBTITLE = PRELOAD
      ANALYSIS = NLSTATICS
      NLSTEP = 110
      LOAD = 120
      SPC = 130
```

```

                BCONTACT = 140
                SPCF = ALL
                $ Generate stress and strain grid shapes
                STRESS(PLOT) = ALL
                STRAIN(PLOT) = ALL
                GPSTRESS(PLOT) = ALL
                GPSTRAIN(PLOT) = ALL
                $ Modal Step for Producing MNF
                $ Default: Select the end of previous load step to output
$ ADAMSMNF
  STEP 20
    ANALYSIS = MODES
    $ Select real Eigen Value Parameters
    METHOD = 210
    $ Turn residual vectors on
    RESVEC = COMPONENT
    STRESS(PLOT) = ALL
    STRAIN(PLOT) = ALL
    GPSTRESS(PLOT) = ALL
    GPSTRAIN(PLOT) = ALL

```

- b. In the above example, the SPC set in the ANALYSIS=NLSTAT must be a static (non-redundant) constraint condition. Note that in the ANALYSIS=MODES STEP, the SPC constraint set has been removed.

In SOL 400, the definition of the attachment a-set for identifying attachment points and for q-set for specifying the desired number of modal amplitudes for orthonormalization is done in a separate new FLXBDY Bulk Data Section shown below:

```

$ FLEXBODY Bulk section
BEGIN BULK FLXBDY = 10
$ Attachment point and component mode (A-SET) selection
ASET1,123456,1,11,111,121
QSET1,0,100001,THRU,100020

```

In SOL400, the ASET/ASET1 and QSET/QSET1, MUST, appear in the FLXBDY bulk data section.

Currently, only one FLXBDY bulk data section (with a positive Flexbody ID) is supported in SOL 400. Any non set related Bulk entries appearing in this Section will be ignored.

- c. If CONTACT is required as part of the preloading for the FLEXBODY=YES run, it is Highly Recommended that the friction option be turned on by using an appropriate BCPARA bulk data entry setting, e.g.,

```

$ Select bilinear Coulomb friction for all subcases
BCPARA, 0, FTYPE, 6

```

If contact friction is not turned on, the tangential motion between the two parts coming into contact will most likely not be constrained and incorrect or fatal results will occur.

- d. If RIGID elements (RBE1/RBE2/RBE3/RBAR/RROD/RJOINT) are in the model, then the Case Control RIGID= LAGRANGE (default for SOL400) should be used to avoid possible wrong results. If an attachment point happens to touch a rigid element, the point should be associated with the independent degree of freedom of the rigid element. Though not recommended, if for some modeling requirement, a dependent rigid element grid is required to be in the attachment set, the user MUST include at least one independent/reference grid for that specific rigid element in the ASET.
22. For STRUCTURE and FLUID coupled system, METHOD(COUPLED) can be used for MNF generation. However, all nodes on fluid face need to be coupled with structure for ADAMSMNF otherwise, mass and inertia of moment will be incorrect in MNF.

## AECONFIG

## Aeroelastic Configuration Name

Assigns the aerodynamic configuration parameter used to locate the associated datablocks on the aerodynamic and aeroelastic databases.

### Format: Assign a DBset member name

```
AECONFIG    =config-name
```

### Example:

Assign a MASTER file for the aerodynamic and aeroelastic DBsets

```
AECONFIG    =PROTO_A
```

Describer	Meaning
config-name	The configuration name. This is the aerodynamic supergroup name identified as part of the aeroelastic model (Character; Default = AEROSG2D).

### Remarks:

1. Typically, the aeroelastic configuration name is specified as the aerodynamic supergroup as part of the model generation in MSC FlightLoads.
2. If AECONFIG is not present, aerodynamic and aeroelastic datablocks will be created from the data in the Bulk Data Section and assigned the default value AECONFIG=AEROSG2D.
3. Multiple configuration names are supported.
4. AECONFIG is typically assigned above the subcase level. If it is overridden at the subcase level, it is necessary to attach an existing aerodynamic database.

**AERCONFIG**

## Aerodynamic Model to be Used for the Rigid Aerodynamics

Enables the user to select a different mesh for the rigid portion of the aerodynamics than for the elastic portion.

**Format:**

AERCONFIG=config-name

**Examples:**

AERC=RAERO

Describer	Meaning
AERC	The configuration name. This is the aerodynamic supergroup name for the aerodynamic model that is used to create the rigid aerodynamics.

**Remarks:**

1. If the AERCONFIG Case Control command is not present in the subcase, the rigid portion of the aerodynamics is based on the same AECONFIG as the flexible aerodynamics.
2. The rigid aerodynamics must be precomputed and attached from an assigned database using FMS commands such as:

```
ASSIGN RMASTER = "raero.master"
DBLOCATE WHERE (AECONFIG=' rconfig' ) LOGICAL=RMASTER
```

**AEROF**

## Aerodynamic Force Output Request

Requests the aerodynamic loads on aerodynamic control points.

**Format:**

AEROF=*n*

**Examples:**

AEROF=ALL

AEROF=5

Describer	Meaning
<i>n</i>	Set identification of a previously appearing SET command (Integer > 0).
ALL	Forces at all points will be output.

**Remarks:**

1. This command is supported in SOLs 144, 146 (frequency response only) and 200 for ANALYSIS=SAERO.
2. The SET command references box or body element identification numbers.
3. Output is in the units of force or moment.
4. Only aerodynamic forces on points specified on the SET command will be output.

**AESYMXY****Aerodynamic Flow Symmetry About The XY Plane**

Aerodynamic XY plane of symmetry flag. This is used to indicate whether the aerodynamic model has symmetry with respect to the ground.

**Format:**

$$\text{AESYMXY} = \left\{ \begin{array}{l} \text{SYMMETRIC} \\ \text{ANTISYMMETRIC} \\ \text{ASYMMETRIC} \end{array} \right\}$$

**Example:**

`AESYMXY = ASYMMETRIC`

<b>Describer</b>	<b>Meaning</b>
SYMMETRIC	Indicates that the aerodynamic model is moving in a symmetric manner with respect to the XY plane.
ANTISYMMETRIC	Indicates that the aerodynamic model is moving in an antisymmetric manner with respect to the XY plane.
ASYMMTRIC	Indicates that the aerodynamic model has no reflection about the XY plane.

**Remarks:**

1. If AESYMXY is not present in case control, aerodynamic XY symmetry will be determined from the SYMXY field of the AEROS Bulk Data entry for static aeroelastic analysis, and from the SYMXY field of the AERO Bulk Data entry for flutter and dynamic aeroelastic analysis.
2. If AESYMXY is present above the subcase level, it is applied to all subcases until overridden.
3. SYMMETRIC implies ground effect, and ASYMMETRIC implies free air analysis.
4. Multiple aerodynamic symmetries are supported.

## AESYMXZ

## Aerodynamic Flow Symmetry About The XZ Plane

Aerodynamic XZ plane of symmetry flag. This is used to support symmetric models about the centerline.

### Format:

$$\text{AESYMXZ} = \left\{ \begin{array}{c} \text{SYMMETRIC} \\ \text{ANTISYMMETRIC} \\ \text{ASYMMETRIC} \end{array} \right\}$$

### Example:

AESYMXZ = SYMMETRIC

Describer	Meaning
SYMMETRIC	Indicates that a half span aerodynamic model is moving in a symmetric manner with respect to the XZ plane.
ANTISYMMETRIC	Indicates that a half span aerodynamic model is moving in an antisymmetric manner with respect to the XZ plane.
ASYMMETRIC	Indicates that a full aerodynamic model is provided (Default).

### Remark:

1. If AESYMXZ is not present in case control, aerodynamic XZ symmetry will be determined from the SYMXZ field of the AEROS Bulk Data entry for static aeroelastic analysis, and from the SYMXZ field of the AERO Bulk Data entry for flutter and dynamic aeroelastic analysis.
2. If AESYMXZ is present above the subcase level, it is applied to all subcases until overridden.
3. Multiple aerodynamic symmetries are supported.

**AEUXREF****Defines the Reference Aerodynamic Extra Point (Controller) Vector**

Reference UXVEC selector for the aeroelastic trim analysis. This is used to indicate an aerodynamic extra point vector about which the stability derivatives are to be computed and printed. The stability derivatives are the change in force due to a unit perturbation of each parameter in the aerodynamic extra point set. Due to the nonlinear nature of the aeroelastic loads, the stability derivatives can be (but are not required to be) a function of the point about which the slope is computed. This input defines which point is to be used in computing the stability derivatives for printing (local slopes will be computed as needed in the trim solver). This selection is typically done within each subcase, but a case control default can be defined by placing an entry above the subcase level.

**Format:**

$$\text{AEUXREF} = \left\{ \begin{array}{c} \text{n} \\ \text{TRIM} \end{array} \right\}$$

**Examples:**

```
AEUXREF=100
AEUXREF=TRIM
```

Describer	Meaning
n	The identification number of a UXVEC Bulk Data entry that defines the point about which stability derivatives will be computed in TRIM cases.
TRIM	Indicates that the stability derivatives should be computed about the trimmed state.

**Remarks:**

1. If, for a particular subcase, AEUXREF is not defined, the “free stream” state will be used (that is, the stability derivatives will be computed about zero values for all parameters). This results in upward compatibility with the linear database paradigm.
2. Only one of a TRIM or a UXVEC ID may be specified on any given subcase. To see stability derivatives about additional points, you must define additional trim subcases.

## ANALYSIS

## Analysis Discipline SUBCASE/STEP/SUBSTEP Assignment

Specifies the type of analysis being performed for the current SUBCASE/STEP/SUBSTEP.

### Format:

ANALYSIS=type

### Examples:

SOL 200

```
SUBCASE 10
  ANALYSIS=STATIC
SUBCASE 20
  ANALYSIS=MODES
```

Describer	Meaning
type	Analysis type. Allowable values and applicable solution sequences (Character):
STATICS	Linear Static Analysis (SOLs 200 & 400)
MODES	Normal Modes Analysis (SOLs 110, 111, 112, 106, 200, & 400) See Remarks <a href="#">2</a> , <a href="#">3</a> , and <a href="#">4</a> .
BUCK	Buckling (SOLs 200 and 400)
DFREQ	Direct Frequency (SOLs 106, 200 and 400). See Remark <a href="#">4</a> .
MFREQ	Modal Frequency (SOLs 200 and 400)
MTRAN	Modal Transient (SOLs 200 and 400)
DCEIG	Direct Complex - Eigenvalue Analysis (SOLs 200 & 400)
MCEIG	Modal Complex - Eigenvalue Analysis (SOLs 200 & 400)
SAERO	Static Aeroelasticity (SOLs 200 and 400)
DIVERGE	Static Aeroelastic - Divergence (SOLs 200 & 400).
FLUTTER	Flutter (SOLs 200 and 400)
HEAT	Heat Transfer Analysis (SOLs 153, 159 and 600 only)
STRUCTURE	Structural Analysis (SOLs 153 & 159 only, default for these two SOLs is HEAT)
HSTAT	Steady State Heat Transfer (SOL 400)
HTRAN	Transient Heat Transfer (SOL 400)
NLSTATICS	Nonlinear Static Analysis (SOL 400). See Remark <a href="#">3</a>
NLTRAN	Nonlinear Transient Analysis (SOL 400). See Remark <a href="#">3</a> .
HOT2COLD	Hot-to-cold Analysis (SOL 106 only). See Remark <a href="#">4</a> .

Describer	Meaning
RCNS	RC Network Thermal Solver Steady State
RCNT	RC Network Thermal Solver Transient

**Remarks:**

- This entry is used in solution sequences that are capable of multiple analysis types and selects the actual analysis to be performed in the SUBCASE (or for SOL 400 the SUBCASE, STEP, or SUBSTEP).
  - For linear solution sequences SOLs 110, 111, and 112 and the nonlinear SOLs 106, 153, and 159, and for Optimization SOL 200 there can be only one **ANALYSIS=** per SUBCASE
  - SOL 600,153 and SOL 600,159 require **ANALYSIS=HEAT**. For other SOL 600,ID executive control entries, **ANALYSIS=** is not used and should not be entered.
  - For SOL 200, EVERY SUBCASE including any superelement SUBCASE must be assigned an **ANALYSIS=** Case Control command either in the explicit SUBCASE or above all SUBCASEs in which case it defaults to all the subcases.
  - For SOL 400 there can, for single physics analysis or chained multi physics analysis, be only one **ANALYSIS=** per STEP.
  - For SOL 400 coupled multi physics analysis there can be only one **ANALYSIS=** per SUBSTEP.
- In the linear solution sequences SOLs 110, 111, 112, 145, and 146 this entry allows data recovery of the normal modes data used in the in the complex Eigenvalue analysis, modal frequency analysis, or modal transient analysis. All commands which control the boundary conditions (SPC, MPC, and SUPORT) and METHOD selection should be copied inside the **ANALYSIS=MODES** SUBCASE or specified above the SUBCASE level. Note in the example below, SOL111 is a frequency response solution sequence so in the frequency response SUBCASE 2 below an **ANALYSIS=MFREQ** is allowed but not required.

```

SOL 111
  METH=40
  SPC=1
  SUBCASE 1 $ Normal Modes
    ANALYSIS=MODES
    DISP=ALL
  SUBCASE 2 $ Frequency response
    STRESS=ALL
    DLOAD=12
    FREQ=4

```

- SOL 400 analysis allows for seven analysis type combinations (nonlinear single physics, nonlinear chained physics, nonlinear coupled physics, linear perturbation analysis, standard linear physics, nonlinear chained analysis with mesh/time change physics, and nonlinear response optimization with ESLNRO (Equivalent Static Loads Nonlinear Response Optimization)).

If there are linear, nonlinear and perturbation subcases, the linear subcases will be solved first. The linear subcases are reordered for processing and the output will be in the following order regardless of original subcase number: STATICS, MODES, BUCKLING, DFREQ or MFREQ, DCEIG or MCEIG, SAERO, FLUTTER.

The general rule is: The solutions of all SUBCASEs are independent of each other. The solution of any STEP is a continuation of the solution of the previous STEP in the same SUBCASE. The solutions of the SUBSTEPS occur simultaneously within a STEP (coupled analysis):

Additionally the following rules should be observed:

- All Coupled Multi-Physics steps have to come before the Single-Physics steps.
  - Single-Physics steps can follow the Multi-Physics Steps.
  - All linear perturbation steps need to be at the end after definition of all possible coupled multi-physics steps and single-physics steps.
  - The Case Control Command NLIC used for Nonlinear Initial Condition should be referenced for further requirements between the analysis types allowed in SOL 400.
- a. Nonlinear single physics: Nonlinear structures or nonlinear heat: For nonlinear structures a **ANALYSIS=NLSTAT** must come before a **ANALYSIS=NLTRAN**. Only Statics to Transient is allowed for structures. For heat transfer a nonlinear steady state heat transfer to a nonlinear transient heat transfer is not allowed.

A structural example:

```
SUBCASE 1
STEP 10
  ANALYSIS=NLSTAT
STEP 20
  ANALYSIS=NLSTAT
STEP 30
  ANALYSIS=NLTRAN
```

- b. Nonlinear chained physics: A nonlinear steady state heat with results used for a nonlinear static structural analysis. Only a steady state heat to a structural nonlinear Statics is allowed.

```
SUBCASE 1
STEP 10
  ANALYSIS=HSTAT
STEP 20
  ANALYSIS=NLSTAT
```

- c. Nonlinear coupled physics: This allows for four combinations of STEP/SUBSTEP within the SUBCASE
- **ANALYSIS=HSTAT** for the first SUBSTEP and **ANALYSIS=NLSTAT** for the second SUBSTEP
  - **ANALYSIS=HTRAN** for the first SUBSTEP and **ANALYSIS=NLTRAN** for the second SUBSTEP
  - **ANALYSIS=HTRAN** for the first SUBSTEP and **ANALYSIS=NLSTAT** for the second SUBSTEP

- **ANALYSIS=HSTAT** for the first SUBSTEP and **ANALYSIS=NLTRAN** for the second SUBSTEP

A coupled analysis example is:

```
SUBCASE 100
STEP 10
  STRESS= ALL
  NLSTRESS=ALL
  NLSTEP=84
SUBSTEP 1
  ANALYSIS=HSTAT
  THERMAL=ALL
  FLUX=ALL
  SPC=35
  LOAD=11
ANALYSIS=NLSTAT
  SPC=2
  LOAD=110
  DISP (PLOT)=1456
STEP 20
  ANALYSIS=NLTRAN (single physics rules follow)
```

- d. Linear perturbation analysis: Linear perturbation analysis is run directly after a nonlinear static (ANALYSIS=NLSTAT) analysis using additional STEP commands containing ANALYSIS=BUCK, MODES, DFREQ, MFREQ, MTRAN, DCEIG, and MCEIG entries.

It should be noted that ANALYSIS=BUCK for linear perturbation is not recommended if the model is highly nonlinear. NLBUCK Case Control command is recommended for highly nonlinear models.

An example is:

```
SOL 400
CEND
TITLE=MSC Nastran SOL 400, Linear Perturbation Analysis
SUBTI=3D General Contact with Large Displacement Turned on
$
SUBCASE 1
STEP 1
  LABEL=Nonlinear Static Analysis with Contact
  ANALYSIS = NLSTATIC
  NLPARM = 1
  BCONTACT = 1
  BOUTPUT=ALL
  SPC = 2
  LOAD = 3
  DISPLACEMENT (SORT1,REAL)=ALL
STEP 2
  LABEL=Linear Perturbation, DFREQ
  ANALYSIS = DFREQ
  DLOAD=200
  FREQ =10
  AUTOSPC=YES
  SPC = 2
  DISPLACEMENT = ALL
```

```
STEP 3
  LABEL=Linear Perturbation, MFREQ
  ANALYSIS = MFREQ
  NLIC STEP 1 LOADFAC 1.0
  METHOD = 30
  DLOAD=200
  FREQ =10
  AUTOSPC=YES
  RESVEC =NO
  SPC = 2
  DISPLACEMENT = ALL
```

- e. Standard linear physics: Runs can include ANALYSIS=STATICS, MODES, BUCKL, DFREQ, MFREQ, MTRAN, DCEIG, MCEIG, SAERO, and FLUTTER. It is recommended to use RIGID=LINEAR if the same answers are desired as in non-SOL 400. These are standard SUBCASE type of analysis. If there are rigid elements present then RIGID=LINEAR is recommended if the same results are desired as in SOLs 103, 105, 107, 108, 110, 111, 112, 145, and 146.

An example is:

```
SUBCASE 2
  LABEL=Linear Static
  ANALYSIS = STATIC
  LOAD      = 1001
  DISP     = 10
  STRESS   = ALL
SUBCASE 101
  DISP     = 10
  STRESS   = ALL
$
STEP 11
  LABEL=Nonlinear Statics, Load 1001
  ANALYSIS = NLSTATIC
  NLPARM   = 11
  LOAD     = 1001
$
STEP 12
  LABEL=Nonlinear Statics, Load 1005
  ANALYSIS = NLSTATIC
  NLPARM   = 11
  LOAD     = 1005
$
STEP 13
  LABEL=Linear Perturbation, Modes
  ANALYSIS = MODES
  METHOD    = 1003
  RESVEC   = NO
  AUTOSPC (NOPRINT) = YES
  DISPL    = ALL
SUBCASE 1004
  LABEL=Get Linear Normal Modes
  ANALYSIS = MODES
  SVECTOR  = ALL
  METHOD    = 1004
```

- f. Nonlinear chained analysis with mesh/time change physics: A standard single physics nonlinear steady state ANALYSIS=HSTAT or transient heat transfer ANALYSIS=HTRAN with either scratch=no or scratch=mini on the job submittal. This is followed by a mechanical job submittal with an ASSIGN hrun='name\_of\_heat\_run.MASTER' and DBLOC DATBLK=(HEATDB) LOGI=hrun in the File Management Section of the Nastran executive and an ANALYSIS=NLSTAT or ANALYSIS=NLTRAN with a TEMP(Load,HSUB,HSTEP,HTIME) in the subsequent mechanical job STEP. The subsequent mechanical job can have both a different mesh than the heat job and different time steps.

An example:

```

SOL 400 (submitted with SCRATCH=MINI from a bulk file named
Course_Mesh_Heat.dat)
CEND
SPC = 1
IC = 10
THERMAL=ALL
SUBCASE 3
  STEP 4
  ANALYSIS=HSTAT
  NLPARM = 1
  LOAD = 202
  SUBCASE 10 (Note if STEP not provided STEP=1 defaulted)
  ANALYSIS=HTRAN
  = 2
  DLOAD = 404
BEGIN BULK

SOL 400 (Mechanical run using solution from
Course_Mesh_Heat.dat)
ASSIGN hrun= 'Course_Mesh_Heat.MASTER' (the ticks ( ' ) are
required)
DBLOC DATBLK=(HEATDB), LOGI=hrun
CEND
TEMPERATURE (INITIAL) = 1
SUBCASE 1
  ANALYSIS=NLTRAN
  STEP 1
  = 1
  SPC = 2
  TEMP (LOAD, HSUBC=3) = 3
  DISPLACEMENT (SORT1, REAL)=ALL
  NLSTRESS = ALL
  STRESS = ALL
  STEP 2
  = 2
  SPC = 2
  TEMP (LOAD, HSUBC=10, HTIME=0.80) = 4
  DISPLACEMENT (SORT1, REAL)=ALL
  NLSTRESS = ALL
  STRESS = ALL
SUBCASE 2
  ANALYSIS=NLTRAN

```

```

STEP 3
= 3
SPC = 2
TEMP (LOAD, HSUBC=10, HTIME=ALL) = 5
DISPLACEMENT (SORT1, REAL)=ALL
NLSTRESS = ALL
stress = all
BEGIN BULK
  
```

- g. Nonlinear response optimization with ESLNRO: A standard single physics nonlinear **ANALYSIS=NLSTAT** is performed with a **NASTRAN ESLOPT=1** in the bulk data file. Besides the usual model grid, loads, element data etc., the bulk data file should contain the standard SOL 200 design criteria.

An example:

```

NASTRAN ESLOPT=1 $
SOL 400
CEND
DESOBJ (MIN) = 10000
ANALYSIS = NLSTATIC
DESSUB = 1
LOAD = 300
SPC = 1
STRESS = ALL
DISP = ALL
NLPARM = 1
BEGIN BULK
  
```

- 4. In SOL 106, the ANALYSIS Case Control command may be used to define a 'linear' perturbation analysis SUBCASE or a user input of the 'stressed' or deformed geometry (normal bulk data input) and 'unload' the structure to determine the unstressed shape SUBCASE.
  - a. 'Linear' perturbation analysis: The ANALYSIS Case Control command may be used to define a 'linear' perturbation analysis SUBCASE, separate from the subcases used to load the model. Normal modes and frequency response subcases with **ANALYSIS=MODES** or **ANALYSIS=DFREQ** will use the final displacement results and loads from the previous nonlinear subcase to generate the stiffness, differential stiffness, and follower force matrices for use in the 'linear' response analyses. Data recovery will be based on the requests above and within the subcase.

An example is:

```

SUBCASE 1
$ LOAD STRUCTURE
LOAD= 100
NLPARM= 100
SUBCASE 2
$ NORMAL MODES
ANALYSIS= MODES
METHOD= 100
DISP= ALL
SUBCASE 3
$ FREQUENCY RESPONSE
ANALYSIS= DFREQ
  
```

```

SET 100= 1 THRU 1000
DISP= 100
SUBCASE 4
$ CONTINUE LOADING STRUCTURE
LOAD= 200
NLPARM= 100
DISP= ALL
SUBCASE 5
$ NORMAL MODES AT THE NEW LOADING
ANALYSIS= MODES

```

In the previous example, subcases 2 and 3 will use the results from subcase 1, subcase 4 will continue the loading application, and subcase 5 will use the results from subcase 4. For the 'linear' analyses, the mass matrix will be based on the undeformed geometry and the damping matrix will be generated using the deformed geometry. This will allow analyses of 'large' displacement results (PARAM, LGDISP, 1), in addition to material nonlinear analyses.

- b. User input of the 'stressed' or deformed geometry: [ANALYSIS=HOT2COLD](#) allows the user to input the 'stressed' or deformed geometry (normal bulk data input) and 'unload' the structure to determine the unstressed shape. This uses an iterative technique with each iteration a nonlinear analysis. This feature will also 'reset' the geometry to the 'unstressed' position for additional subcases. Related PARAMETERS are HTOCTOL, HTOCITS, and HTOCPRT.

An example is:

```

SUBCASE 1
$ UNLOAD STRUCTURE
ANALYSIS=HOT2COLD
LOAD= 100
NLPARM= 100
SUBCASE 2
$ NORMAL MODES UNLOADED STRUCTURE
ANALYSIS= MODES
METHOD= 100
DISP=ALL
SUBCASE 3
$ LOAD the STRUCTURE
LOAD= 100
NLPARM= 100
SUBCASE 4
$ NORMAL MODES OF LOADED STRUCTURE
ANALYSIS= MODES
METHOD= 100
DISP= ALL

```

SUBCASE 1 unloads the model. SUBCASE 2 calculates the modes of the 'undeformed' structure; the differential stiffness and follower force effects will not be included. SUBCASE 3 loads the model. SUBCASE 4 calculates the modes of the loaded structure; the differential stiffness and follower forces effects will be included.

## APRESSURE

## Aerodynamic Pressure Output Request

Requests the aerodynamic pressures in static aeroelastic response.

### Format:

$$\text{APRES} = \left\{ \begin{array}{c} n \\ \text{ALL} \end{array} \right\}$$

### Examples:

APRES=ALL

APRES=6

Describer	Meaning
n	Set identification number of a previously appearing SET command. Only aerodynamic pressures on the referenced aerodynamic boxes will be output (Integer > 0).
ALL	Pressures at all points will be output.

**AUTOSPC**

## Constrains Stiffness Singularities via m-sets or s-sets

Requests that stiffness singularities and near singularities be automatically constrained via single or multipoint constraints.

**Format:**

$$\text{AUTOSPC} \left[ \left( \left[ \text{RESIDUAL} \right] \left[ \begin{array}{c} \text{PRINT} \\ \text{NOPRINT} \end{array} \right], \left[ \begin{array}{c} \text{NOPUNCH} \\ \text{PUNCH} \end{array} \right], [\text{SID} = n], [\text{EPS} = r1], \right. \right. \\ \left. \left. [\text{EPSSING} = r2], \left[ \begin{array}{c} \text{SPC} \\ \text{MPC} \end{array} \right], \left[ \begin{array}{c} \text{ZERO} \\ \text{NOZERO} \end{array} \right] \right) \right] = \left\{ \begin{array}{c} \text{YES} \\ \text{NO} \end{array} \right\}$$
**Examples:**

AUTOSPC=YES

AUTOSPC (PRINT, PUNCH, SID=100, EPS=1.E-6, MPC)=YES

Describer	Meaning
RESIDUAL	For SOL 400, applies AUTOSPC to both the residual structure and superelements. See Remarks 6. and 7.  For SOL 101, applies AUTOSPC to linear analysis with contact. See Remark 9.
PRINT	Enables the printout of a summary table of singularities (Default).
NOPRINT	Disables the printout of a summary table of singularities.
NOPUNCH	Disables the creation of SPC or MPC Bulk Data entries in the PUNCH file (Default).
PUNCH	Generates SPC or MPC Bulk Data entry format in the PUNCH file.
SID=n	Specifies a set identification number for option PUNCH (Default = 999).
EPS=r1	Identifies singularities with a stiffness ratio smaller than r1 to be automatically constrained with single or multipoint constraints. See Remark 2. (Default = 1.E-8).
EPSSING=r2	Identifies the potential singularities with stiffness ratios less than r2. See Remark 2. (Default=1.E-8).
SPC	Applies single-point constraints on degrees of freedom identified as singular. (Default)
MPC	Applies multipoint constraints on degrees of freedom identified as singular.

Describer	Meaning
ZERO	Requests the printout of singularities with zero stiffness ratios in the singularity summary table (Default).
NOZERO	Disables the printout of those singularities with zero stiffness ratios in the singularity summary table.

**Remarks:**

- AUTOSPC specifies the action to take when singularities exist in the stiffness matrix. AUTOSPC=YES means that singularities will be constrained automatically. AUTOSPC=NO means that singularities will not be constrained. If AUTOSPC=NO, then the user should take extra caution analyzing the results of the grid point singularity table and the computed epsilons. See [Constraint and Mechanism Problem Identification in SubDMAP SEKR](#) in the *MSC Nastran Reference Guide* for details of singularity and mechanism identification and constraint.
- Singularity ratios smaller than EPSSING are listed as potentially singular. If AUTOSPC=YES, then the identified singularities with a ratio smaller than EPS will be automatically constrained. If EPSSING has the same value as EPS, then all singularities are listed. If EPSSING is larger than EPS, the printout of singularity ratios equal to exactly zero is suppressed. EPSSING must be greater than or equal to EPS. If not, the program will set EPSSING equal to EPS.
- If the PUNCH keyword is specified, then automatically generated SPCs or MPCs are placed in SPCi or MPCi Bulk Data entry format on the PUNCH file.
- By default, in all solution sequences except 106, 129 and 400, the auto-SPC operation is performed for both superelements and the residual structure. (Auto-SPC processing is disabled in heat transfer analysis). In SOLs 106, 129 and 400, the default is to perform the operation only on superelements. If it is desired to perform auto-SPC on the residual structure in:
  - SOLs 106, then specify PARAM,AUTOSPCR,YES and is only applied to the omitted degrees-of-freedom. The AUTOSPC command is ignored for the residual structure.
  - SOLs 129, then specify PARAM,AUTOSPCR,YES. The AUTOSPC command is ignored for the residual structure.
  - For SOL 400, see Remarks 6. and 7.
- The MPC option may be somewhat more expensive than the SPC option. However, it provides more realistic structural modeling than the SPC. When the MPC option is selected, the multipoint constraint may be applied on some degree of freedom for which the stiffness matrix is identified as singular. If the MPC is inapplicable to some degree of freedom, the SPC is used instead.
- For SOL 400, if RESIDUAL option is requested, the AUTOSPC operation is applied to both the residual structure and the superelements. Without RESIDUAL option, the AUTOSPC operation is applied to the superelements only. For default (no AUTOSPCE command), AUTOSPC operation is not applied to the residual structure, but it is applied to the superelements. Both parameters PARAM,AUTOSPC and PARAM,AUTOSPCR have no effect in SOL 400. Please note that the AUTOSPC (RESIDUAL) command should not be used in the geometrical nonlinear analysis, because it may over constrain the structural model.

7. For SOL 400, the AUTOSPC (RESIDUAL) command can be placed above the subcase level, between subcase and step, and below the step level. The AUTOSPC operation is performed each step of a subcase if it is required. In the following example, step 10 uses SPC option, step 20 uses MPC option, and no AUTOSPC operation is performed for step 30.

```
SUBCASE 1
  STEP 10
    AUTOSPC (RESIDUAL, SPC) = YES
    LOAD = 10
  STEP 20
    AUTOSPC (RESIDUAL, MPC) = YES
    LOAD = 20
  STEP 30
    LOAD = 30
```

For superelements, only one AUTOSPC command can be specified. If there are multiple AUTOSPC commands in the Case Control packet, the one for the first step of the first subcase will be used. In the previous example, the AUTOSPC under step 10 is used.

8. For SOL 400, AUTOSPC equals YES for linear perturbation if DOMAINSOLVER ACMS is defined in the executive system.
9. For SOL 101 with contact, user can turn on AUTOSPC by using RESIDUAL option. i.e., when AUTOSPC(RESIDUAL)=YES, AUTOSPC will be turned on for linear analysis with contact.
10. This entry is not supported by SOL 600. Please enter PARAM,AUTOSPC in the bulk data.

## AUXCASE

### Auxiliary Model Case Control Delimiter

Indicates (delimits) the beginning of Case Control commands for an auxiliary model in SOL 200.

#### Format:

AUXCASE

#### Examples:

AUXCAS  
AUXC

#### Remarks:

1. AUXCASE commands must follow the primary model Case Control commands.
2. All Case Control commands following this entry are applicable until the next AUXCASE command, or the BEGIN BULK delimiter. Commands from preceding Case Control Sections are ignored.
3. Each auxiliary model Case Control must be delimited with the AUXCASE command.
4. The AUXMODEL command is used to associate the auxiliary model Case Control with a particular auxiliary model.

**AUXMODEL**

## Auxiliary Model Identification Number

References an auxiliary model for generation of boundary shapes in shape optimization.

**Format:**

AUXMODEL=*n*

**Examples:**

AUXMODEL=4

AUXM=4

Describer	Meaning
<i>n</i>	Auxiliary model identification number. (Integer > 0)

**Remarks:**

1. AUXMODEL references a particular auxiliary model for analysis and may only be specified in the auxiliary model Case Control Section.
2. See the BEGIN BULK delimiter for the Bulk Data definition of an auxiliary model.

## AVLEXB

### Control for MSC Nastran-AVL EXCITE™ Interface

Control for MSC Nastran-AVL EXCITE™ Interface: (1) EXB file export from SOL 103 and SOL 400, (2) EXCITE™ results import and data recovery in SOL 111, 112 and 400.

#### Format:

```
AVLEXB [EXBBODY = {YES, NO}],

#### Examples:

EXB file export

```
AVLEXB EXBBODY = YES
```

AVL EXCITE™ results import and data recovery

```
AVLEXB EXBBODY=NO AVLPOST=YES POSTUNT=130
```

Describer	Meaning
EXBBODY	Controls the output of MSC Nastran-AVL EXCITE™ (Default = NO): <ol style="list-style-type: none"> <li>1. NO: Do not output AVL EXB Flexible body.</li> <li>2. YES: Output AVL EXB Flexible body.</li> </ol>
MASINVAR	Requests the type of mass invariants to be computed (Default = FULL) : <ol style="list-style-type: none"> <li>1. FULL: All inertia invariants are computed.</li> <li>2. FIRST: Only first order inertia invariants are computed.</li> <li>3. NONE: No inertia invariants are computed.</li> </ol>
RECOVRYM	Controls the output of recovery (output transformation) matrix (Default = No) : <ol style="list-style-type: none"> <li>1. YES: Output A-set to (O+M)-set recovery matrix.</li> <li>2. NO: Do not output the A-set to (O+M)-set recovery matrix.</li> </ol>
EXBOSET	Selects a set of DOFs for controlling the output of recovery matrix (Default = ALL): <ol style="list-style-type: none"> <li>1. U1-U5: DOFs in the user defined set only are included in the O-set output to the EXB file and the partial recovery matrix output for these DOFs. These need to be defined in the bulk data using the USET/USET1 bulk data entry.</li> <li>2. ALL: Complete O-set in the model is retained for recovery.</li> </ol>
OUTGSTRS	Outputs Grid Point Modal Stresses (Default = NO) to the MSC Nastran op2 requires PARAM,POST,1 or PARAM,POST,-1.
OUTGSTRN	Outputs Grid Point Modal Strains (Default = NO) to the MSC Nastran op2 requires PARAM,POST,1 or PARAM,POST,-1.
V1ORTHO	Lower frequency bound of the Craig-Bampton modes in cycles/unit time. value1: Value of the lower bound.
V2ORTHO	Higher frequency bound of the Craig-Bampton modes in cycles/unit time. value2: Value of higher bound.
MFFEXP	Requests output of Mass matrix of O+M set (Default = No). MFFEXP = YES requires the user to request full recovery (RECOVRYM=YES and EXBOSET = ALL).

Describer	Meaning
NOD6	<p>If model is pure bar/beam elements with concentrated masses, this option can output the element dictionary table as well as element stiffness matrix (Default = No):</p> <ol style="list-style-type: none"> <li>1. YES: Output KDICT &amp; KELM</li> <li>2. NO: Do not output KDICT &amp; KELM</li> </ol> <p>If NOD6 = YES these parameters are automatically set MASINVAR = NONE, RECOVERYM = NO, MFFEXP = NO, EXBOSET = YES</p>
AVLPOST	<p>Requests data recovery using the INP4 file generated by AVL EXCITE™ (Default = No):</p> <ol style="list-style-type: none"> <li>1. YES: Request data recovery</li> <li>2. NO: data recovery</li> </ol> <p>AVLPOST = YES requires EXBBODY = NO as the MSC Nastran AVL EXCITE™ interface cannot generate the EXB file and conduct data recovery in the same run.</p>
POSTUNT	<p>Unit number of the assigned INP4 file generated by AVL EXCITE™ which will be used for data recovery.</p>
EXBONLY	<p>Requests standard DMAP solution and data recovery following MSC Nastran-AVL EXCITE™ interface (Default = NO):</p> <ol style="list-style-type: none"> <li>1. NO: Proceed with standard DMAP solution and data recovery after generating EXB file.</li> <li>2. YES: Executes only MSC Nastran-AVL EXCITE™ interface.</li> </ol>

### Remarks:

1. It is highly recommended that the user should run MSC Nastran for Step-1 with maximum smp setting. Calculation of higher order mass invariants are very computation intensive; to make their calculation faster MSC Nastran leverages efficient shared memory parallelization (SMP).
2. To minimize the data storage and enable efficient data recovery in MSC Nastran, the use of MSC Nastran-AVL EXCITE™ Interface requires the use of EXTSEOUT feature. The use of this feature would be in its standard MSC Nastran capacity in SOL 103 or 400, e.g.:

```

ASSIGN OUTPUT2='crankextse.op2',UNIT=80,DELETE
...
EXTSEOUT (ASMBULK,EXTBULK,EXTID=20) DMIGOP2=80
...

```

During step-1 (EXB file export), to limit the size of external superelement (SE) .op2 the user should only request outputs for sets of physical quantities that are of interest. For, e.g., displacement and stress on surface nodes:

```
DISP (PLOT) = 101
...
STRESS (PLOT) = 102
```

above, the displacement and velocity can only be recovered on set 101 and stresses on set 102 during step-2 (data recovery).

DISP=ALL, STRESS=ALL, STRAIN=ALL, etc., should be used carefully for large models during step-1 as it could lead to significant performance degradation and large external SE .op2 file size.

3. AVL EXCITE™ supports the following flexbody types which will be set automatically based on the user inputs of AVLEXB case controls:
  - a. CON6: Is General large motion flexbody which is selected when the user enters “NOD6=NO” and “MASINVAR=FULL/FIRST”.
  - b. SMOT: Is Small motion flexbody which is selected when the user enters “NOD6=NO” and “MASINVAR=NONE”.
  - c. NOD6: Is a special flexbody model consisting of pure bar/beam (1-D) elements with concentrated masses. It is selected when the user enters “NOD6=YES”. Here the dictionary table for bar/beam elements for each bar/beam element shall be outputted into the EXB file. NOD6 automatically means that the following are not calculated and output into the EXB file: (1) Mass invariants, (2) Recovery Matrix, (3) A-set Orthonormalization and associated Eigenvalue/Eigenvector and (4) Component modes.
4. MSC Nastran does not export KELM to EXB file for NOD6 body. AVL EXCITE™ v2019 provides a utility to calculate and write KELM to existing EXB file.
5. Degree of freedom (dof) table (DOFT table) is written to EXB file for the following dof sets:
  - a. A-set : Dof table for a-set are always written out to the EXB file.
  - b. O+M-set : Dof table for o+m-set are only written out to the EXB file if the recovery matrix is requested by the user. In case the user selects partial recovery by specifying the EXBOSET only a subset of o+m-set would be output in the dof Table.
6. GEOM table contains the coordinates of nodes in MSC Nastran basic coordinate system. Two table of coordinates are always written to the EXB file: (1) A-set and (2) F+M-set.
7. OUTGSTRS or OUTGSTRN entries require the use of the standard MSC Nastran STRESS= or STRAIN= Case Control commands used in conjunction with GPSTRESS= or GPSTRAIN= Case Control commands to produce modal grid point stress or strain. They also require the use of PARAM,POST,-1 or PARAM,POST,1. GSTRESS(PLOT)= or GPSTRAIN(PLOT)= will suppress grid stress or strain output to the MSC Nastran .f06 file. The modal grid point stress or strain are not output to the EXB file but to standard MSC Nastran .op2 file.
8. The default value of “MASINVAR = FULL” calculates all the mass invariants. In case of large models the calculations of higher order mass invariants can be time consuming; hence, it is recommended that the user first run with either “MASINVAR = FIRST” or “MASINVAR =NONE” to validate the model.
9. MFFEXP = YES requests output of Mass matrix of F+M set and requires the user to request full recovery (RECOVRYM=YES and EXBOSET = ALL).

10. Typically SOL 400 is used to produce a preloaded AVL EXCITE™ EXB file.
  - a. Standard SOL 400 nonlinear analysis prohibits the existence of an o-set; hence the EXTSEOUT case control must be used (see above Remark 2.).
  - b. In the preload run the structure should be statically supported and follower loading must be applied as a self equilibrating load set (not with SPC relationships!). In the ANALYSIS=MODES step, usually, the structure should be a free-free structure to preserve its six rigid body modes. In order to produce modal amplitudes and mode shapes and to ensure residual vector calculations, SPOINTs and Q-sets are required.

The example below is a typical SOL400 problem setup:

```

ASSIGN OUTPUT2='sepl3rbe.out2',UNIT=80,DELETE
SOL 400
CEND
$
$ Initiate an Nastran-AVL-EXCITE™ interface run
$ AVL REQUIRED ABOVE SUBCASE
AVLEXB EXBBODY=YES, EXBONLY=YES
SUBCASE 1
$ Preload
STEP 10
$ Static load and support for preload
SUBTITLE = PRELOAD
ANALYSIS = NLSTATICS
NLSTEP = 110
LOAD = 120
SPC = 130
BCONTACT = 140
SPCF = ALL
$ Generate stress and strain grid shapes
STRESS(PLOT) = ALL
STRAIN(PLOT) = ALL
GPSTRESS(PLOT) = ALL
GPSTRAIN(PLOT) = ALL
$ Modal Step for Producing EXB file
$ Default: Select the end of previous load step to output
$ AVL EXCITE™ EXB
STEP 20
$ EXTSEOUT must be used to as Standard SOL 400 nonlinear analysis
$ prohibits the existence of an o-set
EXTSEOUT(ASMBULK,EXTBULK,EXTID=100) DMIGOP2=80
ANALYSIS = MODES
$ Select real Eigen Value Parameters
METHOD = 210
$ Turn residual vectors on
RESVEC = COMPONENT
STRESS(PLOT) = ALL
STRAIN(PLOT) = ALL
GPSTRESS(PLOT) = ALL
GPSTRAIN(PLOT) = ALL

```

- c. In the above example, the SPC set in the ANALYSIS=NLSTAT must be a static (nonredundant) constraint condition. Note that in the ANALYSIS=MODES STEP, the SPC constraint set has been removed. The definition of the attachment a-set for identifying attachment points and for q-set for specifying the desired number of modal amplitudes for orthonormalization should be done in the main bulk data section, e.g.:

```

$ Main Bulk section
$ Attachment point and component mode (A-SET) selection
ASET1,123456,1,11,111,121
QSET1,0,100001,THRU,100020

```

- d. If CONTACT is required as part of the preloading, it is highly recommended that the friction option be turned on by using an appropriate BCPARA bulk data entry setting, e.g.,

```

$ Select bilinear Coulomb friction for all subcases
BCPARA, 0, FTYPE, 6

```

If contact friction is not turned on, the tangential motion between the two parts coming into contact will most likely not be constrained and incorrect or fatal results will occur.

11. The AVL EXCITE™ solver expects singularities, other than the rigid body modes, of the model to be constrained; hence, it is recommended that the user constrain singularities automatically using the PARAM,AUTOSPC in SOL 103 and AUTOSPC (RESIDUAL) command in SOL 400.
12. After conducting the AVL EXCITE™ simulation the data recovery is conducted in SOL 111, SOL 112 and SOL 400 using the EXTSEOUT feature. Using External SE to conduct data recovery would make the data recovery faster and minimize the database size by storing only the information required for recovery. The user interface for data recovery is straightforward requiring the attachment of the SE databases, stored on the .op2 file, generated in the SE generation step during EXB file export together with the ASM and PCH files.
13. During the data recovery it should be noted that PARAM,POST setting for the External SE are not picked up from the main bulk. If physical quantities inside External SE (stresses,etc) are to be output to op2 the user can add PARAM,POST in the case control if they want it applied globally or add PARAM,POST manually to the External SE pch file.
14. Virtual mass is supported in MSC Nastran-AVL EXCITE™ Interface through the use of standard VMOPT parameter entry.
15. For STRUCTURE and FLUID coupled system, METHOD(COUPLED) can be used for EXB generation. However, all nodes on fluid face needs to be coupled with structure for AVLEXB otherwise, mass and inertia of moment will be incorrect in EXB.

## AXISYMMETRIC

## Conical Shell Boundary Conditions

Selects boundary conditions for an axisymmetric shell problem or specifies the existence of fluid harmonics for hydroelastic problems.

### Format:

$$\text{AXISYMMETRIC} = \left\{ \begin{array}{c} \text{SINE} \\ \text{COSINE} \\ \text{FLUID} \end{array} \right\}$$

### Example:

AXISYMMETRIC=COSINE

Descriptor	Meaning
SINE	Sine boundary conditions will be used.
COSINE	Cosine boundary conditions will be used.
FLUID	Existence of fluid harmonics.

### Remarks:

1. This command is required for conical shell problems.
2. If this command is used for hydroelastic problems, at least one harmonic must be specified on the AXIF command.
3. See the [Surface Elements](#) in the *MSC Nastran Reference Guide* for a discussion of the conical shell problem.
4. The sine boundary condition will constrain components 1, 3, and 5 at every ring for the zero harmonic.
5. The cosine boundary condition will constrain components 2, 4, and 6 at every ring for the zero harmonic.
6. SPC and MPC Case Control commands may also be used to specify additional constraints. See [Case Control Commands](#).

**B2GG**

## Direct Input Damping Matrix Selection

Selects direct input damping matrix or matrices.

**Format:**

B2GG=name

**Examples:**

B2GG = BDMIG

B2GG = BDMIG1, BDMIG2, BDMIG3

B2GG = 1.25\*BDMIG1, 1.0\*BDMIG2, 0.82\*BDMIG3

SET 100 = B1, B2

B2GG = 100

Describer	Meaning
name	Name of $[B_{gg}^2]$ matrix that is input on the DMIG Bulk Data entry, or name list, with or without factors (see Remark 5.).

**Remarks:**

1. DMIG matrices will not be used unless selected.
2. Terms are added to the damping matrix before any constraints are applied.
3. The matrix must be symmetric, and field 4 on the DMIG,name Bulk Data entry must contain the integer 6.
4. A scale factor may be applied to this input via the PARAM, CB2 entry. See [Parameters](#).
5. The formats of the name list:
  - a. Names without factor.  
Names separated by comma or blank.
  - b. Names with factors.

Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are real numbers. Each name must be with a factor including 1.0.

**B2PP**

## Direct Input Damping Matrix Selection

Selects direct input damping matrix or matrices.

**Format:**

B2PP=name

**Example:**

```
B2PP = BDMIG
B2PP = BDMIG1, BDMIG2, BDMIG3
B2PP = 5.06*BDMIG1, 1.0*BDMIG2, 0.85*BDMIG3
B2PP = (1.25, 0.5) *BDMIG1, (1.0, 0.0) *BDMIG2, (0.82, -2.2) *BDMIG3
```

Descriptor	Meaning
name	Name of $[B_{pp}^2]$ matrix that is input on the DMIG or DMIAx Bulk Data entry, or name list, with or without factors. See Remark 7. (Character).

**Remarks:**

1. DMIG entries will not be used unless selected.
2. B2PP is used only in dynamics problems.
3. DMIAx entries will not be used unless selected by the B2PP command.
4. The matrix must be square or symmetric, and field 4 on the DMIG,name Bulk Data entry must contain a 1 or 6.
5. It is recommended that PARAM,AUTOSPC,NO be specified. See the [Constraint and Mechanism Problem Identification in SubDMAP SEKR](#) in the *MSC Nastran Reference Guide*.
6. The matrices are additive if multiple matrices are referenced on the B2PP command.
7. The formats of the name list:
  - a. Names without factor  
Names separated by comma or blank.
  - b. Names with factors.

Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are either all real numbers, or all complex numbers in the form of two real numbers, separated by a comma, within parentheses as shown in the preceding example. The first real number of the pair is the real part, and the second is the imaginary part. Either part may be zero or blank, but not both. Mixed real numbers and complex numbers are not allowed. Each name must be with a factor including 1.0 for real and (1.0, 0.0) for complex.

## BC Boundary Condition Identification

Identifies multiple boundary conditions for normal modes, buckling, and flutter analysis in SOLs 103, 105, 145, and 200.

### Format:

BC=n

### Example:

BC=23

Describer	Meaning
n	Identification number (Integer > 0).

### Remarks:

1. In SOLs 103, 105, 145, and 200, BC is required in each subcase if multiple boundary conditions are specified for normal modes, buckling, or flutter analysis.
2. If only one boundary condition is specified, then BC does not have to be specified, and n defaults to zero.

## BCHANGE

## Contact Bodies Definition Change Selection

Selects the changes of the definition of contact bodies in SOL 400.

### Format:

BCHANGE=n

### Example:

BCHANGE=10

Describer	Meaning
n	Set identification of the BCHANGE Bulk Data entry, see Remark 2. (Integer > 0)

### Remarks:

1. This command is used only in SOL 400 for 3D Contact analysis.
2. The default SID of the BCHANGE Bulk Data entry is defined on the BCONTACT Case Control command if applicable; however, the SID on the BCHANGE Case Control command can overwrite it.

## BCONCHK

## Contact Model Check

This entry is used to activate contact model check before analysis in SOL 101, 103, 105, 107-112, 200 and 400.

With the contact model check, the initial contact status is checked and output. Displacement-like vectors and norm distance of active nodes to the corresponding contact body and distance to the body are generated. Sign of the distance stands for its status: positive for gap; 0.0 on surface; negative for penetration. It is a global case control and must be above SUBCASE.

Note that BCONCHK does not support BCONTACT=ALLBODY, i.e., no contact status check is reported when BCONTACT=ALLBODY.

### Format:

$$\text{BCONCHK} \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] = \left\{ \begin{array}{l} \text{RUN} \\ \text{STOP} \\ \text{STEP} \end{array} \right\}$$

### Example:

BCONCHK (PRINT) = Run

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

RUN	Execute contact model check and proceed analysis normally.
STOP	Only run contact check and exit job before normal analysis.
STEP	Execute contact check at each output request LOAD/TIME step.

## BCONTACT

## Selects 3D Contact Surfaces

This entry activates contact analysis and selects contact definition tables.

### Overview of contact type definition:

**General Contact** - two bodies may come into contact and separate at any point in the simulation and the bodies may slide along each other's surface with or without friction. The fundamental constraint is no relative normal displacement when bodies are in contact. General contact is available in SOL 101, SOL 400, SOL 600 or SOL 700 only. For SOL 101, contact is the only source of nonlinearity, no large displacements, large rotations or material nonlinearity is available.

**Glued Contact** - two bodies may come into contact and separate at any point in the simulation, but when in contact there is no relative sliding. The fundamental constraint is no relative normal displacement or tangential displacement when bodies are in contact. One can consider this equivalent to two surfaces that have infinite friction. Note that the word glued, only refers to the constraint on the tangential behavior. Bodies that are in glued contact may lose contact if the separation (force or stress based) separation criteria is exceeded, due to Unglue or Breaking Glue.

**Step Glued Contact** - this is available for SOL 400 only. Step Glued contact is activated using a value a negative value of IGLUE for each contact pair. It is similar to Glued Contact, there are two conditions.

1. The contact status will be checked at the beginning of the step, and those nodes or segments that are in contact will remain in glued contact for the entire step. The constraints will change due to large rotations. Furthermore if a large tensile force or stress developed over the interface in the current loadcase, no separation would occur for these regions which are initially in contact. Performing an Unglue or Breaking glue would also not be enforced during the step for these regions. This may be successfully used to model the union of dissimilar meshes, where at a later time one wanted to separate the bodies (like opening of a door).
2. When using Step Glue conventional contact occurs for the nodes/segments of the body which are not in contact at the beginning of the step. That means when they come into contact, they will glue, but they may separate within the same step.

**Permanently Glued Contact** -this is a special case of contact, where the initial configuration is used to determine the contact constraint, and these contact changes do not change throughout the analysis. Nodes or segments which are not initially in contact do not come into contact, and in fact may penetrate the model. The constraint is a glue type, meaning there will be no relative normal or tangential displacement. Permanent glued may be used to connect dissimilar meshes or for simple assembly modeling when no other contact occurs. The bodies will never separate. Permanent glue should not be used in models that experience large rotations. It is applicable to SOL 101, 103, 105, 107, 108, 109, 110, 111, 112, SOL 200 and SOL 400. Permanent Glued contact is activated if the BCTABLE or BCTABL1 that is referenced in the first Loadcase (SOL 100\*) or in the first Step (SOL 200) has a value of IGLUE greater than zero for all contact body pairs.

If the user requires conventional (general) contact for the complete simulation, but Permanent Glued contact is invoked, enter bulk data BCPARA,0,NLGLUE,1 to deactivate the Permanent Glue in a subsequent step.

If large rotation/deformation effect present, turn on SYSTEM(758)=2 will switch Permanently Glued Contact to Step Glued Contact automatically in SOL 400.

Because glued contact is very useful in assembly modeling problems encountered in engineering practice, several special cases are considered as well.

**Moment Carrying Glue** - For General Contact - when a node or surface comes into contact the default condition is that constraints are only placed on the translational degrees of freedom. When Moment Carrying Glue is activated the rotational degrees of freedom are also constrained to ensure moment carrying behavior. This may be used with either beam elements or shell elements.

**Symmetry Contact** - Deformable contact with a rigid Symmetry surface. In this case no friction is allowed. Furthermore no separation is allowed, and finally if the rigid surface is contacted by beams or shells - the rotations are automatically constrained to satisfy the symmetry constraints. You do not need to specify any additional input, other than specifying that the rigid surface is a SYMM body.

### Format:

$$\text{BCONTACT} = \left\{ \begin{array}{c} n \\ \text{ALLBODY} \\ \text{NONE} \end{array} \right\} \text{ or } \left\{ \begin{array}{c} \text{ALLELE} \end{array} \right\} \text{ or } \text{AUTO}(\text{ctype})$$

↑  
SOL 700 only

### Examples:

```
BCONTACT = 5
BCONTACT=ALLBODY
BCONTACT=AUTO, PGLUE
```

Describer	Meaning
n	Identification number of a BCTABLE, BCTABL1, BCONECT, BCHANGE, and/or BCMOVE Bulk Data entry.
ALLBODY	All bodies defined using all the BCBODY entries can potentially contact each other. This option can only be used if it applies to all subcases. (all SOLs) In SOL 400, when BCONTACT=ALLBODY, in any STEP, all BCBODY entries defined in the model can potentially contact each other. In this case, no BCTABLE, BCTABL1, BCONECT is required. See also Remark 3.

Describer	Meaning
NONE	All contact definitions (BCTABLE, BCTABL1, BCONECT, BCBODY, and BCBODY1) are ignored. For SOL 400 and SOL 101, if BCONTACT = NONE is entered in any subcase, it applies for all subcases. (Default for SOLs 101 and 400.)
AUTO(,ctype)	Automatic generate contact. ctype is optional. It may be  TOUCH (default) -- general touching contact;  PGLUE -- Permanently glued contact;  GGLUE -- General Glued Contact; and  SGLUE -- Step Glued Contact.  It works with bulk data section entry BCAUTOP, BCAUTOP is optional. See remark 5. and 6.

### Remarks:

1. BCONTACT is recognized in SOLs 101, 400, and 700, and under the special condition of permanent glued contact in SOLs 103, 105, 107, 108, 109, 110, 111, 112 and 200. The standard SOL 200(without calling SOL 400) can only support permanent glue; but when SOL 200 calls SOL 400(or say SOL 400 optimization), it can support all contact types.
2. For SOLs 101 and 400, if the form BCONTACT=n is applied in any loadcase (subcase or step), Nastran looks into the Bulk Data file to get all BCTABLE, BCTABL1 or BCONECT (required), BCMOVE (optional) and BCHANGE (optional), in the same SID=n. The user can always specify Case Control commands, BCMOVE and/or BCHANGE, to select different SID.  
  
BCONTACT=0 can invoke initial preload contact conditions, such that the contact bodies will just touch each other before analysis begins, but it's not necessary. If presence of BCTABLE, 0, initial contact condition will also be processed, no matter if BCONTACT=0 is given or not. (please refer to BCTABLE, 0 for more information).  
  
The contact analysis during any loadcase is dominated by BCONTACT=n (n>0). Without presence of BCONTACT=n (n>0), no contact analysis works in that particular loadcase.  
In SOL 400 one can have multiple contact interaction types in the model meaning general contact, glued contact, step contact on a contact pair basis. These can change from step to step by activating a new BCTABLE or BCTABL1.  
SOL 700 allows only one BCONTACT Case Control command and only one subcase.
3. For SOLs 101 and 400, if the form BCONTACT=ALLBODY is applied in any loadcase (subcase or step), Nastran does not look into corresponding BCTABLE, BCTABL1 or BCONECT but uses the defaults for all entries on BCTABLE, BCONPRG or BCONPRP. If the user wants to specify BCMOVE and/or BCHANGE Bulk Data entries, the BCMOVE and/or BCHANGE Case Control commands must be given.

4. Permanent glued contact for small deformation and rotation is initiated by BCONTACT=n pointing to BCTABLE/BCONNECT referring a valid positive IGLUE field.  
 If all secondary's for the BCTABLE or BCONPRG corresponding to the first loadcase (first subcase and first step) contain IGLUE >0, permanent glued contact with small rotation condition will be used for all SECNDRY entries in all subcases and all steps unless BCPARA,0,NLGLUE,1 is specified. If IGLUE < 0 exists, step glue is activated to support large deformation and large rotation.
5. For glue contact (PGLUE, GGLUE, and SGLUE), default is to implement the moment carrying glue without node projection, i.e., Insures full moment carrying glue when shells contact. The node will not be projected onto the contact body and an existing initial gap or overlap between the node and the contacted body will not be removed, as the node will not be projected onto the contacted body. Unless IGLUE is defined in BCAUTOP.
6. CTYPE can be specified by bulk data section BCAUTOP also, the value of CTYPE in BCAUTOP will be used if it is specified.
7. When BCONTACT=AUTO is specified, acg file will be generated. An acg file is a file consists of all generated contact bodies, contact pairs and parameters. The name of acg file can be specified by ASSIGN FMS statement.
8. When BCONTACT=AUTO is specified, only elements in residual structure are used to construct contact bodies in superelement models.
9. BEAMB in bulk data entry BCPARA is set to 1 when BCONTACT=AUTO is specified.
10. When BCONTACT=AUTO is specified and modules are present, the contact generation is in two levels: individual module and across modules. For individual module, contact data generation is activated when an BCAUTOP bulk data section entry exists in the module. If there is no BCAUTOP, no contact data will be generated for the module, and user supplied contact data can be used. For across modules, contact pair generation is activated by MDBCPR entry, and parameters are defined by MDBCATP entry.

## BCONTACT

Selects 3D Contact Surfaces in SOL 600

This entry is used to initiate and control 3D contact in SOL 600.

Standard subcase rules apply and BCONTACT may be specified within each subcase to define which bodies may make contact during that particular subcase. A BCONTACT = 0 above the subcase level is used in SOL 600 to invoke an option such that the contact surfaces will just touch each other before the nonlinear simulation begins. It is highly recommended that if contact is specified for any subcase in SOL 600, and if there are any rigid contact surfaces, BCONTACT = 0 and a matching BCTABLE with ID = 0 be included.

### Format:

$$\text{BCONTACT} = \left\{ \begin{array}{c} n \\ \text{ALLBODY} \\ \text{NONE} \end{array} \right\} \text{ or } \left\{ \begin{array}{c} \text{ALL} \\ \text{ALLELE} \\ \text{ALLELE2} \\ \text{ALLGLUE} \\ \text{ALLGLU2} \\ \text{ALLGLUM} \\ \text{ALLGLM4} \\ \text{ALLGLUP} \\ \text{BCBOX} \\ \text{BCPROP} \\ \text{BCMATL} \end{array} \right\}$$

### Examples:

```
BCONTACT = 5
BCONTACT=ALLBODY
```

Describer	Meaning
n	Identification number of a BCTABLE, BCHANGE, and/or BCMOVE Bulk Data entry. If the model has beams, this option or BCPROP or MCMATL must be used.
ALLBODY	All bodies defined using all the BCBODY entries can potentially contact each other. This option can only be used if it applies to all subcases.
NONE	All contact definitions (BCTABLE, BCBODY) are ignored. BCONTACT = NONE may be used for any subcase desired and/or for increment zero - some subcases can have contact and others no contact.
ALL	All elements in the model can potentially contact with each other (Default). When this option is specified, no 3D contact input is required in the bulk data and, if entered, will be ignored. Warning—this option may take excessive computer time. This option can only be used if it applies to all subcases.

Describer	Meaning
ALLELE	Same as ALL. All elements in the model must be the same kind (either shell or solid). This option may not be used if there are beams, bars or rods in the model.
ALLELE2	Same as ALLELE except shell and solid elements may both be in the model in which case separate bodies for each are formed. (This option requires that both shells and solids be in the model.) All beams, bars and rods in the model will be ignored with respect to contact.
ALLGLUE	Same as ALLELE or ALLELE2 except glued contact will be used for all bodies. The glued contact can vary from increment to increment, however when grids come into contact they cannot separate. BCBODY and BCTABLE entries are created automatically. BCBODY Secondary entries have IGLUE=I (see BCTABLE entry).
ALLGLU2	Same as ALLELE or ALLELE2 except glued contact will be used for all bodies. The glued contact can vary from increment to increment, however when grids come into contact they cannot separate. BCBODY and BCTABLE entries are created automatically. BCBODY Secondary entries have IGLUE=2 (see BCTABLE entry).
ALLGLUM	Same as ALLELE or ALLELE2 except glued contact with moment carrying glue will be used for all bodies. BCBODY and BCTABLE entries are created automatically. BCBODY Secondary entries have IGLUE=3 (see BCTABLE entry).
ALLGLM4	Same as ALLELE or ALLELE2 except glued contact with moment carrying glue will be used for all bodies. BCBODY and BCTABLE entries are created automatically. BCBODY Secondary entries have IGLUE=4 (see BCTABLE entry).
ALLGLUP	Same as ALLELE or ALLELE2 except “permanent glue” is used. This option determines which grids are initially in contact and uses this contact situation in a glued condition for the remainder of the analysis. To use this option, specify PERMGLUE on the SOL 600 Executive Control statement. (SOL 600 only) Note for SOL 600, the PERMGLUE option is the only way contact can be used with SOL 600,101 or SOL 600,103 or other “linear” analyses.
BCBOX	All elements defined within a box-like region as defined by the Bulk Data entry BCBOX can potentially contact each other. See Remark 2.
BCPROP	All elements defined by the Bulk Data entry BCPROP can potentially contact each other. See Remark 2.
BCMATL	All elements defined by the Bulk Data entry BCMATL can potentially contact each other. See Remark 2.

### Remarks:

1. Normally, only one form of this entry may be used in any given analysis. Analysis restarts must use the same form as the original run. An exception is that if BCONTACT = NONE is entered for any subcase, BCONTACT=N may also be specified for different subcases. BCONTACT=ALLxxx cannot be mixed with BCONTACT=NONE or BCONTACT=N in the same input file.

2. Bulk Data entries BCBOX, BCPROP, and BCMATL may be used with BCONTACT = n, wherein case IDs specified on the BCBODY entry and on the BCBOX, BCPROP, and/or BCMATL entries must match.
3. For options ALLELE, ALLELE2, ALLGLUE, ALLGLU2, ALLGLUM, and ALLGLM2, no BCBODY or BCTABLE entries should be included in the model. Nastran will automatically create BCBODY and/or BCTABLE entries as necessary for these options.
4. The ALLELE option requires that the model be made up of either all shells or all solids.
5. The ALLELE2 option requires that the model have both shells and solids.
6. The ALLGLUE, ALLGLU2, ALLGLUM and ALLGLM4 options can be used with models with shells only, solids only for a combination of shells and solids.
7. The ALLGLUP option can either be used with BCBODY/BCTABLE entries or without them. If there are not BCBODY/BCTABLE entries, SOL 600 will create them. If they exist, all SECNDRY lines on all BCTABLE entries must specify IGLUE=1.
8. The ALLG\* options are not available for edge contact. Edge contact may only be run using BCONTACT=N and the corresponding BCTABLE having a FBSH line with COPS1 and/or COPM1 properly specified.

## BCMOVE

## Contact Body Movement Selection

Selects movement of bodies in contact in SOL 400.

### Format:

BCMOVE=*n*

### Example:

BCMOVE=10

Describer	Meaning
<i>n</i>	Set identification of the BCMOVE Bulk Data entry. (Integer > 0)

### Remarks:

1. This command is used only in SOL 400 for 3D Contact analysis.
2. The default SID of the BCMOVE Bulk Data entry is defined on the BCONTACT Case Control command if applicable; however, the SID on the BCHANGE Case Control command can overwrite it.

## BEGIN BULK

## Case Control and Bulk Data Delimiter

Designates the end of the Case Control Section and/or the beginning of a Bulk Data Section.

### Format:

```

BEGIN[BULK] [
    AFPM = afpmid
    ARBMODEL = arbmid
    AUXMODEL = auxmind
    MASSID = massid[LABEL = masslabel]
    MODULE= moduleid[APPEND][LABEL = modlabel]
    FLXBDY = flexbody
    SUPER = seid
    TRMC = trimid
    UDS
]
    
```

### Examples:

```

BEGIN BULK
BEGIN AUXMODEL=22
    
```

```

BEGIN BULK TRMC=101
BEGIN TRMC=102
    
```

Descriptor	Meaning
AFPM	Indicates the beginning of an acoustic field point mesh Bulk Data Section.
afpmid	Acoustic field point mesh identification number (Integer > 0).
ARBMODEL	Indicates the beginning of a finite element model FEM for an arbitrary beam cross-section.
arbmid	FEM identification number (Integer > 0).
AUXMODEL	Indicates the beginning of an auxiliary model Bulk Data Section.
auxmid	Auxiliary model identification number (Integer > 0).
FLXBDY	Indicates the beginning of a Adams/Nastran MNF flexbody Bulk Data Section for SOL400 analysis.
flexbody	Flexbody MNF component identification number (Integer>0; Required). Component usually consists of ASET and QSET description for attachment points.
MASSID	Indicates the beginning of the incremental mass case Bulk Data Section.
massid	Incremental mass case identification number (Integer>0; Required).

Describer	Meaning
LABEL	Indicates a massid label.
MODULE	Indicates the beginning of a Module Bulk Data section
moduleid	Module identification number (Integer>0).See Remark 11.
APPEND	Indicates append data to a module.
LABEL	Indicates a Module label. This option will be converted to an MDLABEL Bulk Data entry in the main Bulk Data section.
modlabel	Module label.
SUPER	Indicates the beginning of partitioned superelement Bulk Data Section.
seid	Superelement identification number (Integer $\geq 0$ ).
TRMC	Indicates the beginning of Bulk Data Section for a trim component model. See Remark 9.
trimid	Trim component identification number (Integer>0; Required).
UDS	Indicates the beginning of user defined subroutine section.

### Remarks:

- BEGIN BULK is not required but it is highly recommended that the user supply it. If not specified, then the program will automatically insert one, before the first unique bulk type entry. Parameters are not considered unique bulk type entries so automatic BEGIN BULK inclusion will come after any parameter that precedes entries unique to bulk.
- For an auxiliary model, AUXMID is referenced by the AUXMODEL Case Control command.
- Partitioned Bulk Data Sections defined by BEGIN SUPER are used to define only one superelement each. Bulk Data commands which define superelements are ignored in partitioned Bulk Data Sections.  
  
Superelements specified by a BEGIN SUPER entry can be automatically attached to other superelements based on relative locations of grid points. For connection to the downstream superelement, the global coordinate directions of the attachment grid points of the upstream superelement will be internally transformed to the global coordinate directions of the grid points of the downstream superelement. For displacement data recovery, the output will be in the original global coordinate directions.
- An acoustic field point mesh section defined by BEGIN AFPM is used to define one acoustic field point mesh. Acoustic field point meshes are used for postprocessing of acoustic results in the far field only; i.e., at locations within the acoustic infinite elements.
- The BEGIN SUPER, BEGIN AUXMODEL, and BEGIN AFPM Bulk Data entries must lie between BEGIN BULK and ENDDATA.

6. When employing part superelements using the BEGIN BULK SUPER (or BEGIN SUPER) entry, it should be noted that any parameters that are specified in the main Bulk Data Section apply only to the residual and not to any of the part superelements. Accordingly, to apply certain parameters to all of the superelements, they must be specified in the Case Control Section, or explicitly in all of the BEGIN BULK SUPER (or BEGIN SUPER) portions of the Bulk Data. A common example of such a parameter specification is PARAM,POST, which is used to request postprocessing of results.
7. arbmids can be referenced under the OUTM keyword of the PBMSECT Bulk Data entry to define the geometry of the arbitrary beam cross-section.
8. For model using user defined subroutines, the subroutines can be put in the UDS section. Nastran can build user service from the subroutines using command line keyword uds=model. See the document User Defined Service User's Guide for detail.
9. The parameter WTMASS is supported for trim components with a PARAM, WTMASS, value in each BEGIN TRMC=n Bulk Data.
10. BEGIN MODULE command can only be specified after the BEGIN BULK or an ENDMODULE command has already been specified. In other words, a Module Bulk Data section cannot be nested inside another Module's Bulk Data section.
11. The same module identification number can appear multiple times if APPEND is specified, otherwise a user fatal message will be issued.

**BENDL**

## BAR/BEAM end load Subcase Selection

Function to calculate bar end loads and shear flow.

**Format:**

$$BENDL \left( PRINT = \begin{matrix} YES \\ NO \end{matrix} \right) = \left\{ \begin{matrix} ALL \\ n \\ NONE \end{matrix} \right\}$$

**Examples:**

To output a table of bar end loads/shear flows.

BENDL = ALL

To output a table of bar end loads/shear flows and print table to F06.

BENDL (PRINT=YES) = ALL

Describer	Meaning
PRINT	Prints bar end loads and panel shear flow to the F06 file.
YES	BAR/BEAM end loads and associated CSHEAR, CQUAD4 and CTRIA3 panel shear flows will be printed.
NO	BAR/BEAM end loads and associated CSHEAR, CQUAD4 and CTRIA3 panel shear flows will not be printed. (Default)
ALL	Select all bar/beam/rod type elements associated with “Shell” panels.
n	Identification of a previously defined SET listing “Flange/Boom” elements.
NONE	Turn off BENDL in selected subcases.

**Remarks:**

1. A BENDL Case Control Command is to appear in any subcase for which Bar End Loads and Panel shear flows are required. This entry is only applicable in SOL101 or ANALYSIS=STATIC.
2. The presence of BENDL in a linear statics run will automatically turn on GPFORCE=ALL as well as PARAM, NOELOF, 1.
3. Only CSHEAR, CQUAD4, CTRIA3, CQUADR, and CTRIAR panels will contribute to shear flow and bar end load calculations.
4. Include MDLPRM HDF5 to output OUTSFLOW data block to the HDF5 output file.

5. The following figure shows a typical bar end load and shear flow panel.

6. Print and table FORMAT is:

```

BAR END LOADS APPROXIMATIONS (CBAR)
ELEMENT          TOTAL END LOADS
ID.             END 1          END 2
6              -1.994413E+03  -1.136868E-13
11             2.082592E+03  3.638604E-01
16             -4.721992E+02  -7.329887E+01
21             4.984904E+02  -4.987337E+02
  
```

```

BAR END LOADS SHEAR FLOW APPROXIMATIONS (C
QUAD4)
ELEMENT ID.          SHEAR 12          SHEAR 23          SHEAR 34          SHEAR 41
                   1          9.972063E+01  -2.493060E+02  -9.972063E+01  3.989003E+01
  
```

**BOUTPUT**

## Line Contact or 3D Contact Output Requests

Selects contact regions for output.

**Format:**

$$\text{BOUTPUT} \left[ \left( \left[ \text{SORT1} \right], \left[ \text{PRINT}, \text{PUNCH} \right] \right), \left[ \text{PLOT} \right] \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

```
BOUTPUT=ALL
BOUTPUT=5
```

Describer	Meaning
SORT1	Output is presented as a tabular listing of secondary nodes for each load or time depending on the solution sequence.
SORT2	Output is presented as a tabular listing of load or time for each secondary node.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Histories of all the secondary nodes (all nodes for 3D Contact) listed in all the BOUTPUT Bulk Data entries are output. If no BOUTPUT Bulk Data entries are specified, histories of all the secondary nodes in all the contact regions are output.
n	Set identification of previously appearing SET command. Only contact regions with identification numbers that appear on the SET command are selected for output. If there is a BOUTPUT Bulk Data entry for a contact region selected via the set command, histories for secondary nodes listed in the Bulk Data entry are output. If there is no BOUTPUT Bulk Data entry for a contact region selected via the set command, histories for all the secondary nodes in that contact region are output.
NONE	Result histories for secondary nodes are not calculated or output.

**Remarks:**

1. BOUTPUT is processed in SOLs 101, 106, 129, 153, 159, 400, and 600 only.  
For other solution sequences, only the initial contact status may be output when presence of BCTABLE or BCTABL1 with ID=0.
2. SORT1 is the default in SOLs 106 and 153. SORT2 is the default in SOLs 129 and 159.
3. Only SORT1 is available for 3D Contact.
4. The initial contact status may be output when presence of BCTABLE/ID=0. Please note that all the contact force/stress in the initial state are zero. Only the contact status is relevant.

**BSQUEAL**

## Brake Squeal Analysis Data Selection

Selects data for brake squeal analysis in SOL 400.

**Format:**

BSQUEAL= n

**Example:**

BSQUEAL=10

Describer	Meaning
n	Set identification number of a BSQUEAL Bulk Data entry (Integer > 0).

**Remark:**

1. This command is used only in SOL 400 for brake squeal analysis with 3D Contact.
2. This command is not available with segment-to-segment contact.

## CAMPBELL

### Campbell Diagram Parameters

Specifies Campbell Diagram parameters.

**Format:**

CAMPBELL= n

**Example:**

CAMPBELL= 10

Describer	Meaning
n	Identification number of a CAMPBLL Bulk Data entry (Integer > 0).

**Remark:**

1. CAMPBELL option is supported for SOL 107, SOL110, SOL 200 and SOL 400 analysis.
2. When there is a Case Control request for Campbell diagram, the selected RGYRO Bulk Data entry must have the ASYNC option specified in its SYNCFLG field (Field 3). Otherwise, the program terminates the execution with an appropriate fatal message.

**CLOAD**

## Static Load Request for Upstream Superelement Loads

Requests a CLOAD Bulk Data entry that defines a list of superelement loads and their scale factors in nonlinear static analysis only.

**Format:**

CLOAD=*n*

**Example:**

CLOAD=1 5

Describer	Meaning
<i>n</i>	Identification number of a unique CLOAD Bulk Data entry (Integer > 0).

**Remarks:**

1. This command may only appear in the residual structure subcases (see the Case Control command, [SUPER \(Case\)](#)) and, if used, it must be specified in all of them.
2. The CLOAD Bulk Data entry must reference previously processed LSEQ (load sequence) Bulk Data that was requested by LOADSET Case Control commands on the upstream (SUPER ≠ 0) subcases.
3. The resulting load is added to those produced by LOAD and TEMP(LOAD) Case Control commands in the residual structure subcases.

## CMETHOD

## Complex Eigenvalue Extraction Method Selection

Selects complex eigenvalue extraction parameters.

### Format:

CMETHOD=n

### Example:

CMETHOD=77

Describer	Meaning
n	Set identification of EIGC (and EIGP) Bulk Data entry (Integer > 0).

### Remarks:

1. The CMETHOD command must be specified in order to compute complex eigenvalues.
2. See description of the parameter, [UNSYMF](#), to perform complex eigenvalue analysis in SOL 106.

**CMSENRGY****Component Modal Synthesis Energy Output Request**

Requests the form and type of component modal synthesis (CMS) energy output.

**Format:**

$$\begin{aligned}
 & \text{CMSENRGY} \left( \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \text{ESORT} = \left\{ \begin{array}{c} \text{MODE} \\ \text{ASCEND} \\ \text{RATIO} \end{array} \right\} \right], \\
 & \left[ \text{RESPONSE} = \left\{ \begin{array}{c} \text{BOTH} \\ \text{MODAL} \\ \text{FORCED} \end{array} \right\} \right], \left[ \text{CMSE} = \left\{ \begin{array}{c} \text{ALL} \\ \text{NONE} \\ \text{TOTAL} \\ \text{QSET} \end{array} \right\} \right], \left[ \text{CMKE} = \left\{ \begin{array}{c} \text{ALL} \\ \text{NONE} \\ \text{TOTAL} \\ \text{QSET} \end{array} \right\} \right], \\
 & \left[ \text{CMDE} = \left\{ \begin{array}{c} \text{ALL} \\ \text{NONE} \\ \text{TOTAL} \\ \text{QSET} \end{array} \right\} \right], \left[ \text{FILTER} = \left\{ \begin{array}{c} \text{0.001} \\ \text{fratio} \end{array} \right\} \right], [\text{TOPN} = m] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}
 \end{aligned}$$

**Example:**

CMSENRGY (PHASE, RESPONSE=FORCED, CMSE=TOTAL, CMKE=QSET) = ALL

SET 1001 = 10, 40

CMSENRGY (PUNCH, PRINT, RESPONSE=BOTH, CMSE=ALL, FILTER=0.01) = 1001

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with "PARAM,POST,X" (or the POST Case Control command), while the .h5 binary database file will be generated with "MDLPRM,HDF5,X" specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ESORT

Keyword selecting one of the output sorting options: MODE, ASCEND, or RATIO.

Describer	Meaning	
RESPONSE	MODE	Results are output in order of increasing CMS natural mode number.
	ASCEND	Results are output in order of increasing energy ratio magnitudes.
	RATIO	Results are output in order of decreasing energy ratio magnitudes.
	BOTH	Requests output for both free and forced response solutions.
	MODAL	Specifies that output is to be generated for the free (or real eigenvalue) response solution.
	FORCED	Specifies that output is to be generated for the forced response (modal frequency or modal transient) solution.
CMSE	Keyword requesting output of CMS strain energy ratios.	
CMKE	Keyword requesting output of CMS kinetic energy ratios.	
CMDE	Keyword requesting output of CMS damping energy ratios.	
	ALL	Requests both TOTAL and QSET output.
	NONE	Requests that no CMS energy output be generated.
	TOTAL	Requests CMS energy ratio totals in all component modes of a superelement.
	QSET	Requests CMS energy ratios for individual component modes.
FILTER	Keyword specifying the value of the printed output data filter.	
	fratio	Value of output filter ratio (Default = 0.001).
TOPN	Keyword specifying the number of largest CMS energy ratios to be output.	
	m	The number of largest CMS energy ratios to be output (Default is all ratios).
	n	Results for superelement IDs in SET n will be output.
	ALL	Results for all recovered superelements will be output.
	NONE	No CMS energy ratios will be output.

### Remarks:

1. The CMSENGY command may be requested in the modal solution sequences (SOLs 110, 111, 112, 145, 146, 200) and the real eigenvalue analysis solution sequences (SOLs 103 and 106). It is intended for use when superelements are defined and component modal synthesis techniques are employed. (See the MODALKE and MODALSE Case Control commands for other options.)
2. ESORT, FILTER, and TOPN describers apply only to QSET results output. TOTAL results output is always in increasing order of superelement ID number.
3. QSET CMS energy ratios are output in increasing order of component mode number unless the ESORT keyword specifies a particular sorting order. If a sorting order is specified, the magnitude of the energy ratio is sorted. DESCEND can be used as a synonym for RATIO.

4. The FILTER keyword specifies an absolute value that is used to limit the amount of printed output produced. It is applied to the magnitude of the CMS energy ratio. If the CMS energy ratio magnitude is less than fratio for any natural mode, no output for that natural mode is produced. THRESH can be used as a synonym for FILTER.
5. In order to obtain unforced response (RESPONSE=BOTH or MODAL) output in SOL 111 and SOL 112, a subcase containing the ANALYSIS = MODES option must be present.
6. For modal transient response solution sequences, response quantities are real numbers. There are no imaginary terms. Therefore, polar representations of the data have no meaning.

## COSMSEL

### Select CoSIM Service

Activates Co-Simulation service and select the definition of co-simulation.

#### Format:

COSMSEL = n

#### Example:

COSMSEL = 21

Describer	Meaning
n	Identification number of a COSMSEL Bulk Data entry.

#### Remark:

1. COSMSEL is recognized in SOL 400 only.

**CSSCHD**

## Aerodynamic Control Surface Schedule

Selects control system schedule information.

**Format:**

CSSCHD = n

**Example:**

CSSCHD=10

Describer	Meaning
n	Set identification of a control system schedule that appears on a CSSCHD Bulk Data entry.

**Remark:**

1. One or more CSSCHD Bulk Data entries can be invoked by this Case Control command.

## DBSAVE

## Saving Control Parameter of Datablocks for Advanced Nonlinear Elements

Selects saving of datablocks of advanced nonlinear elements for static and transient nonlinear analysis in SOL 400.

### Format:

DBSAVE=*n*

### Example:

```
DBSAVE =2
SUBCASE=1
  ANALYSIS=HSTAT
SUBCASE=2
  ANALYSIS=NLSTAT
```

```
DBSAVE = -1
SUBCASE=1
  STEP = 1
  ANALYSIS=NLSTAT
  DBSAVE = 1
  STEP = 2
  ANALYSIS=NLSTAT
```

```
SUBCASE=2
  ANALYSIS=NLSTAT
SUBCASE=3
  ANALYSIS=NLSTAT
SUBCASE=4
  ANALYSIS=NLSTAT
```

Descriptor	Meaning
<i>n</i>	selected value to control saving of datablocks of advanced nonlinear elements (Integer > = -1).(Default=0)
-1	No datablocks of advanced nonlinear elements is saved
0	Saving datablocks of advanced nonlinear elements at the end of each loadcase
>0	Saving datablocks of advanced nonlinear elements at the every <i>n</i> th output request of results

### Remarks:

1. DBSAVE can be applied above all the subcases, within subcases, and steps. DBSAVE above all the subcases is going to be applied to all the subcases.
2. If DBSAVE is present both above subcase and in step, the DBSAVE in step is dominant and used to control datablocks saving in this step.
3. When DBSAVE=-1, advanced nonlinear element can't be used in Linear Perturbation or other analysis step with NLIC.

**DEACTEL**

## Elements to be Deactivated for SOL 400 Analysis

Indicates which DEACTEL Bulk Data entry is used to control the elements to be deactivated in a single physics job, or a particular physics pass of a coupled job. SOL 400 for NLSTATIC, and NLTRAN, as well Perturbation analyses only.

**Format:**

DEACTEL=N

**Example:**

DEACTEL=2

Describer	Meaning
N	ID of a matching DEACTEL Bulk Data entry specifying the elements to be deactivated.

**Remarks:**

- Usage is limited to the first subcase (or prior to it), the first step or the first substep of a particular physics pass. Elements are deactivated at the start of the job or the start of the particular physics pass and remain deactivated for the entire job.
- Elements deactivated can not be reactivated at later stage in the analysis.

**DEFORM**

## Element Deformation Static Load

Selects the element deformation set.

**Format:**

DEFORM=n

**Example:**

DEFORM=27

Descriptor	Meaning
n	Set identification number of DEFORM Bulk Data entries (Integer > 0).

**Remarks:**

1. DEFORM Bulk Data entries will not be used unless selected by the DEFORM command in the Case Control Section.
2. DEFORM is only applicable in linear statics, inertia relief, differential stiffness, and buckling problems (SOLs 101, 105, 114, and 200), and will produce a fatal message in other solution sequences.
3. The total load applied will be the sum of external (LOAD), thermal (TEMP(Load)), element deformation (DEFORM), and constrained displacement loads (SPC, SPCD).
4. Static, thermal, and element deformation loads should have unique identification numbers.
5. In the superelement solution sequences, if the DEFORM Case Control command is used in a cold start, it must also be specified in the restart.

## DESGLB

## Request Design Constraints at the Global Level

Selects the design constraints to be applied at the global level in a design optimization task.

### Format:

DESGLB=n

### Examples:

DESGLB=10

DESG=25

Describer	Meaning
n	Set identification of a set of DCONSTR or a DCONADD Bulk Data entry identification number (Integer > 0).

### Remarks:

1. If used, this command must occur before the first subcase.
2. The DESGLB Case Control command is optional and invokes constraints that are to be applied independently of a particular subcase. These constraints could be based on responses that are independent of subcases (e.g., WEIGHT, VOLUME, WMPID, FRMASS, and FATIGUE). The DESGLB command must be used when applying constraints to FRMASS, WMPID and FATIGUE responses.
3. The DESGLB Case Control command can be used to invoke constraints that are not functions of DRESP1 entries; e.g., DRESP2 responses that are not functions of DRESP1 responses are subcase independent.
4. Constraints that are applied to responses that span subcases through the use of the DRSPAN command must be invoked using the DESGLB command.

**DESMOD**                      Design Model Name

Assigns the design model parameter used to locate the associated datablocks for merging of two or more SOL 200 models using the MultiOpt application.

**Format:**

DESMOD=name

**Examples:**

DESMOD=FLUTTER

Describer	Meaning
Name	User-specified name to designate the model. (The first 8 characters must be unique)

**Remarks:**

1. The name is an attribute of the datablocks that require merging across models in order to perform a simultaneous design.
2. The parameter is only used with MultiOpt, that merges simultaneous models.
3. A unique value of DESMOD is needed for each model invoked by MultiOpt.
4. If DESMOD is used in a SOL 200 input file that is not being used in MultiOpt, it will result in a fatal error.
5. MultiOpt supports Multi Model Optimization (MMO) and Global Optimization (GO), see [Design Sensitivity and Optimization User's Guide](#)

## DESOBJ

### Design Objective

Selects the DRESP1, DRESP2 or DRESP3 entry to be used as the design objective.

#### Format:

$$\text{DESOBJ} \left[ \begin{array}{c} \text{MAX} \\ \text{MIN} \end{array} \right] = n$$

#### Examples:

```
DESOBJ=10  
DESO=25
```

Describer	Meaning
MIN	Specifies that the objective is to be minimized.
MAX	Specifies that the objective is to be maximized.
n	Set identification number of a DRESP1, DRESP2 or DRESP3 Bulk Data entry (Integer > 0).

#### Remarks:

1. A DESOBJ command is required for a design optimization task and is optional for a sensitivity task. Only one DESOBJ command may appear in a Case Control Section.
2. The referenced DRESPi entry must define a scalar response (e.g., WEIGHT or VOLUME).
3. If the DESOBJ command refers to a global response, such as weight, it should appear above the first subcase. If the DESOBJ command refers to a subcase-dependent response such as an element stress, it should appear in that subcase. If it refers to a subcase dependent response but is inserted above the first subcase, it will select the response from the first subcase for the objective and ignore the responses in subsequent subcases.
4. Using DREPS2 with weight factors, SOL200 can support multiple objective optimization.
5. MSC Nastran MultiOpt utility supports Multi Model Optimization (MMO) and Global Optimization (GO), see [Design Sensitivity and Optimization User's Guide](#)

## DESSUB

### Design Constraints Request at the Subcase Level

Selects the design constraints to be used in a design optimization task for the current subcase.

#### Format:

DESSUB=n

#### Examples:

DESSUB=10  
 DESS=25

Describer	Meaning
n	Set identification of a set of DCONSTR and/or a DCONADD Bulk Data entry identification number (Integer $\geq 0$ ).

#### Remarks:

1. A DESSUB Case Control command is required for every subcase for which constraints are to be applied. An exception to this is 'global constraints', which are selected by the DESGLB Case Control command.
2. All DCONSTR and DCONADD Bulk Data entries with the selected set ID will be used.
3. Constraints cannot be applied to the FRMASS, FATIGUE, or FRFTG response using the DESSUB command. Use the DESGLB command instead.

## DESVAR

### Design Variable Selection

Selects a set of DESVAR entries for the design set to be used.

#### Format:

$$\text{DESVAR} = \begin{bmatrix} \text{ALL} \\ n \end{bmatrix}$$

#### Example:

DESVAR=10

Describer	Meaning
n	Set identification of a previously appearing SET command (Integer > 0). Only DESVAR Case Control commands with IDs that appear on this SET command will be used in the SOL 200 design task.

#### Remarks:

1. Only one DESVAR Case Control command may appear in the Case Control Section and should appear above all subcase commands.
2. The DESVAR Case Control command is optional. If it is absent, all DESVAR Bulk Data entries will be used.

## DISPLACEMENT

## Displacement Output Request

Requests the form and type of displacement or pressure vector output. Note: PRESSURE and VECTOR are equivalent commands.

### Format:

$$\text{DISPLACEMENT} \left[ \left( \begin{matrix} \text{[SORT1]} \\ \text{[SORT2]} \end{matrix} \right), \begin{matrix} \text{[PRINT, PUNCH]} \\ \text{PLOT} \end{matrix}, \begin{matrix} \text{[REAL or IMAG]} \\ \text{PHASE} \end{matrix} \right] \begin{matrix} \text{[PSDF, ATOC, CRMS]} \\ \text{RALL} \end{matrix} \right],$$

$$\left[ \begin{matrix} \text{[RPRINT]} \\ \text{[NORPRINT]} \end{matrix}, \text{RPUNCH} \right], \text{[CID]}, \left[ \frac{\text{TM} = f}{\text{T1} = f, \text{T2} = f, \text{T3} = f} \right], \left[ \frac{\text{RM} = f}{\text{R1} = f, \text{R2} = f, \text{R3} = f} \right],$$

$$\text{[CONNECTOR} = \left[ \begin{matrix} \text{[ALL]} \\ \text{m} \end{matrix} \right], \left[ \begin{matrix} \text{[STRUCTURE]} \\ \text{FLUID} \\ \text{BOTH} \\ \text{NONE} \end{matrix} \right] \right] = \left\{ \begin{matrix} \text{ALL} \\ \text{n} \\ \text{NONE} \end{matrix} \right\}$$

### Examples:

```
DISPLACEMENT=5
DISPLACEMENTS (REAL) =ALL
DISPLACEMENT (SORT2, PUNCH, REAL) =ALL
DISPLACEMENT (SORT2, PRINT, PSDF, CRMS, RPUNCH) =20
DISPLACEMENT (PRINT, RALL, NORPRINT) =ALL
DISP (T1=1.-3, T3=1.-2) = ALL
DISP (TM=1.-3, PRINT, PLOT) = ALL
DISP (TM=1.-3, PRINT, PLOT, SORT2) = 20
DISP (CONN=23) =54
DISPLACEMENT (PLOT, PRINT, BOTH) = ALL
```

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of load, frequency, or time for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

Describer	Meaning
	* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests that the power spectral density function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 6.
ATOC	Requests that the autocorrelation function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 6.
CRMS	Requests that the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 6.
RALL	Request that all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 6.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
CID	Requests printing of output coordinate system ID in printed output file, (.f06).
TM	Translational magnitude filter. See Remark 8.
T1, T2, T3	Translational component filters. See Remark 8.
RM	Rotational magnitude filters. See Remark 8.
R1, R2, R3	Rotational component filters. See Remark 8.
F	Filter value (Real > 0.0). See Remark 8.

Describer	Meaning
CONNECTOR	<p>A set of CWELD or CFAST, elements are defined from which auxiliary grids will be determined for output post-processing for displacement display in the basic system. This command produces the following actions:</p> <p>The auxiliary point “grids” determined by the set m of connector elements specified on this entry will be appended to the set n defined on the right side of the DISP command.</p> <p>m is the identification of a connector element set defined by a previously appearing SET command.</p> <p>If the right side of the DISP command is defined as NONE, then no points will be output even if the user has defined the keyword CONN=ALL or CONN=m.</p> <p>If the right side of the DISP command is defined as ALL, then auxiliary point “grids” for all connectors will be generated regardless if CONN= is specified.</p> <p>If the user wishes to produce displacements for all the connector elements and have them appended to the set n defined on the right side of the DISP command, then to avoid having to define a previously appearing m SET command with all connectors listed, the user may define CONN=ALL.</p>
ALL	Displacements for all points will be output.
n	Set identification of a previously appearing SET command. Only displacements of points with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	Displacement for no points will be output.
STRUCTURE, FLUID, BOTH	Request eigenvector output data type for normal mode computation (SOL 103) with METHOD(COUPLED) case control. Structure displacement only, Fluid pressure only or both Structure displacement and Fluid pressure output separately. Default is NONE for both structure displacement and fluid pressure together. See Remark 10.

**Remarks:**

1. The defaults for SORT1 and SORT2 depend on the type of analysis:
  - a. SORT1 is the default in static analysis, frequency response, steady state heat transfer analysis, real and complex eigenvalue analysis, flutter analysis, and buckling analysis.
  - b. SORT2 is the default in transient response analysis (structural and heat transfer). SORT2 is not available for real eigenvalue (including buckling), complex eigenvalue, or flutter analysis. If SORT1 is selected in a transient solution for one or more of the commands ACCE, DISP, ENTH, FORC, HDOT, MPCF, OLOA, SPCF, STRA, STRE, and VELO, then the remaining

commands will also be output in SORT1 format. If SORT2 is selected in a static or frequency response solution for one or more of the commands ACCE, DISP, FORC, MPCF, OLOA, SPCF, STRA, STRE, and VELO, then the remaining commands will also be output in SORT2 format.

- c. XY plot requests forces SORT2 and overrides SORT1 requests!
  - d. If a RANDOM request occurs the output will be in SORT2 format, even if SORT1 is requested.
2. VECTOR and PRESSURE are alternate forms and are equivalent to DISPLACEMENT. In complex analysis, the pressure is ALWAYS magnitude-phase.
  3. DISPLACEMENT=NONE overrides an overall output request.
  4. The units of translation are the same as the units of length of the model. Rotations are in units of radians.
  5. Displacement results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
  6. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
  7. Note that the CID keyword affects only grid point related output, such as DISPlacement, VELOcity, ACCEleration, OLOAD, SPCForce and MPCForce. In addition, CID keyword needs to appear only once in a grid-related output request anywhere in the Case Control Section to turn on the printing algorithm.
  8. Displacement components may be selected to control filtering to reduce the amount of output produced. When magnitudes are selected, the component values are ignored. Only a single positive value for  $f$  can be supplied, and comparisons are performed in the global reference frame. Comparisons are performed after the SET intersection is performed against the domain. Selection of this option does not effect the MAXMIN(GRID) operations. Scalar comparisons are performed using the minimum of all supplied values for the filters.

For complex vectors encountered in frequency response analysis, the magnitudes TM and RM follow a derivation using a deterministic interpretation and are calculated as follows:

- For Grid Points

TM

Define

$$C1 = T1real^{**2} + T2real^{**2} + T3real^{**2}$$

$$C2 = T1imag^{**2} + T2imag^{**2} + T3imag^{**2}$$

$$C3 = T1real*T1imag + T2real*T2imag + T3real*T3imag$$

$$C4 = (C1 + C2)/2$$

$$C5 = (C1 - C2)/2$$

Then,

$$TM = C4 + SQRT (C5^{**2} + C3^{**2})$$

RM

The calculations are similar to the above, except that R1, R2 and R3 are used in place of T1, T2 and T3, respectively.

- For Scalar Points

In this case, TM and RM have the same meaning.

Define

$$C1 = T1real**2$$

$$C2 = T1imag**2$$

$$C3 = T1real*T1imag$$

$$C4 = (C1 + C2)/2$$

$$C5 = (C1 - C2)/2$$

Then,

$$TM \text{ (or RM)} = C4 + \text{SQRT} (C5**2 + C3**2)$$

9. When using filters, the compound usage of the verbs PRINT, PLOT is allowed. The entries in the printed output are the entries that exceed any threshold, while the remaining entries within the SET are marked as plot to allow for postprocessing operations. When SORT2 is selected, then PRINT, PLOT must be used to allow for table transpose operations to occur. When any entry in the SORT2 format is above the threshold, all values for time or frequency will be printed for the grid point.
10. Default eigenvector output format of coupled mode computation (SOL 103) is structure displacement and fluid pressure combined in one datablock per same modes DISP(PRINT) = ALL.

The eigenvector table has normal title in f06 file.

```
REAL EIGENVECTOR NO. 1
```

To get structure displacement and fluid pressure separately from coupled mode computation (with METHOD(coupled) in SOL 103), DISP(PRINT,STRUCTURE) = ALL is used for STRUCTURAL displacement only. The eigenvector table has title (STRUCTURE) in f06 file.

```
REAL EIGENVECTOR(STRUCTURE) NO. 1
```

DISP(PRINT,FLUID) = ALL is used for FLUID pressure only. The eigenvector table has the title (FLUID) in f06 file.

```
REAL EIGENVECTOR(FLUID) NO. 1
```

DISP(PRINT,BOTH) = ALL is used for both STRUCTURAL displacement and FLUID pressure but separately. Each eigenvector table includes its own title (STRUCTURE) or (FLUID) in f06 file.

```
REAL EIGENVECTOR(STRUCTURE) NO. 1
```

```
.....
```

```
REAL EIGENVECTOR(FLUID) NO. 1
```

```
.....
```

**DIVERG**

## Static Aeroelastic Divergence Request

Selects the divergence parameters in a static aeroelastic divergence problem.

**Format:**

DIVERG=*n*

**Example:**

DIVERG=70

Describer	Meaning
<i>n</i>	Set identification of a DIVERG Bulk Data entry (Integer > 0).

**Remark:**

1. Static aeroelastic divergence analysis can be performed only in SOLs 144, 200 and 400.

**DLOAD**

## Dynamic Load Set Selection

Selects a dynamic load or an acoustic source to be applied in a transient or frequency response problem.

**Format:**

DLOAD=n

**Example:**

DLOAD=7 3

Descriptor	Meaning
n	Set identification of a DLOAD, RLOAD1, RLOAD2, TLOAD1, TLOAD2, or ACSRCE Bulk Data entry (Integer > 0).

**Remarks:**

1. RLOAD1 and RLOAD2 may only be selected in a frequency response problem.
2. TLOAD1 and TLOAD2 may be selected in a transient or frequency response problem.
3. Either an RLOADi or TLOADi entry (but not both) must be selected in an aeroelastic response problem. If RLOADi is selected, a frequency response is calculated. If TLOADi is selected, the transient response is computed by Fourier transform. When there are only gust loads (GUST Bulk Data entry), the DLOAD selects a TLOADi or RLOADi Bulk Data entry with zero load, along with field 3 of the GUST command.
4. The DLOAD command will be ignored if specified for upstream superelements in dynamic analysis. To apply loads to upstream superelements, refer to the LOADSET Case Control command.
5. For nonlinear dynamic analysis with SOL 400, TEMPERATURE load can't be applied by DLOAD/TEMP/TLOADi. TEMP (case control) and TTEMP (Bulk data) should be used to apply the temperature load. However, for pure linear analysis, DLOAD/TEMP has to be used for temperature load.

**DRSPAN**

## Response Spanning Set Selection

Selects a set of DRESP1 entries for the current subcase that are to be used in a DRESP2 or DRESP3 response that spans subcases.

**Format:**

DRSPAN=*n*

**Example:**

DRSPAN=1 0

Describer	Meaning
<i>n</i>	Set identification of a previously appearing SET command (Integer > 0).

**Remarks:**

1. In SOL 200, DRESP2 or DRESP3 Bulk Data entries can invoke DRESP1 responses that span subcases if these DRESP1 responses have been identified using a DRSPAN Case Control command that references a SET request that identifies the DRESP1 Bulk Data entries.
2. Each DRESP1 identified must produce a scalar value.
3. The DRSPAN Case Control command must be at the subcase level, whereas the SET request can be specified above the subcase level.
4. DRESP2, or DRESP3 that SPANS subcases, cannot reference another DRESP2 and/or DRESP3.
5. DRSPAN must appear in every subcase in the file if the synthetic response is to span the subcases. The synthetic response via DRESP2 or DRESP3 must reference all DRESP1 IDs defined in SETs of DRSPAN. In DEQATN, all DRESP1 IDs should show up in the list of variables. For those DRESP1 IDs that are not needed, it can be dropped from the definition of equation(s).
6. To check the value of spanned response, set parameter P2 of DOPTPRM to a value equal to or larger than 8, see DOPTPRM for details. Note that verification requires performing hand calculation based on user-provided DEQATN for the spanned response.

## DSAPRT

## Design Sensitivity Output Parameters

Specifies design sensitivity output parameters.

### Format:

$$DSAPRT \left[ \begin{array}{c} \text{FORMATTED} \\ \text{UNFORMATTED} \\ \text{NOPRINT} \end{array} \right], \left[ \begin{array}{c} \text{NOEXPORT} \\ \text{EXPORT} \end{array} \right], \text{START} = i, \text{BY} = j, \text{END} = k = \left[ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right]$$

### Examples:

```
DSAPRT (FORMATTED, EXPORT)
DSAPRT (FORMATTED, START=FIRST, BY=3, END=LAST) =1 0 1
DSAPRT (UNFORMATTED, START=FIRST)
DSAPRT (UNFORMATTED, EXPORT)
DSAPRT (FORMATTED, END=4) =ALL
DSAPRT (UNFORMATTED, END=SENS) =ALL
DSAPRT (NOPRINT, EXPORT)
```

Descriptor	Meaning
FORMATTED	Output will be presented with headings and labels.
UNFORMATTED	Output will be printed as a matrix print (see description of the MATPRN module in the <a href="#">MSC Nastran DMAP Programmer's Guide</a> ).
NOPRINT	No output will be printed.
EXPORT	Output will be exported to an external binary file specified by PARAM,IUNIT.
NOEXPORT	Output will not be exported to an external binary file.
START=i	Specifies the first design cycle for output (Integer > 0 or Character: "FIRST" or "LAST"; Default = 1 or "FIRST").
BY=j	Specifies the design cycle interval for output. See Remark 2. (Integer ≥ 0; Default = 0).
END=k	Specifies the last design cycle for output. (Integer > 0 or Character: "FIRST", "LAST", or "SENS"; Default = "LAST")
ALL	All retained design responses (defined on DRESP1, DRESP2 and DRESP3 entries) will be output.
n	Set identification of a previously appearing SET command. Only sensitivities of retained responses with identification numbers that appear on this SET command will be output (Integer > 0).

**Remarks:**

1. Only one DSAPRT may appear in the Case Control Section and it must occur with or above the first SUBCASE command.
2. Sensitivity data will be output at design cycles  $i$ ,  $i+j$ ,  $i+2j$ , ...,  $k$ . Note that the  $BY=0$  implies no sensitivity results will be output at the intermediate design cycles.
3.  $END=SENS$  requests design sensitivity analysis, and no optimization will be performed.
4. If both DSAPRT and  $PARAM,OPTEXTIT, 4, -4$ , or  $7$  are specified, then DSAPRT overrides  $PARAM,OPTEXTIT, 4, -4$ , or  $7$ .  $PARAM,OPTEXTIT$  values and the equivalent DSAPRT commands are described as follows:

OPTEXTIT	Equivalent DSAPRT Command
4	DSAPRT(UNFORMATTED, END=SENS)
-4	DSAPRT(NOPRINT, EXPORT, END=SENS)
7	DSAPRT(UNFORMATTED, START=LAST)

5. The  $n$  and NONE options are not supported for UNFORMATTED output. Only the UNFORMATTED option is supported for EXPORT.
6.  $PARAM,DSZERO$  can be used to set a threshold for the absolute value of the formatted sensitivity prints.
7. Design Sensitivity analysis is never performed following a discrete design optimization. Therefore, no sensitivity output will be produced with  $DSAPRT(END=LAST)$  when discrete optimization is performed at the end of a job.
8. Formatted sensitivity data can also be written into Comma Separated Values(or CSV) file with following steps
  - a.  $DSAPRT(formatted,..)$  request in case control. Note that 'formatted' is a default option.
  - b.  $PARAM,XYUNIT,52$  in bulk data. Unit 52 is simply chosen as an example.
  - c. file assignment statement, such as  
`ASSIGN USERFILE='jobname.csv' FORM=formatted STATUS=new UNIT=52`

## DSYM

## Dihedral Symmetry Option in Cyclic Symmetry

Provides for either one or two planes of overall symmetry in DIH-type cyclic symmetry problems.

### Format:

$$DSYM = \left\{ \begin{array}{c} S \\ A \\ SS \\ SA \\ AS \\ AA \end{array} \right\}$$

### Example:

DSYM=AS

Describer	Meaning
S, A	The problem is assumed to be symmetrical (S) or antisymmetrical (A) with respect to the plane containing side 1 of segment 1.
SS, SA, AS, AA	The problem is assumed to be symmetrical (or antisymmetrical) with respect to the plane containing side 1 of segment 1 (denoted by the first symbol), and also with respect to a plane perpendicular to side 1 (denoted by the second symbol).

**DYSTIFF**

## Dynamic Stiffness Output Request

Requests the form and type of dynamic stiffness output in SOL 108, 111, 200 and SOL 400 only.

$$DYSTIFF \left[ \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT,PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] \right) \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

**Examples:**

DYSTIFF = ALL

DYSTIFF (REAL, PUNCH, PRINT)=17

DYSTIFF = 25

DYSTIFF (SORT2, PRINT)=20

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each frequency.
SORT2	Output will be presented as a tabular listing of frequency for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Dynamic Stiffness at all points will be output. See remark 2.
n	Set identification of a previously appearing SET command. Only dynamic stiffness of points with identification numbers that appear on this SET command will be output. (Integer >0).
NONE	No dynamic Stiffness will be output (Default).

### Remarks:

1. DYSTIFF is available for SOL 108, 111 and SOL 200 and 400 with ANALYSIS=DFREQ and MFREQ. Note that DYSTIFF is available for output only and cannot be utilized as the design response in SOL 200.
2. See Remark 1. under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. DYSTIFF=NONE suppresses the generation of dynamic stiffness output.
4. Dynamic Stiffness,  $d_i$  at a grid point is computed as,  $d_i=f_i/u_i$  where  $f_i$  is the load applied and  $u_i$  is the complex displacement. The dynamic stiffness will be output for the grids having load applied on it.
5. Refrain from using ALL which may produce voluminous output.
6. The dynamic stiffness output will be subjected to the mechanical load only.
7. Dynamic stiffness output is not supported for enforced motion analysis. The results will be zero for enforced motion analysis.

## ECHO Bulk Data Echo Request

Controls echo (i.e., printout) of the Bulk Data.

### Format:

$$\text{ECHO} = \left\{ \begin{array}{l} \text{[SORT]([EXCEPT]cdni,...)} \\ \text{UNSORT} \\ \text{BOTH} \\ \text{NONE} \end{array} \right\}, \text{PUNCH} \left[ \begin{array}{l} \text{SORT} \\ \text{BOTH} \\ \text{NEWBULK} \end{array} \right], \text{FILE} \left\{ \right.$$

### Examples:

```
ECHO=UNSORT
ECHO=BOTH
ECHO=PUNCH, SORT (MAT1, PARAM)
ECHO=SORT (EXCEPT DMI, DMIG)
ECHO=BOTH, PUNCH, FILE
```

(In the above examples See Remark 7.: the PUNCH keyword will always result in the PUNCH file containing the entire bulk data input. Explicit inclusion indicators (CDNI) such as (MAT1, PARAM) will always cause a F06 file to be written that contains only the (CDNI) data.)

Describer	Meaning
SORT	The sorted (arranged in alphanumeric order) Bulk Data will be printed.
EXCEPT	Excludes cdni Bulk Data entries from sorted echo printout. See Remark 6.
cdni,...	Defines Bulk Data entry names to be included, or excluded by EXCEPT, in the sorted echo printout. The PUNCH (.pch) file is not affected by cdni.
UNSORT	The unsorted Bulk Data will be printed. If SORT is also not specified, the sorted Bulk Data will not be printed.
BOTH	Both sorted and unsorted Bulk Data will be printed. This is equivalent to ECHO=SORT, UNSORT.
NONE	Neither sorted nor unsorted Bulk Data will be printed.
PUNCH	The entire Bulk Data will be written to the punch (.pch) file. See Remark 7. for options.
FILE	The entire Bulk Data echo will be written to the separate file with a default suffix of .BECHO in *.f06 form. A user-defined filename must be specified in the ASSIGN statement.
NEWBULK	In SOL 200, a complete unsorted Bulk Data file is written to the PUNCH file with updated design model entries.

### Remarks:

1. If no ECHO command appears, sorted Bulk Data will be printed.
2. Comments will appear at the front of the sorted file if ECHO=PUNCH.
3. Portions of the unsorted Bulk Data can be selectively echoed by including the commands ECHOON and ECHOOFF at various places within the Bulk Data. ECHOOFF stops the unsorted echo until an ECHOON commands is encountered. Many such pairs of commands may be used. The ECHOON and ECHOOFF command may be used in the Executive and Case Control Sections; however, ECHOOFF should not be the first entry and continuation entries are not handled correctly.
4. If the SORT (cdni,...) describer is specified in a restart in SOLs 101 through 200, then the continuation entries will not be printed.
5. If the SORT (cdni,...) describer is used, then it must appear as the last describer, as in the preceding example.
6. If the EXCEPT describer is specified, then it must be specified before all cdni. All Bulk Data entry types will be listed except those given for cdn1, cdn2, etc. If EXCEPT is not specified, then only those Bulk Data entry types listed under cdn1, cdn2, etc. will be listed.
7. PUNCH without options or PUNCH(SORT) produces a sorted listing of the entire bulk data input in the punch file. PUNCH(NEWBULK) produces unsorted bulk data input with updated design model entries in the punch file. PUNCH(BOTH) combines these two outputs.

**EDE****Element Energy Loss Per Cycle Output Request**

Requests the output of the energy loss per cycle in selected elements.

**Format:**

$$\text{EDE} \left[ \left( \begin{array}{c} \text{PRINT} \\ \text{PLOT} \end{array} \right), \begin{array}{c} \text{PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{c} \text{AVERAGE} \\ \text{AMPLITUDE} \\ \text{PEAK} \end{array} \right] \left[ \text{THRESH} = p \right] \left[ \text{NOPERCENT} \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

EDE=ALL

EDE (PUNCH, THRESH=.0001) = 19

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

AVERAGE	Requests average energy (in frequency response analysis only) (Default).
AMPLITUDE	Requests amplitude of energy (in frequency response analysis only).
PEAK	Requests peak energy (for frequency response analysis only). PEAK is the sum of AVERAGE and AMPLITUDE.
THRESH	Energies for elements having an energy value of less than p% will be suppressed in all output files: print, punch, plot, .op2, and .xdb. THRESH overrides the value of TINY described in Remark 1. (Default = 0.001).
NOPERCENT	Do not compute TOTAL ENERGY OF ALL ELEMENTS IN PROBLEM and PERCENT OF TOTAL. The values will appear as zeros. Sparse data recovery and NOPERCENT can result in significant reduction in computing resources. But if RTYPE=TOTSE appears on a DRESP1 entry then full data recovery is necessary and no savings will be realized.
ALL	Energy for all elements will be computed.

Describer	Meaning
n	Set identification number. Energy for all elements specified on the SET n command will be computed. The SET n command must be specified in the same subcase as the EDE command, or above all subcases (Integer > 0).
NONE	Element energy loss will not be output.

### Remarks:

1. If THRESH = p is not specified, then p defaults to the values specified by user parameter TINY.
2. The energy calculations include the contribution of initial thermal strain.
3. Energy density (element energy divided by element volume) is also computed in some solution sequences. It can be suppressed by use of PARAM,EST,-1.
4. For frequency response analysis, the energy may be computed in one of three ways as selected by AVERAGE:

$$E_o = \pi\omega(\{u_r\}^T[B_e]\{u_r\} + \{u_i\}^T[B_e]\{u_i\})$$

AMPLITUDE:

$$E_a = \pi\omega\sqrt{(\{u_r\}^T[B_e]\{u_r\} - \{u_i\}^T[B_e]\{u_i\})^2 + (2\{u_r\}^T[B_e]\{u_i\})^2}$$

PEAK:

$$E_{peak} = E_o + E_a$$

where:

- E = elemental energy.
- $\{u_r\}$  = displacement (real part).
- $\{u_i\}$  = displacement (imaginary part).
- $[B_e]$  = elemental damping.

5. In SOLs 111 and 112, EDE is not available if both PARAM,DDRMM,0 and PARAM,SPARSEDR,NO are specified.
6. Only damping from the viscous dampers (e.g., CVISC, CDAMPi, etc.) are included. Structural damping is not included in the calculation.
7. The usages of REPCASE and OMODES Case Control directives is not supported for ESE, EKE, EDE and GPFO output selections and should not be used.
8. If there are any frequency dependent CBUSH elements present, and PARAM, BUSHNM, NO; then all CBUSH elements will be excluded from the element energy loss output.

9. For transient response, EDE is computed in a quasi-static manner at each time step:  $\frac{1}{2} \{v\}^T [B_e] \{u\}$ ; where  $B_e$  is elemental damping and  $v$  and  $u$  are velocity and displacement respectively.

## EKE

## Element Kinetic Energy Output Request

Requests the output of the kinetic energy in selected elements.

### Format:

$$EKE \left( \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{l} \text{AVERAGE} \\ \text{AMPLITUDE} \\ \text{PEAK} \end{array} \right] \left[ \text{THRESH} = p \right] \left[ \text{NOPERCENT} \right] \right) = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

### Examples:

```
EKE=ALL
EKE (PUNCH, THRESH=.0001) =19
```

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

AVERAGE	Requests average energy (in frequency response analysis only) (Default).
AMPLITUDE	Requests amplitude of energy (in frequency response analysis only).
PEAK	Requests peak energy (for frequency response analysis only). PEAK is the sum of AVERAGE and AMPLITUDE.
THRESH	Kinetic energies for elements having a energy value of less than p% will be suppressed in all output files: print, punch, plot, .op2, and .xdb. THRESH overrides the value of TINY described in Remark 1. (Default = 0.001).
NOPERCENT	Do not compute TOTAL ENERGY OF ALL ELEMENTS IN PROBLEM and PERCENT OF TOTAL. The values will appear as zeros. Sparse data recovery and NOPERCENT can result in significant reduction in computing resources. But if RTYPE=TOTSE appears on a DRESP1 entry then full data recovery is necessary and no savings will be realized.
ALL	Kinetic energy for all elements will be computed.

Describer	Meaning
n	Set identification number. Energy for all elements specified on the SET n command will be computed. The SET n command must be specified in the same subcase as the EKE command, or above all subcases (Integer > 0).
NONE	Kinetic energy values will not be output.

**Remarks:**

1. If THRESH = p is not specified, then p defaults to the values specified by user parameter TINY.
2. The energy calculations include the contribution of initial thermal strain.
3. Energy density (element energy divided by element volume) is also computed in some solution sequences. It can be suppressed by use of PARAM,EST,-1.
4. For frequency response analysis, the energy values may be computed in one of three ways as selected by

AVERAGE:

$$E_o = \frac{1}{4}(\{v_r\}^T [M_e] \{v_r\} + \{v_i\}^T [M_e] \{v_i\})$$

AMPLITUDE:

$$E_a = \frac{1}{4} \sqrt{(\{v_r\}^T [M_e] \{v_r\} - \{v_i\}^T [M_e] \{v_i\})^2 + (2\{v_r\}^T [M_e] \{v_i\})^2}$$

PEAK:

$$E_{peak} = E_o + E_a$$

where:

E = elemental energy.

{v<sub>r</sub>} = velocity (real part).

{v<sub>i</sub>} = velocity (imaginary part).

[M<sub>e</sub>] = elemental mass.

5. In SOLs 111 and 112, EKE is not available if both PARAM,DDRMM,0 and PARAM,SPARSEDR,NO are specified.
6. The usages of REPCASE and OMODES Case Control directives is not supported for ESE, EKE, EDE and GPFO output selections and should not be used.
7. EKE output request is available in SOL 400 multi-disciplinary and linear perturbation analyses using MODES and MCEIG types of analysis.

8. If there are any frequency dependent CBUSH elements present, and PARAM, BUSHNM, NO; then all CBUSH elements will be excluded from the element kinetic energy output.
9. For transient response, EKE is computed in a quasi-static manner at each time step:  $\frac{1}{2} \{v\}^T [M_e] \{v\}$ ; where  $M_e$  is elemental mass and  $v$  is velocity.

## ELAFORCES

### Elastic Forces Output Request

Requests the form and type of elastic forces output.

#### Format:

$$\text{ELAFORCES} \left( \left( \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right), \left( \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) \right) = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

#### Examples:

```
ELAFORCE=ALL
ELAF (REAL, PUNCH, PRINT)=17
ELAFORCE=25
ELAFORCE (SORT2, PRINT)=20
```

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.

PRINT or (blank)	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Elastic forces for all points will be output. See Remarks 2.

Describer	Meaning
NONE	No elastic force will be output.
n	Set identification of a previously appearing SET command. Only points with identification numbers that appear on this SET command will be output (Integer >0).

**Remarks:**

1. Refrain from using ALL in transient analysis which may produce voluminous output.
2. See Remark 1. under [DISPLACEMENT \(Case\)](#), for a discussion of SORT1 and SORT2.
3. ELAFORCE=NONE suppresses the generation of elastic forces output.
4. Although ELAFOR selects the desired grid IDs, it is to be noted that the connections should be included in the computation. Hence,  $F_i$  of a point the requested set can be also expressed as

$$F_i = \sum_{j=1}^n K_{ij}u_j$$

5. ELAFORCE is available for SOL 108, 109, 111, 112 and SOL 200 with ANALYSIS=DFREQ, MFREQ and MTRAN. Note that ELAFORCE is available for output only and can not be utilized as design response.
6. ELAFORCE does not support external SE via OTM due to limitation.
7. ELAFORCE does not support DOMAINSOLVER with PARTOPT=grid.

## ELSDCON

## Element Stress Discontinuity Output Request

Requests mesh stress discontinuities based on element stresses.

### Format:

$$\text{ELSDCON} \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Examples:

ELSDCON=ALL  
ELSDCON=19

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Stress discontinuity requests for all SURFACE and VOLUME Case Control commands defined in the OUTPUT(POST) Section will be output.
n	Set identification number of a previously appearing SET command. Only surfaces and volumes with identification numbers that appear on this SET command will be included in the stress discontinuity output request (Integer >0).
NONE	No element stress discontinuity output.

### Remarks:

1. This output is available in linear static analysis SOLs 101 and 144 only. Output will be presented for each surface or volume as a tabular listing of stress discontinuities for each subcase.
2. Only elements used to define the surface or volume are output. See the description of the SURFACE or VOLUME Case Control commands.

3. Element stress output (STRESS) must be requested for elements referenced on SURFACE and VOLUME Case Control commands. Also, the GPSTRESS command must be present for printed output and the STRFIELD command for postprocessing output using the .xdb file (PARAM,POST,0) for the same surfaces and volumes.

## ELSENS

## Element Sensitivity Output for SOL 108/111

Select SOLUTION frequencies and RESPONSE DOFs for the generation element sensitivity.

### Format:

ELSENS  $\left( \begin{bmatrix} \text{PRINT, PUNCH} \\ \text{PLOT} \end{bmatrix}, \begin{bmatrix} \text{REAL or IMAG} \\ \text{PHASE} \end{bmatrix}, [\text{THRESH} = P], \text{RESPONSE} = r,$

$\left[ \text{SOLUTION} = \begin{Bmatrix} \text{ALL} \\ \text{self} \end{Bmatrix} \right],$

$\left[ \text{MASS, STIFF, DYNAMIC, SQSTIFF, SQDYNA} \right] = \begin{Bmatrix} \text{ALL} \\ n \\ \text{NONE} \end{Bmatrix}$

### Example

```
SET 81 = 100.0, 120.0
SET 91 = 11240/T3, 4001/T1
SET 96 = 15920 THRU 15950
$
ELSENS (RESPONSE=91, SOLUTION=81, MASS, STIFF, DYNAMIC) = 96
```

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

THRESH            The magnitude of element sensitivity less than p will be suppressed in all output files: print, punch, plot, .op2, and .xdb. (Default = 0.0).

RESPONSE        Adjoint load response will be computed for unit load applied at grid point components in SET r.

Describer	Meaning
SOLUTION	Frequency responses at these forcing frequencies, defined in setf, will be used for element sensitivity computation. (Default=all forcing frequencies)
MASS	Sensitivity with element mass matrices will be computed and output.
STIFF	Sensitivity with element stiffness matrices will be computed and output.
DYNAMIC	Sensitivity with element stiffness and mass matrices will be computed and output.
SQMASS	Squared sensitivity with element mass matrices will be computed and output.
SQSTIF	Squared sensitivity with element stiffness matrices will be computed and output.
SQDYNA	Squared sensitivity with element stiffness and mass matrices will be computed and output.
ALL	Sensitivities for all elements will be calculated.
n	Set identification number. Sensitivity for all elements specified on the SET n command will be calculated. The SET n command must be specified in the same subcase as the ELSENS command, or above all subcases ( Integer > 0 ). The IDs in set n must be EID (element ID).
NONE	Elemental sensitivity will not be output.

### Remarks:

1. Set r for RESPONSE has no default.
2. The equations various options of ELSENS

$$\text{ELSENS(MASS)} = [A_{\text{setf}}]^t [M_{\text{elem}}] [A_r]$$

$$\text{ELSENS(STIFF)} = [U_{\text{setf}}]^t [K_{\text{elem}}] [U_r]$$

$$\text{ELSEND(DYNAMIC)} = [A_{\text{setf}}]^t [M_{\text{elem}}] [A_r] + [U_{\text{setf}}]^t [K_{\text{elem}}] [U_r]$$

$$\text{ELSENS(SQMASS)} = [A_{\text{setf}}]^t [M_{\text{elem}}] [A_r] + [A_{\text{setf}}]^* [M_{\text{elem}}]^* [A_r]^*$$

$$\text{ELSENS(SQSTIF)} = [U_{\text{setf}}]^t [K_{\text{elem}}] [U_r] + [U_{\text{setf}}]^* [K_{\text{elem}}]^* [U_r]^*$$

$$\text{ELSEND(DYNAMIC)} = [A_{\text{setf}}]^t [M_{\text{elem}}] [A_r] + [U_{\text{setf}}]^t [K_{\text{elem}}] [U_r] + [A_{\text{setf}}]^* [M_{\text{elem}}]^* [A_r]^* + [U_{\text{setf}}]^* [K_{\text{elem}}]^* [U_r]^*$$

where  $[U_{\text{setf}}]$  is the displacement of SOLUTION

$[A_{\text{setf}}]$  is the acceleration of SOLUTION

$[U_r]$  is the displacement of RESPONSE

$[A_r]$  is the acceleration of RESPONSE

$[K_{\text{elem}}]$  is element stiffness matrix

$[M_{\text{elem}}]$  is element mass matrix

superscript \* means complex conjugate of the term.

**ELSUM** Element Summary Output Request

Requests that a summary of element properties grouped by element type and/or element property type are to be printed.

**Format:**

$$\text{ELSUM}([\text{EID}, \text{PID}, \text{BOTH}, \text{EIDSUM}, \text{PIDSUM}, \text{NSMCONT}, \text{SUMMARY}]) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

**Examples:**

```
ELSUM = 9
ELSUM (PID) = ALL
```

Describer	Meaning
EID	Element summary output is grouped by element type.
PID	Element summary output is grouped by element property type.
BOTH	Both EID and PID groupings are produced.
EIDSUM	Only a summary of the mass totals for the EID grouping is produced.
PIDSUM	Only a summary of the mass totals for the PID grouping is produced.
NSMCONT	Nonstructural mass contributions from NSM, NSM1, NSML, and NSML1 Bulk Data entries are identified.
SUMMARY	Only a summary of the mass totals is produced.
ALL	Element summary output for all elements
n	Set identification of a previously appearing SET command. Produces output for only those elements whose identification numbers appear in the list of this SET command.
NONE	No element summary output is produced.

**Remarks:**

1. The ELSUM Case Control command produces a summary of properties for elements. The properties include element ID, material ID, length or thickness, area, volume, structural mass, nonstructural mass, total mass, and the product of total mass \* WTMASS. Total mass is the sum of the structural and nonstructural masses.

2. Certain element types produce only partial data. For these element types, no mass data is produced, and mass totals will not include any contributions from these element types. Mass data is computed for the following element types: CBAR, CBEAM, CBEND, CHEXA, CMASSi, CONM1, CONM2, CONROD, CPENTA, CQUAD4, CQUAD8, CQUADR, CRAC2D, CRAC3D, CROD, CSHEAR, CTETRA, CTRIA3, CTRIA6, CTRIAR, CTRIAX6, and CTUBE. The mass of elements with mid side nodes is approximated using only the geometry of the corner nodes. To get an accurate total mass, use the output from the Grid Point Weight Generator (PARAM,GRDPNT).
3. EIDSUM takes precedence over EID if both are present. Likewise, PIDSUM takes precedence over PID.
4. The ELSUM Case Control command is ignored in heat transfer solution sequences.
5. The NSMCONT descriptor produces various amounts of output depending upon whether the summary option is selected (SUMMARY, PIDSUM or EIDSUM requested). If NSMCONT is combined with PID, a table is produced that identifies the contribution of each NSM type Bulk Data entry to the total element nonstructural mass. If SUMMARY is included with PID and NSMCONT, an additional table is produced that identifies the mass contributions for each property type by property ID.
6. ELSUM output is only available for the PRINT option, not the PUNCH or PLOT options used in other commands.
7. ELSUM does not support advanced nonlinear elements.

## ENDSTEP

Specifies Final Analysis Step

Specifies final analysis step for SOL 700.

### Format:

ENDSTEP = Value

### Example:

ENDSTEP = 10000

Describer	Meaning
Value	Steps to end the simulation (Integer, Default = 9999999).

**ENDTIME**

Specifies Final Analysis Time

Specifies final analysis time for SOL 700.

**Format:**

ENDTIME = Value

**Example:**

ENDTIME = 0.01

Describer	Meaning
Value	Time in the applicable units for the model (usually seconds) (Real; Default = 1e+20).

## ENDMODULE

Module Bulk Data section delimiter

Indicates (delimits) the end of a Module's Bulk Data section.

### Format:

```
ENDMODULE
```

### Example:

```
ENDMODULE  
END MODULE
```

### Remarks:

1. A BEGIN MODULE command must appear somewhere before ENDMODULE.
2. The ENDDATA command may be used to terminate the last Module's Bulk Data section.

**ENTHALPY**

## Heat Transfer Enthalpy Output Request

Requests form of enthalpy vector output in transient heat transfer analysis (SOL 159).

**Format:**

$$\text{ENTHALPY} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

**Example:**

ENTHALPY=5

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each time.
SORT2	Output will be presented as a tabular listing of time for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Enthalpy for all grid points will be output.
n	Set identification of previously appearing SET command. Only enthalpies of grid points with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	Enthalpy for no grid points will be output.

**Remark:**

1. ENTHALPY=NONE is used to override a previous ENTHALPY = n or ENTHALPY = ALL command.

## EQUILIBRIUM

## Equilibrium Force Output Request

Specifies options for equilibrium force balance output of applied loads, single point constraint forces and forces due to multi-point constraints and rigid elements.

### Format:

$$\text{EQUILIBRIUM} \left[ \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) \right] = \left\{ \begin{array}{l} \text{YES} \\ \text{gid} \\ \text{NONE} \end{array} \right\}$$

### Examples:

```
EQUILIBRIUM
EQUILIBRIUM = 501
```

Descriptor	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

YES	Requests moment summation referenced to origin of basic coordinate system.
gid	Requests moment summation referenced to basic system location specified by the coordinates of grid point gid.
NONE	Equilibrium force balance output will not be generated.

### Remarks:

1. The EQUILIBRIUM Case Control command produces a summary of the applied loads, single point forces of constraint (SPC), and multipoint/rigid body element forces of constraint (MPC), as well as a summation of these quantities. In order for the summation to represent all of the forces in the problem, these forces must be available and, therefore, the specification of an EQUILIBRIUM Case Control command causes the program to automatically compute the SPC and MPC forces. However,

if desired, the associated Case Control commands should request output. The single point forces of constraint are requested by the presence of an SPCFORCE command, and the multipoint/RBE constraint forces are requested by an MPCFORCE command. Applied loads are automatically generated by the presence of the LOAD selection Case Control command.

2. Results are always output in the basic coordinate system.
3. The EQUILIBRIUM Case Control command is applicable to Linear Static analysis (SOL101) only, and does not produce output if any superelements are present.

## ERP

### Equivalent Radiated Power Panel Participation Factor Output Request

Requests the form and type of ERP panel participation factor output for frequency or transient analysis.

#### Format:

$$\begin{aligned}
 & \text{ERP} \left[ \begin{array}{l} \text{[SORT2]} \\ \text{[SORT1]} \end{array} \right], \left[ \begin{array}{l} \text{[PRINT, PUNCH]} \\ \text{PLOT} \end{array} \right] \left[ \text{SOLUTION} = \begin{array}{l} \text{ALL} \\ \text{setf} \\ \text{sett} \end{array} \right], \\
 & \left[ \text{MPF} = \begin{array}{l} \text{ALL} \\ \text{nlm} \\ \text{NONE} \end{array} \right], [\text{MPFSORT} = \text{sorttype}], [\text{ELEMENT}], \\
 & \left[ \text{KEY} = \begin{array}{l} \text{frequency} \\ \text{fraction} \\ \text{time} \end{array} \right], \left[ \text{FILTER} = \begin{array}{l} \text{0.01} \\ \text{real\_value} \end{array} \right], \\
 & \left[ \text{ERPRHO} = \begin{array}{l} \text{1.0} \\ \text{real\_value} \end{array} \right], \left[ \text{ERPC} = \begin{array}{l} \text{1.0} \\ \text{real\_value} \end{array} \right] \\
 & \left[ \text{RHOC} = \begin{array}{l} \text{1.0} \\ \text{real\_value} \end{array} \right], \left[ \text{ERPRLF} = \begin{array}{l} \text{1.0} \\ \text{real\_value} \end{array} \right] \\
 & \left[ \text{ERPREFDB} = \begin{array}{l} \text{1.0} \\ \text{real\_value} \end{array} \right], [\text{CSV} = \text{unit}] = \begin{array}{l} \text{ALL} \\ \text{setp} \\ \text{NONE} \end{array}
 \end{aligned}$$

#### Examples:

```

SET 17 = 10.,20.,30.,40.,80.,100. $ A list of frequencies
SET 25 = ROOF, DOORLF $ A list of ERP Panel names
                    $ from a ERPPNL Bulk Entry
ERP ( PRINT,PUNCH,SOLUTION=17,KEY=frac ) = 25
    
```

Describer	Meaning
SORT1	Output is presented as a tabular listing of ERP panels for each frequency.
SORT2	Output is presented as a tabular listing of frequency for each ERP panel.

Describer	Meaning
-----------	---------

PRINT or (blank)	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PUNCH	X		X*
PLOT		X	X*
			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

SOLUTION	Keyword to select frequencies or time.
ALL	If associated with SOLUTION, all frequencies or times are selected. If associated with <i>setp</i> , all ERPPNL entries are selected.
setf	Identifier of Case Control SET command defining frequencies.
sett	Identifier of Case Control SET command defining times.
MPF	Requests the output of Modal Participation Factors for ERP. See Remark 9.
ALL	All structural modes for which MPF will be computed
nIm	Number of lowest structural modes for which MPF will be computed
NONE	MPF will not be computed. (Default)
MPFSORT	Keyword selecting the sort type. Default is sorting by increasing natural mode number. See Remark 10.
Sorttype	Sort options: ABSA output will be sorted by absolute value in ascending order. ABSD output will be sorted by absolute value in descending order. ALGA output will be sorted by algebraic value in ascending order. ALGD output will be sorted by algebraic value in descending order
ELEMENT	Keyword to request element-by-element ERP output
KEY	Keyword selecting the output item used to sort the printed output. The default produces output sorted on either frequency (SORT2) or ERP panel name (SORT1).  KEY= <i>fraction</i> produces output sorted in descending order of the fractional ERP value of maximum ERP across all frequencies or time steps of a panel.  KEY= <i>time</i> produces output sorted on either time (SORT2) or ERP panel name (SORT1). In transient the default KEY=frequency will automatically become KEY=time.

Describer	Meaning
FILTER	Keyword specifying the value of a filter to be applied to the printed output only. ERP values are printed only if the fractional ERP value of maximum ERP across all frequencies or time steps of a panel exceeds the filter value.
ERPRHO	Fluid density for Equivalent Radiated Power (ERP) analysis. This item is actually an MSC Nastran parameter.
ERPC	Phase speed of the fluid for Equivalent Radiated Power (ERP) analysis. This item is actually an Nastran parameter.
ERPRLF	Radiation loss factor. In frequency the scale factor $C = \text{ERPRLF} * (\frac{1}{2}\text{ERPRHO} * \text{ERPC})$ . In transient the scale factor $C = \text{ERPRLF} * (\text{ERPRHO} * \text{ERPC})$ .
RHOCP	Scale factor used in dB computation. This item is actually an MSC Nastran parameter.
ERPREFDB	Scale factor used in dB computation. This item is actually an MSC Nastran parameter.  The dB calculation is $\text{ERPdB} = 10 \log \left( \text{RHOCP} \cdot \frac{\text{ERP}}{\text{ERPREFDB}} \right)$ .
CSV	Results will be written to a .csv file.  unit      Unit of the .csv file as used on the required ASSIGN statement.  setp      Identifier of case control SET command defining NAMEi entries from an ERPPNL Bulk Data entry defining panels.  NONE      No ERP output is produced.

### Remarks:

- ERP is required to produce any ERP output and ERP request must appear either above SUBCASE level or within 1st SUBCASE. Subsequent SUBCASEs, from 2nd onwards, may or may not have ERP request.
- Output is generated in SORT2 by default. Unlike other Case Control requesting SORT2 format, the ERP command does not force all other output into SORT2 format.
- FILTER has no effect on PUNCHED, CSV or OP2 output.
- In addition to individual panel output a summary named ALLPANEL is produced. If there are multiple subcases, the panel name is formed from the serial subcase number (1-nsubc) and the characters 'ALLP' as in ALLP0002 unless the ERP command request output for ALL panels across the Subcases. In this case, the summary panel name ALLPANEL is retained.
- Selectable frequencies are dependent on the presence of an OFREQ Case Control command.
- ERPRHO, ERPC, ERPRLF, RHOCP, and ERPREFDB are actually PARAM,name,value entries.
- The filter process avoids printing ERP for cases where ERP/ERPMAX is less than the FILTER value. ERPMAX is the maximum ERP value across all frequencies for a panel.
- If output to a .csv file is requested, the file must be assigned with logical key USERFILE and FORM=FORMATTED, e.g.,

ASSIGN USERFILE = myfile.csv UNIT=50 FORM=FORMATTED STATUS=NEW

9. The MPF of ERP will be computed with the same parameters, such as SOLUTION, csv, setp and etc.
10. MPFs for ERP are sorted by increasing order of natural frequencies unless the MPFSORT keyword specifies a different sorting order. If a sorting order is specified, the KEY keyword selects the item that is used for sorting. Since ERP is always positive, ABSA/ALGA and ABSD/ALGD will produce same sorting results.
11. Element ERP includes elements defined via ERPPNL and SET3. For 3D element types, such as HEXA, PENTA and TETRA, element ERP includes those elements at the outer surface of the model. For an element with multiple faces exposed, the element ERP is the summation of ERP of all exposed faces.
12. MPF for ERP and element ERP may increase the volume of output significantly.

## ESE Element Strain Energy Output Request

Requests the output of the strain energy in selected elements.

### Format:

$$\text{ESE} \left[ \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) \left[ \begin{array}{l} \text{AVERAGE} \\ \text{AMPLITUDE} \\ \text{PEAK} \end{array} \right] [\text{THRESH} = p][\text{NOPERCENT}] \right] = \left\{ \begin{array}{l} \text{ALL} \\ n \end{array} \right\}$$

### Examples:

```
ESE=ALL
ESE (PUNCH, THRESH=.0001)=19
```

Descriptor	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

AVERAGE	Requests average energy in frequency response analysis only.
AMPLITUDE	Requests amplitude of energy in frequency response analysis only.
PEAK	Requests peak energy for frequency response analysis only. PEAK is the sum of AVERAGE and AMPLITUDE.
THRESH	Energies for elements having an energy value of less than p% will be suppressed in all output files: print, punch, plot, .op2, and .xdb. THRESH overrides the value of TINY described in Remark 1. (Default = 0.001).
NOPERCENT	Do not compute TOTAL ENERGY OF ALL ELEMENTS IN PROBLEM and PERCENT OF TOTAL. The values will appear as zeros. Sparse data recovery and NOPERCENT can result in significant reduction in computing resources. But if RTYPE=TOTSE appears on a DRESP1 entry then full data recovery is necessary and no savings will be realized.
ALL	Energy values for all elements will be computed.

Describer	Meaning
n	Set identification number. Energy for all elements specified on the SET n command will be computed. The SET n command must be specified in the same subcase as the ESE command, or above all subcases (Integer > 0).
NONE	Element strain energy will not be output.

**Remarks:**

1. If THRESH = p is not specified, then p defaults to the values specified by user parameter TINY.
2. The energy calculations include the contribution of initial thermal strain.
3. Energy density (element strain energy divided by element volume) is also computed in some solution sequences. It can be suppressed by use of PARAM,EST,-1.
4. For frequency response analysis, the energy may be computed in one of three ways as selected by AVERAGE:

$$E_o = \frac{1}{4}(\{u_r\}^T [K_e] \{u_r\} + \{u_i\}^T [K_e] \{u_i\})$$

AMPLITUDE:

$$E_a = \frac{1}{4} \sqrt{(\{u_r\}^T [K_e] \{u_r\} - \{u_i\}^T [K_e] \{u_i\})^2 + (2\{u_r\}^T [K_e] \{u_i\})^2}$$

PEAK:

$$E_{peak} = E_o + E_a$$

where:

- E = elemental energy.
- $\{u_r\}$  = displacement (real part).
- $\{u_i\}$  = displacement (imaginary part).
- $[K_e]$  = elemental stiffness.

5. In SOLs 111 and 112, ESE is not available if both PARAM,DDRMM,0 and PARAM,SPARSEDR,NO are specified.
6. Element data recovery for thermal loads is not currently implemented in dynamics.

7. Element strain energy is available for nonlinear static analysis (SOL 106). However, in a normal modes analysis in SOL 106 with PARAM,NMLOOP (or ANALYSIS=MODES) or a PARAM NMLOOP restart into SOL 103, energies are computed for elements with linear properties only. ESE output request is also available in SOL 400 linear and nonlinear static analyses as well as multi-disciplinary and linear perturbation analyses using MODES and MCEIG types of analysis. All other nonlinear solution sequences do not support element strain energy output.
8. The strain energy for nonlinear elements is calculated by integrating the specific energy rate, the inner product of strain rate, and stress over element volume and time.

$$E = \int_0^t \int_V \dot{\varepsilon}^T \sigma dV dt \quad (5-10)$$

where:

- $\sigma$  = stress tensor
- $\dot{\varepsilon}$  = tensor of the strain rate
- $V$  = element volume
- $t$  = actual time in the load history

Loads from temperature changes are included in Eq. (5-10). If we assume a linear variation of temperatures from subcase to subcase, then the strain energy in Eq. (5-10) for the special case of linear material and geometry becomes

$$E = \frac{1}{2} u^T K_e u - \frac{1}{2} u^T P_{et} \quad (5-11)$$

where  $P_{et}$  is the element load vector for temperature differences.

For linear elements, the default definition of element strain energy is

$$E = \frac{1}{2} u^T K_e u - u^T P_{et} \quad (5-12)$$

where  $P_{et}$  is the element load vector for temperature differences and element deformation.

In Eq. (5-12), the temperatures are assumed to be constant within a subcase. The default definition of the strain energy for linear elements differs from the definition for nonlinear elements by a factor of 1/2 in the temperature loads. To request the strain energy for linear elements using Eq. (5-11), set the parameter XFLAG to 2; the default value for XFLAG is 0, which uses Eq. (5-12) for the strain energy of linear elements.

9. The usages of REPCASE and OMODES Case Control directives is not supported for ESE, EKE, EDE and GPFO output selections and should not be used.

10. If there are any frequency dependent CBUSH elements present, and PARAM, BUSHNM, NO; then all CBUSH elements will be excluded from the element strain energy output.
11. For transient response, ESE is computed in a quasi-static manner at each time step:  $\frac{1}{2} u^T K_e u$ ; where  $K_e$  is elemental stiffness and u is displacement.

## EXPORTLD

Saves a Load Vector on the Database for Subsequent Reuse

Saves the load vector for the current subcase on the database.

### Format:

$$\text{EXPORTLD}([\text{LOADID} = \text{lid}][\text{LOADNAME} = \text{ldname}]) = \left\{ \begin{array}{c} n \\ \text{ALL} \end{array} \right\}$$

### Examples:

```
EXPO (LOADNAME=LANDGEAR)
EXPORTLD=10
```

Describer	Meaning
LOADID=lid	User assignable value for the LOADID describer. Used to uniquely identify a saved load vector for later retrieval (using DBLOCATE, for example). The default value is the subcase ID.
LOADNAME=ldname	User-assignable value (of up to eight characters) for the LOADNAME describer. Used to uniquely identify a saved load vector for later retrieval. The default value is blank.
N	Results for grid point components in SET n will be exported.
ALL	Results for ALL grid point components will be exported. Default is ALL.

### Remarks:

1. Each load vector is stored individually as a one column matrix that is qualified by LOADID and LOADNAME. The combination of both the LOADID and the LOADNAME describers should uniquely identify the load vector to avoid overwriting (or possibly triggering the output twice rule an existing load vector).
2. If placed above the SUBCASE entry, then the load vectors for all subcases are saved.
3. The load vectors are qualified by LOADID and LOADNAME for selection using the WHERE clause on FMS commands that support it.
4. The following table shows the value of the LOADID and LOADNAME describers that are assigned for various EXPORTLD requests:

Example	Results
EXPORTLD	LOADID=subcase ID, LOADNAME=' ' - default value applied.
EXPORTLD(LOADID=12)	LOADID=12, LOADNAME=' '
EXPORTLD(LOADID=1,LOADNAME=FORCE12)	LOADID=1, LOADNAME='FORCE12'
EXPORTLD(LOADNAME=ALLCASES)	LOADID=subcase ID, LOADNAME='ALLCASES'

5. The load vector is typically imported into a run using the FMS DBLOCATE statement. The imported load is referenced by using its LOADID value on a LOAD Case Control command or Bulk Data entry. For example:

```

ASSIGN loads1='run1.MASTER'
DBLOCATE datablk=(EXTLD) WHERE(LOADNAME='ALLCASES'),
CONVERT (LOADID=LOADID+1000) LOGICAL=loads1
...
CEND
LOADS=1001 $ Select external load with LOADID=1001, imported from
previous run.

```

## EXTDRIN

### External Superelement Data Recovery Restart Run Request

Requests the job to perform an external superelement data recovery restart. Also specifies the storage media of the boundary solution data.

**Format:**

```
EXTDRIN (
    DMIGOP2 [= unitop2]
    MATRIXOP4 or MATOP4 [= unitop4]
    MATRIX or MATDB
    DMIGDB
)
```

**Examples:**

```
EXTDRIN
EXTDRIN (DMIGOP2=45)
EXTDRIN (MATOP4)
```

Descriptor	Meaning
DMIGOP2 = <i>unitop2</i>	Retrieve the boundary solution data stored in DMIG Bulk Data internal format on an .op2 file whose Fortran unit number is given by unitop2 (Integer > 0, Default=31).
MATRIXOP4 or MATOP4 = <i>unitop4</i>	Retrieve the boundary solution data on an .op4 file whose Fortran unit number is given by unitop4. (Integer > 0, Default=31).
MATRIXDB or MATDB	Retrieve the boundary solution data stored in the standard matrix format from the database.
DMIGDB	Retrieve the boundary solution data stored in the DMIG Bulk Data internal format from the database.

**Remarks:**

- EXTDRIN is intended for step three in external superelement analysis. External superelement data recovery is accomplished by restarting from the data base created in step one (external superelement creation run) and attaching the boundary solution data from step two (assembly run). The boundary solution data must have been stored in step two via the EXTDROUT Case Control command or user parameter EXTDROUT.
- External superelement data recovery restarts are limited to SOLs 101, 103, 107 through 112, and 400.
- EXTDRIN must be specified above all subcases.
- User parameters EXTDR and EXTDRUNT are the old method for requesting an external superelement data recovery restart. EXTDRIN Case Control command takes precedence over the EXTDR and EXTDRUNT user parameters.
- If data recovery is desired for the external component in SOLs 101, 103, 107 through 112 and 400, there are four methods to transmit the displacements of the reduced model, in Step 2, to the external full model. The method is selected by the EXTDROUT Case Control command in Step 2. The options are as follows:

- a. `EXTDROUT(MATRIXDB[=dbext])`. The displacements of the reduced component model are stored directly on the database. The sequencing of the displacement degrees-of-freedom corresponds to the sequencing in the reduced model. Keyword `dbext` exports the boundary solution data to a new DBset initialized by the “INIT dbext” statement in the File Management section of the input.
- b. `EXTDROUT(DMIGDB[=dbext])`. The displacements of the reduced model are stored on the database in a format which allows automatic connection to the reduced component model if the reduction grid points and scalar points are the same grid points and scalar points used in the analysis model. Keyword `dbext` exports the boundary solution data to a new DBset initialized by the “INIT dbext” statement in the File Management section of the input.
- c. `EXTDROUT(DMIGOP2=unit)`. The same as `EXTDROUT(DMIGDB)` except that the displacements of the reduced model are written in `OUTPUT2` format to a tape unit specified by the unit keyword (Default=31). The output unit can be assigned to a specific file by using an `ASSIGN OUTPUT2` command in the File Management Section.
- d. `EXTDROUT(MATOP4=unit)`. The same as `EXTDROUT(MATRIXDB)` except that the displacements of the reduced model are written in `OUTPUT4` format to a tape unit specified by the unit keyword (Default=31). The output unit can be assigned to a specific file by using an `ASSIGN OUTPUT4` command in the File Management Section.

Data recovery restart for the external superelement (Step 3) is available in SOLs 101, 103, 107 through 112, and 400 and is accomplished by using a restart procedure from the data base created in Step 1 and specifying the `EXTDRIN` Case Control command to import the solutions from Step 2. The method on inputting the reduced displacements into the component model depends on the method used to output the external component in Step 2. The setups for Steps 2 and 3 are:

EXTDROUT Option	Step-2 Assembly Job	Step-3 Data Recovery for External SE
MATRIXDB, or DMIGDB	<p>If <i>dbext</i> is specified in EXTDROUT then in FMS:</p> <p>INIT <i>dbext</i></p> <p>In Case Control:</p> <p>EXTDROUT (MATRIXDB (or DMIGDB) [=dbext])</p> <p>On command line run with <i>scr=no</i> assuming job name is called 'step2.dat'</p>	<p>In FMS:</p> <pre>ASSIGN SEXX='step1.MASTER' RESTART LOGICAL=SEXX ASSIGN SEYYY='step2.MASTER' DBLOCATE DATABLEK=(EXTDB), WHERE (SEID=YYY), LOGICAL=SEYYY</pre> <p>In Case Control:</p> <p>EXTDRIN (MATRIXDB or DMIGDB)</p>
DMIGOP2	<p>In FMS:</p> <pre>ASSIGN OUTPUT2='extsedr.op2', UNIT=45</pre> <p>In Case Control:</p> <p>EXTDROUT (DMIGOP2=45)</p>	<p>In FMS:</p> <pre>ASSIGN SEXX='step1.MASTER' RESTART LOGICAL=SEXX ASSIGN INPUTT2='extsedr.op2', UNIT=45</pre> <p>In Case Control:</p> <p>EXTDRIN (DMIGOP2=45)</p>
MATOP4	<p>In FMS:</p> <pre>ASSIGN OUTPUT4='extsedr.op4', UNIT=45</pre> <p>In Case Control:</p> <p>EXTDROUT (MATOP4=45)</p>	<p>In FMS:</p> <pre>ASSIGN SEXX='step1.MASTER' RESTART LOGICAL=SEXX ASSIGN INPUTT4='extsedr.op4', UNIT=45</pre> <p>In Case Control:</p> <p>EXTDRIN (MATOP4=45)</p>

- For SOL 101, the Step 3 Case Control structure must match the system model subcase structure in the numbers of loading conditions. The loading used in step one to generate the loads transmitted to the analysis model must also be specified in this step. If the analysis model had more loading conditions than the component model, then the loadings defined in Step 1 must be specified first.
- For SOLs 103 and 107 through 112, the Step 3 Case Control structure must match the analysis model subcase structure in the number of eigenvalue extractions, *FREQ/DLOAD* or *TSTEP/DLOAD* subcases.

8. SOL 400 with multidisciplinary and linear perturbation analyses will produce multiple boundary solutions in Step 2; i.e., a boundary solution for each SUBCASE with a unique ANALYSIS command. Hence in SOL 400 for Step 3 as soon as the boundary solutions have been imported, a summary of the boundary solutions will be printed in the f06. Here is a sample:

Assembly Run solutions					
Solution ID	Analysis type	Subcase	Step	Super-element	Title/Subtitle/Label
1	STATICS	2	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED STATICS
		5	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED STATICS FOR BUCKLING ANALYSIS
2	MODES	7	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED NORMAL MODES - SOLVE ALL EIGENVALUES
3	BUCKLE	6	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED BUCKLING - SOLVE ALL EIGENVALUES
4	MODES	3	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED MODAL FREQUENCY - FOUR FREQUENCIES AND DELTA-F=.001 AND F1=1.04
5	MFREQ	3	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED MODAL FREQUENCY - FOUR FREQUENCIES AND DELTA-F=.001 AND F1=1.04
6	MODES	1	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED MODAL TRANSIENT - FIFTY TIME STEPS AND DELTA-T=.001
7	MTRAN	1	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED MODAL TRANSIENT - FIFTY TIME STEPS AND DELTA-T=.001
8	MCEIG	4	0	100	MODEL T-6A (NTA) SEPARATION LOADS ANALYSIS, 270 KEAS HALF AIRCRAFT MODEL WITH PYLON & HMP,CNTRLS LOCKED MODAL COMPLEX - SOLVE FOR FIRST FIVE EIGENVALUES

The “Solution ID” column contains an arbitrary identification number which may be specified on the SOLUTION Case Control command in Step 3 whose usage will be described below. The “Analysis Type”, “Subcase”, and “Step” columns are the same as the ANALYSIS, SUBCASE, and STEP commands specified on Step 2. The “Superelement” column pertains the external superelement ID processed in Step 2. The “Title/Subtitle/Label” is taken from the TITLE, SUBTITLE, and LABEL commands specified in Step 2.

In Step 3, as with any restart, the Case Control must contain the same loads and boundary condition (LBC) commands specified in Step 1 like LOAD, SPC, MPC, METHOD, etc. If there is only one subcase specified in Step 3 then, by default, SOL 400 will perform external superelement data recovery for all solutions above. Here is a sample Step 3 Case Control setup:

```
EXTDRIN . . .
SPC=1
MPC=3
LOAD=5
$
DISP=ALL
STRESS=ALL
```

The displacement and element stress request for all solutions listed in the table above will be computed.

If, however, data recovery is desired at only a few solutions then a SUBCASE and SOLUTION command pair is required to obtain data recovery at each of the desired solutions. The subcases may be specified in any order and the SOLUTION command specifies the desired “Solution ID” from the table above. For example,

```
EXTDRIN . . .
SPC=1
MPC=3
SUBCASE 1
    SOLUTION=5
    STRESS=ALL
SUBCASE 2
    SOLUTION=3
    DISP=ALL
```

Alternatively, the ANALYSIS command may be used instead of the SOLUTION command. For example,

```
EXTDRIN . . .
SPC=1
MPC=3
SUBCASE 1
    ANALYSIS=MFREQ
    STRESS=ALL
SUBCASE 2
    ANALYSIS=BUCKLE
    DISP=ALL
```

If there is more than one solution associated with a particular analysis type, then results will be computed for all “Solution IDs” corresponding to that analysis type.

9. In Step 2, more than one external superelement may be processed by EXTDROUT. The following must be noted if DMIGOP2 or MATOP4 is used.
  - a. In SOLs 101, 103, and 107 through 112, the user must specify separate EXTDROUT as shown in the example below:

```
SUBCASE 1
    SUPER=10
    EXTDROUT (DMIGOP2=45)
SUBCASE 2
    SUPER=20
    EXTDROUT (DMIGOP2=46)
```

- b. In SOL 400, the user may specify separate EXTDROUT as described above or the same EXTDROUT command for all external superelements. If the user specifies the same EXTDROUT, then in the 3rd step a fatal message will be issued as shown below:

Assembly Run Solutions					
Solution ID	Analysis type	Subcase	Step	Super-element	Title/Subtitle/Label
1	MODES	1	0	10	MODAL, 3-STEP EXTERNAL SE, DMIGDB, ASSEMBLY
2	MODES	1	0	20	MODAL, 3-STEP EXTERNAL SE, DMIGDB, ASSEMBLY

\*\*\* USER FATAL MESSAGE 22907 (EXTDRSUM)

The attached boundary solutions %1 contains solutions for more than one external superelement and the desired superelement ID has not been selected.

**USER ACTION:** If the EXTDROUT Case Control command (or PARAM,EXTDROUT) specified DMIGOP2 or MATOP4 then you must specify the superelement ID on the SUPER Case Control command to select the appropriate boundary solution.

If EXTDROUT Case Control command (or PARAM,EXTDROUT) specified MATRIXDB or DMIGDB then you must specify the superelement ID

a) On the SUPER Case Control command to select the appropriate boundary solution.  
or  
b) In the WHERE(SEID=superelement\_ID) clause on the DBLOCATE statement of the boundary solutions database to select the appropriate boundary solution.

The summary shows that the solution file contains solutions for superelements 10 and 20 and the message indicates that only one solution may be processed. So the user must specify the SUPER command to select the desired superelement; e.g.,

```
SUPER=10
EXTDRIN (DMIGOP2=45)
```

Alternatively for EXTDRIN(DMIGDB or MATRIXDB) only, the user may specify WHERE(SEID=10) on the DBLOCATE statement of the boundary solution database.

10. The following examples continue from the examples described in Remark 18 under the EXTSEOUT Case Control command description.

#### Example 1. MATDB / MATRIXDB or DMIGDB Option

- Assembly Job (assume input file is named “assembly.dat”)
  - File Management Section (FMS) Requirement only if it is desired to store the boundary solutions on a dbset separate from DBALL

```
INIT EXTDRDB
```

- Case Control Requirement for MATDB / MATRIXDB Option.

Store boundary solutions on the DBALL dbset

```
EXTDROUT
```

Store boundary solutions on the EXTDRDB dbset

```
EXTDROUT ( MATRIXDB = EXTDRDB )
```

- Case Control Requirement for DMIGDB Option

Store boundary solutions on the DBALL dbset

```
EXTDROUT ( DMIGDB )
```

Store boundary solutions on the EXTDRDB dbset

```
EXTDROUT ( DMIGDB = EXTDRDB )
```

For all options above, “scr = no” must be specified on the Nastran command line to ensure that the databases are saved at the end of the jobs.

- External Superelement Data Recovery Restart Job (repeat following setup for each superelement)
  - File Management Section (FMS) Requirement

### Example 1. MATDB / MATRIXDB or DMIGDB Option

```
ASSIGN SE10='extse10.MASTER'
RESTART LOGI=SE10
ASSIGN ASMB='assembly.MASTER'
DBLOC DATABLK=(EXTDB) WHERE(SEID=10) LOGI=SE10
```

- Case Control Requirement for MATDB / MATRIXDB Option

```
EXTDRIN
```

- Case Control Requirement for DMIGDB Option

```
EXTDRIN ( DMIGDB )
```

### Example 2. DMIGOP2 Option

- Assembly Job

- Setup for SOLs 101, 103, 107 through 112, and 400 each superelement boundary solution is stored on a separate Fortran unit

- File Management Section (FMS) Requirement

```
ASSIGN OUTPUT2='extse10dr.op2' UNIT=25 DELETE
ASSIGN OUTPUT2='extse20dr.op2' UNIT=26 DELETE
ASSIGN OUTPUT2='extse30dr.op2' UNIT=27 DELETE
```

- Case Control Requirement

```
SUBCASE 1
SUPER = 10
EXTDROUT ( DMIGOP2 = 25 )
SUBCASE 2
SUPER = 20
EXTDROUT ( DMIGOP2 = 26 )
SUBCASE 3
SUPER = 30
EXTDROUT ( DMIGOP2 = 27 )
```

- Alternative setup for SOL 400 only – all superelement boundary solutions are stored on the same Fortran unit

- File Management Section (FMS) Requirement

```
ASSIGN OUTPUT2='extalldr.op2' UNIT=25 DELETE
```

- Case Control Requirement

```
EXTDROUT ( DMIGOP2 = 25 )
```

- External Superelement Data Recovery Restart Job (repeat following setup for each superelement)

- Setup for SOLs 101, 103, 107 through 112, and 400

**Example 2. DMIGOP2 Option**

- File Management Section (FMS) Requirement

```
ASSIGN SE10='extse10.MASTER'
RESTART LOGICAL=SE10
ASSIGN INPUTT2='extse10dr.op2' UNIT=25
```

- Case Control Requirement

```
EXTDRIN ( DMIGOP2 = 25 )
```

- Alternative setup for SOL 400 only – all superelement boundary solutions are stored on the same Fortran unit

- File Management Section (FMS) Requirement

```
ASSIGN SE10='extse10.MASTER'
RESTART LOGICAL=SE10
ASSIGN INPUTT2='extalldr.op2' UNIT=25
```

- Case Control Requirement – SUPER command is required to select the correct superelement boundary solution

```
SUPER = 10
EXTDRIN ( DMIGOP2 = 25 )
```

**Example 3. MATOP4 Option**

- Assembly Job

- Setup for SOLs 101, 103, 107 through 112, and 400 each superelement boundary solution is stored on a separate Fortran unit.

- File Management Section (FMS) Requirement

```
ASSIGN OUTPUT4='extse10dr.op4' UNIT=25 DELETE
ASSIGN OUTPUT4='extse20dr.op4' UNIT=26 DELETE
ASSIGN OUTPUT4='extse30dr.op4' UNIT=27 DELETE
```

- Case Control Requirement

```
SUBCASE 1
SUPER = 10
EXTDROUT ( MATOP4 = 25 )
SUBCASE 2
SUPER = 20
EXTDROUT ( MATOP4 = 26 )
SUBCASE 3
SUPER = 30
EXTDROUT ( MATOP4 = 27 )
```

- Alternative setup for SOL 400 only – all superelement boundary solutions are stored on the same Fortran unit.

### Example 3. MATOP4 Option

- File Management Section (FMS) Requirement

ASSIGN OUTPUT4='extalldr.op4' UNIT=25 DELETE

- Case Control Requirement

EXTDROUT ( MATOP4 = 25 )

- External Superelement Data Recovery Restart Job (repeat following setup for each superelement)

- Setup for SOLs 101, 103, 107 through 112, and 400

- File Management Section (FMS) Requirement

ASSIGN SE10='extse10.MASTER'

RESTART LOGICAL=SE10

ASSIGN INPUTT4='extse10dr.op4' UNIT=25

- Case Control Requirement

EXTDRIN ( MATOP4 = 25 )

- Alternative setup for SOL 400 only – all superelement boundary solutions are stored on the same Fortran unit

- File Management Section (FMS) Requirement

ASSIGN SE10='extse10.MASTER'

RESTART LOGICAL=SE10

ASSIGN INPUTT4='extalldr.op4' UNIT=25

- Case Control Requirement – SUPER command is required to select the correct superelement boundary solution

SUPER = 10

EXTDRIN ( MATOP4 = 25 )

**EXTDROUT**

## External Superelement Boundary Solution Storage Request.

Requests the job to store external superelement boundary displacements and column labels; e.g., eigenvalues, forcing frequencies, time steps. Also specifies the storage media of the boundary solution data.

**Format:**

$$\text{EXTDROUT} \left[ \begin{array}{l} DMIGOP2 [= unitop2] \\ MATRIXOP4 \text{ or } MATOP4 [= unitop4] \\ \text{MATRIXDB or MATDB} [= dbext] \\ DMIGDB [= dbext] \end{array} \right] \text{ NOCASE}$$
**Examples:**

```
EXTDROUT
EXTDROUT (DMIGOP2=45)
EXTDROUT (MATOP4 NOCASE)
```

Describer	Meaning
DMIGOP2 = unitop2	Store the boundary solution data in DMIG Bulk Data internal format on an .op2 file whose Fortran unit number is given by unitop2 (Integer > 0, Default=31).
MATRIXOP4 or MATOP4 = unitop4	Store the boundary solution data on an .op4 file whose Fortran unit number is given by <i>unitop4</i> . (Integer ≠ 0, Default=31). <i>unitop4</i> is a non-zero integer with the following meanings:  <i>unitop4</i> > 0: Store in sparse format  <i>unitop4</i> < 0: Store in non-sparse format on Fortran unit number given by  unitop4
MATRIXDB or MATDB = dbext	Store the boundary solution data in the standard matrix format in the database. Dbext is the name of a new dbset on which to store the boundary data. Dbext must be allocated on an INIT FMS statement.
DMIGDB	Store the boundary solution data in the DMIG Bulk Data internal format in the database. Dbext is the name of a new dbset on which to store the boundary data. Dbext must be allocated on an INIT FMS statement.
NOCASE	NOCASEBy default in SOL 400 only, the TITLE/SUBTITLE/LABEL contents are exported along with boundary data. Specify NOCASE if you do not want these contents to be exported.

**Remarks:**

1. EXTDROUT is intended for step two (or assembly run) in external superelement analysis.
2. EXTDROUT is honored in SOLs 101, 103, 107 through 112, and 400 only.

3. In SOLs 101, 103, and 107 through 112, if there are multiple external superelements and DMIGOP2 or MATOP4 is requested then EXTDROUT must be specified in separate subcases for each external superelement along with the SUPER command and unitop4 or unitop2 must be unique for each external superelement. Separate EXTDROUT commands are not required in SOL 400. See Remarks 9. and 10. under the EXTDRIN Case Control command description.
4. User parameters EXTDROUT and EXTDRUNT are the old method for requesting the storage of boundary solution data. EXTDROUT Case Control command takes precedence over the EXTDROUT and EXTDRUNT user parameters.
5. See EXTDRIN's case control command description for a description of EXTDROUT and EXTDRIN usage.

## EXTSEOUT

## External Superelement Creation Specification

Request the creation of an external superelement in SOLs 101, 103, 107 through 112, or 400 only.

### Format:

$$\text{EXTSEOUT} \left[ \left[ \text{STIFFNESS} \text{ MASS} \text{ DAMPING} \text{ K4DAMP} \text{ LOADS} \text{ FSCOUPL}, \right. \right.$$

$$\left. \left. \text{ASMBULK} \left[ = \left\{ \begin{array}{l} \text{MAN} \\ \text{MANQ} \\ \text{AUTO} \end{array} \right\}, \text{EXTBULK}, \text{EXTID} = \textit{seid}, \left[ \begin{array}{l} \text{QSET} \\ \text{ASET} \end{array} \right], \right. \right.$$

$$\left. \left. \text{DMIGSFIX} = \left\{ \begin{array}{l} \textit{cccccc} \\ \text{EXTID} \end{array} \right\} \left[ \begin{array}{l} \text{MATDB (or MATRIXDB) [= dbext]} \\ \text{DMIGDB [= dbext]} \\ \text{DMIGOP2 = unitop2} \\ \text{DMIGPCH} \\ \text{MATOP4 (or MATRIXOP4) = unitop4} \end{array} \right] \right] \right.$$

### Example(s):

```

EXTSEOUT
EXTSEOUT (DMIGOP2=26)
EXTSEOUT (ASMBULK EXTID=200)
EXTSEOUT (ASMBULK EXTBULK EXTID=100)
EXTSEOUT (ASMBULK=AUTO EXTBULK EXTID=100)
EXTSEOUT (ASMBULK=MANQ EXTID=10 DMIGDB)
EXTSEOUT (ASMBULK EXTID=100 DMIGOP2=26)
EXTSEOUT (ASMBULK EXTID=100 DMIGPCH)
EXTSEOUT (ASMBULK EXTID=100 DMIGSFIX=XSE100 DMIGPCH)
EXTSEOUT (ASMBULK EXTID=200 DMIGSFIX=EXTID DMIGPCH)
EXTSEOUT (ASMBULK EXTID=100 MATOP4=26)
EXTSEOUT (ASMBULK EXTID=200 MATOP4=-25)

```

(See also Remarks 17. and 18.)

Describer	Meaning
STIFFNESS	Store the boundary stiffness matrix. See Remarks 1. and 2.
MASS	Store the boundary mass matrix. See Remark 1.
DAMPING	Store the boundary viscous damping matrix. See Remarks 1. and 2.

Describer	Meaning
K4DAMP	Store the boundary structural damping matrix. See Remark 1.
LOADS	Store the boundary static loads matrix. See Remark 1.
FSCOU	Store the boundary fluid-structure coupling matrix. See Remark 1.
ASMBULK or ASMBULK = MAN	Generate Bulk Data entries for use in a subsequent superelement assembly process and store them on the assembly punch file (.asm). This data, which is used in the main bulk data portion of a subsequent assembly job, includes an SEBULK entry that specifies MANUAL as the method for searching boundary points, and an SECONCT entry that defines connections for boundary grid and scalar points. See Remarks 3., 6., and 15.
ASMBULK = MANQ	Similar to the ASMBULK = MAN option, except that the generated SECONCT entry defines connections not only for boundary grid and scalar points, but also for Q-set points. This allows the user to have control over the Q-set points of the external superelement in the subsequent assembly job. See Remarks 3., 5., and 15.
ASMBULK = AUTO	Generate Bulk Data entries for use in a subsequent superelement assembly process, and store them on the assembly punch file (.asm). This data, which is to be used in the main bulk data portion of a subsequent assembly job, includes an SEBULK entry that specifies AUTO as the method for searching boundary points, and an SECONCT entry that defines connections for boundary scalar points. See Remarks 3., 6., and 15.
EXTBULK	Generate Bulk Data entries related to the external superelement and store them on the standard punch file (.pch). This data is used in the BEGIN SUPER portion of the bulk data of a subsequent assembly job. EXTBULK need not be specified if DMIGPCH or MATOP4 (see the following descriptions) is specified. See Remarks 3., 7., 8., and 15.  Note that, in general, the EXTBULK keyword is not required and is provided solely for user convenience. In the absence of EXTBULK and the associated output on the standard punch file resulting from it, the subsequent assembly job will retrieve the required data for the external superelement from the medium on which the boundary matrices are stored.
EXTID= <i>seid</i>	<i>seid</i> (integer > 0) is the superelement ID to be used on the SEBULK and SECONCT (if applicable) Bulk Data entries stored on the assembly punch file (.asm) if ASMBULK is specified, and in the BEGIN SUPER Bulk Data entry stored on the standard punch file (.pch) if EXTBULK or DMIGPCH is specified. See Remarks 3. - 9., 13., and 17.
DMIGSFIX = <i>cccccc</i>	<i>cccccc</i> is the suffix (up to six characters) to be employed in the names of the DMIG matrices stored on the standard punch file (.pch) if the DMIGPCH option is specified. See Remarks 10. - 13. See also Example 3 in Remark 18.

Describer	Meaning
DMIGSFIX = EXTID	The <i>seid</i> defined by the EXTID keyword is the suffix to be employed in the names of the DMIG matrices stored on the standard punch file (.pch) if the DMIGPCH option is specified. See Remarks 3., 10. - 13. See also Example 3 in Remark 18.
MATDB (or MATRIXDB) = dbext (Default)	Store the boundary matrices and other information on the database. Dbext is the name of a new dbset on which to store the boundary matrices. Dbext must be allocated on an INIT FMS statement. By default, matrices are stored on DBALL. See Example 1 in Remark 18. Dbext is required if 3-step external superelement data recovery will be performed.
DMIGDB= dbext	Similar to MATDB (or MATRIXDB) except that the boundary matrices are stored as DMIG Bulk Data entries on the database. Dbext is the name of a new dbset on which to store the boundary matrices. Dbext must be allocated on an INIT FMS statement. By default, matrices are stored on DBALL. See Example 1 in Remark 18. Dbext is required if 3-step external superelement data recovery will be performed.
DMIGOP2 = <i>unitop2</i>	Store the boundary matrices as DMIG Bulk Data entries on an .op2 file whose Fortran unit number is given by <i>unitop2</i> (Integer > 0). See Remark 16. See also Example 2 in Remark 18.
DMIGPCH	Store the boundary matrices as DMIG Bulk Data entries on the standard punch file (.pch). Note that, if boundary matrices include both structural and fluid grids, use DMIGOP2 instead. See Remarks 3. and 7. - 15. See also Example 3 in Remark 18.
MATOP4 = <i>unitop4</i> (or MATRIXOP4 = <i>unitop4</i> )	<p><i>unitop4</i> is a non-zero integer with the following meanings:</p> <p><i>unitop4</i> &gt; 0</p> <p>Store the boundary matrices in <i>sparse</i> format on an .op4 file whose Fortran unit number is given by <i>unitop4</i></p> <p><i>unitop4</i> &lt; 0</p> <p>Store the boundary matrices in <i>non-sparse</i> format on an .op4 file whose Fortran unit number is given by <math> unitop4 </math></p> <p>See Remarks 3., 7., 8., 15., and 16. See also Example 4 in Remark 18.</p>
ASET/QSET	Specifies how the external superelement's q-set dofs (dynamic degrees-of-freedom) are defined on the exported file. By default, all q-set dofs are written to QSET/QSET1 entries which means the superelement's modes will be "added" to but not synthesized into the assembly's modes. By specifying ASET, the q-set dofs are written to ASET/ASET1 entries and will be synthesized into the assembly's. The ASET/QSET switch does not affect DMIGPCH media option which always writes ASET/ASET1 entries.

**Remarks:**

1. If none of the descriptors STIFFNESS through FSCOUPL is specified, then all matrices are stored.
2. STIFFNESS and DAMPING may be abbreviated to STIF and DAMP, respectively.
3. EXTID with an *seid* value must be specified if one or more of ASMBULK, EXTBULK, DMIGPCH, or MATOP4 are specified.

If the DMIGSFIX = EXTID form is employed along with the DMIGPCH specification, the value *seid* may not exceed 999999 since this value becomes part of the names given to the DMIG matrices generated on the standard punch file (.pch). See Remark 13., and Example 3 in Remark 18.

If PARAM,AUTOQSET,YES is specified to used generate the Q-set degrees of freedom (DOFs) (generalized coordinates), the value *seid* may not exceed 999 since this value becomes part of the automatically generated IDs of the SPOINTs representing the Q-set DOFs. See explanation in Item c under Remark 17.

4. If ASMBULK is specified, the following Bulk Data entries are generated and stored on the assembly punch file (.asm):

```
SEBULK  seid ... (specifies MANUAL as the method for searching
boundary points)
SECONCT seid ... (defines connections for boundary grid and scalar
points)
```

```
GRID entries for boundary and access grid points
SPOINT entries for boundary and access scalar points
CORD2x entries associated with the boundary and access GRID
entries
```

5. If ASMBULK = MANQ is specified, the following Bulk Data entries are generated and stored on the assembly punch file (.asm):

```
SEBULK  seid ... (specifies MANUAL as the method for searching
boundary points)
SECONCT seid ... (defines connections for boundary grid and
scalar points as well as for Q-set points)
GRID entries for boundary and access grid points
SPOINT entries for boundary and access scalar points as well as
for Q-set points
CORD2x entries associated with the boundary and access GRID
entries
```

6. If ASMBULK = AUTO is specified, the following Bulk Data entries are generated and stored on the assembly punch file (.asm):

```
SEBULK  seid ... (specifies AUTO as the method for searching
boundary points)
SECONCT seid ... (defines connections for boundary scalar
points)
```

```
GRID entries for access grid points
CORD2x entries associated with the access grid points
SPOINT entries for boundary and access scalar points
```

7. If DMIGPCH or MATOP4 is specified, then EXTBULK need not be specified. Also, the model cannot have rotors (ROTOR, ROTORG, ROTORSE, and ROTORAX Bulk Data entries).
8. If DMIGPCH is not specified, but EXTBULK or MATOP4 is specified, the following Bulk Data entries are generated and stored on the standard punch file (.pch):

```
BEGIN BULK seid
GRID entries for boundary points
GRID entries for interior points referenced by PLOTEL entries
SPOINT entries for boundary scalar points as well as for Q-set
points
CORD2x entries associated with the above GRID entries
EXTRN
ASET
QSET/QSET1
PLOTEL
```

9. If DMIGPCH is specified, the following Bulk Data entries are generated and stored on the standard punch file (.pch):

```
BEGIN SUPER seid
GRID entries for boundary points
SPOINT entries for boundary scalar points as well as for Q-set
points
CORD2x entries associated with the boundary GRID entries
ASET/ASET1
PLOTEL entries referencing the boundary GRID entries
DMIG entries for the requested boundary matrices
```

10. The DMIGSFIX keyword is ignored if DMIGPCH is not specified.
11. If DMIGPCH is specified without the DMIGSFIX keyword, then the boundary DMIG matrices generated and stored on the standard punch file (.pch) will have names of the following form:

```
KAAX (boundary stiffness matrix)
MAAX (boundary mass matrix)
BAAX (boundary viscous damping matrix)
K4AAX (boundary structural damping matrix)
PAX (boundary load matrix)
AAX (boundary fluid-structure coupling matrix)
```

See Example 3 in Remark 18.

12. If the DMIGSFIX = *cccccc* form is employed along with the DMIGPCH specification, then the boundary DMIG matrices generated and stored on the standard punch file (.pch) will have names of the following form:

```
Kcccccc (boundary stiffness matrix)
Mcccccc (boundary mass matrix)
Bcccccc (boundary viscous damping matrix)
K4cccccc (boundary structural damping matrix)
Pcccccc (boundary load matrix)
Acccccc (boundary fluid-structure coupling matrix)
```

See Example 3 in Remark 18.

13. If the DMIGSFIX = EXTID form is employed along with the DMIGPCH specification, then the boundary DMIG matrices generated and stored on the standard punch file (.pch) will have names of the following form:  

```
Kseid (boundary stiffness matrix)
Mseid (boundary mass matrix)
Bseid (boundary viscous damping matrix)
K4seid (boundary structural damping matrix)
Pseid (boundary load matrix)
Aseid (boundary fluid-structure coupling matrix)
```

where *seid* is the superelement ID specified by the EXTID keyword.  
See Example 3 in Remark 18.
14. If the DMIGPCH option is specified, the boundary DMIG matrices generated and stored on the standard punch file (.pch) may not be as accurate as the boundary matrices resulting from the other options (MATDB/MATRIXDB, or DMIGOP2 ,or MATOP4). Accordingly, this may result in decreased accuracy from the subsequent assembly job using these DMIG matrices.
15. The punch output resulting from EXTSEOUT usage is determined by ASMBULK, EXTBULK, DMIGPCH, and MATOP4 as follows:
  - No ASMBULK, EXTBULK, DMIGPCH or MATOP4  
No punch output.
  - ASMBULK, but no EXTBULK, or DMIGPCH, or MATOP4  
Punch output is generated and stored on the assembly punch file (.asm) as indicated in Remarks 4. through 6.
  - No ASMBULK, but EXTBULK, DMIGPCH, or MATOP4  
Punch output is generated and stored on the standard punch file (.pch) as indicated in Remarks 8. or 9. (as appropriate).
  - ASMBULK and EXTBULK, DMIGPCH or MATOP4  
Punch output consists of two distinct and separate parts. One part is generated and stored on the assembly punch file (.asm) as indicated in Remarks 4. through 6. The other part is generated and stored on the standard punch file (.pch) as indicated in Remarks 8. or 9. (as appropriate).
16. If DMIGOP2 = *unitop2* or MATOP4 = *unitop4* is specified, an appropriate ASSIGN OUTPUT2 or ASSIGN OUTPUT4 statement must be present in the File Management Section (FMS) for the specified Fortran unit numbers. See Examples 2 and 4 in Remark 18.
17. The creation of an external superelement using EXTSEOUT involves running a Nastran job, with the following additional data:
  - a. The data for the creation of the external superelement is specified by the EXTSEOUT Case Control command. It is best to specify this command above the subcase level. However, if the Nastran job itself involves superelements, then the EXTSEOUT command may also be specified within the subcase that is applicable to the residual.
  - b. The boundary points of the external superelement are specified by ASET/ASET1 Bulk Data entries.

- c. If the external superelement creation involves component mode reduction, then Q-set degrees of freedom (DOFs) (generalized coordinates) must be defined. This can be done either by automatically defining them via PARAM,AUTOQSET,YES or by explicitly specifying them via QSET/QSET1 Bulk Data entries. Note that for the latter case of explicit definition, only SPOINTs may be specified as Q-set points; no grid points may be specified. If this requirement is not met, the program terminates the execution with an appropriate fatal message.

If PARAM,AUTOQSET,YES is specified, SPOINTs are automatically generated internally to represent the Q-set DOFs. The IDs of these SPOINTs are of the form 9 $sssnnnn$  where  $sss$  is the superelement ID  $seid$  specified by the EXTID keyword, and  $nnnn$  is a mode number. Both  $sss$  and  $nnnn$  will have leading zeros inserted in them to ensure that  $sss$  is a three-digit number and  $nnnn$  is a four-digit number. Thus, for example, the Q-set DOF corresponding to the 8<sup>th</sup> mode of superelement ID 5 would be represented by an SPOINT with an automatically generated ID of 90050008, while the Q-set DOF corresponding to the 50<sup>th</sup> mode of superelement ID 25 would be represented by an SPOINT with an automatically generated ID of 90250050.

Because of the preceding numbering scheme, the superelement ID  $seid$  specified by the EXTID keyword must necessarily not exceed 999 when PARAM,AUTOQSET,YES is specified. The program terminates the job with a User Fatal Message if this condition is not met.

Further, because of the preceding numbering scheme, the user should ensure that, when PARAM,AUTOQSET,YES is specified, the IDs of the grid and scalar points of the external superelement do not conflict with the automatically generated SPOINT IDs of the Q-set DOFs. The program terminates the job with a User Fatal Message if this condition is not met.

- d. The fixity of the boundary DOFs for the component mode reduction may be specified using the BSETi/BNDFIXi and CSETi/BNDFREE/BNDFRE1 Bulk Data entries. (The default scenario assumes that all boundary DOFs are fixed for component mode reduction.)
- e. The output for the external superelement is generated in the assembly job. This output consists of displacements, velocities, accelerations, SPC forces, MPC forces and element stresses, strains and forces. However, in order for this output to be generated in the assembly job, the output requests must be specified in the external superelement creation run. Normally, the only output requests for the external superelement that are honored in the assembly job are those that are specified in the creation run. There is, however, one important exception to this: the output for the boundary and access grid and scalar points, as well as for all grid points associated with PLOT entries, can be obtained in the assembly job *even if there is no output request specified for these points in the creation run.*

If the creation run contains the load requests TEMPERATURE (LOAD) or DEFORM, then element stresses and element forces will not be available in the assembly run.

- f. If the assembly job involves the use of PARAM Bulk Data entries, then the following points should be noted:
- PARAM entries specified in the main bulk data portion of the input data apply *only to the residual and not to the external superelements.*
  - PARAM entries specified in the BEGIN SUPER portion of the Bulk Data for an external superelement apply *only to that superelement.*

- The most convenient way of ensuring that PARAM entries apply not only to the residual, but also to all external superelements, is to specify such PARAM entries in the Case Control Section, not in the main bulk data. This is particularly relevant for PARAMs such as POST.
  - g. If EXTSEOUT is used in SOL 400 for a multidisciplinary or linear perturbation analysis and there are rigid elements present then RIGID=LINEAR must be specified.
18. The following examples illustrate details of job setups for the external superelement creation and the subsequent assembly process for various scenarios. These examples assume that there are three external superelement creation jobs, one each for external SE 10 (extse10.dat), SE 20 (extse20.dat) and SE 30 (extse30.dat), followed by an assembly job.

Example 1. MATDB / MATRIXDB or DMIGDB Option	
■	External SE Creation Jobs
•	File Management Section FMS Requirement only if 3rd step external superelement data recovery is desired
	SE 10: INIT EXTDB
	SE 20: INIT EXTDB
	SE 30: INIT EXTDB
	These INIT statements along with the DBEXT keyword below will create separate DBsets called “extse10.EXDTB”, “extse20.EXTDB”, and “extse30.EXTDB” and store the necessary data for the Assembly Job on them. All other data will be stored on DBALL.
•	Case Control Requirement for the MATDB / MATRIXDB option if 3 <sup>rd</sup> step external superelement data recovery is <b>not</b> desired.
	SE 10: EXTSEOUT (ASMBULK EXTID = 10)
	SE 20: EXTSEOUT (ASMBULK EXTID = 20)
	SE 30: EXTSEOUT (ASMBULK EXTID = 30)
	The EXTBULK keyword may be specified, but it is not necessary.
•	Case Control Requirement for the DMIGDB option if 3 <sup>rd</sup> step external superelement data recovery is <b>not</b> desired.
	SE 10: EXTSEOUT (ASMBULK EXTID = 10 DMIGDB)
	SE 20: EXTSEOUT (ASMBULK EXTID = 20 DMIGDB)
	SE 30: EXTSEOUT (ASMBULK EXTID = 30 DMIGDB)
	For both options, scr = no should be specified on the Nastran job command line to ensure that the databases are saved at the end of the jobs.
•	Case Control Requirement for the MATDB / MATRIXDB option if 3 <sup>rd</sup> step external superelement data recovery is desired.
	SE 10: EXTSEOUT (ASMBULK EXTID = 10 MATDB=SE10)
	SE 20: EXTSEOUT (ASMBULK EXTID = 10 MATDB=SE20)

**Example 1. MATDB / MATRIXDB or DMIGDB Option (continued)**

SE 30: EXTSEOUT (ASMBULK EXTID = 10 MATDB=SE30)

- Case Control Requirement for the DMIGDB option if 3<sup>rd</sup> step external superelement data recovery is desired.

SE 10: EXTSEOUT (ASMBULK EXTID = 10 DMIGDB=SE10)

SE 20: EXTSEOUT (ASMBULK EXTID = 10 DMIGDB=SE20)

SE 30: EXTSEOUT (ASMBULK EXTID = 10 DMIGDB=SE30)

- Assembly Job

- File Management Section (FMS) Requirement

(Note: If DBEXT was specified on the EXTSEOUT command in the External SE Creation Jobs then the extse10.DBALL, etc. files may be hidden (moved or renamed) from the Assembly Job for purposes of security or privacy.)

```
ASSIGN dbname10='extse10.MASTER'
```

```
ASSIGN dbname20='extse20.MASTER'
```

```
ASSIGN dbname30='extse30.MASTER'
```

```
DBLOCATE DATABLE=(EXTDB, EXTROTDB) CONVERT(SEID=10)
```

```
LOGICAL=dbname10
```

```
DBLOCATE DATABLE=(EXTDB,EXTROTDB) CONVERT(SEID=20)
```

```
LOGICAL=dbname20
```

```
DBLOCATE DATABLE=(EXTDB, EXTROTDB) CONVERT(SEID=30)
```

```
LOGICAL=dbname30
```

(Note: All of the data blocks stored on the databases for the external SEs have the same common name of EXTDB or EXTROTDB for external SEs with rotors.)

- Case Control Requirement

If 3<sup>rd</sup> step data recovery is desired for the external superelement, specify EXTDROUT Case Control command in a separate subcase for each superelement. See also the examples under Remark 10 of the EXTDRIN Case Control command for additional File Management and Case Control requirements for the Assembly Job.

- Bulk Data Requirement

The following INCLUDEs are required. They may be specified anywhere in the Main Bulk Data.

```
INCLUDE 'extse10.asm'
```

```
INCLUDE 'extse20.asm'
```

```
INCLUDE 'extse30.asm'
```

### Example 2. DMIGOP2 Option

- External SE Creation Jobs

- File Management Section (FMS) Requirement

ASSIGN OUTPUT2='extse10\_op2' UNIT=25 DELETE

ASSIGN OUTPUT2='extse20\_op2' UNIT=26 DELETE

ASSIGN OUTPUT2='extse30\_op2' UNIT=27 DELETE

- Case Control Requirement

SE 10: EXTSEOUT (ASMBULK EXTID = 10 DMIGOP2 = 25)

SE 20: EXTSEOUT (ASMBULK EXTID = 20 DMIGOP2 = 26)

SE 30: EXTSEOUT (ASMBULK EXTID = 30 DMIGOP2 = 27)

The EXTBULK keyword may be specified, but it is not necessary.

scr = yes may be specified on the Nastran command line unless a 3rd step external superelement data recovery restart is desired.

- Assembly Job

- File Management Section (FMS) Requirement

ASSIGN INPUTT2='extse10\_op2' UNIT=25

ASSIGN INPUTT2='extse20\_op2' UNIT=26

ASSIGN INPUTT2='extse30\_op2' UNIT=27

- Case Control Requirement

If 3rd step data recovery is desired for the external superelement, specify EXTDROUT Case Control command in a separate subcase for each superelement. See also the examples under Remark 10 of the EXTDRIN Case Control command for additional File Management and Case Control requirements for the Assembly Job.

- Bulk Data Requirement

The following INCLUDEs are required. They may be specified anywhere in the main bulk data.

INCLUDE 'extse10.asm'

INCLUDE 'extse20.asm'

INCLUDE 'extse30.asm'

### Example 3. DMIGPCH Option

- External SE Creation Jobs

- Case Control Requirement

SE 10: EXTSEOUT (ASMBULK EXTID = 10 DMIGPCH)

SE 20: EXTSEOUT (ASMBULK EXTID = 20 DMIGPCH,

**Example 3. DMIGPCH Option (continued)**

DMIGSFIX = XSE20)

SE 30: EXTSEOUT (ASMBULK EXTID = 30 DMIGPCH,

DMIGSFIX = EXTID)

scr = yes may be specified on the Nastran command line since there is no need for the databases to be saved at the end of the jobs.

- Assembly Job

- Case Control Requirement

K2GG = (KAAX, KXSE20, K30)

M2GG = (MAAX, MXSE20, M30)

B2GG = (BAAX, BXSE20, B30)

K42GG = (K4AAX, K4XSE20, K430)

P2G = (PAX, PXSE20, P30)

A2GG = (AAX, AXSE20, A30)

- Case Control Requirement

If 3rd step data recovery is desired for the external superelement, specify EXTDROUT Case Control command along with the commands above in a separate subcase for each superelement. See also the examples under Remark 10 of the EXTDRAIN Case Control command for additional File Management and Case Control requirements for the Assembly Job.

- Bulk Data Requirement

The following INCLUDEs are required. They may be specified anywhere in the main bulk data.

INCLUDE 'extse10.asm'

INCLUDE 'extse20.asm'

INCLUDE 'extse30.asm'

The following INCLUDEs are also required. They must be grouped together and specified at the very end of the main bulk data (just before the ENDDATA delimiter).

INCLUDE 'extse10.pch'

INCLUDE 'extse20.pch'

INCLUDE 'extse30.pch'

### Example 4. MATOP4 Option

#### ■ External SE Creation Jobs

- File Management Section (FMS) Requirement

```
ASSIGN OUTPUT4='extse10_op4' UNIT=25 DELETE
```

```
ASSIGN OUTPUT4='extse20_op4' UNIT=26 DELETE
```

```
ASSIGN OUTPUT4='extse30_op4' UNIT=27 DELETE
```

- Case Control Requirement

```
SE 10:  EXTSEOUT (ASMBULK EXTID = 10 MATOP4 = 25)
```

```
SE 20:  EXTSEOUT (ASMBULK EXTID = 20 MATOP4 = 26)
```

```
SE 30:  EXTSEOUT (ASMBULK EXTID = 30 MATOP4 = -27)
```

Note: Boundary matrices will be stored in *sparse* format on .op4 files with Fortran unit numbers 25 and 26 and in *non-sparse* format on the .op4 file with Fortran unit number 27.

scr = yes may be specified on the Nastran command line unless a 3rd step external superelement data recovery restart is desired.

#### ■ Assembly Job

- File Management Section (FMS) Requirement

```
ASSIGN INPUTT4='extse10_op4' UNIT=25
```

```
ASSIGN INPUTT4='extse20_op4' UNIT=26
```

```
ASSIGN INPUTT4='extse30_op4' UNIT=27
```

- Case Control Requirement

If 3rd step data recovery is desired for the external superelement, specify EXTDROUT Case Control command in a separate subcase for each superelement. See also the examples under Remark 10 of the EXTDRIN Case Control command for additional File Management and Case Control requirements for the Assembly Job.

- Bulk Data Requirement

The following INCLUDEs are required. They may be specified anywhere in the main bulk data.

```
INCLUDE 'extse10.asm'
```

```
INCLUDE 'extse20.asm'
```

```
INCLUDE 'extse30.asm'
```

The following INCLUDEs are also required. They must be grouped together and specified at the very end of the main bulk data (just before the ENDDATA delimiter).

```
INCLUDE 'extse10.pch'
```

```
INCLUDE 'extse20.pch'
```

```
INCLUDE 'extse30.pch'
```

19. If EXTBULK is specified, then METADATA entries will be copied to the .pch file.
20. Data recovery for the external superelement is possible via two methods: two-step and three-step.
  - a. In the two-step method, EXTSEOUT automatically generates output transformation matrices (OTMs) based on STRESS, FORCE, DISPLACEMENT, SPCFORCE, MPCFORCE, STRAIN, and MONITOR Case Control commands specified in the first (creation) run. Then in the second (assembly) run, data recovery is performed on the external superelement. This data recovery is limited to certain element types and specialized outputs. For example, grid point forces and stresses, corner stresses, strain and kinetic energies, and composite stresses are not supported in the OTMs. If Modules are present in the first run, then OTMs are generated for those grid points and elements in Module 0 only.
  - b. The three-step method requires a restart of the first run to perform data recovery on the external superelement. This method supports all data recovery options in the two-step method as well as grid point forces and stresses, corner stresses, strain and kinetic energies, and composite stresses. The method is explained in the description of the EXTDRIN Case Control command. If Modules are present in the first run, this method allows for data recovery in any Module.
  - c. Both methods are described in more detail in the *MSC Nastran Superelements and Modules User's Guide*.
  - d. For dynamically reduced external superelements, the displacement OTMs created with dynamic reduction include both the dynamic effects of the o-set and also the fixed boundary effects of the o-set due to interior loads. With the two-step method, only one of these effects should be included in a SOL 101, 106 and 400 (with ANALYSIS=STATICS) assembly. Therefore, if there are interior loads in the external superelement and the two-step method is being used, attaching the dynamically reduced external superelements in a static analysis of the assembly is not recommended.
21. Superelement can be used in conjunction with residual structures in fluid-structure interaction analysis / acoustic analysis, with the following restrictions:
  - a. If the superelement contains both structural and fluid degrees-of-freedom (dof), then the residual structure can only have either structural dof or fluid dof - it cannot have both.
  - b. Similarly, if the residual structure has both structural and fluid dof, then the superelement should only have either structural dof or fluid dof - it cannot have both.

## FATIGUE

### Fatigue Output Request

Requests one or more fatigue analyses for use in pseudo-static (SOL 101), modal (SOL 103), modal transient (SOL 112), and frequency response (SOL 108 and SOL 111) runs.

#### Format (SOL 101, 103, 112, 200 with ANALYSIS=STATICS):

$$\text{FATIGUE} \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \text{FORMAT} = [\text{CODE}], \left[ \begin{array}{l} \text{BULK} \\ \text{SET} \end{array} \right], \left[ \text{STATICS} \right], \text{STROUT} = [\text{CODE}] \right) = \left\{ \begin{array}{l} \text{n} \end{array} \right\}$$

#### Format (SOL 108, 111, 200 with ANALYSIS=DFREQ or MFREQ) (See Remark 12.):

$$\text{FATIGUE} \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \text{FORMAT} = [\text{CODE}], \left[ \text{BULK} \right], \left[ \begin{array}{l} \text{FREQ} \\ \text{DFREQ} \\ \text{MFREQ} \end{array} \right] \right) = \left\{ \begin{array}{l} \text{n} \end{array} \right\}$$

#### Examples:

FATIGUE=100

SET 99 = 100, 200

FATIGUE (SET) = 99

Descriptor	Meaning
SORT1	Printed output will be presented as a tabular listing of elements for each fatigue analysis or event. In the case of duty cycle, where multiple events are output (EVNTOUT=1 on FTGSEQ bulk data), each event is presented as a separate fatigue analysis. Output written to the OEFTG data blocks is always in SORT1 format.
SORT2	Printed output will be presented as a tabular listing of events for each element, node, or angle. This is only applicable for duty cycle (loading sequences with more than one event - EVNTOUT=1 on FTGSEQ bulk data). If there is only one event, the output is identical to SORT1. Output written to the OEFTG data blocks is always in SORT1 format.

Describer	Meaning
-----------	---------

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

See Remark 15. regarding data blocks produced by the FATIGUE case control.

FORMAT	Request that fatigue be output in specific file formats. See Remark 6. and 11.
STROUT	Request that certain stress or strain output be included. See Remarks 13. and 14.
CODE	Codes for specific file format or stress output. See Remark 6., 11., and 13.
BULK	Specifies that the <i>n</i> refers directly to bulk data IDs of FTGSEQ/ FTGLOAD, FTGPARM and FTGDEF entries of the same ID (default) to process.
SET	Specifies that the <i>n</i> refers to a previously appearing SET ID (SOL 101, 103, & 112 only) containing the IDs of FTGSEQ/FTGLOAD, FTGPARM, FTGDEF bulk data entries to process. This is a mechanism to request multiple fatigue output requests in a single analysis run.
STATICS	<b>SOL 200 only.</b> Specifies the FATIGUE case control is for ANALYSIS=STATICS subcases in a SOL 200 optimization run. This is the default if not specified. See Remark 9.
FREQ DFREQ MFREQ	<b>SOL 200 only.</b> Either of these specifies the FATIGUE case control is for frequency response (ANALYSIS=MFREQ or DFREQ) subcases in a SOL 200 optimization run. This is not the default and must be specified if the FATIGUE case control is referenced on a DRESP1 of type FRFTG. See Remark 9.
n	ID of FTGSEQ/FTGLOAD, FTGPARM, FTGDEF bulk data entries of the same ID (BULK option) to process, or  ID of a previously occurring SET case control entry (SET option) containing the IDs of the FTGSEQ/FTGLOAD, FTGPARM, FTGDEF bulk data entries to process (SOL 101, 103, & 112 only).

### Remarks:

1. A single FATIGUE case control is required to perform one (SOL 108/111) or more (SOL 101/103/112) fatigue analyses and must be present above the SUBCASE level. If not present, no fatigue analysis will occur regardless of the presence of other bulk data related to fatigue analysis.
2. It is not necessary to include any case control STRESS and/or STRAIN output requests in order for the FATIGUE output request to obtain the necessary stresses or strains for the fatigue calculation.
3. For a single fatigue analysis, BULK=n points to a FTGDEF, a FTGPARM, and a FTGSEQ (or FTGLOAD) entry, each with ID=n.
4. For multiple fatigue analyses, SET=n points to a previously appearing SET case control and each member of the SET is the ID of a FTGDEF, a FTGPARM, and a FTGSEQ (or FTGLOAD) bulk data entry with that ID (SOL 101, 103, or 112 only).
5. A fatigue analysis must have, at a minimum, loading and material data defined on either FTGSEQ or FTGLOAD and MATFTG bulk data entries, respectively, for a fatigue analysis to be valid. FTGPARM and FTGDEF entries can be absent, in which case, defaults will be used.
6. The following additional, optional, fatigue output file formats may be requested. The given codes must be summed if multiple files are requested. Example: CSV file and FEF file CODE would be 64+128=192. Note the following:
  - For multi-layered results, such as shells that compute top and bottom results, a separate file for each is generated for FEF formats with `_top` (or `_t`) or `_bottom` (or `_b`) designations in the name. For FEF file output, if only a single file with worst case layer results is desired, add 256 or 10,000 to the CODE. In this case no additional designation is put in the file name or `_w` is used. Using the above example would give 448 or 10192. Either mechanism works. Other designations that can appear in the filenames are `_N` or `_E` for element nodal or element center, respectively, and `_EVi` for event *i*, or `_EVS` for event summary only.
  - Note that CSV file output only ever creates a single file as both layers are reported in the single file.
  - Some output is not available for duty cycle jobs if EVNTOUT>0 on the FTGSEQ bulk data entry. Check messages if the `£06` and `log` files if the requested output files are not being generated.

File Format	CODE for SOLs 101/103/112	CODE for SOLs 108/111
No additional output	0	0
CSV File (Comma Separated - Excel File)*	64	64
FEF (Patran Results File)†	128	128

\* For random vibration fatigue using SOLs 108 or 111, the CSV file output request is also dependent on the LOGLVL field setting on the FTGPARM entry. By default a `<jid>PSD.csv` file is always generated, which at a minimum contains the input PSD, stress transfer function (TF) and result PSD for the critical entity.

†SOL 101, 103, 112 produce FEF files of type 'PATRAN 2 els' or 'PATRAN 2 nod' with .fef extension; SOL 108, 111 produce FEF files of type 'PATRAN 2 els' with .els\_fef extension. Also see Remark 11.

7. RESTARTs are possible with FATIGUE output request as long as the stress/strain state of the entities requested does not change. Most parameters on the FTGPARM (LOC excluded as it requires a different set of stresses/strains) can be changed on a RESTART. Different loading (FTGSEQ) and materials (MATFTG) can also be investigated using the RESTART capability (SOLs 101, 103, & 112 only).
8. Standard fatigue output is:

Stress-Life (SN) Analysis	Strain-Life (eN) Analysis
LIFE (Repeats*)	LIFE (Repeats)
LOG of LIFE (Repeats)	LOG of LIFE (Repeats)
LIFE (user units)†	LIFE (user units)
LOG of LIFE (user units)	LOG of LIFE (user units)
DAMAGE	DAMAGE
LOG of DAMAGE	LOG of DAMAGE
MAX STRESS‡	MAX STRESS or STRAIN **
MIN STRESS	MIN STRESS or STRAIN

\*Or Seconds for SOL 108 and SOL 111

†User units are fatigue equivalent units as defined on the FTGSEQ or FTGLOAD entry and other output is available depending on the settings of the FTGPARM entry. Please see those entries for more detail.

‡For SOLs 108 and 111 Maximum Stress = Mean Stress + MAXPEAK\*RMS Stress, Minimum Stress = Mean Stress - MAXPEAK\*RMS Stress. MAXPEAK is defined on FTGPARM entry and is defaulted to 3.0.

\*\*Depends on FTGPARM line used: STRESS or STRAIN.

9. STATICS, FREQ, DFREQ, MFREQ options are utilized in SOL 200 only. Fatigue and design sensitivity analysis will be performed for the designated analysis type only. If STATICS is specified (default), FATIGUE case control must be associated with subcases containing ANALYSIS=STATIC for a pseudo-static fatigue analysis and the fatigue DRESP1 responses/constraints specified must be of RTYPE=FATIGUE. If one of FREQ, DFREQ, MFREQ is specified, FATIGUE case control must be associated with subcases containing ANALYSIS=MFREQ or DFREQ for random vibration fatigue analysis and the fatigue DRESP1 response/constraints specified must be of RTYPE=FRFTG.
10. For SOL 108/111 with FATIGUE analysis, PARAM,SPARSEDR,no and PARAM,DDRMM,-1 both must be present. Otherwise, FATIGUE analysis will be skipped. Or, PARAM,SPARSEDR,yes, which is default, can be used instead.

11. The FEF file output request produces PATRAN 2 style elemental or nodal ASCII results files that can be imported directly into Patran for post processing. In order to import these files into Patran a template file is also required in order to tell Patran how to map the columns of data in the files to proper, meaningful labels. The analysis job produces both the FEF file and the corresponding template files. The template file has the extension `.tml` or `.res_tmpl` with the same base name as the FEF file. Jobs run with `LOC=ELEM` or `NODE` on the `FTGPARM` entry create elemental based FEF files or all SOL sequences. Jobs run with `LOC=NODA` produce nodal based FEF files for **SOLs 101, 103, and 112** and produce elemental based FEF files for **SOLs 108 and 111**. In Patran these files are imported under the **File|Import** menu with the **Object** set to **Results** and the **Format** set to either **PATRAN 2 els...** or **PATRAN 2 nod...** for elemental or nodal based FEF results files, respectively. The **Element Node Results** switch must be set to **Connectivity Based** for proper import of elemental based results.

You must use the job produced template files to import the FEF files. However, if you routinely postprocess in Patran you may wish to copy the appropriate template file to the standard template file location provided with the Patran installation. The advantage of putting it where the standard template files reside is that you may select it directly from the list without navigating the file browser to the location of the job produced template files. The disadvantage is that if you use customized fatigue equivalent units, the labels may change and not match.

12. When a **FATIGUE** case control is present to perform random vibration fatigue analysis using **SOLs 108 and 111**, only one **FREQUENCY** case control set is allowed for all transfer function **SUBCASEs** and should be above the **SUBCASE** level or only present in 1st **SUBCASE**. The **FREQUENCY** set cannot change from **SUBCASE** to **SUBCASE** or a fatal error is issued.
13. **SOL 101, 103, or 112 only**: The following additional, optional, stress or stain output may be requested. The given codes must be summed if multiple requests are required. Example: `CODE` would be `1+2=3` for fatigue stress and maximum stress range vector results. The presence of this output request overrides the `STROUT` entry on the `FTGPARM` entry. If `PLOT` is specified in the **FATIGUE** case control, no output is printed and only available in the `OUTPUT2` or `HDF5` files.

Additional Stress/Strain Output	CODE
No additional output	0
<b>Fatigue Stress/Strain</b> - these are the physical (or modal) stress/strain tensors passed to the fatigue analysis for each requested entity of the fatigue analysis for each SUBCASE (or mode). Valid for SOL 101, 103, and 112 only.	1
<b>Maximum Stress/Strain Range Magnitude or Vector</b> - this is the stress/strain maximum range magnitude (for all scalar COMB values of the FTGPARM entry) or vector (for 2D critical plane* analysis, COMB=CRITICAL) for all requested entities at the critical angle for SOLs 101, 103, and 112 only, as returned from the fatigue analysis. When LOC=ELEM or NODE on the FTGPARM entry, the computed vector is in the basic coordinate system. For LOC=NODA, the computed vector is in the SURFACE system as defined by OUTPUT field on the NAVG line of the FTGPARM entry. For scalar COMB values, a vector is not computed and only the x-component of the vector is provided. The other two components are always zero in this case.	2
<b>Stress/Strain Scalar Response Time History</b> - this is the computed scalar response time history (for all COMBs on the FTGPARM entry) at all time points as returned from the fatigue analysis for SOLs 101, 103, and 112 only. This is the actual response from which rainflow ranges and damage are computed. While individual events are processed, the ALL event is not processed when METHOD=0 on FTGPARM. Also LAYER=1 or 2 on the FTGPARM entry is honored for STROUT=4, but LAYER=0 prints values for both top and bottom. To limit output and ensure decent performance maxENTS on the FTGDEF entry is defaulted to 100 and if the number of entities exceeds this, the job stops. Setting maxENTS to a high number is not recommended due to performance issues.	4
<b>Stress/Strain Tensor Time History</b> - this is the computed tensor time history response at all time points for all requested entities used by the fatigue analysis for SOL 112 only.	8

\* COMB = CRITICAL on the FTGPARM entry.

- STROUT is not honored in manual restarts using SOL FTGRSTRT (automatic restarts are OK). STROUT=4 may use additional memory space on your system. For STROUT=4, it is also highly recommended to limit the number of requested entities on the FTGDEF bulk data entry. If the job stops because too many entities are requested, you can set maxENTS on the FTGDEF entry. STROUT=4 has the potential to produce enormous amounts of response data and external files, which can severely affect performance and disk space. STROUT=4 produces temporary CSV response files of each entity. These CSV files are deleted after the job completes unless scr=no is used when submitting the job. When METHOD=0 on the FTGSEQ entry, STROUT=4 only produces responses for each event. Only when METHOD=1 or 2 will STROUT=4 produce responses for all events combined or if there is only one event.

15. Output Data Blocks: The following table indicates the output data blocks produced by the FATIGUE case control and which parameters trigger creation of those data blocks. See the DMAP Programmers Guide for a description of these data blocks.

Data Block	Comment
OEFTG	<b>SOL 101, 103, 112 only.</b> This is the standard output data block for that is produced simply by the presence of a FATIGUE case control containing fatigue life/damage and related data for time-based fatigue analysis. Data from STROUT=2 is also written to this data block.
OEFTGM	<b>SOL 101, 103, 112 only.</b> This is the multiaxial/biaxial output data block that is produced by the presence of a FATIGUE case control with the usage of the MULTI key word on the FTGPARM entry for time-based fatigue analysis
OEFTGV	<b>SOL 108, 111 only.</b> This is the standard output data block for that is produced simply by the presence of a FATIGUE case control containing fatigue life/damage and related data for frequency-based fatigue analysis.
OES1FS	<b>SOL 101 only.</b> This is a physical stress tensor data block like OES that is created due to the presence of STROUT=1 usage in a FATIGUE case control.
OESFTGR	<b>SOL 103, 112 only.</b> This is a modal stress tensor data block like OES that is created due to the presence of STROUT=1 usage in a FATIGUE case control.
OEFTGRS	<b>SOL 101, 103, 112 only.</b> This is the scalar stress history response data block created due to the presence of STROUT=4 usage in a FATIGUE case control.
OES1FS	<b>SOL 112 only.</b> This is a tensor stress history data block like OES that is created due to the presence of STROUT=8 usage in a FATIGUE case control.

**FBODYLD**

## Free Body Load Output Request

Selects a set of submodels for which free body loads are to be produced and stored.

**Format:**

$$\text{FBODYLD(LID)} = \left\{ \begin{array}{c} \text{ALL} \\ \text{name1, name2, name3, ...} \end{array} \right\}$$

**Examples:**

```
FBODYLD=ALL
```

```
FBODYLD (100) =WINGLD
```

```
FBODYLD (200) =WINGLD, TAILLD
```

Descriptor	Meaning
LID	Optional user-defined load ID. If LID is not supplied, the subcase ID is used to define this value.
ALL	Loads will be produced for all FBODYLD Bulk Data entries.
name $i$	Name of an FBODYLD Bulk Data entry that defines the submodel to be used for the load.

**Remarks:**

1. It is recommended, but not required, that the LID be unique across subcases.
2. A separate load is created for each name $i$ .
3. The name list supplies one or more names separated by comma or blank.
4. Each load is stored individually as a one column matrix that is qualified by LID, name $i$ , submodel name, loadcase label, and submodel label (where submodel name is the name on the FBODYSB Bulk Data entry, loadcase label is the label on the FBODYLD Bulk Data entry, and submodel is the label on the FBODYSB Bulk Data entry).

## FEMCHECK

Specifies model checking options

Specifies model checking options at the start of the run. Specifically checks for RBE3 elements with unconnected independent (Gij) grids and RBE2 elements with unconnected dependent (GMi) grids. Also validates some other case controls in Frequency and Transient analysis before start of the run. RBE2 will only result in WARNING messages, and all other options will result in FATAL messages.

### Format:

$$FEMCHECK = \left\{ \begin{array}{c} NONE \\ ALL \\ RBE3, RBE2, DLOAD, FREQ, SDAMP, TSTEP \end{array} \right\}$$

### Examples:

```
FEMCHECK=ALL
FEMCHECK=RBE3, RBE2, DLOAD, FREQ, SDAMP, TSTEP
```

Describer	Meaning
NONE	No checking. This is the default.
ALL	Turns on all checking listed in the following.
RBE3	To make sure every independent (Gij) grid on a RBE3 bulk data entry is attached to an element, PLOTEL, or DMIG.
RBE2	To give a WARNING message for each dependent (GMi) grid on a RBE2 bulk data entry that is not attached to an element, PLOTEL, or DMIG.
DLOAD	For frequency analysis, check if DLOAD case control is specified. For transient analysis, check if DLOAD or IC case control is specified. Make sure DLOAD case control refers to a valid bulk data entry, i.e. DLOAD, RLOAD1, RLOAD2, TLOAD1, TLOAD2, ACSRCE, ACLOAD.
FREQ	Check if FREQUENCY case control is specified for frequency analysis. FREQ case control must also refer to a valid bulk data entry, i.e. FREQ, FREQ1, FREQ2, FREQ3, FREQ4, FREQ5.
SDAMP	Check if SDAMPING Case Control references a valid Bulk Data entry. It must refer to a valid bulk data entry, i.e. TABLED1, TABLED2, TABLED3, TABLED4, TABLED5, TABDMP1.
TSTEP	For SOL 108/109/111/112, TSTEP case control must refer to a TSTEP bulk data entry. For SOL 129/159, TSTEP case control should refer to a TSTEPNL bulk data entry.

### Remark:

1. This command should be applied above all SUBCASEs.

**FLSFSEL**

## Control for Fluid-Structure Frequency Selection

Control for fluid-structure frequency selection.

**Format:**

$$\begin{aligned} \text{FLSFSEL} \quad & \left[ \text{LFREQFL} = \begin{Bmatrix} 0.0 \\ fl_1 \end{Bmatrix} \right], \left[ \text{HFREQFL} = \begin{Bmatrix} 1. + 30 \\ fl_2 \end{Bmatrix} \right], \\ & \left[ \text{LFREQ} = \begin{Bmatrix} 0.0 \\ fs_1 \end{Bmatrix} \right], \left[ \text{HFREQ} = \begin{Bmatrix} 1. + 30 \\ fs_2 \end{Bmatrix} \right], \\ & \left[ \text{LMODESFL} = \begin{Bmatrix} 0 \\ mf \end{Bmatrix} \right], \left[ \text{LMODES} = \begin{Bmatrix} 0 \\ ms \end{Bmatrix} \right], \\ & \left[ \text{FLUIDSE} = \begin{Bmatrix} 0 \\ seidf \end{Bmatrix} \right] \end{aligned}$$

**Example:**

FLSFSEL            HFREQ = 4.            HFREQFL = 9

Descriptor	Meaning
LFREQFL	Requests in Hertz, lower bound frequency for modal fluid calculations.
$fl_1$	Lower frequency range for fluid, real number.
HFREQFL	Requests in Hertz, upper bound frequency for modal fluid calculations.
$fl_2$	Upper frequency range for fluid, real number.
LFREQ	Requests in Hertz, lower bound frequency for modal structure calculations.
$fs_1$	Lower frequency range for structure, real number.
HFREQ	Requests in Hertz, upper bound frequency for modal structure calculations.
$fs_2$	Upper frequency range for structure, real number
LMODESFL	Lowest modes for fluid portion of model, 0 implies LFREQFL-HFREQFL will determine number of modes.
mf	Number of lowest modes to use for fluid portion of model.
LMODES	Lowest modes for structure portion of model, 0 implies LFREQ-HFREQ will determine number of modes.
ms	Number of lowest modes to use for structure portion of model.

Describer	Meaning
FLUIDSE	Defines a specified superelement to be used for fluids only.
seidf	Defines a fluid only superelement.

**Remarks:**

1. This entry represents a collection of PARAM,name,value entries. See [Parameters](#) for detailed description of the parameters collected on this entry. The value of any of these parameters may be given as either the character value given in this description, or the numeric value given in [Parameters](#) of this guide.
2. If LMODES (or LMODESFL)=0, the retained modes are determined by the parameters LFREQ and HFREQ (or LFREQFL and HFREQFL).

**FLSPOUT**

## Control for Fluid-Structure Mode Participation Output

Control for fluid-structure mode participation output.

**Format:**

$$\begin{aligned}
 \text{FLSPOUT} \quad & \left[ \text{FLUIDMP} = \begin{Bmatrix} \text{ALL} \\ n_{\text{modes}} \\ \text{NONE} \end{Bmatrix} \right], \left[ \text{GRIDFMP} = \begin{Bmatrix} \text{ALL} \\ \text{setf participations} \end{Bmatrix} \right] \\
 & \left[ \text{OUTFMP} = \begin{Bmatrix} \text{ALL} \\ p_{\text{highest}} \\ \text{NOPRINT} \end{Bmatrix} \right], \left[ \text{FEPS} = \begin{Bmatrix} 1. - 11 \\ \text{epsf} \end{Bmatrix} \right], \\
 & \left[ \text{ARF} = \begin{Bmatrix} 0.95 \\ \text{arf}_v \end{Bmatrix} \right], \\
 & \left[ \text{STRUCTMP} = \begin{Bmatrix} \text{ALL} \\ m_{\text{modes}} \\ \text{NONE} \end{Bmatrix} \right], \left[ \text{OUTSMP} = \begin{Bmatrix} \text{ALL} \\ q_{\text{highest}} \\ \text{NOPRINT} \end{Bmatrix} \right] \\
 & \left[ \text{PANELMP} = \begin{Bmatrix} \text{ALL} \\ \text{setp participations} \\ \text{NONE} \end{Bmatrix} \right], \left[ \text{GRIDMP} = \begin{Bmatrix} \text{ALL} \\ \text{setg participations} \\ \text{NONE} \end{Bmatrix} \right] \\
 & \left[ \text{SEPS} = \begin{Bmatrix} 1. - 11 \\ \text{eps} \end{Bmatrix} \right], \left[ \text{ARS} = \begin{Bmatrix} 0.95 \\ \text{ars}_v \end{Bmatrix} \right] \\
 & \left[ \text{PSORT} = \begin{Bmatrix} \left( \begin{Bmatrix} \text{ABSOLUTE} \\ \text{REAL} \\ \text{IMAGINARY} \end{Bmatrix}, \begin{Bmatrix} \text{DESCENDING} \\ \text{ASCENDING} \end{Bmatrix} \right) \\ \text{O2E} = \begin{Bmatrix} \text{YES} \\ \text{NO} \end{Bmatrix} \end{Bmatrix} \right]
 \end{aligned}$$

**Examples:**

SET 23 = ROOF, DRIVERSD  
 SET 211 = 1023, 4069, 56790

FLSPOUT      FLUIDMP = 30      STRUCTMP = 40,      OUTSMP = 30,  
                  PANELMP = 23      GRIDMP = 211

Describer	Meaning
FLUIDMP	Requests fluid participation calculation of fluid response on selected fluid points.
ALL	Requests that all the fluid modes extracted be used.
n	Requests that up to the first n fluid modes be used.
NONE	Requests no participation calculation.
GRIDFMP	Requests inclusion or exclusion of specific fluid grids to be used in all the requested types of participation calculations. These are also the fluid grids that can be referred to on plot and .op2 tables.
ALL	Requests inclusion in all the requested types of the participation calculations of all fluid points.
setf	Case Control set ID listing a selected set of fluid grids to be used in all the requested types of participation calculations.
OUTFMP	Requests the FLUID FLUIDMP participation factors to be output for print.
ALL	Requests that all FLUID FLUIDMP participation factors to be output for print.
p	Requests the p highest FLUIDMP participation factors to be output.
NOPRINT	Produces tables for plotting but do not print any results.
FEPS	Filters threshold for fluid participation.
epsf	Threshold value.
ARF	Acceptance ratio for fluid participation.
arf_v	Fluid participation values $< arf\_v * \max\_value$ in a column of the output matrix will be set to zero.
STRUCTMP	Requests structural, load, and panel participation calculations on the selected fluid points. FLUIDMP must be specified for this command to become active.
ALL	Requests that all the structural modes extracted be used.
m	Requests that up to the first m structural modes be used.
NONE	Requests no participation calculation.
OUTSMP	Requests that structural STRUCTMP participation factors to be output for print.
ALL	Request that all STRUCTMP participation factors be output.
q	Requests that the q highest STRUCTMP participation factors be output.
NOPRINT	Produces tables for plotting but does not print any results.
PANELMP	Requests inclusion or exclusion of panel participation calculations on the selected fluid points. FLUIDMP and STRUCTMP must both be specified for this command to become active.

Describer	Meaning
ALL	Requests all panels defined be included in the participation calculations on the selected fluid points.
setp	Case Control set ID listing selected panels for panel participation calculations on the selected fluid points. the set consists of the character names of the panels (new V2001)
NONE	Requests exclusion from the participation calculations.
GRIDMP	Requests inclusion or exclusion of a structural panel grid participation calculation on the selected fluid points. FLUIDMP and STRUCTMP must both be specified for this command to become active.
ALL	Requests, for panels selected, that each and every individual panel grid be included as a separate calculation in the participation calculations on selected fluid points.
setg	Case Control set ID listing structural panel grids for grid mode participation on the selected fluid points.
NONE	Requests exclusion from the participation calculations.
SEPS	Filter threshold for structure participation.
epss	Threshold value.
ARS	Acceptance ratio for structure related fluid participation.
ars_v	Structure fluid participation values $< arf\_v^* \max\_value$ in a column of the output matrix will be set to zero.
PSORT	Requests type of sort.
O2E	Controls generation of tables of mode participation versus natural frequency for excitation frequencies. These tables are accessible in XYPLOT.

### Remarks:

1. This entry represents a collection of PARAM,name,value entries and must appear above the subcase level. See [Parameters](#) for detailed descriptions of the parameters collected on this entry. The value of any of these parameters may be given as either the character value given in this description, or the numeric value given in [Parameters](#) on this guide.
2. If  $n$ ,  $m$ ,  $p$ , or  $q$  are greater than the number computed, Nastran will invoke the ALL option for the current value.
3. PSORT values must occur in pairs such as (ABSOLUTE,DESCENDING).
4. The underlined item in the { } braces give the value of the keyword if the keyword and its describers are omitted from this entry. For example, if FLUIDMP is omitted from the FLSPOUT entry, then no fluid mode participation will be computed (unless a PARAM,FLUIDMP,value explicitly appears in a subcase or [Bulk Data Entries](#)).

## FLSTCNT

## Miscellaneous Fluid-Structure Control Parameters

Control for fluid-structure symmetry and force requests.

### Format:

$$\text{FLSTCNT} \left[ \text{ACSYM} = \begin{Bmatrix} \text{YES} \\ \text{NO} \end{Bmatrix} \right], \left[ \text{ACOUT} = \begin{Bmatrix} \text{PEAK} \\ \text{RMS} \\ \text{PEAKINT} \\ \text{RMSINT} \end{Bmatrix} \right] \\
 \left[ \text{PREFDB} = \begin{Bmatrix} \text{1.0} \\ \text{prp} \end{Bmatrix} \right], \left[ \text{ASCOUNP} = \begin{Bmatrix} \text{YES} \\ \text{NO} \end{Bmatrix} \right] \\
 \left[ \text{SKINOUT} = \begin{Bmatrix} \text{NONE} \\ \text{PUNCH} \\ \text{PRINT} \\ \text{ALL} \end{Bmatrix} \right]$$

### Example(s):

FLSTCNT      ACSYM = YES      ACOUT = RMS

Descriptor	Meaning
ACSYM	Requests symmetric or nonsymmetric solution for fluid-structure analysis.
YES	Requests symmetrized coupled fluid-structure analysis.
NO	Requests no symmetric coupled fluid-structure analysis.
ACOUT	Requests peak or rms for output to be used with the FORCE request.
PEAK, PEAKINT	Requests peak value output to be used with the FORCE request.
RMS, RMSINT	Requests rms value output to be used with the FORCE request.
PREFDB	Specifies the peak reference pressure.
prp	Value for the peak reference pressure.
ASCOUNP	Request a coupled or noncoupled fluid-structure analysis.
YES	Request a coupled fluid-structure analysis.
NO	Request a noncoupled fluid-structure analysis.
SKINOUT	Request that sets of grid point and element lists be output for both the fluid and structure at the fluid-structure interface.

Describer	Meaning
NONE	Requests no output of sets.
PUNCH	Requests set output to punch file (.pch) only.
PRINT	Requests set output to .f06 file only.
ALL	Requests set output to both .pch and .f06 files.

**Remarks:**

1. This entry represents a collection of PARAM,name,value entries. See [Parameters](#) for detailed descriptions of the parameters collected on this entry. The value of any of these parameters may be given as either the character value given in this description, or the numeric value given under the parameter description in this guide.
2. Options with suffix INT generates INTENSITY, instead of ACCLERATION. Unlike ACCELERATION which is complex, INTENSITY is a scalar quantity.

## FLUX Heat Transfer Gradient and Flux Output Request

Requests the form and type of gradient and flux output in heat transfer analysis.

### Format:

$$\text{FLUX} \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Examples:

```
FLUX=ALL
FLUX (PUNCH, PRINT) =17
FLUX=25
```

Descriptor	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL Flux for all elements will be output.

NONE Flux for no elements will be output.

n Set identification of a previously appearing SET command. Only fluxes of elements with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. FLUX=ALL in SOL 159 may produce excessive output.
2. FLUX=NONE overrides an overall request.

**FMETHOD**

## Flutter Analysis Method Parameter Selection

Selects the parameters to be used by the aerodynamic flutter analysis.

**Format:**

FMETHOD=n

**Example:**

FMETHOD=72

Describer	Meaning
n	Set identification number of a FLUTTER Bulk Data entry (Integer > 0).

**Remarks:**

1. An FMETHOD command is required for flutter analysis.
2. A CMETHOD command is also required for the K-method of flutter analysis.
3. If this entry is being used in SOL 200 in conjunction with flutter design conditions, the METHOD selected on the FLUTTER Bulk Data entry must be "PK" or "PKNL".

## FORCE

### Element Force Output or Particle Velocity Request

Requests the form and type of element force output, or particle velocity output, in coupled fluid-structural analysis. Note: ELFORCE is an equivalent command.

#### Format:

$$\text{FORCE} \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \begin{array}{l} \text{CENTER} \\ \text{CORNER or BILIN} \\ \text{SGAGE} \\ \text{CUBIC} \end{array} \right], \left[ \begin{array}{l} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{array} \right], \left[ \begin{array}{l} \text{RPRINT} \\ \text{NORPRINT} \end{array} \right], \text{RPUNCH} \right) = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

#### Examples:

```
FORCE=ALL
FORCE (REAL, PUNCH, PRINT)=17
FORCE=25
FORCE (SORT2, PRINT, PSDF, CRMS, RPUNCH)=20
FORCE (PRINT, RALL, NORPRINT)=ALL
```

Descriptor	Meaning												
SORT1	Output will be presented as a tabular listing of elements for each load, frequency, eigenvalue, or time, depending on the solution sequence.												
SORT2	Output will be presented as a tabular listing of frequency or time for each element type.												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

Describer	Meaning
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
CENTER	Output CQUAD4, CQUADR, and CTRIAR element forces at the center only. The default for CQUAD4 is CENTER. The default for CQUADR and CTRIAR is CORNER.
CORNER or BILIN	Output CQUAD4, QUADR, and CTRIAR element forces at the center and at the grid points using strain gage approach with bilinear extrapolation.
SGAGE	Output CQUAD4 element forces at the center and at the grid points using strain gage approach.
CUBIC	Output CQUAD4 element forces at the center and at the grid points using cubic bending correction.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
ALL	Forces for all elements will be output.
n	Set identification of a previously appearing SET command. Only forces of elements with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	Forces for no elements will be output.

**Remarks:**

1. ALL should not be used in a transient problem.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.

3. ELFORCE is an alternate form and is entirely equivalent to FORCE.
4. FORCE=NONE overrides an overall request.
5. If PARAM,SPARSEDR,NO is specified, then to request force output on damping elements in modal frequency response analysis (e.g., SOL 111), the mode displacement method (PARAM,DDRMM,-1) must be selected.

Force output on damping elements is not available in transient response analysis.

6. In nonlinear transient analysis, the FORCE request is ignored for nonlinear elements in SOL129. In SOL400 with "ANALYSIS=NLTRAN" Element FORCE output for the CWELD/CFAST elements is available. All other elements capable of force output such as the CBEAM, CQUAD4, etc., will not produce nonlinear transient force output.

If "PARAM, OLDWELD, YES" is specified, then the CWELD/CFAST elements will not produce with "ANALYSIS=NLTRAN" Element FORCE output.

7. The options CENTER, CORNER, CUBIC, SGAGE, and BILIN are recognized only in the first subcase, and determine the option to be used in all subsequent subcases with the STRESS, STRAIN, and FORCE Case Control commands. Consequently, options specified in subcases other than the first subcase will be ignored. The BILIN or CORNER option is not available for advanced nonlinear elements and nonlinear material or composite elements. The default option will be applied to those elements.
  - a. If the STRESS command is specified in the first subcase, then the option on the STRESS command is used in all subcases with STRESS, STRAIN, and FORCE commands.
  - b. If the STRAIN command and no STRESS command is specified in the first subcase, then the option on the STRAIN command is used in all subcases containing STRESS, STRAIN, and FORCE commands.
  - c. If the FORCE command and no STRESS or STRAIN commands is specified in the first subcase, then the option on the FORCE command is used in all subcases containing STRESS, STRAIN, and FORCE commands.
  - d. If STRESS, STRAIN, and FORCE commands are not specified in the first subcase, then the CENTER option is used in all subcases containing STRESS, STRAIN, and FORCE commands.
8. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
9. In general, for nonlinear elements, force output is not available. For CGAP, CELASi, or CBUSH elements in nonlinear analysis, use the STRESS in NLSTRESS command to obtain force output.
10. Forces and moment output for line elements are total forces and for shell elements they are forces per unit length.
11. The FORCE request is ignored for solid elements in all solution sequences as it has no meaning for solids.
12. Random response for element type CBEAM3 is not supported.

## FREQUENCY

## Frequency Set Selection

Selects the set of forcing frequencies to be solved in frequency response problems.

### Format:

FREQUENCY=*n*

### Example:

FREQUENCY=1 7

Describer	Meaning
<i>n</i>	Set identification number of <i>FREQ</i> , <i>FREQ1</i> , <i>FREQ2</i> , <i>FREQ3</i> , <i>FREQ4</i> , and <i>FREQ5</i> Bulk Data entries. (Integer > 0)

### Remarks:

1. A frequency set selection is required for a frequency response problem.
2. A frequency set selection is required for transient response by Fourier methods (SOL 146).
3. All *FREQ<sub>i</sub>* entries with the same set identification numbers will be used. Duplicate frequencies will be ignored.  $f_N$  and  $f_{N-1}$  are considered duplicated if

$$|f_N - f_{N-1}| < \text{DFREQ} \cdot |f_{MAX} - f_{MIN}|$$

where DFREQ is a user parameter with a default of  $10^{-5}$ .  $f_{MAX}$  and  $f_{MIN}$  are the maximum and minimum excitation frequencies of the combined *FREQ<sub>i</sub>* entries, respectively.

4. If there are multiple frequency response subcases, improved performance can be obtained by making the all the subcases that share the same FREQUENCY ID contiguous. For SOL 200, it is an error if there are noncontiguous subcases that have the same boundary condition and FREQUENCY ID.
5. When a FATIGUE case control is also present to perform random vibration fatigue analysis using SOLs 108 and 111, only one FREQUENCY case control set is allowed for all transfer function SUBCASEs and should be above the SUBCASE level or only present in 1st SUBCASE. The FREQUENCY set cannot change from SUBCASE to SUBCASE or a fatal error is issued.

**FRF**

Frequency Response Function (FRF) Generation and/or FRF Based Assembly (FBA) Specification

Specifies the information needed for FRF generation and/or the FBA process. SOLs 108 and 111 only.

**Format:**

$$\text{FRF} \left[ \left[ \left[ \begin{array}{c} \text{GEN} \\ \text{ASM} \\ \text{GENASM} \end{array} \right] \right] \left[ \text{COMPID} = \text{cmpid} \right] \left[ \text{COMPNAME} = \text{cmpname} \right] \right]$$

$$\left[ \text{CONNPTS} = \text{setid} \right] \text{XITOUT} = \left[ \begin{array}{c} \text{UNIT} \\ \text{UNITALL} \\ \text{USER} \\ \text{USERTOTL} \end{array} \right]$$

$$\left[ \text{ASMOUT} = \left[ \begin{array}{c} \text{COMP} \\ \text{ALL} \\ \text{ASSEMBLY} \\ \text{CONNINFO} \\ n \\ \text{cname} \end{array} \right] \right] \left[ \text{LOADLBL} = \left[ \begin{array}{c} \text{STD} \\ \text{ALT} \\ \text{ALT X} \end{array} \right] \right]$$

$$\left[ \left[ \begin{array}{c} \text{DB} \\ \text{OP2} = \text{unit} \end{array} \right] \right]$$

$$\left[ \begin{array}{l} \text{ICFGEN=} \\ \text{ICFUSE=} \\ \text{ICFAUTO=} \end{array} \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{compname} \end{array} \right\} \right] = \left\{ \begin{array}{l} \text{ICFDB} \\ \text{ICFOP2}=\{\text{icfunit}\} \end{array} \right\}$$

**Examples:**

```

FRF
FRF (COMPID = 10 COMPNAME = WING CONNPTS = 1000 LOADLBL = ALT)
FRF (COMPID = 20 COMPNAME = STRUT CONNPTS = 2000 OP2 = 25)
FRF (COMPID = 30 COMPNAME = BODY CONNPTS = 300 XITOUT = UNITALL)
FRF (ASM)
FRF (ASM LOADLBL = ALTX)
FRF (ASM ASMOUT = ALL)
FRF (GENASM COMPID = 50 COMPNAME = SUSPENSX CONNPTS = 200)
FRF (ASM ICFGEN = ALL)
FRF (ASM ICFUSE = 100)
FRF (ASM ICFGEN = 200 ICFOP2 = 33)
FRF (ASM ICFUSE = -1 ICFOP2 = 33)
FRF (ASM ICFAUTO = 100)
FRF (ASM ICFAUTO = -5 ICFOP2 = 31)

```

Descriptor	Meaning
GEN (Default)	Generate the FRFs for the specified component. See Remarks 3. and 4., and the Examples in Remark 13.
ASM	Compute the FRFs of an assembly of components from the FRFs of the individual components. See Remarks 5., 9., 10. and 11., and Examples 2 and 3 in Remark 13.
GENASM	Generate the FRFs for the specified component and follow it by computing the FRFs of an assembly of components from the FRFs of the individual components. See Remarks 4., 9., 10. and 11., and Examples 4 and 5 in Remark 13.
COMPID = <i>compid</i>	<i>compid</i> (Integer > 0) is the identification number of the component whose FRFs are to be generated. See Remarks 3. through 7., and Examples 2 through 5 in Remark 13.
COMPNAME = <i>compname</i>	<i>compname</i> (up to eight characters) is the name of the component whose FRFs are to be generated. See Remarks 3. through 7., and Examples 2 through 5 in Remark 13.

Describer	Meaning
CONNPTS = <i>setid</i>	<p><i>setid</i> (integer &gt; 0) refers to the set that defines the points at which the FRF component specified by the COMPID/COMPNAME keywords is to be connected during a subsequent FRF based assembly (FBA) process. Only those points that are defined in this set (and no others) will be considered for connection during the FBA process. See Remarks 7., 12.(c) and 12.(d), and Examples 2 through 5 in Remark 13.</p>
XITOUT = UNIT	<p>Output the FRF results only for those unit excitations that are specified explicitly via FRFXIT / FRFXIT1 Bulk Data entries or implicitly via the DLOAD Case Control request. See Remark 8.</p> <p>The output for each of the above excitations is identified by a separate subcase. The IDs of these subcases are numbered consecutively starting from 1.</p>
XITOUT = UNITALL	<p>Output FRF results not only for unit excitations specified explicitly via FRFXIT / FRFXIT1 Bulk Data entries or implicitly via the DLOAD Case Control command, but also for unit excitations that are internally applied automatically by the program at the connection points of the FRF component(s). See Remarks 8. and 12.(c), and Example 2 in Remark 13.</p> <p>The output for each of the above excitations is identified by a separate subcase. The IDs of these subcases are numbered consecutively starting from 1.</p>

Describer	Meaning
XITOUT = USER	<p>Output the FRF results for the following excitations implied by the DLOAD Case Control request:</p> <ol style="list-style-type: none"> <li>a. A separate excitation for each individual DOF that has a non-zero load value specified for it</li> <li>b. An excitation representing the total load</li> </ol> <p>Thus, if a DLOAD Case Control request involves non-zero load values on N DOFs, then this request gives results for (N+1) excitations, with the first N such excitations representing individual and separate loads on the N DOFs and the (N+1)th excitation representing the total load. See Remark 8.</p> <p>The output for each of the above (N+1) excitations is identified by a separate coded subcase ID of the form <i>xxxxyyyy</i>. Here <i>xxxx</i> is the user subcase ID corresponding to the DLOAD under consideration. For the first N excitations, <i>yyyy</i> has values ranging from 1 through N (with leading zeros where appropriate). For the (N+1)th excitation representing the total load, the coded subcase ID is of the form <i>xxxx9999</i>.</p> <p>Because of the above coded numbering scheme, when XITOUT = USER is specified (or assumed; see Remark 8), the program will not allow any user subcase ID to exceed 9999. If it does, the program terminates the job with an appropriate fatal message.</p>
XITOUT = USERTOTL	<p>Output the FRF results for the single excitation representing the total load implied the DLOAD Case Control request. This corresponds to the (N+1)th excitation mentioned earlier. See Remark 8.</p> <p>The output for this single excitation representing the total load is identified by the coded subcase ID of the form <i>xxxx9999</i> where <i>xxxx</i> is the user subcase ID corresponding to the DLOAD under consideration.</p> <p>Because of the above coded numbering scheme, when XITOUT = USERTOTL is specified, the program will not allow any user subcase ID to exceed 9999. If it does, the program terminates the job with an appropriate fatal message.</p>
ASMOUT = CONNINFO	<p>In the FBA process, terminate the job after generating the FRF component connection information output without performing any further FRF assembly calculations.</p>
ASMOUT = COMP (Default)	<p>In the FBA process, output the FRF results for all of the individual FRF components comprising the assembly. See Remarks 10. and 11.</p>

Describer	Meaning
ASMOUT = ALL	In the FBA process, output the FRF results not only for all of the individual FRF components comprising the assembly, but also for the assembled FRF configuration considered as a separate entity. See Remarks 10. and 11., and Example 3 in Remark 13. See also Remark 2.
ASMOUT = ASSEMBLY	In the FBA process, output the FRF results only for the assembled FRF configuration considered as a separate entity. This is equivalent to specifying ASMOUT = 0 (described later). See Remarks 2. and 10.
ASMOUT = <i>n</i>	<p><i>n</i> is an integer with the following meanings:</p> <p><i>n</i> = 0</p> <p>In the FBA process, output the FRF results only for the assembled FRF configuration considered as a separate entity. This is equivalent to specifying ASMOUT = ASSEMBLY (described earlier). See Remarks 2. and 10.</p> <p><i>n</i> &gt; 0</p> <p>In the FBA process, output the FRF results only for those FRF components of the assembly whose IDs are specified by SET ID <i>n</i>.</p> <p><i>n</i> &lt; 0</p> <p>In the FBA process, output the FRF results only for that single FRF component of the assembly whose ID is given by <math> n </math>.</p>
ASMOUT = <i>cname</i>	In the FBA process, output the FRF results only for that single FRF component of the assembly whose name is given by <i>cname</i> .
LOADLBL = STD (Default)	The load labels in the output in the FRF and FBA jobs explicitly identify the grid (or scalar) point and its component where the load is applied.
LOADLBL = ALT	<p>The load labels in the output in the FRF and FBA jobs identify the grid (or scalar) point and its component where the load is applied by using the following notation:</p> <p>GGGGGGGG:+C</p> <p>where GGGGGGGG is the grid (or scalar) point ID and C indicates the component where the load is applied. C may have the following values:</p> <p>X Indicates grid point component 1 or a scalar point                      Y Indicates grid point component 2                      Z Indicates grid point component 3                      RX Indicates grid point component 4                      RY Indicates grid point component 5                      RZ Indicates grid point component 6</p>
LOADLBL = ALTX	Same as LOADLBL = ALT except that the load labels also identify whether the load applied is a unit load or a user load.

Describer	Meaning
DB (Default)	Store the FRF matrices and other information on the database. See Examples 2 and 4 in Remark 13.
OP2 = <i>unit</i>	Store the FRF matrices and other information on an OUTPUT2 file whose Fortran unit number is given by <i>unit</i> (integer > 0). See Examples 3 and 5 in Remark 13.
ICFGEN = ALL	Generate ICF information in the FBA process for all of the FRF components of the assembly
ICFGEN = n	<p>n is a non-zero integer with the following meanings: n &gt; 0</p> <p>Generate ICF information in the FBA process only for those FRF components of the assembly whose IDs are specified by SET ID</p> <p>n,</p> <p>n&lt;0</p> <p>Generate ICF information in the FBA process only for that single FRF component of the assembly whose ID is given by  n .</p>
ICFGEN = compname	FRF component whose name is given by compname.
ICFUSE = n	<p>n is a non-zero integer with the following meanings:</p> <p>n &gt; 0</p> <p>Use ICF information by employing in the FBA process a Configuration that consists of only those FRF components whose IDs are specified by SET ID n.</p> <p>n &lt; 0</p> <p>Use ICF information by employing in the FBA process a Configuration that consists of only that single FRF component whose ID is given by  n .</p>
ICFUSE = compname	Configuration that consists of only that single FRF component whose name is given by compname.

Describer	Meaning
ICFAUTO = n	n is a non-zero integer with the following meanings:  n > 0  First generate and then use ICF information in the FBA process only for those FRF components whose IDs are specified by SET  ID n.  n < 0  First generate and then use ICF information in the FBA process only for that single FRF component whose ID is given by  n .
ICFAUTO = compname	only for that single FRF component whose name is given by compname.
ICFDB (Default)	ICF information is to be stored or is resident on the database.
ICFOP2 = <i>icfunit</i>	ICF information is to be stored or is resident on an OUTPUT2 file whose Fortran unit number is given by icfunit (integer > 0).

**Remarks:**

1. This command is supported only in SOLs 108 and 111.
2. A component ID of 0 is assigned to the assembled FRF configuration resulting from the FBA process.
3. The COMPNAME keyword must be specified if the COMPID keyword is specified and vice versa.
4. If the COMPID/COMPNAME keywords are specified along with the GEN/GENASM keyword, then it implies that the FRFs computed for the specified component are employed in a subsequent FBA process. In this case, the FRF generation results will be saved on the specified medium, and the .asm (assembly punch) file will be generated and saved with a single FRFCOMP Bulk Data entry in it for subsequent use in an FBA process.
5. If the COMPID/COMPNAME keywords are not specified with the GEN/GENASM keyword, then it implies that the FRFs computed are for a single shot configuration with no subsequent FBA process involved. In this case, the GENASM keyword is equivalent to the GEN keyword.
6. The COMPID/COMPNAME keywords are ignored if the ASM keyword is specified.
7. The CONNPTS keyword must be specified if the COMPID/COMPNAME keywords are specified. It is ignored otherwise.
8. If the XITOUT keyword is not specified, the default of XITOUT = UNIT is assumed if there is no DLOAD Case Control request and the default of XITOUT = USER is assumed if there is a DLOAD Case Control request. If the user specifies XITOUT = USER or XITOUT = USERTOTL, but there is no DLOAD Case Control request, the program issues a warning message and assumes XITOUT = UNIT.

9. If the ASM/GENASM keyword is specified, the resulting FBA process will generate a connection information table in the .f06 file, indicating the relationship between the internal point IDs of the assembled FRF configuration (referred to as component 0 as indicated in Remark 2.) and the external point IDs of the associated FRF components.
10. The normal output from an FBA process run, implied by the default of ASMOUT = COMP, gives the results for the individual FRF components that comprise the assembled FRF configuration. If output is also desired for the assembled configuration as a separate entity (component 0 as indicated in Remark 2.), then ASMOUT = ALL must be specified in the FRF command to obtain the expanded output. However, in this case, the output for component 0 will be limited to displacements, velocities, and accelerations, and these will be output in terms of the internal point IDs mentioned in Remark 9. See Example 3 in Remark 13.
11. The ASMOUT keyword is ignored if the GEN keyword is specified.
12. The generation of FRFs for a component and their use in a subsequent FBA process using the FRF Case Control command involves running a standard SOL 108 or SOL 111 job, with the following additional data:
  - a. The DOFs where loads are to be applied must be specified either indirectly via the DLOAD Case Control command and/or directly via the FRFXIT/FRFXIT1 Bulk Data entries. The DLOAD Case Control command points to appropriate Bulk Data loading entries. All DOFs with nonzero load values will have unit loads applied to them. The FRFXIT entry permits specification of unit load for a single DOF with a label. The FRFXIT1 entry permits specification of unit loads at multiple DOFs.
  - b. There is no requirement that unit loading data be defined for every component for which FRFs are generated, since some components in a configuration may not have any loads applied to them.
  - c. Regardless of whether an FRF component has unit loads explicitly specified for it, as in Remark 12(a) or not, as in Remark 12(b), the program will internally apply unit loads automatically at all DOFs for all connection points comprising the set referenced by the CONNPTS keyword. This ensures that correct results are obtained from subsequent FBA processes.
  - d. The specific points at which FRFs are computed in an FRF generation run consist of the following:
    - All points specified via DISP, VELO, and ACCE requests
    - All points associated with elements for which STRESS/FORCE requests are specified
    - All points at which unit loads are applied (as per the scheme indicated in Remark 12(a))
    - All points comprising the set referenced by the CONNPTS keyword
    - All grid points referenced in PLOTTEL Bulk Data entries
  - e. It is assumed in an FBA process that the FRFs of all of the FRF components have been generated at the same forcing frequencies, and that these are also the forcing frequencies at which the FBA process is to be performed. As a result, the FBA process derives these forcing frequencies from the saved data of the first of the FRF components being assembled, and uses them in the FBA process.

In order to ensure the validity of the FBA process, the program checks to make sure that all of the FRF components have been generated using the same number of forcing frequencies and further that all of these forcing frequencies are the same for all of the FRF components. If both of these conditions are not met, the program terminates the job with an appropriate fatal message.

13. The following examples illustrate details of job setups for FRF generation and the subsequent FBA process for various scenarios.

Example 1 involves FRF generation for a single shot configuration without any FBA process.

Examples 2 through 5 assume that there are three components – 10, 20 and 30 – for which FRFs are to be generated (frgen10.dat, frgen20.dat and frgen30.dat) and that the FRFs of these components are to be subsequently assembled in an FBA process to obtain the FRFs of the assembled configuration.

Example 6 illustrates an FBA process involving the assembly of two components – 10 and 20 – whose FRFs are generated by Nastran, with a third FRF component – 40 – whose FRFs have been generated from test, with its FRF and other information resident on an Universal File (UF).

Examples 2, 3 and 6 illustrate the use of the ASM option for the FBA process while Examples 4 and 5 illustrate the use of the GENASM option for the FBA process.

Examples 7 through 13 deal with an airplane model comprising five FRF components, namely, fuselage (1), horizontal tail (2), vertical tail (3), inboard wings (4) and outboard wings (5). Example 7 illustrates the generation of the FRFs for these five components while the other examples are FBA jobs that illustrate the generation and usage of ICFs (inter component forces) for several scenarios using the ICFGEN, ICFUSE and ICFAUTO keywords of the FRF Case Control command, employing both database and OUTPUT2 usage.

Loading data must be defined for Example 1 either via FRFXIT/FRFXIT1 Bulk Data entries or via the DLOAD Case Control request. For all other examples, loading data may be defined as desired either in the FRF generation runs or in the FBA process or both.

Example 1. Generate FRFs for a Single Shot Configuration with No Subsequent FBA Process
<ul style="list-style-type: none"> <li>■ FRF Generation Job                             <ul style="list-style-type: none"> <li>• Case Control Requirement</li> </ul> </li> </ul>
FRF
Loading data must be defined either via the DLOAD Case Control command and/or via FRFXIT/FRFXIT1 Bulk Data entries.

### Example 2. Generate FRFs for Components 10, 20, and 30 Using the DB Option and Subsequently Assemble Their FRFs to Obtain FRFs of the Assembled Configuration Using the ASM Option

#### ■ FRF Generation Jobs

- Case Control Requirement

FRF component 10: FRF (COMPID = 10 COMPNAME = COMP10 CONNPTS = 100)

FRF component 20: FRF (COMPID = 20 COMPNAME = COMP20 CONNPTS = 200)

FRF component 30: FRF (COMPID = 30 COMPNAME = COMP30 CONNPTS = 300)

For these jobs, scr = no should be specified on the Nastran job command lines to ensure that the databases are saved at the end of the jobs.

These jobs automatically generate .asm files for subsequent use by the FBA job.

#### ■ FBA Job

- File Management Section (FMS) Requirement

ASSIGN dbname10 = 'frfgen10.MASTER'

ASSIGN dbname20 = 'frfgen20.MASTER'

ASSIGN dbname30 = 'frfgen30.MASTER'

DBLOCATE DATABLE = (FRFDB) LOGICAL = dbname10

DBLOCATE DATABLE = (FRFDB) LOGICAL = dbname20

DBLOCATE DATABLE = (FRFDB) LOGICAL = dbname30

(Note: All of the data blocks stored on the databases from the FRF generation runs have the same common name of FRFDB.)

- Case Control Requirement

FRF (ASM XITOUT = UNITALL)

The XITOUT = UNITALL request gives output for all unit excitations (both user specified unit loads and internally applied unit loads).

- Bulk Data Requirement

The following INCLUDEs are required.

INCLUDE 'frfgen10.asm'

INCLUDE 'frfgen20.asm'

INCLUDE 'frfgen30.asm'

**Example 3. Generate FRFs for Components 10, 20, and 30 Using the OP2 Option and Subsequently Assemble Their FRFs to Obtain FRFs of the Assembled Configuration Using the ASM Option**

■ FRF Generation Jobs

- File Management Section (FMS) Requirement

ASSIGN OUTPUT2 = 'frfgen10\_op2' UNIT = 25 DELETE

ASSIGN OUTPUT2 = 'frfgen20\_op2' UNIT = 26 DELETE

ASSIGN OUTPUT2 = 'frfgen30\_op2' UNIT = 27 DELELE

For these jobs, scr = yes may be specified on the Nastran job command lines since there is no need for the databases to be saved at the end of the jobs.

These jobs automatically generate .asm files for subsequent use by the FBA job.

- Case Control Requirement

FRF component 10: FRF (COMPID = 10 COMPNAME = COMP10 CONNPTS = 100 OP2 = 25)

FRF component 20: FRF (COMPID = 20 COMPNAME = COMP20 CONNPTS = 200 OP2 = 26)

FRF component 30: FRF (COMPID = 30 COMPNAME = COMP30 CONNPTS = 300 OP2 = 27)

■ FBA Job

- File Management Section (FMS) Requirement

ASSIGN INPUTT2 = 'frfgen10\_op2' UNIT = 25

ASSIGN INPUTT2 = 'frfgen20\_op2' UNIT = 26

ASSIGN INPUTT2 = 'frfgen30\_op2' UNIT = 27

- Case Control Requirement

FRF (ASM ASMOUT = ALL)

The ASMOUT = ALL request gives output from the FBA process not only for FRF components 10, 20 and 30, but also for the assembled configuration as a separate entity (component 0) as indicated in Remark 10.

- Bulk Data Requirement

The following INCLUDEs are required.

INCLUDE 'frfgen10.asm'

INCLUDE 'frfgen20.asm'

INCLUDE 'frfgen30.asm'

**Example 4. Generate FRFs for Components 10 and 20 Using the DB Option and Subsequently Assemble their FRFs with Those of Component 30 Using the DB and GENASM Options to Obtain the FRFs of the Assembled Configuration.**

■ FRF Generation Jobs

- Case Control Requirement

FRF component 10: FRF (COMPID = 10 COMPNAME = COMP10 CONNPTS = 100)

FRF component 20: FRF (COMPID = 20 COMPNAME = COMP20 CONNPTS = 200)

For these jobs, scr = no should be specified on the Nastran job command line to ensure that the databases are saved at the end of the jobs.

These jobs automatically generate .asm files for subsequent use by the FBA job.

■ Combined FRF Generation and FBA Job

- File Management Section (FMS) Requirement

ASSIGN dbname10 = 'frfgen10.MASTER'

ASSIGN dbname20 = 'frfgen20.MASTER'

DBLOCATE DATBLK=(FRFDB) LOGICAL=dbname10

DBLOCATE DATBLK=(FRFDB) LOGICAL=dbname20

(Note: All data blocks stored on the databases from the FRF generation runs have the same common name of FRFDB.)

For this job, scr = no should be specified on the Nastran job command line to ensure that the database for FRF component 30 is saved for subsequent use by the FBA process.

- Case Control Requirement

FRF (GENASM COMPID = 30 COMPNAME = COMP30 CONNPTS = 300)

- Bulk Data Requirement

The following INCLUDEs are required.

INCLUDE 'frfgen10.asm'

INCLUDE 'frfgen20.asm'

**Example 5. Generate FRFs for Components 10 and 20 Using the OP2 Option and Subsequently Assemble their FRFs with Those of Component 30 Using the OP2 and GENASM Options to Obtain the FRFs of the Assembled Configuration.**

■ FRF Generation Jobs

- File Management Section (FMS) Requirement

ASSIGN OUTPUT2 = 'frfgen10\_op2' UNIT = 25 DELETE

ASSIGN OUTPUT2 = 'frfgen20\_op2' UNIT = 26 DELETE

- Case Control Requirement

FRF component 10: FRF (COMPID = 10 COMPNAME = COMP10 CONNPTS = 100 OP2 = 25)

FRF component 20: FRF (COMPID = 20 COMPNAME = COMP20 CONNPTS = 200 OP2 = 26)

For these jobs, scr = yes may be specified on the Nastran job command line since there is no need for the databases to be saved at the end of the jobs.

These jobs automatically generate .asm files for subsequent use by the FBA job.

■ Combined FRF Generation and FBA Job

- File Management Section (FMS) Requirement

ASSIGN INPUTT2 = 'frfgen10\_op2' UNIT = 25

ASSIGN INPUTT2 = 'frfgen20\_op2' UNIT = 26

ASSIGN OUTPUT2 = 'frfgen30\_op2' UNIT = 27 DELETE

- Case Control Requirement

FRF (GENASM COMPID = 30 COMPNAME = COMP30 CONNPTS = 300 OP2 = 27)

- Bulk Data Requirement

The following INCLUDEs are required.

INCLUDE 'frfgen10.asm'

INCLUDE 'frfgen20.asm'

**Example 6. Generate FRFs for Components 10 and 20 Using the OP2 Option and Subsequently Assemble their FRFs with Those of Test FRF Component 40 Using the ASM Option to Obtain the FRFs of the Assembled Configuration.**

■ FRF Generation Jobs

- File Management Section (FMS) Requirement

ASSIGN OUTPUT2 = 'frfgen10\_op2' UNIT = 25 DELETE

ASSIGN OUTPUT2 = 'frfgen20\_op2' UNIT = 26 DELETE

- Case Control Requirement

FRF component 10: FRF (COMPID = 10 COMPNAME = COMP10 CONNPTS = 100 OP2 = 25)

FRF component 20: FRF (COMPID = 20 COMPNAME = COMP20 CONNPTS = 200 OP2 = 26)

For these jobs, scr = yes may be specified on the Nastran job command line since there is no need for the databases to be saved at the end of the jobs.

These jobs automatically generate .asm files for subsequent use by the FBA job.

■ FBA Job

- File Management Section (FMS) Requirement

ASSIGN INPUTT2 = 'frfgen10\_op2' UNIT = 25

ASSIGN INPUTT2 = 'frfgen20\_op2' UNIT = 26

ASSIGN UNVFILE = 'frfgen40\_unv' UNIT = 28 \$ Universal File

- Case Control Requirement

FRF (ASM)

- Bulk Data Requirement

FRFCOMP,40,TSTCMP40,UF,28

The following INCLUDEs are also required.

INCLUDE 'frfgen10.asm'

INCLUDE 'frfgen20.asm'

**Example 7. Generate FRFs for Components 1 through 5 Using the OP2 Option**

- File Management Section (FMS) Requirement

```
FRF Component 1:ASSIGN OUTPUT2 = 'fuselage_op2' UNIT=25 DELETE
FRF Component 2:ASSIGN OUTPUT2 = 'hor_tail_op2' UNIT=26 DELETE
FRF Component 3:ASSIGN OUTPUT2 = 'ver_tail_op2' UNIT=27 DELETE
FRF Component 4:ASSIGN OUTPUT2 = 'ib_wings_op2' UNIT=28 DELETE
FRF Component 5:ASSIGN OUTPUT2 = 'ob_wings_op2' UNIT=29 DELETE
```

- Case Control Requirement

```
FRF Component 1:FRF (COMPID = 1 COMPNAME = FUSELAGE CONNPTS =
1000 OP2=25)
FRF Component 2:FRF (COMPID = 2 COMPNAME = HOR_TAIL CONNPTS =
1000 OP2=26)
FRF Component 3:FRF (COMPID = 3 COMPNAME = VER_TAIL CONNPTS =
1000 OP2=27)
FRF Component 4:FRF (COMPID = 4 COMPNAME = IB_WINGS CONNPTS =
1000 OP2=28)
FRF Component 5:FRF (COMPID = 5 COMPNAME = OB_WINGS CONNPTS =
1000 OP2=29)
```

These jobs automatically generate .asm files for subsequent use by the FBA process.

For these jobs, scr = yes may be specified on the Nastran job command lines since there is no need for the databases to be saved at the end of the jobs.

**Example 8. Generate ICFs on the Database for All Five FRF Components of Example 7 (Step 1 of Two-Step Process)**

- File Management Section (FMS) Requirement

```
ASSIGN INPUTT2 = 'fuselage_op2' UNIT=25
ASSIGN INPUTT2 = 'hor_tail_op2' UNIT=26
ASSIGN INPUTT2 = 'ver_tail_op2' UNIT=27
ASSIGN INPUTT2 = 'ib_wings_op2' UNIT=28
ASSIGN INPUTT2 = 'ob_wings_op2' UNIT=29
```

- Case Control Requirement

**Example 8. Generate ICFs on the Database for All Five FRF Components of Example 7 (Step 1 of Two-Step Process)**

```
FRF (ASM ICFGEN = ALL)
```

- Bulk Data Requirement

```
INCLUDE 'fuselage.asm'
INCLUDE 'hor_tail.asm'
INCLUDE 'ver_tail.asm'
INCLUDE 'ib_wings.asm'
INCLUDE 'ob_wings.asm'
```

For this job, scr = no should be specified on the Nastran job command line since the database containing the ICF information needs to be saved for use in a subsequent FBA job (Example 9).

**Example 9. Use ICFs of Example 8 for An Assembly Configuration Consisting of FRF Components 1, 4 and 5 (Step 2 of Two-Step Process)**

- File Management Section (FMS) Requirement

```
ASSIGN INPUTT2 = 'fuselage_op2' UNIT=25
ASSIGN INPUTT2 = 'ib_wings_op2' UNIT=28
ASSIGN INPUTT2 = 'ob_wings_op2' UNIT=29
ASSIGN ICFDATA = 'example8.MASTER'
DBLOCATE (DATBLK = ICFDB) LOGICAL = ICFDATA
```

- Case Control Requirement

```
SET 100 = 1,4,5
FRF (ASM ICFUSE = 100)
```

- Bulk Data Requirement

```
INCLUDE 'fuselage.asm'
INCLUDE 'ib_wings.asm'
INCLUDE 'ob_wings.asm'
```

For this job, scr = yes may be specified on the Nastran job command line since there is no need for the database to be saved at the end of the job.

### Example 10. Generate ICFs on an OUTPUT2 File for FRF Components 1, 2 and 3 of Example 7 (Step 1 of Two-Step Process)

- File Management Section (FMS) Requirement

```
ASSIGN INPUTT2 = 'fuselage_op2' UNIT=25  
ASSIGN INPUTT2 = 'hor_tail_op2' UNIT=26  
ASSIGN INPUTT2 = 'ver_tail_op2' UNIT=27  
ASSIGN INPUTT2 = 'ib_wings_op2' UNIT=28  
ASSIGN INPUTT2 = 'ob_wings_op2' UNIT=29  
ASSIGN OUTPUT2 = 'icf123_op2' UNIT=33 DELETE
```

- Case Control Requirement

```
SET 100 = 1,2,3  
FRF (ASM ICFGEN = 100 ICFOP2 = 33)
```

- Bulk Data Requirement

```
INCLUDE 'fuselage.asm'  
INCLUDE 'hor_tail.asm'  
INCLUDE 'ver_tail.asm'  
INCLUDE 'ib_wings.asm'  
INCLUDE 'ob_wings.asm'
```

For this job, scr = yes may be specified on the Nastran job command line since there is no need for the database to be saved at the end of the job.

**GPFORCE**

## Grid Point Force Output Request

Requests grid point force balance at selected grid points.

**Format:**

$$\text{GPFORCE} \left( \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \begin{array}{l} GE \\ G \\ B \\ DAMP \\ M \\ ALLDLDS \end{array} \right] \right) = \left\{ \begin{array}{l} \text{ALL} \\ n \end{array} \right\}$$

**Examples:**

GPFORCE=ALL

GPFORCE=17

Descriptor	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 files can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output. See Remark 14.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees. See Remarks 13. and 14.
GE	Element appropriate element structural GE <sub>i</sub> value contribution of force $K4 \times U_c$ output in addition to the standard elastic force output.
G	Element appropriate element structural global G value contribution of force $K \times U_c$ output in addition to the standard elastic force output.
B	Element appropriate element viscous damping contribution of force $K \times i \times \omega \times U_c$ output in addition to the standard elastic force output.

Describer	Meaning
DAMP	Element appropriate GE, B, and G will be explicitly output in addition to explicit current elastic force output.
M	Element appropriate element mass contribution of force $M \times \omega^2 \times U_c$ output in addition to the standard elastic force output.
ALLDLDS	Element appropriate GE, B, G, and M will be output in addition to the standard elastic force output.
ALL	Grid point force balance for all grid points will be output.
n	Set identification number of a previously appearing SET command. Only grid points with identification numbers that appear on this SET command will be included in the grid point force balance output (Integer >0).

### Remarks:

- The printing of the grid point forces will be suppressed if PARAM,NOGPF,-1 appears in the Bulk Data.
- The Bulk Data entry PARAM,NOELOF,+1 will cause the output of the grid point forces to be aligned with the edges of the two-dimensional elements. The default value of -1 will suppress this output. See Remark 4.
- The Bulk Data entry PARAM,NOELOP,+1 will cause the output of the sum of the forces parallel to the edges of adjacent elements. The default value of -1 will suppress this output. See Remarks 4. and 10.
- The output of grid point forces aligned with the edges of elements is available for the following elements:
  - CBAR
  - CROD
  - CBEAM
  - CSHEAR
  - CONROD
  - CTRIA3
  - CQUAD4
  - CTUBE

The positive direction for grid point forces aligned with the edges of elements is from the reference point to the load point as indicated on the printed output. See Remark 10.

- The grid point force balance is computed from linear and nonlinear elements, and includes the sum of applied loads, contact force, thermal loads, MPC forces, rigid elements, general elements, DMIG entries and SPC forces. Effects not accounted for include those from mass elements in dynamic analysis (inertia loads), slideline force contributions, and boundary loads from upstream superelements. These effects may lead to an apparent lack of equilibrium at the grid point level. The following table summarizes those effects that are considered and those effects that are ignored in the calculation of grid point forces in the global coordinate system:

Contributions Included	Contributions Ignored
Applied Loads	DMI Forces
SPC Forces	Boundary Loads from Upstream Superelements
Element Elastic Forces	Forces on elements with geometric or material nonlinear properties during normal modes analysis in SOL 106; also called linear perturbation analysis.
GENEL Forces	Connector elements CFAST, CSEAM, and CWELD.
DMIG Referenced by K2GG Case Control command	
Thermal Loads	
MPC and Rigid Element Forces	
Contact Forces	

6. Only the element elastic forces are included when the grid point forces are aligned with the edges of elements. See Remark 10.
7. In inertia relief analysis, the SPCFORCE and applied load output includes both the effect of inertial loads and applied loads.
8. When pressure loads are applied, the GPFDR module uses the discrete load vector and does not include any distributed effects.
9. GPFORCE is not available in 129. For SOLs 108 and 111, if the only frequency dependency is associated with the CBUSH, CELAS1, CELAS3, CDAMP1, CDAMP3, or (PARAM, SHLDAMP DIFF), or if any PBUSH has a GE<sub>i</sub> value other than GE1, then PARAM,BUSHNM,YES (Default) must be used. GPFORCE, for any solution sequence, does not include forces from boundary superelements. The unbalance represents the forces from adjacent superelements.
10. Grid point force output is available for nonlinear static analysis for SOLs 106 and 400. SOL106 with thermal loading does not back out the thermal load so result will not sum to zero, this is a limitation of SOL106. Contributions from slideline elements are ignored. PARAM,NOELOF and PARAM,NOELOP are not supported in nonlinear and Remarks 2., 3., 4., and 6. do not apply.
11. The usages of REPCASE and OMODES Case Control directives is not supported for ESE, EKE, EDE and GPFO output selections and should not be used.
12. The (GE, G, B, DAMP, M, and ALLDLDS) are only meaningful in SOL108, SOL111 or ANALYSIS=DFREQ or MFREQ analysis. Frequency response CYCLIC SYMMETRY ANALYSIS is not supported.

<b>Elements and features Not supported (These elements will be ignored in the GPFORCE Calculations)</b>	
ELEMENT NAME	ANALYSIS
CDUM3-7	User Defined Element
<b>Fluid</b>	
CHEXA (CHEXPR)	PSOLID with FCTN=FLUID, PORO, or PSLDSDL
CPENTA (CPENPR)	PSOLID with FCTN=FLUID, PORO, or PSLDSDL
CTETRA (CTETPR)	PSOLID with FCTN=FLUID, PORO, or PSLDSDL
CPYRAM (CPYRPR)	PSOLID with FCTN=FLUID, PORO, or PSLDSDL
CAABSF	Acoustic Absorber Element
<b>Cyclic Symmetry</b>	
CTRIAX6	
<b>SOL400 elements associated with PLPLANE</b>	
QUAD4FD, QUADFD, QUADX4FD, QUADXFD, TRIA3FD, TRIAFD, TRIA3FD, TRIAXFD	Plane strain elements
<b>Structures</b>	
CBUSH2D	Rotor Dynamic element
CHACAB	Acoustic Absorber element
CHACBR	Acoustic Barrier Element
Unsupported elements will appear in the GPFORCE output with incomplete load calculations. Thus, grids associated with them, in general, will not sum to zero.	

13. In general, for frequency response, the “\*totals\*” rows will not be zero, except when ALLDLDS is chosen. Also if “PHASE” is also chosen, only the first row of “\*TOTALS\*” will be zero.

SOL111 and SOL200/SOL400 with ANALYSIS=MFREQ, by their nature, introduce noise into the solution. As a result, some “\*totals\*” may have poor zeros. This is especially true when heavy structural damping is present. The reason is that for structural damping, residual vectors are not computed.

For frequency dependent elements using master frequencies, for forcing frequencies not at the master frequencies, the interpolation for the solution vector is done on the KGG, K4GG, etc., matrices; while, for GPFORCE, the interpolations are done on the individual element stiffness matrices and the individual values of GE appearing on the MATiF entries. As a result, for an interpolated result, far from its bounding master frequencies, with ALLDLDS, the totals may be several orders higher than results when the interpolated results have tighter bounding master frequencies.

For frequency dependent elements, the F-OF-MPC, that include both Nastran MPC entry results and RIGID element results, may be in error. This will cause the “\*totals\*” to show very large values.

To avoid this, it is recommended that these types of constraints do not touch grids associated with frequency dependent elements. The reason for this, is that the MPC/RBEi forces of constraint are currently based on the nominal values of element properties.

14. For PRINT and PUNCH options, when PHASE is chosen, the F06 and PCH files will be in magnitude-phase format. However, in any analysis that involves complex numbers, any and all of the HDF5 output is automatically converted to real-imaginary format.
15. For frequency response, the GPFFORCE calculations are:

#### GPFFORCE Calculations

$F$  = KELM  $\times$  (UGR+UGI) - standard elastic force contribution at the grid

$F_{GE}$  =  $i \times$  GEVAL  $\times$  GEFACT  $\times$  KELM4  $\times$  (UGR+UGI) - structural damping force contribution at the grid

$F_B$  = BELM  $\times i \times \omega \times$  (UGR+UGI) - viscous damping force contribution at the grid

$F_G$  =  $i \times G \times$  KELM  $\times$  (UGR+UGI) - global G/GF - global damping force contribution at the grid

$F_M$  = WTMASS  $\times$  MELM  $\times \omega^2 \times$  (UGR + UGI) - inertia force contribution at the grid.

KELM - an element stiffness matrix

KELM4 - an element structural damping matrix

BELM - an element viscous damping matrix

MELM - an element mass matrix

UGR - real displacement at the grid

UGI - imaginary displacement at the grid

$\omega = 2 \pi f$  where  $f$  is the current forcing frequency.

$i = \sqrt{-1}$

### GPFORCE Calculations

Depending on the element type, GEVAL is determined from a MATi entry or a PROPERTY entry. For elements referring to extended damping on MAT2 or MAT9 entries, GEVAL=1.0 and the KELM4 contains the cumulative results.

When frequency dependent material or properties are evoked, when a frequency is between master frequencies the element forces will be interpolated based on MFREQUENCY case control, LINEAR or LOG10.

The various loads appear in the SOURCE column of the GPFORCE output as:

ELEMENT NAME	Corresponds to F the standard elastic force contribution at the grid.
F-OF-G	Corresponds to $F_G$ the global damping force contribution at the grid.
F-OF-GE	Corresponds to $F_{GE}$ the structural damping force contribution at the grid.
F-OF-B	Corresponds to $F_B$ the viscous damping force contribution at the grid.
F-OF-M	Corresponds to $F_M$ the inertia force contribution at the grid.
Special "Elements"	
GENEL	Corresponds to Non-frequency dependent standard elastic force contribution at the grid.
K2GG	Corresponds to Non-frequency dependent standard elastic force contribution at the grid.
K42GG	Corresponds to Non-frequency dependent F-OF-GE at the grid.
B2GG	Corresponds to Non-frequency dependent F-OF-B at the grid.
M2GG	Corresponds to Non-frequency dependent F-OF-M at the grid.

The above user supplied matrices are displayed using the user supplied naming convention.

#### SDAMP, RSDAMP, and Rayleigh damping

F-OF-SDP	Corresponds to Non-forcing frequency dependent Modal damping at the grid. PARAM, KDAMP, 1 (Default)
F-OF-K4D	Corresponds to Non-forcing frequency dependent Modal damping at the grid. PARAM, KDAMP, -1
F-OF-RAY	Corresponds to Non-forcing frequency dependent Rayleigh damping at the grid.

GEFACT (see Bulk Data entry DAMPING, default=1.0) effect appears as a scaling to F-OF-GE

F-OF-SDP, F-OF-K4D, and F-OF-RAY output is controlled by the appearance of the GPFORCE key words: GE, DAMP or ALLDLDS.

The remaining source entries: APP-LOAD, F-OF-SPC, F-OF-MPC remain the same as in statics.

**GPKE**

## Grid Point Kinetic Energy Output Request

Requests the output of the kinetic energy at selected grid points in normal modes analysis only.

**Format:**

$$\text{GPKE} \left[ \left( \begin{array}{c} \text{PRINT} \\ \text{NOPRINT} \end{array} \right), \text{PUNCH}, \text{THRESH} = e \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

**Examples:**

GPKE=ALL

GPKE (PRINT, PUNCH)=19

Descriptor	Meaning
PRINT	The printer will be the output medium.
NOPRINT	Generates, but does not print, grid point kinetic energy output.
PUNCH	The punch file will be the output medium.
e	Minimum energy threshold. Only energies above this value will be printed and/or punched.
ALL	Grid point kinetic energy for all grid points will be output.
n	Set identification number of a previously appearing SET command. Only grid points with identification numbers that appear on this SET command will be included in output (Integer > 0).
NONE	Grid point kinetic energy for no points will be output.

**Remarks:**

1. Grid point kinetic energy is only available for normal modes analysis.
2. Both PRINT and PUNCH may be requested.
3. GPKE=NONE overrides an overall output request.
4. For models using the lumped mass formulation, the grid point kinetic energy can be used to examine the distribution of kinetic energy among the grid points. It is computed as:

$$E_{k_g} = \Phi_g^{mass} \otimes [M_{gg} \Phi_g^{mass}]$$

where  $\Phi_g^{mass}$  represents the mass-normalized eigenvectors so that the total grid point kinetic energy is scaled to be unity. Note that the operator  $\otimes$  indicates term-wise matrix multiplication.

5. The grid point kinetic energy output has limited meaning for a coupled mass formulation. Since this mass formulation produces a coupling of mass across grid points, the sharing of kinetic energy among grid points can occur. In general, this obscures the meaning of the computation as a means of identifying important model parameters to control modal behavior.

**GPRSORT**

## Composites Ply Results Sorted Output

Request sorted output of composites ply results (stress, strain, and failure indices) by global ply ID for a given element set.

**Format:**

$$\text{GPRSORT} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \end{array} \right\}$$

**Examples:**

```
GPRSORT=ALL
GPRSORT=22
```

Describer	Meaning
ALL	All composite elements referencing a PCOMPG property entry type. See Remarks <a href="#">1.</a> and <a href="#">2.</a>
n	Set identification number of a previously appearing SET command.

**Remarks:**

1. Composite element output will be sorted by global ply ID and element ID. Note that this sorted output is only available for composite elements referencing a PCOMPG property entry. Global ply IDs can only be specified on the PCOMPG entry.
2. Composite elements referencing the PCOMP property entry will be excluded from the sorted output.

## GPSDCON

## Grid Point Stress Discontinuity Output Request

Requests mesh stress discontinuities based on grid point stresses.

### Format:

$$\text{GPSDCON} \begin{bmatrix} \text{PRINT, PUNCH} \\ \text{PLOT} \end{bmatrix} = \begin{Bmatrix} \text{ALL} \\ \text{n} \end{Bmatrix}$$

### Examples:

GPSDCON=ALL  
GPSDCON=19

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Stress discontinuity requests for all SURFACE and VOLUME commands defined in the OUTPUT(POST) Section will be output.
n	Set identification number of a previously appearing SET command. Only surfaces and volumes with identification numbers that appear on this SET command will be included in the stress discontinuity output request (Integer > 0).
NONE	No grid point stress discontinuity output.

### Remarks:

1. This output is available in linear static analysis SOLs 101 and 144 only. Output will be presented for each surface or volume as a tabular listing of stress discontinuities for each subcase.
2. Only elements used to define the surface or volume are output. See the description of the SURFACE or VOLUME commands.
3. Element stress output (STRESS) must be requested for elements referenced on SURFACE and VOLUME commands. Also, the GPSTRESS and STRFIELD commands must be present for printed output.

**GPSTRAIN**

## Grid Point Strain Output Request for Printing Only

Requests grid point strains for printing only.

**Format:**

$$\text{GPSTRAIN} \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

**Examples:**

```
GPSTRAIN=ALL
GPSTRAIN=19
```

Descriptor	Meaning												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Grid point strain requests for all SURFACE and VOLUME commands defined in the OUTPUT(POST) Section will be output.
n	Set identification number of a previously appearing SET command. Only surfaces and volumes with identification numbers that appear on this SET command will be included in the grid point strain output request (Integer > 0).
NONE	No grid point strain output.

**Remarks:**

1. For statics, normal modes, and transient analysis, output will be presented for each surface or volume as a tabular listing of grid point strains for each load, eigenvalue, and time step. (See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.)
2. Only grid points connected to elements used to define the surface or volume are output. See the description of the SURFACE or VOLUME commands.

3. Element strain output (STRAIN) must be requested for elements referenced on SURFACE and VOLUME commands.
4. In nonlinear transient analysis, grid point strains are computed only if parameter LGDISP is -1, which is the default, and only for elements with linear material properties.
5. For the postprocessing of grid point strains using the .xdb file or the computation of mesh strain discontinuities, the STRFIELD command must also be specified.

**GPSTRESS**

## Grid Point Stress Output Request for Printing Only

Requests grid point stresses for printing only.

**Format:**

$$\text{GPSTRESS} \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

GPSTRESS=ALL  
GPSTRESS=19

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Grid point stress requests for all SURFACE and VOLUME commands defined in the OUTPUT(POST) Section will be output.
n	Set identification number of a previously appearing SET command. Only surfaces and volumes with identification numbers that appear on this SET command will be included in the grid point stress output request (Integer > 0).
NONE	No grid point stress output.

**Remarks:**

1. For statics, normal modes, and transient analysis, output will be presented for each surface or volume as a tabular listing of grid point stresses for each load, eigenvalue, and timestep. (See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.)
2. Only grid points connected to elements used to define the surface or volume are output. See the description of the SURFACE or VOLUME commands.

3. Element stress output (STRESS) must be requested for elements referenced on SURFACE and VOLUME commands.
4. For the postprocessing of grid point stresses using the .xdb file or the computation of mesh stress discontinuities, the STRFIELD command must also be specified.
5. Grid point stress is not output for midside nodes.

**GROUNDCHECK**

## Rigid Body Motion Grounding Check

Perform grounding check analysis on the stiffness matrix to expose unintentional constraints by moving the model rigidly.

**Format:**

$$\text{GROUNDCHECK} \left[ \left( \begin{array}{l} \text{PRINT} \\ \text{NOPRINT} \end{array} \right), \text{PUNCH, SET} = \left( \begin{array}{l} \text{G, N, N + AUTOSPC, F, A} \\ \text{ALL} \end{array} \right) \right] = \left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$$

$$\text{GRID} = \text{gid, THRESH} = e,$$

$$\text{DATAREC} = \left[ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right], (\text{RTHRESH} = r)$$

**Examples:**

GROUNDCHECK=YES

GROUNDCHECK (GRID=12, SET=(G, N, A), THRESH=1.E-5, DATAREC=YES) =YES

Descriptor	Meaning
PRINT	Write output to the print file. (Default)
NOPRINT	Do not write output to the print file.
PUNCH	Write output to the punch file.
SET	Selects degree-of-freedom set(s) (Default: SET=G).
gid	Reference grid point for the calculation of the rigid body motion.
e	Maximum strain energy which passes the check. The default value is computed by dividing the largest term in the stiffness matrix by 1.E10.
DATAREC	Requests data recovery of grounding forces (Default: DATAREC=NO).
r	Grounding forces which are larger than r percent of the largest grounding force will be printed if DATAREC=YES (Default = .10; 0. < r < 1.0).

**Remarks:**

- GROUNDCHECK must be specified above the subcase level.
- SET=N+AUTOSPC (check the N-set stiffness, including the effect of PARAM,AUTOSPC) uses the stiffness matrix for the n-set, with the rows corresponding to degrees-of-freedom constrained by the PARAM,AUTOSPC operation zeroed out. If AUTOSPC was not performed, then this check is redundant with respect to SET=N.
- If DATAREC=YES, GROUNDCHECK FORCES will be printed in the displacement coordinate system of the associated GRID points.

4. For CBEAM/CBEAM3, it is recommended to use SPOINT ID for warping DOFs. Use of GRID ID for warping DOFs may cause one or more directions to fail the rigid body check.
5. If Lagrange multipliers are present via RIGID=LAGRAN or LGELIM then for degree-of-freedom sets N, N+AUTOSPC, F, and A the check will be performed on degree-of-freedom sets NL, NL+AUTOSPC, FL, and AL. The output will also be labeled accordingly.

**GUST**

## Aerodynamic Gust Load Requests

Selects the gust field in an aeroelastic response problem.

**Format:**

GUST=n

**Example:**

GUST=73

Describer	Meaning
n	Set identification of a GUST Bulk Data entry (Integer > 0).

**Remark:**

1. The choice of transient or frequency response GUST depends upon the type of TLOAD or RLOAD referenced on the selected GUST entry.

## GVECTOR

### Eigenvector Output Request in SOLs 200 and 400

Requests the form and type of eigenvector output in SOLs 200 and 400. For other solutions use [DISPLACEMENT \(Case\)](#)

#### Format:

$$GVECTOR \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

#### Examples:

GVECTOR=ALL  
GVECTOR (PUNCH) =NONE

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Eigenvectors for all points will be output.
NONE	Eigenvectors for no points will be output.
n	Set identification of a previously appearing SET command. Only displacements of points with identification numbers that appear on this SET command will be output (Integer > 0).

#### Remarks:

1. GVECTOR=NONE overrides an overall output request.
2. Output will be presented as a tabular listing of grid points for each eigenvector.
3. GVECTOR is intended to specified in subcases with ANALYSIS=MFREQ, MTRAN, MCEIG, FLUTTER, and SAERO.

**HADAPT**

## Mesh Adaptivity Activation and Control

Specifies Mesh adaptivity control parameters in SOLs 101 and 400.

**Format:**

HADAPT=N

**Example:**

HADAPT=1

Describer	Meaning
N	Identification number for a HADAPTL Bulk Data entry (Integer > 0).

**Remarks:**

1. The HADAPT command can be used only in SOL 101 or SOL 400 with ANALYSIS=STATICS.
2. In SOL 101, with NO SUPERELEMENTS, the HADAPT command may appear either above all SUBCASEs or within specific SUBCASEs. In the last scenario, only stresses on the solution corresponding to the specific SUBCASE where the HADAPT command has been placed will be used to compute error indicators should the user requests an error indicator based refinement criterion (see Bulk Data entries, [HADACRI](#) and [HADAPTL](#)). If superelements are present, then the HADAPT command should appear only in Residual Superelement (SE0) SUBCASE structure.
3. In SOL 400, the HADAPT command can only be placed on a Linear static structural analysis SUBCASE (ANALYSIS=STATICS) either above all STEPS or within each single STEP. All STEPs must be Linear Static structural STEPs (ANALYSIS=STATICS). In other words an adaptive meshing linear analysis cannot be chained with any other analysis type.
4. HADAPT remeshing should only be performed on lower order elements.

## HARMONICS

### Harmonic Analysis or Printout Control

Controls the number of harmonics output in axisymmetric shell or axisymmetric fluid problems; controls the number of harmonics to be used for analysis in cyclic symmetry problems.

#### Format for Axisymmetric Problems:

$$\text{HARMONICS} = \left\{ \begin{array}{c} \text{ALL} \\ \text{NONE} \\ \text{h} \end{array} \right\}$$

#### Format for Cyclic Symmetric Problems:

$$\text{HARMONICS} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \end{array} \right\}$$

#### Examples:

HARMONICS=ALL  
 HARMONICS=32

Descriptor	Meaning
ALL	All harmonics will be output in the case of axisymmetric shell or axisymmetric fluid problems. All harmonics will be used for analysis in cyclic symmetry problems.
NONE	No harmonics will be output. This option is not available for use in cyclic symmetry problems.
h	Available harmonics up to and including harmonic h will be output in the case of axisymmetric shell or axisymmetric fluid problems (Integer $\geq 0$ ).
n	Harmonics specified in SET n will be used for analysis in cyclic symmetry problems (Integer $> 0$ ).

#### Remarks:

1. If no HARMONICS command is present in the Case Control Section for axisymmetric shell or fluid problems, printed output is prepared only for the zero harmonic.
2. This command must be present in cyclic symmetry problems with HARMONICS=ALL or n; otherwise, the program will abort without performing any analysis.
3. In cyclic symmetry analysis, n must be defined as a set of integers on a SET command.

**HDOT****Heat Transfer Rate of Change of Enthalpy Output Request**

Requests form of rate of change of enthalpy vector output in transient heat transfer analysis (SOL 159).

**Format:**

$$\text{HDOT} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Example:**

HDOT=5

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each time.
SORT2	Output will be presented as a tabular listing of time for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Rate of change of enthalpy for all points will be output.
NONE	Rate of change of enthalpy for no points will be output.
n	Set identification of previously appearing SET command. Only rates of change of enthalpy for points with identification numbers that appear on this SET command will be output (Integer > 0).

**Remark:**

1. HDOT=NONE is used to override a previous HDOT=n or HDOT=ALL command.

## HOUTPUT

## Harmonic Output Request in Cyclic Symmetry Problems

Requests harmonic output in cyclic symmetry problems.

### Format:

$$\text{HOUTPUT}[(C, S, C^*, S^*)] = \left\{ \begin{array}{c} \text{ALL} \\ K \end{array} \right\}$$

### Examples:

```
HOUTPUT=ALL
HOUTPUT (C, S) =5
```

Describer	Meaning
C, S, C*, S*	Harmonic coefficients. See Remark 4.
ALL	All harmonics will be output.
k	Set identification number of harmonics for output (Integer > 0).

### Remarks:

1. Set k must be defined on a SET command, and output will be computed for all available harmonics in SET k.
2. HOUTPUT=ALL requests output for all harmonics specified on the HARMONICS command.
3. Either the HOUTPUT or NOUTPUT command is required to obtain data recovery in cyclic symmetry analysis.
4. C and S correspond to the cosine and sine coefficients when the STYPE field is ROT or AXI on the CYSYM Bulk Data entry.

C, S, C\*, and S\* correspond to the cosine symmetric, sine symmetric, cosine antisymmetric, and sine antisymmetric coefficients, respectively, when the STYPE field is DIH on the CYSYM Bulk Data entry.

## HTFLOW

## Elemental Heat Flow Output Request

Requests heat flow output at selected structural elements.

### Format:

$$\text{HTFLOW} \left[ \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{NOPRINT} \end{array} \right) \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \end{array} \right\}$$

### Example:

```
HTFLOW = ALL
HTFLOW = 15
```

Describer	Meaning
PRINT	The printer will be the output medium.
NOPRINT	Generate, but do not print out, the output.
PUNCH	The punch file will be the output medium.
ALL	Heat flow for all structural elements will be output.
n	Set identification of previously appearing SET command. Only structural elements with identification numbers that appear on this SET command will be included in the heat flow output (Integer > 0).

### Remarks:

1. Elemental heat flow output is available for steady state thermal analysis (SOL 101 and SOL 153) and transient thermal analysis (SOL 159).
2. Heat flow is computed from the applied heat loads and the effect of convection and radiation heat transfer on boundary elements (CHBDYE, CHBDYG, and CHBDYP).
3. See Remarks 6.-8. of the descriptions of CHBDYE Bulk Data for the side conventions of solid elements, shell elements, and line elements.

## IC Transient Analysis Initial Condition Set Selection

Selects the initial conditions for transient analysis (SOLs 109, 112, 129, 159, 400 and 600).

### Format:

$$IC \begin{bmatrix} \text{PHYSICAL} \\ \text{MODAL} \\ \text{STATSUB[,DIFFK]} \end{bmatrix} = n$$

### Examples:

```
IC = 10
IC (PHYSICAL) = 100
IC (MODAL) = 200
IC (STATSUB) = 1000
IC (STATSUB, DIFFK) = 2000
```

Descriptor	Meaning
PHYSICAL	The TIC Bulk Data entries selected by set n define initial conditions for coordinates involving grid, scalar, and extra points (Default).
MODAL	The TIC Bulk Data entries selected by set n define initial conditions for modal coordinates and extra points. See Remark 3.
STATSUB	Use the solution of the static analysis subcase n as the initial condition. See Remark 4.
DIFFK	Include the effects of differential stiffness in the solution. See Remarks 4. and 5.
n	For the PHYSICAL (Default) and MODAL options, n is the set identification number of TIC Bulk Data entries for structural analysis (SOLs 109, 112, 129, and 600) or TEMP and TEMPD entries for heat transfer analysis (SOLs 159, 400 and 600). For the STATSUB option, n is the ID of a static analysis subcase (Integer > 0).

### Remarks:

1. For structural analysis, TIC entries will not be used (therefore, no initial conditions) unless selected in the Case Control Section.
2. Only the PHYSICAL option (Default) may be specified in heat transfer analysis (SOLs 159, 400 and 600). The initial temperature of a point should be equal to its boundary temperature at time = 0. For SOL 400 transient thermal analysis, the boundary temperature at time = 0 takes precedence over the initial temperature if both temperatures are not identical.
3. IC(MODAL) may be specified only in modal transient analysis (SOL 112).
4. IC(STATSUB) and IC(STATSUB,DIFFK) cannot be specified together in the same run. This will cause FATAL and stop the execution.
5. The DIFFK keyword is meaningful only when used in conjunction with the STATSUB keyword.
6. The following examples illustrate the usage of the various options of the IC Case Control command.

**Example (a)**

```
$ SPECIFY INITIAL CONDITIONS FOR PHYSICAL COORDINATES  
$ IN SOL 109 OR SOL 112  
IC(PHYSICAL) = 100
```

or

```
IC = 100
```

**Example (b)**

```
$ SPECIFY INITIAL CONDITIONS FOR MODAL COORDINATES  
$ IN SOL 112  
IC(MODAL) = 200
```

**Example (c)**

```
$ SPECIFY STATIC SOLUTION AS INITIAL CONDITION  
$ IN SOL 109 OR SOL 112  
$ (DIFFERENTIAL STIFFNESS EFFECT NOT INCLUDED)  
SUBCASE 10 $ STATIC ANALYSIS  
LOAD = 100  
SUBCASE 20 $ TRANSIENT ANALYSIS  
IC(STATSUB) = 10 $ POINTS TO STATIC ANALYSIS SUBCASE ID
```

**Example (d)**

```
$ SPECIFY STATIC SOLUTION AS INITIAL CONDITION  
$ IN SOL 109 OR SOL 112  
$ (DIFFERENTIAL STIFFNESS EFFECT INCLUDED)  
SUBCASE 100 $ STATIC ANALYSIS  
LOAD = 1000  
SUBCASE 200 $ TRANSIENT ANALYSIS  
IC(STATSUB,DIFFK) = 100 $ POINTS TO STATIC ANALYSIS SUBCASE ID
```

## ICF Inter-Component Forces (ICF) Output Request

Requests the form and type of inter-component force (ICF) vector output from an FBA job.

### Format:

$$\text{ICF} \left[ \left( \left[ \begin{array}{l} \text{PHYSICAL} \\ \text{MODAL} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] \right) \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

### Examples:

```
ICF = 5
ICF (SORT2, PRINT, PUNCH, IMAG) = ALL
ICF (SORT2) = 20
ICF = ALL
```

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each frequency. See Remarks 1. through 4.
SORT2	Output will be presented as a tabular listing of frequency for each grid point. See Remarks 1., 3. and 5.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

- REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
- PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
- ALL ICFs for all points will be output. See Remarks 1. through 5.

Describer	Meaning
n	Set identification of a previously appearing SET command. Only ICFs for points with identification numbers that appear on this SET command will be output (Integer > 0). See Remarks 1. through 6.
NONE	ICFs for no points will be output.

**Remarks:**

1. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2. In the SORT1 format, only nonzero values will be output.
2. In SORT1 format, ICFs recovered at consecutively numbered scalar points are printed in groups of six (sextets) per line of output. However, if a scalar point is not consecutively numbered, it will begin a new sextet on a new line of output. If a sextet can be formed and all values are zero, then the line will not be printed. If a sextet cannot be formed, then zero values may be output.
3. ICFs are defined only for the connection points of FRF components in an FBA job and are regarded as null for non-connection points of FRF components. Therefore, ICF output is meaningful only for the connection points of FRF components in an FBA job.
4. In SORT1 format, ICF output is ignored for non-connection points and will be output for the requested connection points of FRF components only if their ICFs are non-null.
5. In SORT2 format, ICF output is honored for all requested connection and non-connection points of FRF components even if their ICFs are null.
6. ICF output request is ignored for undefined points.

## IMPERFECT

### Select Geometric Imperfection

Select geometric imperfection cases in SOL 400.

#### Format:

```
IMPERFECT = n
```

#### Example:

```
IMPERFECT = 5
```

Descriptor	Meaning
------------	---------

n	Identification number of an IMPGEOM or IMPCASE bulk data entry.
---	---

#### Remark:

1. This command must be above all subcases.

**INCLUDE**

## Insert External File

Inserts an external file into the input file. The INCLUDE statement may appear anywhere within the input data file.

**Format:**

```
INCLUDE 'filename'
```

**Example:**

The following INCLUDE statement is used to obtain the Bulk Data from another file called MYCASE.DATA:

```
SOL 101
CEND
TITLE = STATIC ANALYSIS
LOAD = 100
INCLUDE 'MYCASE.DATA'
BEGIN BULK
ENDDATA
```

Describer	Meaning
filename	Physical filename of the external file to be inserted. The user must supply the name according to installation or machine requirements. It is recommended that the filename be enclosed by single right-hand quotation marks (').

**Remarks:**

1. INCLUDE statements may be nested; that is, INCLUDE statements may appear inside the external file. The nested depth level must not be greater than 10.
2. The total length of any line in an INCLUDE statement must not exceed 72 characters. Long file names may be split across multiple lines. For example, the file:

```
/dir123/dir456/dir789/filename.dat
```

may be included with the following input:

```
INCLUDE '/dir123
           /dir456
           /dir789/filename.dat'
```

3. See the for more examples.

## INTENSITY

## Acoustic Intensity Output Request

Requests output of acoustic intensity on wetted surface. SOLs 108 and 111 only.

### Format:

$$\text{INTENSITY} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{c} \text{PRINT,PUNCH} \\ \text{PLOT} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

Describer	Meaning
SORT1	Output will be presented as tabular listing of grid points for each excitation frequency (Default).
SORT2	Output will be presented as tabular listing of excitation frequencies for each grid point.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Intensities will be computed for all grid points of the wetted surface.
n	Set identification of a previously defined set of grid points. Intensities will be computed for the grid points in this set only.
NONE	Acoustic intensities will not be processed.

### Remarks:

1. INTENSITY = NONE overrides an overall request.
2. This Case Control command can be used in SOL 108 and SOL 111 only.

**IRLOAD**

## Nonlinear Inertia Relief Selection (SOL 400 only)

Selects nonlinear inertia relief set for SOL 400

**Format:** IRLOAD={ QLINEAR  
NONE }

**Example:**

IRLOAD=QLINEAR

Describer	Meaning
QLINEAR	Inertia Load Calculation with small displacement (Quasi-Linear) is activated in SOL 400.
NONE	No Inertia Relief (Default)

**Remark:**

1. This command is active only in SOL 400 with ANALYSIS=NLSTATIC and its use requires a set of STATIC supports that constrain all six rigid body motions.
2. IRLOAD=QLINEAR, which has to be applied above to all SUBCASES, is a global case control command and activates the inertia load calculations in SOL 400 for all applied static loads. In nonlinear static analyses (ANALYSIS=NLSTAT), it also activates the inertia relief analysis with small displacement. When IRLOAD=QLINEAR with large displacement (PARAM,LGDISP,1), a fatal error message will be issued. Also superelements in conjunction with IRLOAD=QLINEAR will cause a fatal error.  
IRLOAD=NONE (default) deactivates the inertia load calculations.
3. IRLOAD=QLINEAR is ignored by perturbation analyses in SOL 400.

**K2GG**

## Direct Input Stiffness Matrix Selection

Selects direct input stiffness matrix or matrices.

**Format:**

K2GG=name

**Example:**

```
K2GG = KDMIG
K2GG = KDMIG1, KDMIG2, KDMIG3
K2GG = 1.25*KDMIG1, 1.0*KDMIG2, 0.82*KDMIG3
SET 100 = K2, K3, K4
K2GG = 100
```

Describer	Meaning
name	Name of a [ $K_{gg}^2$ ] matrix that is input on the DMIG Bulk Data entry, or name list with or without factors. See Remark 6. (Character).

**Remarks:**

- DMIG matrices will not be used unless selected.
- Terms are added to the stiffness matrix before any constraints are applied.
- The matrix must be symmetric and field 4 on the DMIG,name Bulk Data entry must contain the integer 6.
- A scale factor may be applied to this input using the PARAM, CK2 entry. See [Parameters](#).
- The matrices are additive if multiple matrices are referenced on the K2GG command.
- The formats of the name list:
  - Names without factor.  
Names separated by comma or blank.
  - Names with factors.  
Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are real numbers. Each name must be paired with a factor including 1.0.
- If there are multiple subcases in the analysis, the K2GG command must appear above the first subcase or in the first subcase. K2GG requests in the second and subsequent subcases will be ignored. For superelements, it should occur in the first subcase for the appropriate superelement.

**K2PP**

## Direct Input Stiffness Matrix Selection

Selects direct input stiffness matrix or matrices, which are not included in normal modes.

**Format:**

K2PP=name

**Example:**

```
K2PP = KDMIG
K2PP = KDMIG1, KDMIG2, KDMIG3
K2PP = 5.06*KDMIG1, 1.0*KDMIG2, 0.85*KDMIG3
K2PP = (1.25, 0.5) *KDMIG1, (1.0,0.0) *KDMIG2, (0.82, -2.2) *KDMIG3
```

Describer	Meaning
name	Name of a $[K_{pp}^2]$ matrix that is input on the DMIG or DMIAX Bulk Data entry, or name list with or without factors. See Remark 6.

**Remarks:**

1. DMIG and DMIAX entries will not be used unless selected by the K2PP command.
2. The matrix must be square or symmetric, and field 4 on the DMIG,name Bulk Data entry must contain a 1 or 6.
3. It is recommended that PARAM,AUTOSPC,NO be specified. See the [Constraint and Mechanism Problem Identification in SubDMAP SEKR](#) in the *MSC Nastran Reference Guide*.
4. K2PP matrices are used only in dynamic response problems. They are not used in normal modes.
5. The matrices are additive if multiple matrices are referenced on the K2PP Case Control command.
6. The formats of the name list:
  - a. Names without factor  
Names separated by comma or blank.
  - b. Names with factors.

Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are either all real numbers, or all complex numbers in the form of two real numbers separated by a comma, within parentheses, as shown in the preceding example. The first real number of the pair is the real part, and the second is the imaginary part. Either part may be zero or blank, but not both. Mixed real numbers and complex numbers are not allowed. Each name must be paired with a factor including 1.0 for real and (1.0, 0.0) for complex.

## K42GG

## Direct Input Stiffness Element Damping Selection

Selects direct input structural element damping matrix or matrices.

### Format:

K42GG=name

### Example:

K42GG = KDMIG

K42GG = KDMIG1, KDMIG2, KDMIG3

K42GG = 2.03\*KDMIG1, 0.84\*KDMIG2

Descriptor	Meaning
name	Name of a $[K_{gg}^2]$ matrix that is input on the DMIG Bulk Data entry, or name list with or without factors. See Remark 4.

### Remarks:

1. DMIG matrices will not be used unless selected.
2. Terms are added to the structural element damping matrix before any constraints are applied.
3. The matrix must be symmetric, and field 4 on the DMIG,name Bulk Data entry must contain the integer 6.
4. The formats of the name list:
  - a. Names without factor.  
Names separated by comma or blank.
  - b. Names with factors.  
Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are real numbers. Each name must be paired with a factor including 1.0.
5. If there are multiple subcases in the analysis, the K42GG command must appear above the first subcase or in the first subcase. K42GG requests in the second and subsequent subcases will be ignored. For superelements, it should occur in the first subcase for the appropriate superelement.

**LABEL**                      Output Label

Defines a character string that will appear on the third heading line of each page of printer output.

**Format:**

LABEL=label

**Example:**

LABEL=DEMONSTRATION PROBLEM

Describer	Meaning
label	Any character string.

**Remarks:**

1. LABEL appearing at the subcase level will label output for that subcase only.
2. LABEL appearing before all subcases will label any outputs that are not subcase-dependent.
3. If no LABEL command is supplied, the label line will be blank.
4. LABEL information is also placed on plotter output, as applicable. Only the first 65 characters will appear.

## LDLABEL

Label assigned to a subcase (static load case) in the external superelement creation run

Assigns a character string to an external superelement creation run's subcase in order to identify the static load in the assembly run.

### Format:

```
LDLABEL [=load_label]
```

### Example:

```
LDLABEL  
LDLABEL=GRAVITY LOAD ON THE OUTBOARD NACELLE
```

Describer	Meaning
load_label	Any character string.

### Remarks:

1. The LDLABEL command is used only when the EXTSEOUT command is specified.
2. If the LDLABEL is specified in any subcase but not all subcases then the following defaults will be applied to those subcases without LDLABEL in the following order:
  - a. LABEL inside the subcase
  - b. If no LABEL, then SUBTITLE inside the subcase
  - c. If no SUBTITLE, then TITLE inside the subcaseIf it is desired that the default logic is to be applied to all subcases then specify LDLABEL with no argument above all subcases.
3. If the same load\_label is specified in more than one SUBCASE then a User Warning Message will be issued.
4. Load\_label may be referenced on the [SELOAD](#) Bulk Data entry.

**LINE****Maximum Lines Per Printed Page**

Defines the maximum number of output lines per printed page.

**Format:**

LINE=n

**Example:**

LINE=35

Describer	Meaning
n	Maximum number of output lines per page (Integer > 0; Default = 50).

**Remarks:**

1. For 11 inch paper, 50 lines per page is recommended; for 8-1/2 inch paper, 35 lines per page is recommended.
2. The NASTRAN statement keyword NLINES may also be used to set this value. See the [NLINES \(9\)](#) Nastran Statement.

## LOAD

### External Static Load Set Selection

Selects an external static load set.

#### Format:

LOAD=n

#### Example:

LOAD=15

Descriptor	Meaning
n	Set identification of at least one external load Bulk Data entry. The set identification must appear on at least one ACCEL, ACCEL1, FORCE, FORCE1, FORCE2, FORCEAX, GRAV, LOAD, MOMAX, MOMENT, MOMENT1, MOMENT2, MPCD, PLOAD, PLOAD1, PLOAD2, PLOAD4, PLOADB3, PLOADX, QVOL, QVECT, QHBDY, QBDY1, QBDY2, QBDY3, PRESAX, RFORCE, SPCD, or SLOAD entry (Integer > 0).

#### Remarks:

1. A GRAV entry cannot have the same set identification number as any of the other loading entry types. Apply a gravity load along with other static loads, a LOAD Bulk Data entry must be used.
2. LOAD is only applicable in linear and nonlinear statics, inertia relief, differential stiffness, buckling, and heat transfer analyses.
3. The total load applied will be the sum of external (LOAD), thermal (TEMP(LOAD)), element deformation (DEFORM), and constrained displacement (SPC) loads.
4. Static, thermal, and element deformation loads should have unique set identification numbers.

## LOADNAME

Name to be Associated with a SUBCASE in PAA

Provides a name to be associated with a loading condition.

### Format:

LOADNAME = load\_name

### Example:

LOADNAME = GRAVITY LOAD ON OUTBOARD NACELLEL

Describer	Meaning
Load_name	Character string (up to 64 characters long) providing a user-defined name for a loading in PAA.

### Remark:

1. This command is used only in PAA and provides a user-defined name for a loading condition.
2. LOADNAMEs may be used to combine loads in a COMBINE or SOLVE PAA run using a LOADCNAM Bulk Data entry.
3. The LOADNAME command is ignored in non-PAA applications

## LOADSET

### Static Load Set Selection

Selects a sequence of static load sets to be applied to the structural model. The load sets may be referenced by dynamic load commands.

**Format:**

LOADSET=*n*

**Example:**

LOADSET=100

Descriptor	Meaning
<i>n</i>	Set identification number of at least one LSEQ Bulk Data entry. (Integer > 0)

**Remarks:**

1. When used in superelement analysis, this command must be used for all superelements. The number of static load vectors created for each superelement depends upon the type of analysis. In static analysis, the number of vectors created is equal to the number of unique EXCITEIDs on all LSEQ entries in the Bulk Data; in dynamic analysis, the number of vectors created is equal to the number of unique EXCITEIDs on all RLOAD1, RLOAD2, TLOAD1, TLOAD2 and ACSRCE entries in the Bulk Data.
2. When the LOADSET command is used in superelement statics, the residual structure should have as many loading conditions as the number of unique EXCITEID sets defined on all LSEQ entries. The subcases after the first should contain only SUBTITLE and LABEL information, and residual structure output requests. SUBTITLE and LABEL information for all superelements will be obtained from the residual structure.
3. When multiple subcases are specified in the dynamic solution sequences (SOLs 108, 109, 111, 112, 118, 146), the LOADSET must appear in the first subcase or above all subcases. In SOL 200 with ANALYSIS=DFREQ, MFREQ, or MTRAN, a different LOADSET may be specified in the first subcase pertaining to each ANALYSIS command.
4. In SOL 101, the design sensitivity output will identify all expanded subcases by a sequence of unique integers beginning with *n*.
5. In the nonlinear static solution sequences (SOLs 106 and 153), the LOADSET must appear above all subcases and only one LOADSET may be specified.
6. Only one LOADSET command is allowed per superelement and it must be specified in the superelement's first subcase.
7. It is no longer necessary to employ LOADSET/LSEQ data to specify static loading data for use in dynamic analysis. In the absence of a LOADSET Case Control command, all static loads whose load set IDs match the EXCITEIDs on all RLOAD1, RLOAD2, TLOAD1, TLOAD2, and ACSRCE Bulk Data entries are automatically processed.

8. . If you use the LOADSET command in a static analysis, the loading matrix will be generated corresponding to, and in ascending order of, the EXCITEID's on the referenced LSEQ entries. Any LOAD commands within subcases will be ignored.
9. Use of the LOADSET/LSEQ should be avoided as it is an obsolete entry and is never needed and is only documented for legacy code. Some new features such as SUBSTEP do not support it and will issue a fatal message.

## M2GG

## Direct Input Mass Matrix Selection

Selects direct input mass matrix or matrices.

### Format:

M2GG=name

### Example:

```

M2GG = MDMIG
M2GG = MDMIG1, MDMIG2, MDMIG3
M2GG = 1.25*MDMIG1, 1.0*MDMIG2, 0.82*MDMIG3
SET 200 = M1, M2
M2GG = 200

```

Describer	Meaning
name	Name of a $[M_{gg}^2]$ matrix that is input on the DMIG Bulk Data entry, or name list with or without factors see Remark 6. (Character).

### Remarks:

- DMIG matrices will not be used unless selected.
- Terms are added to the mass matrix before any constraints are applied.
- The matrix must be symmetric, and field 4 on the DMIG, name entry must contain a 6.
- M2GG input is not affected by PARAM,WTMASS. M2GG input must either be in consistent mass units or PARAM,CM2 may be used.
- The matrices are additive if multiple matrices are referenced on the M2GG command.
- The formats of the name list:
  - Names without factor.  
Names separated by comma or blank.
  - Names with factors.  
Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are real numbers. Each name must be paired with a factor including 1.0.
- If there are multiple subcases in the analysis. the M2GG command must appear above the first subcase or in the first subcase. M2GG requests in the second and subsequent subcases will be ignored. For superelements. it should occur in the first subcase for the appropriate superelement.

**M2PP****Direct Input Mass Matrix Selection**

Selects direct input mass matrix or matrices, which are not included in normal modes.

**Format:**

M2PP=name

**Example:**

```
M2PP = MDMIG
M2PP = MDMIG1, MDMIG2, MDMIG3
M2PP = 5.06*MDMIG1, 1.0*MDMIG2, 0.85*MDMIG3
M2PP = (1.25, 0.5) *MDMIG1, (1.0, 0.0) *MDMIG2, (0.82, -2.2) *MDMIG3
```

Describer	Meaning
name	Name of a $[M_{pp}^2]$ matrix that is input on the DMIG or DMIAX Bulk Data entry, or name list with or without factors, see Remark 7. (Character).

**Remarks:**

- DMIG and DMIAX entries will not be used unless selected by the M2PP input.
- M2PP input is not affected by PARAM,WTMASS. M2PP input must be in consistent mass units.
- The matrix must be square or symmetric, and field 4 on the DMIG, name entry must contain a 1 or 6.
- It is recommended that PARAM,AUTOSPC,NO be specified. See [Constraint and Mechanism Problem Identification in SubDMAP SEKR](#) in the *MSC Nastran Reference Guide*.
- M2PP matrices are used only in dynamic response problems. They are not used in normal modes problems.
- The matrices are additive if multiple matrices are referenced on the M2PP command.
- The formats of the name list:
  - Names without factor  
Names separated by comma or blank.
  - Names with factors.

Each entry in the list consists of a factors followed by a star, followed by a name. The entries are separated by commas or blanks. The factors are either all real numbers, or all complex numbers in the form of two real numbers, separated by a comma, within parenthesis as shown in the preceding example. The first real number of the pair is the real part, and the second is the imaginary part. Either part may be zero or blank, but not both. Mixed real numbers and complex numbers are not allowed. Each name must be with a factor including 1.0 for real and (1.0, 0.0) for complex.

## MASSET

### Mass Combination Selection

Selection of a mass combination in multiple mass combination analysis (MMC). This case control command can be used in various solutions sequences SOLs 101, 103, 107-112, 144-146, 200 and 400.

#### Format:

MASSET = n

#### Example:

MASSET = 11

Describer	Meaning
n	Set ID of a MASSET bulk data entry (Integer > 0).

#### Remarks:

- Using a particular mass combination in analysis only requires referencing the mass combinations ID in MASSET case control at the subcase level (or at step level in Sol 400). If no MASSET is defined in the subcase then (like traditional non MMC analysis) the base mass is used as the mass for that subcase. Example for selecting mass combinations at the subcase level:

```
SUBCASE 101
...
MASSET = 11 $
...
SUBCASE 102
...
MASSET = 12 $
```

- The MASSET bulk data entry defines a linear combination of incremental/base mass cases to form the subcase-dependent mass. The bulk data for the incremental mass case is preceded by “BEGIN MASSID=yyy”, where yyy > 0 is the integer ID of the mass increment case. The only data that will be used from the incremental mass bulk data section is element connections and element mass properties including materials (Parameters and grid data included in the incremental mass section will be ignored). The incremental mass will be computed based on the grid data supplied in the base mass bulk data section and the element properties supplied in the incremental mass section. Typically the user will construct the incremental mass by adding concentrated masses (e.g. CONM2, CMASS1 etc.) or by changing the material or element properties of the set of elements defined in incremental mass bulk data section.

```
BEGIN massid=101 label='mass increment using conm2s'
BEGIN massid=102 label='mass increment using materials'
```

- If Part SE are used in the model, mass increment related to these SEs can be specified in a separate bulk data section, “BEGIN SUPER=zzz MASSID=yyy”, where zzz > 0 is the Superelement ID and yyy is the mass increment ID.

```
BEGIN SUPER=2 massid=101 label='mass increment using conm2s'
```

**MASTER**

## Redefine the MASTER Subcase

Allows the redefinition of a MASTER subcase.

**Format:**

```
SUBCASE n
```

```
MASTER
```

**Example:**

```
SUBCASE 10
```

```
MASTER
```

Describer	Meaning
n	

**Remarks:**

1. All commands in a MASTER subcase apply to the following subcases until a new MASTER subcase is defined.
2. Suppose that superelement 10 has SPC set 10, MPC set 10, and LOAD sets 101 and 102. Suppose also that superelement 20 has SPC set 20, MPC set 20, and LOAD sets 201 and 202. Then the following Case Control setup specifies the required subcase structure:

```
TITLE = MY MODEL
DISP = ALL
SEALL = ALL
SUBCASE 101
MASTER
  SPC = 10
  MPC = 10
  SUPER = 10, 1
  LOAD = 101
  LABEL = SUPER 10
  ESE = ALL
SUBCASE 102
  LOAD = 102
  SUPER = 10, 2
SUBCASE 201
MASTER
  SPC = 20
  MPC = 20
  SUPER = 20, 1
  LOAD = 201
  LABEL = SUPER 20
SUBCASE 202
  LOAD = 202
  SUPER = 20, 2
```

3. MASTER may also be used advantageously in multiple boundary condition Case Control setups. Suppose that constraint sets 10 and 20 are to be solved with three loading conditions each: 1, 2, and 3; and 4, 5, and 6, respectively. The following Case Control Section may be used:

```
TITLE = MULTIPLE BOUNDARY CONDITIONS
DISP = ALL
SYM 1
MASTER
  SPC = 10
  LOAD = 1
SYM 2
  LOAD = 2
SYM 3
  LOAD = 3
SYM 4
  MASTER
  SPC = 20
  LOAD = 4
SYM 5
  LOAD = 5
SYM 6
  LOAD = 6
SYMCOM 10
  SYMSEQ = 1., 1., 1., -1., -1., -1.
SYMCOM 20
  SYMSEQ = -1., -1., -1., 1., 1., 1.
```

4. The MASTER command must appear immediately after a SUBCASE or SYM command.

**MAXLINES**

## Maximum Number of Output Lines

Sets the maximum number of output lines.

**Format:**

MAXLINES=n

**Example:**

MAXLINES=150000

Describer	Meaning
n	Maximum number of output lines allowed (Integer > 0; Default = 999999999).

**Remarks:**

1. If MAXLINES is exceeded, the program will terminate.
2. MAXLINES may also be specified on the NASTRAN statement with SYSTEM(14). See the [MAXLINES \(14\)](#).
3. The code counts the number of pages and assumes that the number of lines output is the number of lines allowed per page, specified by the “LINES” command, times the number of pages.

## MAXMIN

## MAXMIN Survey Output Request (old form)

Specifies options for max/min surveys of certain output data associated with grid points.

### Format:

$$\text{MAXMIN} \left( \left[ \left\{ \begin{array}{c} \text{MAX} \\ \text{BOTH} \\ \text{MIN} \\ \text{VMAG} \end{array} \right\}, = \text{num} \right], \left[ \text{CID} = \left\{ \begin{array}{c} \text{GLOBAL} \\ \text{BASIC} \\ \text{cid} \end{array} \right\} \right], \text{oplist}, \text{COMP} = \text{list} \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Example:

MAXMIN (BOTH=10, CID=1000, DISP, COMP=T1/T3)=501

Descriptor	Meaning
MAX	Specifies that only maximum values are to be output. See Remark 1.
MIN	Specifies that only minimum values are to be output. See Remark 1.
BOTH	Specifies that both maximum and minimum values are to be output. See Remark 1.
VMAG	Specifies that vector magnitude resultants are to be output. See Remark 2.
num	Specifies the maximum number of values that will be output. See Remark 3. (Integer > 0, Default = 5).
CID	Specifies the coordinate system frame of reference in which the max/min values will be output. See Remarks 1. and 3.
GLOBAL	Requests output in the global coordinate system frame of reference.
BASIC	Requests output in the basic coordinate system frame of reference.
cid	Requests output in the local coordinate system defined by cid (Integer > 0).
oplist	Specifies a list of one or more standard Case Control commands for which max/min results are to be produced. The list may include any of DISP,SPCF, OLOAD,MPCF,VELO,ACCE, or ALL. See Remark 6 (Character, no Default).
list	Specifies a list of grid point degree of freedom component directions that will be included in the max/min survey output. The components are separated by slashes and are selected from T1, T2, T3, R1, R2, and R3. See Remarks 4. and 5. (Character, Default=/T1/T2/T3/R1/R2/R3).
ALL	MAXMIN survey results for all points will be output.
NONE	MAXMIN survey results for no points will be output.
n	Set identification of a previously appearing SET command. The max/min results survey will be output only for the points specified SET n (Integer > 0).

**Remarks:**

1. The MAXMIN command produces an algebraically ascending sorted list of the output quantities specified for all of the points in the selected set. MAX refers to the largest magnitude positive values, while MIN refers to the largest magnitude negative values. The output format is similar to that of displacement output. All components will be output for a grid point, and the order of the grid points will be in sort on the particular component that was surveyed. The output title contains the identification number of the set of points participating in the max/min output, the coordinate system frame of reference, the number of MAX and MIN values output, and the component that was surveyed. When the output being surveyed is in the global output coordinate system reference frame, and BASIC or a local output coordinate system is specified as cid, both the sorted system output and the original reference system output are displayed for the grid point if these systems are different.
2. Vector magnitude results are computed for both translations and rotations and are displayed under the T1 and R1 column headings. The presence of the COMP keyword is ignored.
3. The default value of 5 generates a minimum of 10 output lines for the BOTH option. There will be 5 maximum values and 5 minimum values produced. In addition, if coordinate system are involved, both surveyed and original data will be output. This could result in as many as 10 more lines of output for each surveyed component.
4. Multiple MAXMIN commands may be specified for a subcase. This permits different output quantities to have different MAXMIN specification within a subcase. For example,
 

```
SET 501=1,3,5,7 THRU 99, 1001, 2001
MAXMIN (DISP, COMP=T3) = 501
MAXMIN (SPCF, COMP=T1/R3) = ALL
```
5. Scalar point output is included only if component T1 is included in the list.
6. MAXMIN output will only be generated for items in the oplist when there is an associated Case Control command present. For example, a DISP Case Control command must be present in order for the MAXMIN(DISP) = ALL command to produce output. Use of ALL keywords for the oplist requests MAXMIN output for all output commands acceptable to MAXMIN that are present in Case control Section.

## MAXMIN

## Requests Output of Maximums and Minimums in Data Recovery (new form)

Requests the output of maximums and minimums in data recovery.

### Format:

$$\text{MAXMIN} \left[ \left[ \begin{array}{c} \text{GRID} \\ \text{ELEM} \\ \text{BOTH} \end{array} \right], \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{NOPRINT} \end{array} \right], \left[ \begin{array}{c} \text{VONMISES} \\ \text{MAXS or SHEAR} \end{array} \right], \right. \\ \left. \left[ \begin{array}{c} \text{CENTER} \\ \text{CUBIC} \\ \text{SGAGE} \\ \text{CORNER or BILIN} \end{array} \right], \left[ \begin{array}{c} \text{STRCUR} \\ \text{FIBER} \end{array} \right] \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Example:

```
MAXMIN (GRID) = 12
MAXMIN (ELEM) = ALL
MAXMIN = NONE
```

Descriptor	Meaning
GRID	Indicates the request is applied to grid points.
ELEM	Indicates the request is applied to elements.
BOTH	Indicates the request is applied to both elements and grid points (Default).
PRINT	Compute and write the output to the .f06 file (Default).
PUNCH	Compute and write output to the punch file.
NOPRINT	Compute but do not write out the results.
ALL	Max/min results will be reported for all elements.
n	Set identification number. The referenced SET command defines a set of elements or grid points to be monitored.
NONE	Max/min results will not be reported.
VONMISES	von Mises stress/strains are output.
MAXS or SHEAR	Maximum shear stress/strains are output.
STRCUR	Strain at the reference plane and curvatures are output for plate elements.
FIBER	Stress/Strain at locations Z1, Z2 are computed for plate elements.
CENTER	Output CQUAD4 stress/strains at the center only.

Describer	Meaning
CORNER or BILIN	Output CQUAD4 element stress/strains at the center and grid points using strain gage approach with bilinear extrapolation.
SGAGE	Output CQUAD4 element stress/strains at center and grid points using strain gage approach.
CUBIC	Output CQUAD4 element stress/strains at center and grid points using cubic bending correction.

**Remarks:**

1. MAXMIN is not allowed in REPCASE, but is allowed in SUBCOM and SYMCOM.
2. The OTIME command may be used to limit the time span of monitoring.
3. No corresponding output request such as DISP, STRESS, etc., is required (Except for STRAIN). Also, SET=n may request more elements or grid points for monitoring than is requested by Outputs. Currently for strain the output request STRAIN=n is required where n can reference any element. If strain at fibers is requested then, then STRAIN (FIBER) = n is required.

The output is comprised of two parts: (1) a summary of the maximum/minimum values and the times they occur, and (2) the associated output for all components of the element or grid. The first part is always output, and the second part is only output if the FULL describer is specified on the MAXMIN(DEF) Case Control command. See the next section for a description of the new Case Control commands. Here are sample Case Control commands for the output of maximum von Mises stresses using the BRIEF option:

```
MAXMIN(DEF) STRESS QUAD4 SMAX1 ABSOLUTE(5) BRIEF
SET 100=4
MAXMIN(ELEM)=4
```

4. See DISPLACEMENT, STRESS, or STRAIN Case Control commands for additional keyword implications.

## MAXMIN(DEF)

Defines Parameters for Monitoring Maximums and Minimums (new form)

Defines parameters and output options for the monitoring of maximums and minimums in data recovery. MAXMIN(DEF) must be specified above all subcases. The MAXMIN(ELEM) and/or MAXMIN(GRID) Case Control command is then required to print the max/min results.

### Format for Grid Point Output:

$$\text{MAXMIN(DEF)} \{ \text{DISP, VELO, ACCE, MPCF, SPCF, OLOAD} \}$$

$$\{ \text{T1 T2 T3 R1 R2 R3 MAGT MAGR} \},$$

$$\left[ \text{ABSOLUTE(p) MINALG(q) MAXALG(r)} \right] \left[ \text{RMS} \right] \left[ \begin{array}{l} \text{BRIEF} \\ \text{FULL} \end{array} \right],$$

$$\left[ \begin{array}{l} \text{ALL(p)} \\ \text{CID} = \left\{ \begin{array}{l} \text{GLOBAL} \\ \text{BASIC} \\ \text{cid} \end{array} \right\} \end{array} \right]$$

### Format for element output:

$$\text{MAXMIN(DEF)} \left\{ \begin{array}{l} \text{STRESS} \\ \text{STRAIN} \\ \text{FORCE} \end{array} \right\} \{ \text{eltype1 [, eltype2, ...]} \}$$

$$\left\{ \text{comp1} \left[ \begin{array}{l} \text{CENTER} \\ \text{ALL} \\ \text{GROUP} \\ \text{ENDS} \end{array} \right] \left[ \text{ , comp2...} \right] \right\},$$

$$\left[ \text{ABSOLUTE(p) MINALG(q) MAXALG(r)} \right] \left[ \text{RMS} \right] \left[ \begin{array}{l} \text{BRIEF} \\ \text{FULL} \end{array} \right]$$

$$\left[ \begin{array}{l} \text{ALL(p)} \end{array} \right]$$

### Examples:

```
MAXMIN(DEF) stress (quad4,smxl) MAXA=5
MAXMIN(DEF) disp T1 T2 T3 MAGT RMS FULL
```

Describer	Meaning
DISP, VELO, etc. (grid point output) STRESS, etc. (element output)	Type of result to be monitored.
T1, T2, etc.	Name of the grid point component to be monitored.
MAGT	Specifies the magnitude of the translational components are to be monitored.
MAGR	Specifies the magnitude of the rotational components are to be monitored
eltype1 eltype2 ...	Name of the element type(s) to be monitored. At least one element type must be present. All elements designations are generic and the "C", designation Connections, should be dropped. The exceptions for this are the CONROD and CONV element types.
comp1 comp2...	Name of the element component(s) to be monitored; e.g., etmax1 for max shear strain in the Z1 plane. The component names are defined in the Nastran Data Definition Language (NDDL). Also, the item codes from <a href="#">Item Codes</a> may be used.
ABSOLUTE(p)	Print out the top p absolute values (Default for p is 5).
MINALG(q)	Print out the bottom q minimum algebraic values (Default for q is 5).
MAXALG(r)	Print out the top r maximum algebraic values (Default for r is 5).
ALL(p)	Print out all options: ABSOLUTE, MINALG, and MAXALG. (Default for p is 5).
BRIEF	Print out only the maxmin results (Default).
FULL	Print out the maxmin results followed by the standard data recovery format for the elements and grids at the retained set of the maximum or minimum occurrences.
GLOBAL	Selects the global coordinate system (see CD on the GRID entry) for monitoring grid point results.
BASIC	Selects the basic coordinate system for monitoring grid point results (Default).
cid	Specifies a coordinate system ID for a system defined on a CORDij entry for monitoring grid point results.
RMS	Print out the root-mean-square value of each maximum or minimum value requested by ABSOLUTE, MIN, or MAX over all time steps.
CENTER	Component selector when element allows for component name to occur in multiple places (Default).

Describer	Meaning
ALL	Selects all locations in an element where multiple locations exist.
GROUP	Reduces all occurrences of a component name to a single value before the action is performed.
ENDS	Selects the ends of a BEAM element ignoring intermediate stations.

### Remarks:

1. MAXMIN(DEF) must be specified above all subcases, but this is not sufficient to request monitoring of maximums and minimums. The MAXMIN command must also be specified above or inside subcases.
2. MAXMIN(DEF) may be specified more than once.
3. Multiple element types may be grouped together, if the same component name is to be monitored across those types, by enclosing the element types in parentheses. This grouping does not combine the element types during processing. Each type and component action is performed in class.
4. Multiple component names may be compared collectively to the current maximum (or minimum), but only the maximum (or minimum) component in the group will be reported in the output. This is requested by enclosing the component names in parentheses.
5. Grid point component output is always converted to the basic coordinate system for monitoring when processing "sort1". The global system is the default when processing "sort2".
6. Results for layers in composite elements, or intermediate stations in CBAR and CBEAM elements, are not supported.
7. Only real data recovery is supported.
8. When no MINA, MAXA, or ABSO keyword is supplied, the default values of p, q, and s will be 5. When any keyword is supplied, the other unreferenced keyword values will be set to zero, and no output will be created.
9. The component action keywords of CENTER, ALL, GROUP, and ENDS can only be applied to component names defined in the NDDL and occur at multiple places in element data recovery. They cannot be used with Item Codes.
10. Specify CQUAD4C and CTRIAC for corner stresses of CQUAD4 and CTRIA3 elements.
11. MAXMIN data output to the .op2 and .xdb files are not supported.
12. SORT1 and SORT2 output Case Control options (such as DISP(SORT2)=ALL), cause MAXMIN to behave differently.
  - SORT1 is only supported in SOLs 101, 103, 105, and 109. For each static loadcase, mode buckling eigenvalue, or time step, all the grids or elements will be searched for maximums and minimums.
  - SORT2 is only supported in SOL 112. For each selected grid or element, all the time steps will be searched for maximums and minimums.

## MCFRACTION

### Modal Contribution Fractions Output Request

Requests the form and type of modal contribution fraction output.

#### Format:

$$\begin{aligned}
 & \text{MCFRACTION}(\text{[STRUCTURE]}, \left[ \begin{array}{c} \text{[PRINT, PUNCH]} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{c} \text{[REAL or IMAG]} \\ \text{PHASE} \end{array} \right], \text{[(SORT = sorttype)]}, \\
 & \left[ \text{KEY} = \begin{array}{c} \text{[FRACTION]} \\ \text{sortitem} \end{array} \right], \left[ \text{ITEMS} = \begin{array}{c} \text{[FRACTION]} \\ \text{ALL} \\ \text{(itemlist)} \end{array} \right] \left[ \text{SOLUTION} = \begin{array}{c} \text{[ALL]} \\ \text{m} \\ \text{NONE} \end{array} \right] \left[ \text{FILTER} = \begin{array}{c} \text{[0.001]} \\ \text{fratio} \end{array} \right] \\
 & \left[ \text{NULL} = \begin{array}{c} \text{[12]} \\ \text{ipowr} \end{array} \right] = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}
 \end{aligned}$$

#### Example:

```

SET 1001 = 10.0, 20.0, 100.0
SET 2001 = 716/T3, 809/T3, 412/T1
MCFRACTION (STRUCTURE, PRINT, PUNCH, ITEM=FRACTION,
             SORT=ABSD, KEY=PROJECTION, SOLUTION=1001)=2001
MCFRACTION (ITEMS=(FRACTION, PROJECTION), FILTER=0.01)=2001
    
```

Describer	Meaning
STRUCTURE	Request pertains to structure points only.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG      Requests rectangular format (real and imaginary) of complex output.

Describer	Meaning
PHASE	Requests polar format (magnitude and phase) of complex output.
SORT	Keyword selecting one of the sort type options. Default is to produced output in increasing natural mode number order.
sorttype	One of the following modal contribution fraction output sorting options: ABSA - output will be sorted by absolute value in ascending order. ABSD - output will be sorted by absolute value in descending order. ALGA - output will be sorted algebraically in ascending order. ALGD - output will be sorted algebraically in descending order.
KEY	Keyword selecting a sorting operation key quantity.
sortitem	Item from the item list table on which the SORT operation is performed. (Default is FRACTION.)
ITEMS	Keyword specifying data selection options.
itemlist	One (or more) of the following modal contribution fraction output items. If more than one item is selected, the list must be enclosed in parentheses:

Item Identifier	Description
RESPONSE	Each mode's response at each degree of freedom is selected.
PROJECTION	Projection of modal response on solution.
FRACTION	Fraction of total displacement per mode (PROJECTION divided by total).
SCALED	Scaled magnitude (PROJECTION divided by largest magnitude of modal response).
MODEDISP	Modal displacements (complex solution at each DOF by mode number).
MODERESP	Modal response for each mode (polar format with respect to total displacement).

SOLUTION	Keyword specifying the output solution time step, forcing frequency, or complex eigenvalue selections for which modal fractions will be generated (Default = ALL).
m	Results for solutions in SET m will be output.
FILTER	Keyword specifying the value of the printed output data filter.
fratio	Value of output filter ratio (Default = 0.001).
NULL	Keyword specifying the power of ten used to detect a null response quantity.
ipowr	The power of ten used to detect a null response quantity (Default = 12).
n	Results for grid point components in SET n will be output.
ALL	Results for all solutions and/or grid point components will be output.
NONE	No modal contribution fractions will be output.

**Remarks:**

1. The MCFRACTION Case Control command is useful in modal frequency response (SOL 111), modal transient response (SOL 112), and modal complex eigenvalue analysis (SOL 110) solution sequences only. If superelements are used, its use is restricted to residual structure data recovery operations only. MCFRACTION is not supported in SOL 200 or 400.
2. Printed output includes results for all of the data items described in the itemlist table.
3. Punched output includes results for only the data items selected by the ITEMS keyword.
4. Modal contribution fractions are sorted by increasing order of mode number unless the SORT keywords specifies a particular sorting order. If a sorting order is specified, the KEY keyword selects the particular data item in the printed results tabular output listing that is sorted. When MODEDISP is selected, the magnitude is sorted. When MODERESP is selected, the real portion of the response is sorted.
5. The SOLUTION keyword can be used to select a subset of the solutions available. If SET m is specified, the items in the SET list are forcing frequency values, time step values, or complex eigenvalue mode numbers, depending upon the solution sequence used.
6. The FILTER keyword specifies a filter ratio value that is used to limit the amount of printed output produced. It applies to the data item selected by the KEY keyword if it is specified. If no KEY keyword is present, the default value of KEY=FRACTION will be used. The maximum value for the selected data item across all natural modes is determined. If the ratio of the data item value to the maximum data item value is less than fratio for any natural mode, no output for that natural mode is produced.
7. If the magnitude of the total response at a selected grid pint component is less than  $1.0 \times 10^{-\text{ipowr}}$ , no modal contribution fraction output is generated for that degree of freedom. If ipowr is not in the range of 1 to 31, the default value of 12 is used for ipowr, producing a null response threshold of  $1.0 \times 10^{-12}$ .
8. For modal transient response solution sequences, response quantities are real numbers. There are no imaginary terms. Therefore, polar representations of the data has no meaning. Furthermore, projections of responses onto the total response are simply the individual modal contribution to the total response at a degree of freedom. Thus, the only items available for output are the individual modal response magnitude (PROJECTION), the modal fraction (FRACTION), and the scaled response magnitude (SCALED). Selection of any of the other items from the itemlist table causes selection of the modal response magnitude (PROJECTION) item.
9. A request of MCFRACTION output for a SET that contains no degrees-of-freedom in the analysis set, will result in the message: "SYSTEM WARNING MESSAGE 2001 (MCFRAC)"

## MCHSTAT

## Change State in SOL 600

Indicates which MCHSTAT Bulk Data entry option will be used to control the state variables (temperatures) used in this subcase for a thermal stress simulation in SOL 600.

### Format:

MCHSTAT=N

### Example:

MCHSTAT=10

Describer	Meaning
N	ID of a matching Bulk Data MSCHSTAT entry specifying temperatures or other state variable values to be used from a previous analysis for this subcase.

### Remark:

1. This entry may only be used in SOL 600.

## MEFFMASS

## Modal Effective Mass Output Request

Requests the output of the modal effective mass, participation factors, and modal effective mass fractions in normal modes analysis.

### Format:

$$\text{MEFFMASS} \left[ \begin{array}{l} \text{PRINT} \\ \text{NOPRINT} \end{array} \right] \left[ \begin{array}{l} \text{PUNCH} \\ \text{NOPUNCH} \end{array} \right], \text{GRID} = \text{gid}, \left[ \begin{array}{l} \text{SUMMARY, PARTFAC,} \\ \text{MEFFM, MEFFW,} \\ \text{FRACSUM, ALL} \end{array} \right] = \left\{ \begin{array}{l} \text{YES} \\ \text{NO} \end{array} \right\}$$

### Examples:

```
MEFFMASS
MEFFMASS (GRID=12, SUMMARY, PARTFAC)
```

Describer	Meaning
PRINT	Write output to the print file (Default).
NOPRINT	Do not write output to the print file.
PUNCH	Write output to the punch file.
NOPUNCH	Do not write output to the punch file (Default).
gid	Reference a grid point for the calculation of the rigid body mass matrix. The default is the origin of the basic coordinate system.
SUMMARY	Requests calculation of the total effective mass fraction, modal effective mass matrix, and the rigid body mass matrix (Default).
PARTFAC	Requests calculation of modal participation factors.
MEFFM	Requests calculation of the modal effective mass in units of mass.
MEFFW	Requests calculation of the modal effective mass in units of weight.
FRACSUM	Requests calculation of the modal effective mass fraction.

### Remarks:

- The SUMMARY describer produces three outputs:

- Modal effective mass matrix  $[\varepsilon^T][m][\varepsilon]$

where:

$$\varepsilon = \text{Modal participation factors: } [m^1][\phi^T][M_{aa}][D_{ar}].$$

$$m = \text{Generalized mass matrix.}$$

$$\phi = \text{Eigenvectors.}$$

$M_{aa}$  = Mass matrix reduced to the a-set (g-set for superelements).

$D_{ar}$  = Rigid body transformation matrix with respect to the a-set.

- b. A-set rigid body mass matrix:  $[D_{ar}^T][M_{aa}][D_{ar}]$ . For superelement this is computed at the g-set
  - c. Total effective mass Fraction: i.e., diagonal elements of the modal effective mass matrix divided by the rigid body mass matrix.
2. The PARTFAC descriptor outputs the modal participation factors table  $\epsilon$ .
  3. The MEFFM descriptor outputs the modal effective mass table  $\epsilon^2$ , the term-wise square of the modal participation factors table.
  4. The MEFFW descriptor outputs the modal effective weight table; i.e., the modal effective mass divided by PARAM, WTMAS.
  5. The FRACSUM descriptor outputs the modal effective mass fraction table; i.e., the generalized mass matrix (diagonal term) multiplied by the modal effective mass divided by the rigid body mass matrix (diagonal term).
  6. For superelements, the MEFFMASS Case Control command uses the residual structure eigenvalues and eigenvectors, by default. If, however, PARAM, FIXEDB, -1 is specified, then the MEFFMASS Case Control command uses the component mode eigenvalues and eigenvectors.

**METHOD**

## Real Eigenvalue Extraction Method Selection

Selects the real eigenvalue extraction parameters.

**Format:**

$$\text{METHOD} \begin{bmatrix} \text{BOTH} \\ \text{STRUCTURE} \\ \text{FLUID} \\ \text{COUPLED} \end{bmatrix} = n$$

**Examples:**

METHOD=33

METHOD (FLUID) =34

METHOD (COUPLED) =100

Describer	Meaning
BOTH	The referenced EIGR or EIGRL Bulk Data entry will be applied to both the structure and the fluid portion of the model (Default).
STRUCTURE or FLUID	The referenced EIGR or EIGRL Bulk Data entry is applied to the structural or fluid portion of the model.
COUPLED	The referenced EIGR or EIGRL Bulk Data entry is applied to the structural and fluid coupled system of the model.
n	Set identification number of an EIGR or EIGRL Bulk Data entry for normal modes or modal formulation, or an EIGB or EIGRL entry for buckling (Integer > 0).

**Remarks:**

1. An eigenvalue extraction method must be selected when extracting real eigenvalues.
2. If the set identification number selected is present on both EIGRL and EIGR and/or EIGB entries, the EIGRL entry will be used.
3. METHOD(FLUID) and METHOD(STRUCTURE) permits a different request of EIGR or EIGRL for the fluid portion of the model in coupled fluid-structural analysis.
  - If METHOD(STRUCTURE) or METHOD(FLUID) is also specified, then they will override the METHOD(BOTH) selection.
  - The METHOD(FLUID) and METHOD(STRUCTURE) may be specified simultaneously in the same subcase for the residual structure only. Do not specify METHOD(FLUID) in a superelement subcase even if the superelement contains fluid elements.

- The auto-omit feature (see [Real Eigenvalue Analysis in SubDMAPs SEMR3 and MODERS](#) in the *MSC Nastran Reference Guide*) is not recommended. Therefore, only those methods of eigenvalue extraction that can process a singular mass matrix should be used; e.g., the EIGRL entry, or MGIV and MHOU on the EIGR entry.
4. METHOD(COUPLED) is only used when STRUCTURE and FLUID COUPLED problem. The corresponding EIGRL or EIGR requires either the frequency range of interest or ND (number of roots desired) entry. The real coupled modes computation is done with combination of Lanczos method and Subspace iteration method.

METHOD(COUPLED) is recommended for heavy fluid (like liquids) model. When it is applied to the light fluid model, it might require more coupled modes to get the correct result.

Real coupled method is not supported in SOL 200 and SOL 400. If Case Control METHOD(COUPLED) is used in SOL 200 or SOL 400, the following error message will be returned:

```
*** USER FATAL MESSAGE 22996 (SUBDMAP PREOPT)
```

```
    CASE CONTROL COMMAND METHOD(COUPLED) IS NOT SUPPORTED IN SOL  
200 and SOL 400.
```

**MFLUID**

## Fluid Boundary Element Selection

Selects the MFLUID Bulk Data entries to be used to specify the fluid-structure interface.

**Format:**

MFLUID = n

**Example:**

MFLUID = 919

Describer	Meaning
n	Set identification number of one or more MFLUID Bulk Data entries (Integer > 0).

**Remark:**

1. For additional discussion, see [Coupled Fluid-Structure Analysis](#) in the *Dynamic Analysis User's Guide*.
2. Use parameter PARAM,VMOPT controls how the virtual mass is processed.
3. Virtual mass is not supported with the following features:
  - a. Cyclic symmetry analysis (SOLs 114, 115, 116 and 118)
  - b. ADAMS MNF generation (ADAMSMNF Case Control command)
  - c. AVL/EXCITE™ generation (AVLEXB Case Control command).

## MFREQUENCY

### Master Frequency Set Selection Frequency Response

Selects the set of forcing frequencies to be used in frequency analysis as master frequencies for K, B, and K4 matrix generation at each master frequency, in frequency dependent analysis.

#### Format:

$$MFREQUENCY\left(\begin{matrix} \text{Linear} \\ \text{Log10} \end{matrix}\right), [TOL= 0.1] = \begin{pmatrix} \text{AUTO} \\ \text{NOAUTO} \\ n \end{pmatrix}$$

#### Example:

MFREQ (TOL=.15) ← Nastran will generate a master frequency list with TOL=.15

Describer	Meaning
Linear	Linear interpolation will be used between master frequencies to compute K, B, and K4 matrices found on selected Case Control FREQ entry. (Character, Default)
Log10	Log interpolation will be used between master frequencies to compute K, B, and K4 matrices found on selected FREQ entry. (Character)
TOL	For the default option AUTO, for frequency dependent TABLEDi entries associated with the presence of any MAT1F, MAT2F, MAT8F, MAT9F entries or the combined presence of any MAT1F, MAT2F, MAT8F, MAT9F entries and any PBUSHT, PELAST, PDAMPT entries a master frequency will be selected whenever there is a TOL jump in any table value. A TOL=0.0 is the same as NOAUTO. (Real ≥0.0)
AUTO	For frequency dependent analysis associated with the presence of any MAT1F, MAT2F, MAT8F, MAT9F entries or the combined presence of any MAT1F, MAT2F, MAT8F, MAT9F entries and any PBUSHT, PELAST, PDAMPT entries, Nastran will automatically, depending on associated frequency dependent TABLEDi entries and the required Case Control FREQ=m entry, generate a series of master frequencies. (Character, Default).  If the user has supplied a Case Control MFREQ entry pointing to a FREQ, FREQ1, or FREQ2 bulk data entry, Nastran will use the user supplied entry and its associated frequency list.
NOAUTO	If the user has not supplied a MFREQ Case Control entry and the analysis meets the requirements of AUTO above, then NOAUTO will prevent the generation of master frequencies. In this case, the required Case Control FREQ will be used for all frequencies. And all frequencies are considered master frequencies. (Character)
n	Set identification number of FREQ, FREQ1, and FREQ2 Bulk Data entries. (Integer > 0)

**Remark:**

1. Both direct frequency and modal frequency allow, through MAT1F, MAT2F, MAT8F, MAT9F, and PBUSHT, PELAST, PDAMPT entries frequency dependent analysis. The presence of any active MAT1F, MAT2F, MAT8F, or MAT9F entry or the combined presence of any MAT1F, MAT2F, MAT8F, MAT9F entries and any PBUSHT, PELAST, PDAMPT entries a master frequency will initiate the master frequency feature in frequency analysis.
2. MFREQ should be above or in the first subcase.
3. The K, B, and K4 matrices, at master frequencies, are formed in the standard way, using material and property values at the associated current master frequency.
4. For frequencies selected between master frequencies, interpolation of the K, B, and, K4 matrices are performed. These interpolated frequencies are selected using the required Case Control FREQ=m entry.
5. Interpolation between master frequencies  $K^{lm}$  and  $K^{2m}$ ;  $K_{ij} = (d_2 K^{lm}_{ij} + d_1 K^{2m}_{ij}) / (d_1 + d_2)$  where.

For Linear:

$$d1 = (f-f1); \quad d2 = (f2 - f)$$

For Log10:

$$d1 = (\log_{10}(f) - \log_{10}(f1)); \quad d2 = (\log_{10}(f2) - \log_{10}(f))$$

6. For master frequencies there is full displacement, velocity, acceleration type data recovery as well as full element force and stress type data recovery.
7. For interpolated frequencies, there is only (a-set) or modal (h-set) displacement, velocity, acceleration type data recovery. Because, the solution of interpolated frequencies is based on interpolated K, B, and K4, the element stress and force data will be less accurate as the interpolated frequency gets farther from a master frequency. This is, also true, for fluid data recovery such as Panel Participation Factors. If accurate element results are required at specific frequencies, then MFREQ=n should be used to define Master frequencies. If accurate element results are required at all frequencies, then the user should either set MFREQ to the same set as defined on the Case Control Command FREQ=n or set MFREQ=NOAUTO.
8. For modal frequency analysis, associated with master frequencies, residual vector methods for viscous and structural damping have been greatly enhanced and orthogonalization techniques are employed which require the removal of free – free modes. For this reason the structure must be statically constrained with the use of SUPORT entries. Case Control selectable SUPORT1 entries may also be used.
9. For preloading (STATSUB), with the presence of any MAT1F, MAT2F, MAT8F, MAT9F entries or the combined presence of any MAT1F, MAT2F, MAT8F, MAT9F entries and any PBUSHT, PELAST, PDAMPT entries, a fatal message will be issued.

\*\*\* USER FATAL MESSAGE 22711 (MTMD56)

FREQUENCY case control command missing for frequency response analysis.

STATSUB static loading is not currently supported for frequency dependent material/property.

10. PARAM, NMNLFREQ, REAL (Default=0.0) allows users to select material or property values for frequency dependent materials or properties at a desired frequency other than the “nominal” values specified on the MATi or PBUSH, PCOMP, PCOMPG, PDAMP, or PELAS entries. These values are used in determining the eigenvalue solution used in the modal frequency analysis.
11. If a user supplies a FREQ, FREQ1, or FREQ2 entry with a 0.0 value of forcing frequency the following message will be issued:

\*\*\* USER WARNING MESSAGE 22714 (SUBDMAP MFREQRS)

Forcing frequency value of 0.0 detected, nominal (initial) material properties used.

The rationale for this selection is that 0.0 Hz is a static solution and SOL 101 would use material nominal.

12. Some examples of interaction between MFREQ=AUTO and an always required FREQ=m and interpolated values are as follows:

If frequency dependent TABLEDi entries associated with the presence of any MAT1F, MAT2F, MAT8F, MAT9F entries or the combined presence of any MAT1F, MAT2F, MAT8F, MAT9F entries and any PBUSHT, PELAST, PDAMPT entries are detected, and the user has not specified any MFREQ Case Control entries, then Nastran will automatically scan the TABLEDi entries. Nastran does this by using the required FREQ=m entry and for any TABLEDi where there is a TOL jump between two consecutive FREQ=m frequencies determining a “Master frequency”.

FREQ, 11, 10., 15., 20., 30., 40., 50., 65.,
, 85., 105., 130., 160., 190., 230., 275., 330.,
, 400.
```

Where for the above, Nastran has based on the user supplied  $FREQ=10$  Case Control entry, scanned all the active user supplied  $TABLEDi$  entries, and whenever there is a jump in table value of 10% (default TOL), it creates an entry into the master frequency list  $MFREQ=11$ .

$MFREQ$  will issue the message:

```
***AUTOMATIC MASTER FREQUENCY LIST HAS BEEN SELECTED FOR  
SUBCASE ID      1:  
FREQ, 11, 10., 15., 20., 30., 40., 50., 65.,  
      ,85., 105., 130., 160., 190., 230., 275., 330.,  
      ,400.
```

## MODALKE

### Modal Kinetic Energy Request

Requests a modal kinetic energy calculation and specifies the output form.

#### Format:

$$\text{MODALKE} \left[ \left( \left[ \text{SORT1} \right] \left[ \text{PRINT} \right], \text{PUNCH} \right) \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] \left[ \text{ESORT} = \left\{ \begin{array}{c} \text{MODE} \\ \text{ASCEND} \\ \text{DESCEND} \end{array} \right\} \right] \right]$$

$$\left[ \text{THRESH} = e \right] \left[ \left\{ \begin{array}{c} \text{TIME} \\ \text{FREQ} \end{array} \right\} = \left\{ \begin{array}{c} \text{ALL} \\ r \end{array} \right\} \left[ \left\{ \begin{array}{c} \text{AVERAGE} \\ \text{AMPLITUDE} \\ \text{PEAK} \end{array} \right\} \right] \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

#### Examples:

```
MODALKE= ALL
SET 200= 1, 3, 4, 5, 7
MODALKE (ESORT=DESCEND, THRESH=.001) = 200
```

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of modes for each frequency or time step.
SORT2	Output will be presented as a tabular listing of frequencies or time steps for each mode.
PRINT	Write the results to the .f06 file (Default).
NOPRINT	Do not write the results to the .f06 file.
PUNCH	Write the results to the punch (.f07) file.
ESORT	Present the modal energies sorted by mode number, ascending energy value or descending energy value (Default is MODE)
THRESH	Write out only those energies greater than e (Default = 0.001).
TIME or FREQ	Compute energies at all time steps, or frequencies, or the set of frequencies defined by SET r (Default = ALL).
AVERAGE	Requests average energy in frequency response analysis only (Default).
AMPLITUDE	Requests amplitude of energy in frequency response analysis only.
PEAK	Requests peak energy for frequency response analysis only. PEAK is the sum of AVERAGE and AMPLITUDE.
ALL, n, NONE	Compute modal energies for (1) all modes, (2) the modes defined on SET n, or (3) no modes.

**Remarks:**

1. Modal kinetic energy calculations will be limited to SOLs 112 (modal transient response) and 111 (modal frequency response).
2. The MODES descriptor selects from the set of the modes selected by the combination of the Case Control command MODESELECT, and user parameters PARAM,LMODES; PARAM,LFREQ; PARAM,HFREQ. If a mode is selected outside this set, a User Warning Message is issued.
3. The TIME (or FREQ) descriptor selects from the set of the time steps (or forcing frequencies) selected by the OTIME (or OFREQ) Case Control command. If a time or frequency is selected outside this set, a User Warning Message is issued.
4. For frequency response analysis, the energy may be output as real or complex values. When REAL is specified, the output will be one of AVERAGE, AMPLITUDE or PEAK energy. (See Remark 4. of the EKE Case Control Command for a definition of these terms.) When IMAG or PHASE is specified, the output will be complex energy values.

**Output Format:**

The output formats for complex energy in frequency response analysis follow.

**For SORT1 option:**

FREQUENCY = 2.100000E+01			
M O D A L K I N E T I C E N E R G Y (REAL/IMAGINARY)			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	1.171343E-04 0.0	1.409326E-02 0.0	1.065749E-02 0.0
2	2.049217E-05 0.0	2.465558E-03 0.0	1.864483E-03 0.0
3	5.175167E-04 0.0	6.226612E-02 0.0	4.708635E-02 0.0
4	1.732168E-05 0.0	2.084095E-03 0.0	1.576016E-03 0.0

This format repeats for each frequency.

**For SORT2 option:**

MODE NUMBER = 1			
M O D A L K I N E T I C E N E R G Y (MAGNITUDE/PHASE)			
FREQUENCY	ACTUAL	NORMALIZED	FRACTIONAL
1.000000E+00	8.147644E-04 0.0	1.000000E+00 0.0	9.924866E-01 0.0
2.000000E+00	4.066132E-03 0.0	1.000000E+00 0.0	9.936857E-01 0.0
3.000000E+00	1.411670E-02 0.0	1.000000E+00 0.0	9.955440E-01 0.0

This format repeats for each mode number.

The output formats for AVERAGE energy in frequency response analysis follow. The particular type (AVERAGE, AMPLITUDE or PEAK) is identified in the output title.

### For SORT1 option:

```
FREQUENCY = 2.100000E+01
```

MODAL KINETIC ENERGY ( AVERAGE )			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	5.856715E-05	1.409326E-02	1.065749E-02
2	1.024608E-05	2.465558E-03	1.864483E-03
3	2.587583E-04	6.226612E-02	4.708635E-02
4	8.660840E-06	2.084095E-03	1.576016E-03

This format repeats for each frequency.

### For SORT2 option:

```
MODE NUMBER = 1
```

MODAL KINETIC ENERGY ( AVERAGE )			
FREQUENCY	ACTUAL	NORMALIZED	FRACTIONAL
1.000000E+00	4.073822E-04	1.000000E+00	9.924866E-01
2.000000E+00	2.033066E-03	1.000000E+00	9.936857E-01
3.000000E+00	7.058351E-03	1.000000E+00	9.955440E-01
4.000000E+00	2.872413E-02	1.000000E+00	9.977741E-01

This format repeats for each mode number.

The output formats for transient response analysis follow.

### For SORT1 option:

```
TIME STEP = 1.000000E+00
```

MODAL KINETIC ENERGY			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	1.483182E-02	3.610759E-01	2.316040E-01
2	4.107675E-02	1.000000E+00	6.414274E-01
3	2.165481E-04	5.271792E-03	3.381472E-03
4	1.387959E-05	3.378941E-04	2.167345E-04

This format repeats for each time step.

### For SORT2 option:

```
MODE NUMBER = 2
```

MODAL KINETIC ENERGY			
TIME STEP	ACTUAL	NORMALIZED	FRACTIONAL
0.000000E+00	0.0	0.0	0.0
9.999999E-02	2.512383E-03	1.000000E+00	9.420497E-01
2.000000E-01	8.475699E-03	1.000000E+00	9.56881E-01
3.000000E-01	1.415435E-02	1.000000E+00	9.568216E-01

This format repeats for each mode number.

### Processing:

Modal kinetic energy is calculated using the following relations:

For transient analysis,

$$[\text{Actual KE}] = \frac{1}{2} \{\dot{u}_h\}^T [M_{hh}] \{\dot{u}_h\}$$

For frequency response analysis,

$$[\text{Actual KE}] = \frac{1}{2} \{u_h\}^T [\text{diag}(\omega_i^2)] [M_{hh}] \{u_h\}$$

where  $\omega_i$  is the excitation frequency and output is complex. See Remark 4 of the [EKE \(Case\)](#) Case Control command for energy calculation relations when output is real.

[Normalized Kinetic Energy] = norm[Actual Kinetic Energy], normalized per column.

[Fractional Kinetic Energy] = [Normalized Kinetic Energy]/[diagonal [ $\{1.0\}^T$  [Normalized Kinetic Energy]]], term-by-term division.

## MODALSE

### Modal Strain Energy Request

Requests modal strain energy calculation and specifies the output form.

#### Format:

$$\text{MODALSE} \left[ \left( \left[ \text{SORT1} \right] \left[ \text{PRINT} \right] \left[ \text{NO PRINT} \right], \text{PUNCH} \right) \left[ \left[ \text{REAL or IMAG} \right] \left[ \text{PHASE} \right] \right] \left[ \text{ESORT} = \left\{ \begin{array}{l} \text{MODE} \\ \text{ASCEND} \\ \text{DESCENT} \end{array} \right\} \right] \right] \\ \left[ \text{THRESH} = e \right] \left[ \left\{ \begin{array}{l} \text{TIME} \\ \text{FREQ} \end{array} \right\} = \left\{ \begin{array}{l} \text{ALL} \\ r \end{array} \right\} \right] \left[ \left[ \left[ \text{AVERAGE} \right] \right] \left[ \left[ \text{AMPLITUDE} \right] \right] \left[ \left[ \text{PEAK} \right] \right] \right] \right] = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

#### Examples:

```
MODALSE= ALL
SET 100= 1, 3, 4, 5, 7
MODALSE (ESORT=ASCEND, THRESH=.0001) = 100
```

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of modes for each frequency or time step.
SORT2	Output will be presented as a tabular listing of frequencies or time steps for each mode.
PRINT	Write the results to the .f06 file (Default).
NO PRINT	Do not write the results to the .f06 file.
PUNCH	Write the results to the punch (.f07) file.
ESORT	Present the modal energies sorted by mode number, ascending energy value or descending energy value (Default is MODE).
THRESH	Write out only those energies greater than e (Default = 0.001).
TIME or FREQ	Compute energies at all time steps or frequencies or the set of frequencies defined by SET r (Default = ALL).
AVERAGE	Requests average energy in frequency response analysis only (Default).
AMPLITUDE	Requests amplitude of energy in frequency response analysis only.
PEAK	Requests peak energy for frequency response analysis only. PEAK is the sum of AVERAGE and AMPLITUDE.
ALL, n, NONE	Compute modal energies for all modes, the modes defined on SET n, or (3) no modes.

**Remarks:**

1. Modal strain energy calculations will be limited to SOLs 112 (modal transient response) and 111 (modal frequency response).
2. The MODES descriptor selects from the set of the modes prescribed by the combination of Case Control command MODESELECT, and user parameters PARAM,LMODES; PARAM,LFREQ; and PARAM,HFREQ. If a mode is selected outside this set, a User Warning Message is issued.
3. The TIME (or FREQ) descriptor selects from the set of the time steps (or forcing frequencies) prescribed by the OTIME (or OFREQ) Case Control command. If a time or frequency is selected outside this set, a User Warning Message is issued.
4. For frequency response analysis, the energy may be output as real or complex values. When REAL is specified, the output will be one of AVERAGE, AMPLITUDE or PEAK energy. (See Remark 4 of the ESE Case Control Command for a definition of these terms.) When IMAG or PHASE is specified, the output will be complex energy values.

**Output Format:**

The output formats for complex energy in frequency response analysis follow.

**For SORT1 option:**

FREQUENCY = 2.100000E+01			
M O D A L S T R A I N E N E R G Y (REAL/IMAGINARY)			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	1.171343E-04 0.0	1.409326E-02 0.0	1.065749E-02 0.0
2	2.049217E-05 0.0	2.465558E-03 0.0	1.864483E-03 0.0
3	5.175167E-04 0.0	6.226612E-02 0.0	4.708635E-02 0.0
4	1.732168E-05 0.0	2.084095E-03 0.0	1.576016E-03 0.0

This format repeats for each frequency.

**For SORT2 option:**

MODE NUMBER = 1			
M O D A L S T R A I N E N E R G Y (MAGNITUDE/PHASE)			
FREQUENCY	ACTUAL	NORMALIZED	FRACTIONAL
1.000000E+00	8.147644E-04 0.0	1.000000E+00 0.0	9.924866E-01 0.0
2.000000E+00	4.066132E-03 0.0	1.000000E+00 0.0	9.936857E-01 0.0
3.000000E+00	1.411670E-02 0.0	1.000000E+00 0.0	9.955440E-01 0.0

This format repeats for each mode number.

The output formats for AVERAGE energy in frequency response analysis follow. The particular type (AVERAGE, AMPLITUDE or PEAK) is identified in the output title.

### For SORT1 option:

```
FREQUENCY = 2.100000E+01
```

MODAL STRAIN ENERGY ( AVERAGE )			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	5.856715E-05	1.409326E-02	1.065749E-02
2	1.024608E-05	2.465558E-03	1.864483E-03
3	2.587583E-04	6.226612E-02	4.708635E-02
4	8.660840E-06	2.084095E-03	1.576016E-03

This format repeats for each frequency.

### For SORT2 option:

```
MODE NUMBER = 1
```

MODAL STRAIN ENERGY ( AVERAGE )			
FREQUENCY	ACTUAL	NORMALIZED	FRACTIONAL
1.000000E+00	4.073822E-04	1.000000E+00	9.924866E-01
2.000000E+00	2.033066E-03	1.000000E+00	9.936857E-01
3.000000E+00	7.058351E-03	1.000000E+00	9.955440E-01
4.000000E+00	2.872413E-02	1.000000E+00	9.977741E-01

This format repeats for each mode number.

The output formats for transient response analysis follow.

### For SORT1 option:

```
TIME STEP = 1.000000E+00
```

MODAL STRAIN ENERGY			
MODE NUMBER	ACTUAL	NORMALIZED	FRACTIONAL
1	1.483182E-02	3.610759E-01	2.316040E-01
2	4.107675E-02	1.000000E+00	6.414274E-01
3	2.165481E-04	5.271792E-03	3.381472E-03
4	1.387959E-05	3.378941E-04	2.167345E-04

This format repeats for each time step.

### For SORT2 option:

```
MODE NUMBER = 2
```

MODAL STRAIN ENERGY			
TIME STEP	ACTUAL	NORMALIZED	FRACTIONAL
0.000000E+00	0.0	0.0	0.0
9.999999E-02	2.512383E-03	1.000000E+00	9.420497E-01
2.000000E-01	8.475699E-03	1.000000E+00	9.56881E-01
3.000000E-01	1.415435E-02	1.000000E+00	9.568216E-01

This format repeats for each mode number.

### Processing:

Modal strain energy is calculated using the following relations:

$$[\text{Actual SE}] = \frac{1}{2} \{u_h\}^T [M_{hh}] \{u_h\}$$

For frequency response analysis real output, see Remark 4 of the [ESE \(Case\)](#) Case Control command for energy calculation relations.

$$\begin{aligned} [\text{Normalized Strain Energy}] &= \text{norm}[\text{Actual Strain Energy}], \text{ normalized per column.} \\ [\text{Fractional Strain Energy}] &= [\text{Normalized Strain Energy}] / [\text{diagonal} [\{1.0\}^T [\text{Normalized Strain Energy}]]], \text{ term-by-term division.} \end{aligned}$$

**MODES****Subcase Repeater**

Repeats a subcase.

**Format:**

MODES=n

**Example:**

MODES=3

Descriptor	Meaning
n	Number of times the subcase is to be repeated (Integer > 0).

**Remarks:**

1. This Case Control command can be illustrated by an example. Suppose stress output is desired for the first five modes only, and displacements for the next two modes, and forces for the remaining modes. The following example would accomplish this:

```
SUBCASE 1 $ FOR MODES 1 THRU 5
MODES = 5
STRESS = ALL
SUBCASE 6 $ FOR MODES 6 AND 7
DISPLACEMENTS = ALL
MODES = 2
SUBCASE 8 $ FOR MODE 8 AND REMAINING MODES
FORCE = ALL
```

2. This command causes the results for each mode to be considered as a separate, successively numbered subcase, beginning with the subcase number containing the MODES command. In the preceding example, this means that subcases 1, 2, 3, etc. are assigned to modes 1, 2, 3, etc., respectively.
3. If this command is not used, eigenvalue results are considered to be a part of a single subcase. Therefore, any output requests for the single subcase will apply for all eigenvalues.
4. All eigenvectors with mode numbers greater than the number of subcases defined in the Case Control Section are printed with the descriptors of the last subcase. For example, to suppress all printout for modes beyond the first three, the following Case Control commands could be used:

```
SUBCASE 1
MODES = 3
DISPLACEMENTS = ALL
SUBCASE 4
DISPLACEMENTS = NONE
BEGIN BULK
```

5. This command may be of no use in non-eigenvalue analysis and may cause data recovery processing to be repeated.

## MODESELECT

### Computed Mode Selection

Selects a subset of the computed modes for inclusion or exclusion in modal dynamic analysis.

#### Format:

Mode selection based on arbitrary mode numbers:

$$\text{MODESELECT} \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right) = n$$

#### Alternate Format 1:

Mode selection based on number of lowest modes:

$$\text{MODESELECT} \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right) \text{LMODES} = lm$$

#### Alternate Format 2:

Mode selection based on range of mode numbers:

$$\text{MODESELECT} \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right) [\text{LMODENM} = lom][\text{HMODENM} = him]$$

#### Alternate Format 3:

Mode selection based on frequency range:

$$\text{MODESELECT} \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right) [\text{LFREQ} = lof][\text{HFREQ} = hif]( [\text{UNCONSET}] = m )$$

#### Alternate Format 4:

Mode selection based on modal effective mass fraction (MEFFMFRA) criteria:

$$\text{MODESELECT} \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right) \left[ \begin{array}{l} [\text{T1FR} [= t1fr]][\text{T2FR} [= t2fr]][\text{T3FR} [= t3fr]] \\ [\text{R1FR} [= r1fr]][\text{R2FR} [= r2fr]][\text{R3FR} [= r3fr]] \\ [\text{ALLFR} [= allfr]][\text{UNCONSET} = m] \left[ \begin{array}{c} \text{SUM} \\ \text{ANYMIN} \\ \text{ALLMIN} \end{array} \right] \end{array} \right]$$

See Remark 14. for examples illustrating the use of the preceding formats.

Describer	Meaning
STRUCTURE	References computed modes of the structure (Default).
FLUID	References computed modes of the fluid.
$n > 0$	Set identification of a previously appearing SET command. ONLY those modes whose mode numbers are in SET $n$ will be included in the analysis. If SET $n$ is not defined, then ONLY mode $n$ will be included in the analysis (Integer).
$n < 0$	$ n $ refers to the set identification of a previously appearing SET command. The modes whose mode numbers are in SET $ n $ will be EXCLUDED from the analysis. If SET $ n $ is not defined, then mode $ n $ will be EXCLUDED from the analysis (Integer).
lm	Number of lowest modes that are to included. (Integer > 0).
lom	Lower limit of the mode number range for selecting the modes. See Remark 5. (Integer > 0).
him	Upper limit of the mode number range for selecting the modes. See Remark 5. (Integer > lom > 0).
lof	Lower limit of the frequency range for selecting the modes. See Remark 6. (Real $\geq$ 0.0).
hif	Upper limit of the frequency range for selecting the modes. See Remark 6. (Real > lof $\geq$ 0.0).
UNCONSET	Specifies a single mode or a set of modes for unconditional_inclusion or exclusion, regardless of the selection criterion, and regardless of the inclusion or exclusion of other modes.
$m > 0$	Set identification of a previously appearing SET command. Modes whose mode numbers are in SET $m$ will be included in the analysis, regardless of the selection criterion, and regardless of the inclusion or exclusion of other modes. If SET $m$ is not defined, then mode $m$ will be included in the analysis, regardless of the selection criterion, and regardless of the inclusion or exclusion of other modes (Integer).
$m < 0$	$ m $ refers to the set identification of a previously appearing SET command. Modes whose mode numbers are in SET $ m $ will be excluded from the analysis, regardless of the selection criterion and regardless of the inclusion or exclusion of other modes. If SET $ m $ is not defined, then mode $ m $ will be excluded from the analysis, regardless of the selection criterion and regardless of the inclusion or exclusion of other modes (Integer).
TiFR / RiFR	Flags explicitly listing components whose modal effective mass fraction (MEFFMFRA) values are to be considered for mode selection.
<i>tifr / rifr</i>	Threshold values for the listed TiFR / RiFR components. See Remark 8. (0.0 < Real $\leq$ 1.0).
ALLFR	Flag indicating that the MEFFMFRA values of components not explicitly listed by the TiFR / RiFR flags are also to be considered for mode selection.

Describer	Meaning
allfr	Threshold value for components not explicitly listed by the TiFR / RiFR flags. See Remark 8. ( $0.0 < \text{Real} \leq 1.0$ ).
SUM	For each specified component, the modes are selected as follows:  The modes are first sorted in descending order of the corresponding MEFFMFRA values. Then, starting from the first mode in this sorted list, the modes are selected until the sum of corresponding MEFFMFRA values equals or just exceeds the threshold value for that component (Default).
ANYMIN	Any mode whose MEFFMFRA value for any specified component equals or exceeds the threshold value for that component will be selected.
ALLMIN	Any mode whose MEFFMFRA values for all of the specified components equal or exceed the corresponding threshold values for those components will be selected.

**Remarks:**

1. This command is meaningful only in modal dynamic analysis (SOLs 110, 111, 112, 145, 146, and 200). It is ignored in all other analyses.
2. Only one MODESELECT command is allowed for the structure and only one MODESELECT command is allowed for the fluid and these should be specified above the subcase level.
3. The various formats of this command may not be combined.
4. The computed modes used for mode selection include the augmented modes (if any) resulting from residual vector calculations.
5. If LMODENM is specified without HMODENM, a default value of 10000000 (ten million) is assumed for HMODENM. If HMODENM is specified without LMODENM, a default value of 1 is assumed for LMODENM.
6. If LFREQ is specified without HFREQ, a default value of  $1.0\text{E}+30$  is assumed for HFREQ. If HFREQ is specified without LFREQ, a default value of 0.0 is assumed for LFREQ.
7. If the format involving the MEFFMFRA criteria is employed, it is not necessary to specify a MEFFMASS Case Control command or, even if such a command is specified, to explicitly request the calculation of the modal effective mass fractions. In the absence of such a command or request, the program will automatically perform the necessary calculations internally to ensure that the required modal effective mass fractions are computed.
8. If the T1FR / R1FR / ALLFR keywords are specified without the corresponding *tifr* / *r1fr* / *allfr* threshold values, then a default value of 0.95 (that is, 95%) is assumed for these threshold values. If the selection criterion is SUM, and a default value of 0.05 (that is, 5%) is assumed if the selection criterion is ANYMIN or ALLMIN.
9. The modal effective mass for a given mode is a measure of how much mass is associated with that mode, and indicates the sensitivity of that mode to base excitation. Modal effective mass is meaningful only for fixed base modes. If a structure is not restrained, all the modal effective mass will be associated with its rigid body modes.

10. When the MODESELECT Case Control command is used in conjunction with the parameters LMODES/LMODESFL, LFREQ/LFREQFL, and HFREQ/HFREQFL, the hierarchy of their usage is as follows:
  - a. If there is a MODESELECT Case Control command, it takes precedence over the parameters LMODES/LMODESFL, LFREQ/LFREQFL, and HFREQ/HFREQFL. (It does not matter whether these parameters are defined directly via PARAM entries, or indirectly using the FLSFSEL Case Control command.)
  - b. If there is no MODESELECT Case Control command, then parameter LMODES/LMODESFL takes precedence over parameters LFREQ/LFREQFL and HFREQ/HFREQFL. In this case, the number of lowest modes specified by LMODES/LMODESFL will be included in the modal dynamic analysis.
  - c. If there is no MODESELECT Case Control command and no LMODES/LMODESFL parameter, then parameters LFREQ/LFREQFL and HFREQ/HFREQFL are honored. In this case, all of the computed modes whose frequencies are in the range specified by LFREQ/LFREQFL and HFREQ/HFREQFL will be included in the modal dynamic analysis.
  - d. If there is no MODESELECT Case Control command and no LMODES/LMODESFL, LFREQ/LFREQFL, or HFREQ/HFREQFL parameter, then all of the computed modes will be included in the modal dynamic analysis.
11. If a subset of the computed modes is selected for subsequent use in the modal dynamic analysis, the user is informed of this by a User Information Message. Also, a new eigenvalue table indicating the actual modes selected for the analysis is output. If the user has employed a MODESELECT command involving the MEFFMFRA criteria, the modal effective mass fractions for the selected modes are also output.
12. If the mode selection criterion results in no modes being selected for subsequent use in the modal dynamic analysis, the program terminates the job with a fatal message indicating that no modal formulation is possible.
13. If the use of the MODESELECT command results in the selection of all of the computed modes for subsequent use, the user is informed of this by a User Information Message.
14. The following examples illustrate the use of the various formats of the MODESELECT command described above.

### Examples Illustrating Mode Selection Based on Arbitrary Mode Numbers:

```
$ INCLUDE ONLY STRUCTURE MODES 7, 9 AND 12 IN THE ANALYSIS
SET 100 = 7, 9, 12
MODESELECT = 100
$ EXCLUDE FLUID MODES 5 AND 6 FROM THE ANALYSIS
SET 200 = 5, 6
MODESELECT (FLUID) = -200
$ EXCLUDE STRUCTURE MODE 5 FROM THE ANALYSIS
MODESELECT = -5 $ (SET 5 NOT DEFINED)
```

**Examples Illustrating Mode Selection Based on Number of Lowest Modes:**

```

$ INCLUDE THE LOWEST 10 STRUCTURE MODES IN THE ANALYSIS
MODESELECT (LMODES = 10)
$ INCLUDE THE LOWEST 5 FLUID MODES IN THE ANALYSIS
MODESELECT (FLUID LMODES = 5)

```

**Examples Illustrating Mode Selection Based on Range of Mode Numbers:**

```

$ INCLUDE ONLY STRUCTURE MODES 10 THRU 20 IN THE ANALYSIS
MODESELECT (LMDENM = 10 HMDENM = 20)
$ INCLUDE ALL STRUCTURE MODES HIGHER THAN THE 6th MODE
$ IN THE ANALYSIS
MODESELECT (LMDENM = 7)
$ INCLUDE THE LOWEST 10 FLUID MODES IN THE ANALYSIS
MODESELECT (FLUID HMDENM = 10)

```

**Examples Illustrating Mode Selection Based on Frequency Range:**

```

$ INCLUDE ALL STRUCTURE MODES WITH CYCLIC FREQUENCIES
$ IN THE RANGE OF 0.1 HZ. TO 100.0 HZ. IN THE ANALYSIS
MODESELECT (LFREQ = 0.1 HFREQ = 100.0)
$ INCLUDE ALL STRUCTURE MODES WITH CYCLIC FREQUENCIES
$ EQUAL TO OR BELOW 50.0 HZ., BUT INCLUDE THE 10th AND 11th
$ MODES REGARDLESS OF THEIR CYCLIC FREQUENCIES
SET 1000 = 10, 11
MODESELECT (HFREQ = 50.0 UNCONSET = 1000)
$ INCLUDE ALL STRUCTURE MODES WITH CYCLIC FREQUENCIES
$ EQUAL TO OR ABOVE 5.0 HZ., BUT EXCLUDE THE 6 MODE
$ REGARDLESS OF ITS CYCLIC FREQUENCY
MODESELECT (LFREQ = 5.0 UNCONSET = -6) $ SET 6 NOT DEFINED

```

**Examples Illustrating Mode Selection Based on Modal Effective Mass Fraction (MEFFMFRA) Criteria:**

```
MODESELECT (T3FR)
```

The default selection criterion of SUM is assumed, and a default value of 0.95 (95%) is therefore assumed for the threshold value for component T3.

As many modes with the highest MEFFMFRA(T3) values as possible, such that the sum of the values is equal to or just exceeds 0.95, will be selected.

```
MODESELECT (T1FR = 0.90 T2FR R3FR = 0.85)
```

The default selection criterion of SUM is assumed, and a default value of 0.95 (95%) is therefore assumed for the threshold value for component T2.

As many modes with the highest MEFFMFRA(T1) values as possible, such that the sum of the values is equal to or just exceeds 0.90, will be selected.

Similarly, as many modes with the highest MEFFMFRA(T2) values as possible, such that the sum of those values is equal to or just exceeds 0.95, will be selected.

As many modes with the highest MEFFMFRA(R3) values as possible, such that the sum of those values is equal to or just exceeds 0.85, will be selected.

```
MODESELECT (T1FR T3FR = 0.10 UNCONSET = -6 ANYMIN)
$ SET 6 NOT DEFINED
```

Since the selection criterion is specified as ANYMIN, a default value of 0.05 (5%) is assumed for the threshold value for component T1.

All modes, excluding mode 6, whose:

```
MEFFMFRA(T1) values are equal to or greater than 0.05 OR
MEFFMFRA(T3) values are equal to or greater than 0.10
```

will be selected.

```
SET 1000 = 20, 30
MODESELECT (T2FR = 0.1 R3FR = 0.15 ALLFR UNCONSET = 1000 ALLMIN)
```

The ALLFR flag indicates that the T1, T3, R1, and R2 components which are not explicitly specified above must also be considered in mode selection. Since the selection criterion is specified as ALLMIN, a default value of 0.05 (5%) is assumed for the threshold value for these components.

All modes whose:

```
MEFFMFRA(T1) values equal or exceed 0.05 AND
MEFFMFRA(T2) values equal or exceed 0.10 AND
MEFFMFRA(T3) values equal or exceed 0.05 AND
MEFFMFRA(R1) values equal or exceed 0.05 AND
MEFFMFRA(R2) values equal or exceed 0.05 AND
MEFFMFRA(R3) values equal or exceed 0.15
```

will be selected.

Modes 20 and 30 will be selected regardless of their MEFFMFRA values.

**MODTRAK**

## Mode Tracking Request

Selects mode tracking options in design optimization (SOL 200).

**Format:**

MODTRAK = n

**Example:**

MODTRAK=100

Describer	Meaning
n	Set identification of a MODTRAK Bulk Data entry (Integer > 0).

**Remark:**

1. Selection of a MODTRAK Bulk Data entry with the MODTRAK Case Control command activates mode tracking for the current subcase. This request is limited to normal modes subcases (ANALYSIS=MODES) in design optimization (SOL 200).

## MONCARL

### Control for Monte-Carlo simulation

Control for Monte-Carlo simulation using the non-parametric variability method (NPVM). This Case Control command can be used in SOL 111 only.

#### Format:

MONCARL ( [NSAMPLE=m] , [SEED=k] , [OFFD= r ] ) = n

#### Example:

MONCARL (NSAMPLE=100) =5

Descriptor	Meaning
NSAMPLE = m	Specifies the number of random samples, m ( Integer >=0, Default = 0).
SEED = k	Specifies the random number generator seed, k (Integer > 0, Default = 777).
OFFD = r	Specifies the scale factor for off-diagonal entries of the random matrix, r (Real, Default = 1.0).
n	Set identification number of a MONCARL Bulk Data entry (Integer > 0).

#### Remarks:

1. Only one MONCARL command may appear in the Case Control Section and should appear above all SUBCASE commands.
2. Keeping in mind the size and the naively parallel nature of Monte-Carlo problem typical simulation would be run in a parallel mode. The parallel DMP simulation is restricted to Multi-Master mode in order to get a good scalable performance. Multi-Master mode can be specified using "RUNOPT=MULTIPAR", in "DOMAINSOLVER" Executive Control statement, e.g.:  
DOMAINSOLVER ACMS (PARTOPT=DOF, RUNOPT=MULTIPAR)
3. Running the Monte-Carlo simulation in Nastran would result in a concatenated OP2, HDF5 and PCH file containing the response results of each random sample of Monte-Carlo simulation. Each random sample would appear as a unique subcase in the OP2, HDF5 and PCH file.
4. PLT Viewer (provided with Nastran) can be used to read the result of Monte-Carlo simulation to generate meaningful response statistics. Currently the PLT Viewer can only read HDF5 and "PCH files in SORT 1 format" (not OP2).
5. HDF5 is the recommended output method for reading into PLT Viewer. Use NASTRAN system cell (702) HDF5=1 to request HDF5 output.

## MONITOR

### Print Selection for Monitor Data

Specifies options in the printing of monitor data.

#### Format:

$$\text{MONITOR}[(\text{REAL or IMAG}, \text{PHASE}, \text{NODSP1}, \text{NOPNT1}, \text{NOPNT2}, \text{NOPNT3})] = \begin{cases} \text{ALL} \\ \text{NONE} \end{cases}$$

#### Example:

```
MONITOR (PHASE, NOPNT1) =ALL
MONITOR (IMAG, NODSP1) =ALL
```

Describer	Meaning
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output (Default).
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
NODSP1	Do not include MONDSP1 results in the MONITOR point prints (default is to provide these prints).
NOPNT1	Do not include MONPNT1 results in the MONITOR point prints (default is to provide these prints).
NOPNT2	Do not include MONPNT2 results in the MONITOR point prints (default is to provide these prints).
NOPNT3	Do not include MONPNT3 results in the MONITOR point prints (default is to provide these prints).
ALL	Print all monitor point results, except for those deselected.
NONE	Do not print monitor point results

#### Remarks:

1. The MONITOR command is required in order to obtain MONITOR results in the printed output in SOLs 101, 103, 108, 109, 111, 112, 146, 200 and 400 (ANALYSIS = NLSTAT or NLTRAN).
2. SOL 144 does not require the MONITOR command and is ignored.
3. The MONITOR command should be above the subcase level or in the first subcase (above the step level for SOL 400). MONITOR commands in subcases subsequent to the first one or in any steps for SOL 400 are ignored.
4. MONPNT1 is not applicable in SOL 103.

5. The MONITOR command is not required for SOL 144 except in the special case of MONPNT3 with any exclusion flags other than SMAD. Monitor points with exclusion flags require special processing of the GRID point force data and are not recommended because of the potential excessive cost.
6. Results for dynamic solutions (SOLs 108, 109, 111, 112, 146 and 400 with NLTRAN) will be in SORT2 format. All other solutions will be in SORT1 format.

### Output Format:

In frequency response analysis, there is no output format of complex energy.

### For SOLS 101, 103, and 144 - SORT1:

```

S T R U C T U R A L   I N T E G R A T E D   F R E E   B O D Y   M O N I T O R   P O I N T   L O A D S (MONPNT3)
MONITOR POINT NAME = FORCSM1                                SUBCASE NO.      1
LABEL = SUMMATION OF FORCES AT GRID 9
CP = 0                                X = 8.000000E+01      Y = 0.000000E+00      Z = 0.000000E+00

  AXIS   REST.  APPLIED
  ----   -
  CX     1.600000E+01
  CY     1.600000E+01
  CZ     1.600000E+01
  CMX    0.000000E+00
  CMY   -3.200000E+02
  CMZ    3.200000E+02
    
```

This format repeats for each monitor point and repeats for each subcase or mode.

### SOLS 108, 109, 111, 112 and 146 - SORT2:

```

S T R U C T U R A L   I N T E G R A T E D   F R E E   B O D Y   M O N I T O R   P O I N T   L O A D S (MONPNT3)
MONITOR POINT NAME = FORCSM1                                COMPONENT = CX                                SUBCASE NO.      1
LABEL = SUMMATION OF FORCES AT GRID 9
CP = 0                                X = 8.000000E+01      Y = 0.000000E+00      Z = 0.000000E+00

  TIME STEP   RESULTANT
  ----
  0.000000E+00  0.000000E+00
  1.000000E-02  7.692307E-01
  2.000000E-02  1.301775E+00
  3.000000E-02  1.137915E+00
  4.000000E-02  6.557894E-01
  5.000000E-02  9.679956E-01
  6.000000E-02  1.354058E+00
  7.000000E-02  9.230635E-01
  8.000000E-02  6.696146E-01
  9.000000E-02  1.178594E+00
  9.999999E-02  1.275434E+00
    
```

This format repeats for each monitor point.

**MPC****Multipoint Constraint Set Selection**

Selects a multipoint constraint set.

**Format:**

MPC = n

**Example:**

MPC=1 7

Describer	Meaning
n	Set identification number of a multipoint constraint set. This set identification number must appear on at least one MPC or MPCADD Bulk Data entry (Integer > 0).

**Remarks:**

1. In cyclic symmetry analysis, this command must appear above the first subcase command.
2. Multiple boundary conditions (MPC sets) are not allowed in superelement analysis. If more than one MPC set is specified per superelement (including the residual), then the second and subsequent sets will be ignored.
3. In addition to select MPC/MPCADD bulk data entries, MPC=n can also be used to select a group of rigid elements for the analysis via SET3,n bulk data entry with RBEin or RBEex in DES field of SET3 bulk data entry.
4. SET3,n is not needed if ALL rigid elements in the model are to be utilized.
5. Rigid element set section is supported in SOL 400 if 'RIGID=LINEAR' is present in case control deck.

## MPCFORCES

## Multipoint Forces of Constraint Output Request

Requests the form and type of multipoint force of constraint vector output.

### Format:

$$\text{MPCFORCES} \left( \left( \begin{matrix} \text{SORT1} \\ \text{SORT2} \end{matrix} \right), \left[ \begin{matrix} \text{PRINT, PUNCH} \\ \text{PLOT} \end{matrix} \right], \left[ \begin{matrix} \text{REAL or IMAG} \\ \text{PHASE} \end{matrix} \right], \left[ \begin{matrix} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{matrix} \right], \right. \\ \left. \left[ \begin{matrix} \text{RPRINT} \\ \text{NORPRINT} \end{matrix} \right], \text{RPUNCH}, [\text{CID}] \right) = \left\{ \begin{matrix} \text{ALL} \\ \text{n} \\ \text{NONE} \end{matrix} \right\}$$

### Examples:

```
MPCFORCES=5
MPCFORCES (SORT2, PUNCH, PRINT, IMAG) =ALL
MPCFORCES (PHASE) =NONE
MPCFORCES (SORT2, PRINT, PSDF, CRMS, RPUNCH) =20
MPCFORCES (PRINT, RALL, NORPRINT) =ALL
```

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.
PRINT or (blank)	Printer File (.f06)
PUNCH	Punch File (.pch)
PLOT	Plot File (.op2/.h5)

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAGE Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

Describer	Meaning
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests that the power spectral density function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis post-processing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control Section. See Remark 8.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
CID	Request the printing of output coordinate system ID in printed output file (.f06) file.
ALL	Multipoint forces of constraint for all points will be output. See Remarks 2. and 5.
NONE	Multipoint forces of constraint for no points will be output.
n	Set identification of a previously appearing SET command. Only multipoint constraint forces for points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2. In the SORT1 format, only nonzero values will be output.
2. In a statics problem, a request for SORT2 causes loads at all points (zero and nonzero) to be output.
3. MPCFORCES=NONE overrides an overall output request.
4. In SORT1 format, MPCFORCES recovered at consecutively numbered scalar points are printed in groups of six (sextets) per line of output. However, if a scalar point is not consecutively numbered, then it will begin a new sextet on a new line of output. If a sextet can be formed and all values are zero, the line will not be printed. If a sextet cannot be formed, then zero values may be output.

5. MPCFORCE results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
6. MPCFORCE results due to linear elements only are available in SOL 129 with MDLPRM, MPCF129, 1.
7. In inertia relief analysis, the MPCFORCE output includes both the effects of applied and inertial loads.
8. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
9. Note that the CID keyword affects only grid point related output, such as DISplacement, VELO, ACCE, OLOAD, SPCForce and MPCF. In addition, the CID keyword needs to appear only once in a grid related output request anywhere in the Case Control Section to turn on the printing algorithm.

**MPRES**

## Fluid Pressure Output Request

Requests the pressure for selected wetted surface elements when virtual mass (MFLUID) is used.

**Format:**

$$\text{MPRES} \left( \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right), \left( \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

MPRES=5

MPRES (IMAG) =ALL

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Fluid pressures for all elements will be output.
NONE	Fluid pressures for no elements will be output.
n	Set identification number of a previously appearing SET command. Only fluid pressures for elements in this set will be output (Integer >0).

**Remark:**

1. If PARAM,SPARSEDR,NO is specified, then PARAM,DDRMM,-1 is also required in the modal solution sequences (SOLs 111, 112, 146, and 200).

## NLBUCK

## Nonlinear Buckling Request

Perform a nonlinear buckling analysis in SOL 400.

### Format:

$$NLBUCK = \left[ \begin{array}{c} \text{END} \\ \text{ALL} \\ r \end{array} \right]$$

### Examples:

```
NLBUCK
NLBUCK=END
NLBUCK=ALL
NLBUCK=0.3
```

Descriptor	Meaning
END	At the end of the step an eigenvalue projection is made to predict the buckled load (Default).
ALL	After each converged load increment within the step an eigenvalue projection is made to predict the buckled load.
r	After every multiple of r load step an eigenvalue projection is made to predict the buckled load. Buckling will also be computed at the final load increment. A tolerance of 1.E-6 is used to determine the load step's closeness to r. (Real)

### Remark:

1. The eigenvalue projection is only attempted after the first two converged load increments in order for there to be at least two tangent stiffness matrices for the projection.
2. NLBUCK may be specified in any STEP or SUBCASE along with an NLSTEP command. The NLPARM command is not allowed with NLBUCK.
3. In order to obtain the most accurate value for critical buckling factor, the user must set NO=1 on the NLSTEP entry. Specifying PARAM,LGDISP>0 is also recommended.
4. In addition to NLBUCK, a METHOD Case Control command may be specified to reference an EIGB, EIGR or EIGRL Bulk Data entry, or if asymmetric follower stiffness exists then a CMETHOD Case Control command may be specified to reference an EIGC entry. The EIGx entries should request the computation of at least the first mode. If no METHOD/CMETHOD command is present, a minimum of two eigenvalues are extracted for the buckling projection using an eigenvalue extraction method appropriate for the form of the tangent stiffness (symmetric or asymmetric). For manual control of follower stiffness symmetry see the description of user PARAMETERS FOLLOWWK and FKSVMFAC.

5. If NLBUCK=0.3 and the TOTTIME on the NLSTEP Buck Data entry is 1.0 then the buckling will be computed at load steps 0.3, 0.6, 0.9, and 1.0. Also, if the load factor is not a multiple of  $r$  then the next load factor will be used; for example, if TOTIME=1.0 and there are 50 load increments and  $r=.45$  then buckling will be computed at load factors 0.46, 0.90, and 1.0.
6. There are three methods of eigenvalue extraction available for nonlinear buckling—Lanczos (EIGRL or EIGR entry with METHOD=LAN), enhanced inverse power method (EIGB entry with METHOD=SINV), and complex (EIGC entry) for unsymmetric stiffness due to follower stiffness.
  - a. If no METHOD and no CMETHOD command is specified, then the program will automatically attempt to compute two modes (ND=2) with an unspecified eigenvalue range (F1 and F2) using the real Lanczos method if the stiffness matrix is symmetric or the complex Lanczos method if the stiffness matrix is unsymmetric.
  - b. The Lanczos method is recommended in most cases especially in finding the lowest mode.
  - c. If no modes can be found with no eigenvalue range was specified, then it is highly recommended that a range (L1 and L2 on EIGB, F1 and F2 on EIGR, and V1 and V2 on EIGRL) be specified.
  - d. If higher modes are desired, then the enhanced inverse power method is recommended with a narrow eigenvalue range specified for L1 and L2 on the EIGB entry.
  - e. If a METHOD command is specified but the stiffness is unsymmetric then User Warning Message 9430 will be issued.
7. Guidelines and limitations:
  - a. NLPARAM Case Control command is not permitted in a nonlinear buckling step. NLSTEP must be specified in the nonlinear buckling step and KMETHOD=PFNT (default) is strongly recommended along with NO=1 for FIXED time stepping or INTOUT=YES for ADAPT time stepping. If KMETHOD=ITER then KSTEP=1 is strongly recommended.
  - b. It is strongly recommended that PARAM,LGDISP,1 is specified.
  - c. It is strongly recommended to specify an eigenvalue range on the EIGR, EIGRL, EIGB, and EIGC Bulk Data entries. But with NLBUCK=ALL it may be difficult to define a range for all load increments.

## NLHARM

### Nonlinear Harmonic Analysis Parameter Selection

Selects the parameters used for nonlinear harmonic response analysis.

#### Format:

NLHARM = n

#### Example:

NLHARM = 79

Describer	Meaning
n	Set identification of NLHARM Bulk Data entry. (Integer > 0)

#### Remarks:

1. This entry references the NLHARM Bulk Data entry which defines the number of subharmonics and harmonics to be used in the analysis as well as referencing the excitation frequency specification.
2. Gyroscopic terms are included if the RGYRO Case Control command and Bulk Data entry are specified. If gyroscopic terms are desired, the user must specify the constant roter speed (ASYNC option) for the reference rotor.

**NLIC****Nonlinear Initial Condition or Preload**

Selects a previously executed load increment as the initial conditions or preload for a nonlinear or perturbation STEP in SOL 400.

**Format:**

$$\text{NLIC} \left[ \text{SUBCASE } i \left[ , \text{STEP } j \left[ , \left[ \begin{array}{c} \text{LOADFACT} \\ \text{TIME} \end{array} \right] \left[ \begin{array}{c} (T = \text{tol}) \\ \text{NEAR} \end{array} \right] f \right] \right] \right]$$
**Example:**

```
NLIC SUBCASE 100 STEP 10 LOADFACT 0.8
NLIC SUBCASE 100 STEP 10 LOADFACT (t=0.01) 0.66
NLIC STEP 10 TIME 12.0
NLIC TIME NEAR 7.8
```

Describer	Meaning
SUBCASE	Keyword to select the SUBCASE ID
i	Specifies the identification number of a previously executed subcase. (Integer > 0; Default is the subcase where the current NLIC is located).
STEP	Keyword to select the STEP ID.
j	Specifies the identification number of a previously executed STEP (Integer > 0, Default is the last STEP).
LOADFACT	Keyword to select load factor or time. Both keywords are equivalent.
TIME	
f	Specifies the load factor of a previously executed load increment in linear or nonlinear static analysis (Real > 0.0, see Remark 3 for default).
T	Keyword to select the tolerance.
NEAR	Keyword for the nearest load factor or time to f.
tol	Specified the load factor or time tolerance to f. (Real ≥ 0.0; Default = 1.0E-06)

**Remarks:**

1. The NLIC command can only point to a load increment whose output flag is on - an available restart point in the static analysis. If NLIC is not pointing to an available restart point, a fatal error will be issued and the job will be terminated.
2. The NLIC can be used in nonlinear static, nonlinear transient and perturbation analysis. If SUBCASE referred in NLIC is not the current SUBCASE, this usage is not recommended. The system(779) = 1 may be used to avoid this usage, which stops the job in this case.

3. For nonlinear transient analysis (ANALYSIS=NLTRAN), NLIC can only appear in the first transient analysis STEP in a SUBCASE. (Note that the first transient analysis step may not be the first step of subcase.) Otherwise, it will be ignored and a warning message will be issued.
4. For linear perturbation analysis, NLIC must point to a previous NLSTATIC step in the same SUBCASE.
5. If NLIC is specified without any of the keywords, or NLIC is not present in a nonlinear STEP or perturbation STEP, the initial condition or PRELOAD is taken from the last available restart point in the immediate previous static step.
6. In the same nonlinear transient step, NLIC cannot appear together with the IC Case Control command. A fatal error message will be issued if NLIC and IC appear in the same step. Please note that IC is meaningful only in the first STEP of a SUBCASE, and the step is a nonlinear transient analysis.
7. When Keyword NEAR is used, the search for the nearest load factor or time is limited inside the specified SUBCASE i STEP j.
8. NLIC can be used in SOL 400 only.
9. If NLIC is used with ANALYSIS=NLSTATIC it may cause convergence problems. If NLIC is used across different subcases: the initial conditions, the deformation, the strains, the stresses, etc., are carried over between Subcases. However, the load is NOT carried over. This can cause an unbalanced load condition that may cause convergence problems.

**NLLOAD**

## Nonlinear Load Output Request

Requests the form and type of nonlinear load output for transient problems.

**Format:**

$$\text{NLLOAD}[(\text{PRINT}, \text{PUNCH})] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Example:**

NLLOAD=ALL

Describer	Meaning
PRINT	The printer will be the output medium.
PUNCH	The punch file will be the output medium.
ALL	Nonlinear loads for all solution points will be output.
NONE	Nonlinear loads will not be output.
n	Set identification of a previously appearing SET command. Only nonlinear loads for points with identification numbers that appear on this SET command will be output (Integer > 0).

**Remarks:**

1. Nonlinear loads are output only in the solution (d or h) set.
2. The output is available in SORT2 format only.
3. Both PRINT and PUNCH may be used.
4. NLLOAD=NONE allows overriding an overall output request.

## NLOPRM

## Nonlinear Regular and Debug Output Control Parameters - SOL 400

Controls MSC Nastran nonlinear solution output, debug printout, debug POST and punch-out of contact constraints of MPC and MPCY Bulk Data entries.

### Format:

NLOPRM = [OUTCTRL = {STD,SOLUTION,INTERM}]

$$\left[ \text{NLDBG} = \left\{ \begin{array}{l} \text{NONE} \\ \text{NLBASIC, NRDBG, ADVDBG, } \left\{ \begin{array}{l} \text{N3DBAS} \\ \text{N3DMED} \\ \text{N3DADV} \\ \text{N3DSUM} \end{array} \right\} \end{array} \right\} \right]$$

$$\left[ \text{DBGPOST} = \left\{ \begin{array}{l} \text{NONE} \\ \text{LTIME} \\ \text{LSTEP} \\ \text{LSUBC} \\ \text{ALL} \end{array} \right\}, \left[ \text{MPCPCH} = \left\{ \begin{array}{l} \text{NONE} \\ \text{BEGN, OTIME, STEP} \\ \text{YBEGN, YOTIME, YSTEP} \end{array} \right\} \right] \right]$$

$$\left[ \text{DELIMIT} = \left\{ \begin{array}{l} \text{No} \\ \text{Yes} \end{array} \right\} \right]$$

$$\left[ \text{GRIDINF} = \left\{ \begin{array}{l} \text{No} \\ \text{MAXGRID} \\ \text{GID} \end{array} \right\} \right]$$

### Example(s):

NLOPRM                    OUTCTRL=STD, SOLUTION                    DBGPOST=LTIME  
 NLOPRM                    OUTCTRL=(SOLUTION, INTERM),                    MPCPCH=(OTIME, STEP)

Descriptor	Meaning
OUTCTRL	Selects one or more following nonlinear solution output options
STD	Standard Nastran output (Default)
SOLUTION	Solution set output which does not include solutions for superelements

Describer	Meaning
	INTERM Intermediate nonlinear solution output in OP2 and HDF5 files, at each solution output interval, set by the user through nonlinear solution controls, such as NLPARM.
NLDBG	Keyword selecting one or more debug printout options
	NONE No debug print output (Default)
	NLBASIC Basic nonlinear information printout
	NRDBG Newton-Raphson iteration information printout
	ADVDBG Advance nonlinear debug printout
	N3DBASE For 3D contact, it requests to print out the error tolerance of each contact body in the F06 file.
	N3DMED For 3D contact, it requests to print out the summary table of all contact parameters, in addition to the printout by N3DBAS, in the .f06 file.
	N3DADV For 3D contact, it requests to print out the body contact information in long form, in addition to the printouts by both N3DBAS and N3DMED, in the F06 file.
	N3DSUM For 3D Contact, it simplifies body contact information in N3DADV.
DBGPOST	Selects one of the following debug POST options
	NONE No output (Default)
	LTIME To output all iterations in the last load or time increment
	LSTEP To output all iterations in the last STEP
	LSUBC To output all iterations in the last SUBCASE
	ALL To output all iterations
MPCPCH	Selects one or more following options to punch out contact constraint equations in terms of MPC or MPCY Bulk Data entries in Nastran PCH file. This is not available for segment-to-segment contact.
	NONE No MPC or MPCY punch output (Default)
	BEGN MPC punch in the beginning of the very first iteration
	OTIME MPC punch at every user requested output step
	STEP MPC punch at the end of each load case, such as SUBSTEP, STEP and SUBCASE
	YBEGN MPCY punch in the beginning of the very first iteration
	YOTIME MPCY punch at every user requested output step
	YSTEP MPCY punch at the end of each load case, such as SUBSTEP, STEP and SUBCASE)
DELIMIT	Select output of delimiter for subcases, steps, increments, and iterations.

Describer	Meaning
	No No output (default)
	Yes Select output
GRIDINF	Select output of grid point information (1) displacements of the grid; (2) EID: element ID connected to this grid; (3) PID: property ID of relevant elements; (4) ID of contact body which the grid belongs to; and, (5) if the grid locates on the surface of contact body.
	No No output (default)
	MAXGRID Output information of grid which has maximum displacement component
	GID Output information of grid which user specifies

**Remarks:**

1. This Case Control command is used to better control nonlinear solution output during solution process, to provide MSC users a direct access to nonlinear solutions even the job is still running, to give the users some tools to debug the nonlinear solution process and gain some insight of nonlinear solution procedure, and to allow users to print out MPC and MPCY equations from contact constraints before and during solution process.
2. OUTCTRL=SOLUTION is designed to debug nonlinear analysis which may fail during the analysis. For other selections, some results such as displacement, SPC force, and so on, are written into F06 file only after the analysis is finished completely. This is helpful for user to understand the nonlinear analysis when job is terminated abnormally. With OUTCTRL=SOLUTION, only part of the results will be output. Availability of output request for debugging purposes are summarized at the following table.

Output Request	OP2	F06
BOUTPUT	NO	YES
DISPLACEMENT	YES	YES
GPFORCE	NO	NO
MPCFORCES	YES	YES
NLSTRESS	NO	YES
OLOAD	YES	YES
SPCFORCES	YES	YES
STRESS	NO	NO
STRAIN	NO	NO

Please note that OP2 file only includes the results at the end time of every load step, instead of the user-specified output intervals assigned in NLSTEP or NLPARM. It is recommended to use OUTCTRL=SOLUTION,INTERM to get nonlinear solutions in both F06 and intermediate OP2 files for debugging purposes.

3. For OUTCTRL = INTERM, the intermediate output is only available in OP2 file. GPFORCE is not available in intermediate OP2 files and can be obtained by OUCTRL=STD.
4. For NLDBG, all nonlinear information is printed out in only F06 file.
5. For DBGPOST, all nonlinear information is printed out in the MASTER/DBALL.
6. For MPCPCH, it is a punch output that MPC and MPCY requests cannot be mixed.
7. In MPCPCH punch output, it is restricted that SID=1 for a general contact and SID=2 for the glued contact.
8. When using MPCPCH for the permanent glued contact, user may specify any keyword of BEGN, STEP and OTIME to punch output MPC type of constraints, or any keyword of YBEGN, YSTEP and YOTIME to punch out MPCY type of constraints.
9. The output to the file is also influenced by the NLPACK Param. For example, one NLTRAN analysis has NLSTEP as:

```
NLSTEP, 900, 0.2
, fixed, 2000, 20
, mech, u
```

It has total 2000 increments, and is asked output every 20 increments. Therefore, total output is 100 time step. In NASTRAN, default value of NLPACK is 100, in this model, therefore, NASTRAN will write the results to OP2 after collecting 100 output, i.e., this model will write results to OP2 only one time. With "intermediate output request, you will have only one OP2 file.

If NLPACK=1, NASTRAN will write results to OP2 for every output request. In this model, NASTRAN will write results to OP2 for every output request, i.e., writing 100 times in this model. With "intermediate output request, you will have 100 OP2 files.

If NLPACK=2, NASTRAN will write results to OP2 for every two output requests. In this model, NASTRAN will write results to OP2 for every two output request, i.e., writing 50 times in this model. With "intermediate output request, you will have 50 OP2 files.

10. MPCPCH is not supported in thermal contact with DQNEAR because MPC constraints do not apply to the near thermal contact behavior.

## NLPARM

### Nonlinear Static Analysis Parameter Selection

Selects the parameters used for nonlinear static analysis.

#### Format:

NLPARM = n

#### Example:

NLPARM=10

Describer	Meaning
n	Set identification of NLPARM and NLPCI Bulk Data entries (Integer > 0).

#### Remarks:

1. NLPARM and NLPCI Bulk Data entries will not be used unless selected.
2. NLPARM may appear above or within a subcase.
3. For SOL 600, the only fields used are ID, NINC, DT (creep only), EPSU, EPSP, and EPSW. Use PARAM,MARCOTIM instead of INTOUT. For other fields, advanced convergence controls are available using the NLAUTO, NLSTRAT, and PARAM,MARCDEF Bulk Data entries.

## NLRESTART

## Nonlinear Restart Request

Request a RESTART execution at a specified point for SOL 400.

Please note that when running NLRESTART with Advanced Nonlinear Element, the Data Blocks for Advanced Nonlinear Element must be saved in the corresponding cold start run with the proper DBSAVE, NLPACK, and INTOUT. See Remark 12.

### Format:

$$\text{NLRESTART} \left[ \text{SUBCASE } i \left[ , \text{STEP } j \left[ , \begin{array}{l} \text{LOADFAC } f \\ \text{TIME } t \end{array} \right] \right] \right] [\text{OVERRIDE}]$$

### Example:

```
NLRESTART SUBCASE 1, STEP 2, LOADFAC 0.3
```

Descriptor	Meaning
i	Specifies the identification number of a previously executed SUBCASE (Integer; Default is the first SUBCASE).
j	Specifies the identification number of a previously executed STEP (Integer; Default is the first STEP).
f	Specifies the load factor of a previously executed load increment in nonlinear static analysis (Real; $0.0 \leq f \leq 1.0$ ; Default = 1.0).
t	Specifies the time of a previously executed time step in nonlinear transient analysis (Real; $t_0 \leq t \leq t_n$ , where $t_0$ is the initial time of STEP j, and $t_n$ is the last time of STEP j; Default = $t_n$ ).
OVERRIDE	To force the run to continue even though there are fundamental changes to the model's geometry, properties, and/or connectivity. In general, NLRESTART does not allow changes to the model's geometry, properties, or connectivity and UFM 9424 will be issued if a change is detected. Please be cautious in using OVERRIDE because the model changes may result in wrong answers and/or a fatal termination and, therefore, is not recommended in all cases.

### Remarks:

1. The NLRESTART command can be used in SOL 400 (NONLIN) only.
2. The NLRESTART command must appear before any SUBCASE command.
3. To perform a restart, the data base for the original run must be made available by using the ASSIGN File Management statement or other equivalent method.

4. The restart run can only be executed at a load increment (or time step) whose output flag is on an available restart point. (See the field INTOUT on the NLPARM Bulk Data entry, and NO on ). When a user-specified restart point is not available, the closest previous restart point that is available will be applied automatically.
5. If only NLRESTART is specified, a restart begins from the last available restart point in the previous run. Otherwise, at least one set of the SUBCASE i, STEP j, or LOADFC f (or TIME t) must be specified.
6. In static analysis, f is reset to 0.0 when  $f < 0.0$ , and it makes the restart begin from the beginning of STEP j. f is reset to 1.0 when  $f > 1.0$ , which makes the restart begin from the beginning of the next STEP (after STEP j).
7. In transient analysis, t is reset to  $t_0$  when  $t < t_0$ , and it makes the restart begin from the beginning of STEP j. t is reset to  $t_n$  when  $t > t_n$ , which makes the restart begin from the beginning of the next STEP (after STEP j).
8. The NLRESTART Case Control command must contain all of the commands used in the original execution up to the point where the restart is requested.
9. All data contained on the database from the restart point will be deleted when the restart begins.
10. When using NLRESTART, its corresponding COLD START input model should not use "PARAM,DBALL,SCRATCH", which will remove the database required for NLRESTART after completion of COLD START run.
11. NLRESTART is used for Nonlinear Restart Request. The restart step must be a nonlinear analysis, NLSTAT or NLTRAN. NLRESTART from perturbation step or thermal analysis step is not supported in SOL400.
12. DBSAVE in the Case Control Section is used to control saving of datablocks of advanced nonlinear elements for static and transient nonlinear analysis in SOL 400.
  - 1 No datablocks of advanced nonlinear elements is saved
  - 0 Saving datablocks of advanced nonlinear elements at the end of each loadcase (default)
  - >0 Saving datablocks of advanced nonlinear elements at the every nth output request of results

In DBSAVE=0, NLRESTART may start at the end of the loadcase (load step) for advanced nonlinear elements. If DBSAVE=n (>0), NLRESTART may start at the every INTOUT\* n th output point.

For NLTRAN analysis in SOL 400, the output to the file, i.e., NLRESTART usage, is also influenced by the NLPACK Param. For example, one NLTRAN analysis has NLSTEP as:

```
NLSTEP, 900, 0.2
, fixed, 2000, 20
, mech, u
```

It has total 2000 increments, and is asked output every 20 increments. Therefore, total output is 100 time step. In NASTRAN, default value of NLPACK is 100, in this model, therefore, NASTRAN will write the results to OP2 after collecting 100 output, i.e., this model will write results to OP2 only one time. With intermediate output request, you will have only one OP2 file.

If NLPACK=1, NASTRAN will write results to OP2 for every output request. In this model, NASTRAN will write results to OP2 for every output request, i.e., writing 100 times in this model. With intermediate output request, you will have 100 OP2 files.

If NLPACK=2, NASTRAN will write results to OP2 for every two output requests. In this model, NASTRAN will write results to OP2 for every two output request, i.e., writing 50 times in this model. With intermediate output request, you will have 50 OP2 files.

Similarly, NLRESTART can be started at those output points ONLY.

13. When NLRESTART is used with Advanced Nonlinear Elements in a linear perturbation analysis, if the cold start run is not a linear perturbation analysis itself, then MDLPRM,NLRSTRTM,1 must be used in the cold start run to allow proper memory allocation between the two runs.

## NLSTEP

### Nonlinear Control Parameters for Mechanical, Thermal, and Coupled Analysis Selection

Selects integration and output time steps for static and transient nonlinear analysis in SOL 400.

#### Format:

NLSTEP=*n*

#### Example:

```
NLSTEP=10
SUBSTEP=1
ANALYSIS=HSTAT
SUBSTEP=2
ANALYSIS=NLSTAT
```

Describer	Meaning
<i>n</i>	Identification number of a NLSTEP Bulk Data entry. (Integer > 0).

#### Remarks:

1. An NLSTEP entry can be selected to execute a nonlinear static or nonlinear transient analysis in SOL 400. A NLSTEP is used in lieu of a NLPARM or both.
2. If a NLSTEP is present *anywhere* in a SUBCASE, then any NLPARM or entries in the SUBCASE *will be ignored*.
3. When used for coupled analysis, the NLSTEP must be above the first SUBSTEP command. A *single* NLSTEP entry is *used for all SUBSTEPS* of the STEP. (See the above example for use with coupled analysis.)

**NLSTRESS**

## Nonlinear Element Stress Output Request

Requests the form and type of nonlinear element stress output in SOLs 106 and 400.

**Format:**

$$\text{NLSTRESS} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right), [\text{NLOUT} = m] \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{See Remark 3} \end{array} \right\}$$

**Examples:**

```
NLSTRESS=5
NLSTRESS (SORT1, PRINT, PUNCH, PHASE)=15
NLSTRESS (PLOT)=ALL
NLSTRESS (NLOUT=23)=ALL
```

Describer	Meaning
SORT1	Output will be presented as a tabular listing of elements for each load.
SORT2	Output will be presented as a tabular listing of load for each element type.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Stresses for all nonlinear elements will be output.
n	Set identification of a previously appearing SET command. Only stresses for elements with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	No nonlinear element stress will be output (Default).
NLOUT	For SOL 400 only. Allows the selection of additional types of nonlinear output.
m	Identification of a NLOUT Bulk Data entry. (Integer > 0)

**Remarks:**

1. ALL should not be used in a transient problem due to potentially excessive output.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. If there is a stress request, the default output set is that of the STRESS request.
4. For NLTRAN analysis, NLSTRESS does not support SORT1 selection.

**NONLINEAR**

## Nonlinear Dynamic Load Set Selection

Selects nonlinear dynamic load set for transient response or nonlinear harmonic response problems.

**Format:**

NONLINEAR = n

**Example:**

NONLINEAR=75

Describer	Meaning
n	Set identification of NOLINi, NLRGAP or NLRSFD Bulk Data entry (Integer > 0).

**Remark:**

1. Nonlinear force Bulk Data entries (NOLINi, NLRGAP or NLRSFD) will be ignored unless selected in the Case Control Section.
2. At least one degree of freedom must be defined on a nonlinear force entry and called up by the NONLINEAR Case Control command in nonlinear harmonic response.

## NOUTPUT

### Normal Output Request in Cyclic Symmetry Problems

Requests physical output in cyclic symmetry problems.

#### Format:

$$\text{NOUTPUT} \left\{ k, \begin{matrix} R \\ L \end{matrix} \right\} = \left\{ \begin{matrix} \text{ALL} \\ m \end{matrix} \right\}$$

#### Examples:

```
NOUTPUT (R) =ALL
NOUTPUT (2) =5
NOUTPUT (4, L) =10
```

Describer	Meaning
ALL	Output for all segments is desired.
m	Output for segments specified in SET m is desired (Integer > 0).
k	Used in eigenvalue analysis to request eigenvector and internal force output for harmonics specified in SET k (Integer > 0).
R, L	Output for only the right- or left-half of segments specified as ALL or in SET m. R and L are used in dihedral symmetry only.

#### Remarks:

1. Sets k and m are defined on SET commands.
2. In cyclic symmetry analysis, this command, or the HOUTPUT command, is required to obtain data recovery.

**NSM****Selects Nonstructural Mass Set Entries**

Selects nonstructural mass (NSM) set for mass generation.

**Format:**

NSM = n

**Example:**

NSM = 5

Describer	Meaning
n	Set identification number of a nonstructural mass that appears on a NSM, NSML, NSM1, NSML1, or NSMADD Bulk Data entry (Integer > 0).

**Remark:**

1. Different NSM sets may be selected for superelements and residuals but within a superelement or residual it may not change within the subcase structure.

## NVELOCITY

### Velocity Normal Output Request

Request output of velocity normal for structural grids in SOLs 108 and 111 only.

#### Format:

$$\text{NVELOCITY} \left[ \left( \begin{array}{l} \text{[SORT1]} \\ \text{[SORT2]} \end{array} \right), \left( \begin{array}{l} \text{[PRINT, PUNCH]} \\ \text{PLOT} \end{array} \right), \left( \begin{array}{l} \text{[REAL or IMAG]} \\ \text{[PHASE]} \end{array} \right), \text{ERP} \right] = \left. \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

NVELOCITY (PLOT, ERP) = ALL

Describer	Meaning												
SORT1	Output will be presented as tabular listing of grid points for each excitation frequency (Default).												
SORT2	Output will be presented as tabular listing of excitation frequencies for each grid point.												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											

\* The .op2 binary database file will be generated with "PARAM,POST, X" (or the POST Case Control command), while the .h5 binary database file will be generated with "MDLPRM,HDF5, X" specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAGE yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is In degrees.
ERP	Flag to accept ERP set convention.
ALL	Velocity normal will be computed for all surface structural grid points.
n	Set identification of a previously defined set of grid points. Velocity Normal will be computed for the grid points in this set only.
NONE	Velocity normal will not be processed.

Describer	Meaning
-----------	---------

**Remarks:**

1. NVELOCITY = NONE overrides an overall request.
2. The PLOT option is used if results are requested for post-processing but no printed or punched output is desired.
3. Even with NVELOCITY=all, Velocity Normal will be computed only for structural grids at the surface of the model. Fluid grids, if exist, are not included in NVELOCITY output.
4. With ERP flag in NVELOCITY command, structural grids of all ERPPNL will be considered as candidates for NVELOCITY output and subjected to further screening of NVELOCITY set.
5. For 3D model, ERPPNL points to SET3 with all PSOLID IDs in the model is the easiest way to compute NVELOCITY of structural surface GRIDs.
6. This Case Control command can be used in SOL 108 and SOL 111 only

**OFREQUENCY**

## Output Frequency Set

Selects a set of frequencies for output requests.

**Format:**

$$\text{OFREQUENCY} = \left\{ \begin{array}{c} \text{ALL} \\ n \end{array} \right\}$$

**Examples:**

OFREQUENCY=ALL  
OFREQUENCY=15

Describer	Meaning
ALL	Output for all frequencies will be computed.
n	Set identification of a previously appearing SET command. Output for frequencies closest to those given on this SET command will be output (Integer > 0).

**Remarks:**

1. In real eigenvalue, buckling, and complex eigenvalue analyses, the OMODES Case Control command allows for an alternate way of selecting the modes to be output based on their mode numbers. In these cases, if both the OMODES and OFREQUENCY requests appear, the OMODES request takes precedence.
2. If this command is not specified in the Case Control Section (or, in the case of real eigenvalue, buckling, and complex eigenvalue analyses, if neither the OMODES nor the OFREQUENCY request is specified), then output will be generated for all frequencies.
3. The number of solutions selected will always be equal to the number of quantities in the selected set. The closest values are used.
4. In flutter analysis (SOL 145), the selected set refers to the imaginary part of the complex eigenvalues. The physical interpretation of this quantity depends on the method of flutter analysis as follows:
  - K- or KE-method: velocity (input units).
  - PK-method: frequency.
5. In aeroelastic response analysis (SOL 146) with RLOAD selection, the selected set refers to the frequency (cycles per unit time).
6. In complex eigenvalue analysis (SOLs 107 and 110), the selected set refers to the imaginary part of the complex eigenvalues.
7. If this command is specified in more than one subcase, then it is recommended that the first subcase contain OFREQ=ALL, and that subsequent subcases contain OFREQ = n. Also, data recovery requests should be specified only in the subsequent subcases. For example:

```
SUBCASE 1
OFREQ = ALL $ 0.0 through 0.5
SUBCASE 2
SET 10 = 0.0 0.1 0.3
OFREQ = 10
DISP = ALL
SUBCASE3
SET 20 = 0.4 0.5
OFREQ = 20
STRESS = ALL
```

## OIMPERFECT

### Request Output of Imperfection

Request output imperfection vectors in SOL 400. Imperfection vectors are coordinate variations applied on grid points to express geometric imperfection.

#### Format:

$$\text{OIMPERFECT} \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array}, \text{GEOM} \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

#### Examples:

OIMPERFECT(GEOM) = 5

OIMPERFECT(PLOT)=ALL

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

GEOM	To output grid points with updated coordinates in punch file.
ALL	Imperfection vectors for all points will be output.
n	Set identification of a previously appearing SET command. Only imperfection vectors of points with identification numbers that appear on this SET command will be output.
NONE	Imperfection vectors for no points will be output.

#### Remark:

1. This command must be above all subcases.

## OLOAD

### Applied Load Output Request

Requests the form and type of applied load vector output.

#### Format:

$$\text{OLOAD} \left( \left( \begin{matrix} \text{SORT1} \\ \text{SORT2} \end{matrix} \right), \left[ \begin{matrix} \text{PRINT, PUNCH} \\ \text{PLOT} \end{matrix} \right], \left[ \begin{matrix} \text{REAL or IMAG} \\ \text{PHASE} \end{matrix} \right], \left[ \begin{matrix} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{matrix} \right], \right. \\ \left. \left[ \begin{matrix} \text{RPRINT} \\ \text{NORPRINT} \end{matrix} \right], \text{RPUNCH}, [\text{CID}] \right) = \left\{ \begin{matrix} \text{ALL} \\ \text{n} \\ \text{NONE} \end{matrix} \right\}$$

#### Examples:

```
OLOAD=ALL
OLOAD (SORT1, PHASE)=5
OLOAD (SORT2, PRINT, PSDF, CRMS, RPUNCH=20
OLOAD (PRINT, RALL, NORPRINT)=ALL
```

Describer	Meaning												
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.												
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.												
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.												

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

Describer	Meaning
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 10.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 10.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level and RANDOM must be selected in the Case Control Section. See Remark 10.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in the Case Control. See Remark 10.
RPRINT	Writes random analysis results to the print file (Default).
NORPRINT	Disables the writing of random analysis results to the print file.
RPUNCH	Writes random analysis results to the punch file.
CID	Requests printing of output coordinate system ID to printed output file (.f06).
ALL	Applied loads for all points will be output. See Remarks 1. and 7.
NONE	Applied load for no points will be output.
n	Set identification of a previously appearing SET command. Only loads on points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2. In the SORT1 format, only nonzero values will be output.
2. In a statics problem, a request for SORT2 causes loads at all requested points (zero and nonzero) to be output.
3. OLOAD=NONE overrides an overall output request.
4. In the statics superelement solution sequences, and in the dynamics solution sequences (SOLs 107 through 112, 118, 145, 146, and 200). OLOADs are available for superelements and the residual structure. Only externally applied loads are printed. Loads transmitted from upstream superelements are not printed. Transmitted loads can be obtained with GPFORCE requests.

In the nonlinear transient analysis solution sequences (SOLs 129 and 159), OLOADs are available only for residual structure points and include loads transmitted by upstream superelements.

5. In nonlinear analyses SOL 106 and 129, OLOAD output will not reflect changes due to follower forces. But SOL 400 OLOAD output reflects the follower force change correctly. Notes, in SOL 400, the first OLOAD output before starting nonlinear iteration process, only reflects total non-follower force without thermal load and follower force.
6. Loads generated by the SPCD Bulk Data entry do not appear in OLOAD output.
7. In SORT1 format, OLOADs recovered at consecutively numbered scalar points are printed in groups of six (sextets) per line of output. However, if a scalar point is not consecutively numbered, it will begin a new sextet on a new line of output. If a sextet can be formed and it is zero, then the line will not be printed. If a sextet cannot be formed, then zero values may be output.
8. OLOAD results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
9. In static inertia relief analysis, the OLOAD output includes both the inertia loads and applied loads.
10. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
11. Note that the CID keyword affects only grid point related output, such as DISP, VELO, ACCE, OLOAD, SPCF and MPCF. In addition, CID the keyword needs to appear only once in a grid point related output request anywhere in the Case Control Section to turn on the printing algorithm.
12. OLOAD output is not available in SOL 600.

## OMODES

## Output Modes Set

Selects a set of modes for output requests.

### Format:

$$\text{OMODES} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \end{array} \right\}$$

### Examples:

```
OMODES = ALL
OMODES = 20
```

Describer	Meaning
ALL	Output for all extracted modes will be computed (Default).
n	Set identification of a previously appearing SET command. Output for those extracted modes appearing on this SET command will be computed.

### Remarks:

1. This command is valid only in SOLs 103, 105, 107, 110, 111, 112, 145, 146, 200 and 400. It is ignored in all other analyses.
2. In contrast to the OFREQUENCY Case Control command, which provides an alternate way of selecting the modes to be output based on their frequencies, the OMODES command allows mode selection based on integer mode ID. For example:

```
SUBCASE 10
...
SET 11 = 1, 3, 5, 7
OMODES = 11
DISP = ALL
...
SUBCASE 20
...
SET 21 = 25., 28., 31.
OFREQ = 21
DISP = ALL
...
```

3. If both the OMODES and the OFREQUENCY requests appear, the OMODES request takes precedence.
4. If neither the OMODES nor the OFREQUENCY request is specified, output will be generated for all modes.
5. Note that the OMODES command has no effect on the number of modes computed. It only selects a subset of the computed modes for which output is to be generated.

6. In superelement analysis, the set definition, using an OMODES command, for an upstream superelement, will not be recognized unless a similar request appears for its downstream neighbor. The downstream request should either be comprised of the union of all upstream requests, or left blank, as the OMODES default is ALL. Note that the program does not check to see if this condition is satisfied.
7. If OMODES is used in conjunction with a FATIGUE case control command, the OMODES request must be for contiguous modes from 1 through n and the FTGLOAD bulk data entries cannot invoke modes greater than n.
8. OMODES is intended to be specified above all subcases or in the first subcase. In SOLs 200 and 400, the first subcase would be the first subcase with ANALYSIS=MODES, MTRAN, MFREQ, MCEIG, SEAERO, and FLUTTER. See the MODES command to allow different output requests for individual modes.

**OTIME**                      Output Time Set

Selects a set of times for output requests.

**Format:**

$$\text{OTIME} = \left\{ \begin{array}{c} \text{ALL} \\ n \end{array} \right\}$$

**Examples:**

```
OTIME =ALL
OTIME =15
```

Descriptor	Meaning
ALL	Output for all times will be computed.
n	Set identification number of a previously appearing SET command. Output for times closest to those given on this SET command will be computed (Integer > 0).

**Remarks:**

1. If the OTIME command is not supplied in the Case Control Section, then output for all times will be computed.
2. This command is particularly useful for requesting a subset of the output (e.g., stresses only at peak times, etc.).
3. This command can be used in conjunction with the MODACC module to limit the times for which modal acceleration computations are performed.
4. If this command is specified in more than one subcase in the modal solution sequences, then it is recommended that the first subcase contain OTIME=ALL, and that subsequent subcases contain OTIME=n. Also, data recovery requests should be specified only in the subsequent subcases. For example:

```
SUBCASE 1
  OTIME ALL
SUBCASE 2
  OTIME = 10
  SET 10 = . . .
  DISP = ALL
SUBCASE 3
  OTIME = 20
  SET 20 = . . .
  STRESS = ALL
```

5. The OTIME command is not effective in nonlinear transient analysis (SOL 129) or in SOL 400, ANALYSIS=NLTRAN. However, the OTIME command can be used in the nonlinear transient thermal analysis (SOL 159) and in SOL400, ANALYSIS=HTRAN to limit the output to specified output times.

6. In superelement analysis, the set definition, using an OTIME command for an upstream superelement, will not be recognized unless a similar request appears for its downstream neighbor. The downstream request should either be comprised of the union of all upstream requests, or left blank, as the OTIME default is ALL. Note that the program does not check to see if this condition is satisfied.

## OUTPUT

### Case Control Delimiter

Delimits the various types of commands for the structure plotter, curve plotter, grid point stress.

#### Format:

$$\text{OUTPUT} \left[ \left( \left\{ \begin{array}{c} \text{PLOT} \\ \text{POST} \\ \text{XYOUT} \\ \text{XYPLOT} \end{array} \right\} \right) \right]$$

#### Examples:

OUTPUT (POST)  
 OUTPUT (PLOT)  
 OUTPUT (XYOUT)

Describer	Meaning
PLOT	Beginning of the structure plotter request. This command must precede all structure plotter control commands. Plotter commands are described in <a href="#">OUTPUT(PLOT) Commands</a> .
POST	Beginning of grid point stress SURFACE and VOLUME commands. This command must precede all SURFACE and VOLUME commands. These commands are described in <a href="#">OUTPUT(PLOT) Commands</a> .
XYOUT or XYPLOT	Beginning of curve plotter request. This command must precede all curve plotter control commands. XYPLOT and XYOUT are equivalent. Curve plotter commands are described in <a href="#">X-Y PLOT Commands</a> .

#### Remarks:

1. The structure plotter request OUTPUT(PLOT), the curve plotter request OUTPUT(XYOUT or XYPLOT), and the grid point stress requests (OUTPUT(POST)) must follow the standard Case Control commands.
2. If OUTPUT is specified without a describer, then the subsequent commands are standard Case Control commands.
3. Case Control commands specified after OUTPUT(POST) are SURFACE and VOLUME.
4. This command must appear at the end of normal Case Control just above the Begin Bulk Command. Any Case Control command, controlling, say, selection and flow of the MSC Nastran run such as TEMP(LOAD), that occurs after this entry, will be ignored.

## P2G Direct Input Load Matrix Selection

Selects direct input load matrices.

### Format:

P2G=name

### Example:

```
P2G = LDMIG
P2G = LDMIG1, LDMIG2, LDMIG3
SET 100 = LDMIG, L1, L8
P2G = 100
P2G = 1.25*LDMIG1, 1.0*LDMIG2, 0.82*LDMIG3
```

Describer	Meaning
name	Name of a $[P_g^2]$ matrix to be input on the DMIG Bulk Data entry, or name list with or without factors. See Remark 4. (Character).

### Remarks:

- Terms are added to the load matrix before any constraints are applied.
- The matrix must be columnar in form (e.g., Field 4 on DMIG entry, IFO, must contain the integer 9.)
- A scale factor may be applied to this input using the user parameter PARAM,CP2. See [Parameters](#).
- The formats of the name list:
  - Names without factor.  
Names separated by a comma or blank.
  - Names with factors.  
Each entry in the list consists of a factor, followed by a star, followed by a name. The entries are separated by a comma or blank. The factors are real numbers. Each name must be paired with a factor including 1.0.
- SOL 101: P2G should be selected above all subcase. The number of columns specified for NCOL on the DMIG Bulk Data entry must equal the number of subcases.

SOL 106 and SOL 400: There are two choices. P2G may be selected in every subcase (or step in SOL 400), with NCOL=1. Otherwise, P2G may be selected above the subcases and PARAM,CP2 selected in every subcase.

## PACCELERATION

## Particle Acceleration Output Request for SOL 108/111

Request the form and frequency steps of particle acceleration output.

### Format:

$$PACCELERATION \left( \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \text{SOLUTION} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setf} \end{array} \right\} \right] \right) =$$

$$\left\{ \begin{array}{c} \text{ALL} \\ \text{setg} \\ \text{NONE} \end{array} \right\}$$

### Example:

```
PACCELERATION = ALL
SET 20 = 104 THRU 204, 1005 THRU 1901
SET 50 = 105.0, 250.0, 310.0
PACCE (PUNCH, SOLUTION=50) = 20
```

Descriptor	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG	Requests rectangular format (real and imaginary). Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase). Phase output is in degrees.
SOLUTION	Selects a set of excitation frequencies for which the particle accelerations will be processed. The default is all excitation frequencies. See Remark 3.
setf	Set identification of excitation frequencies.
setg	Set identification of grid points on wetted surface. See Remark 2.

**Remarks:**

1. This entry will be available only for fluid-structure coupling problem. The particle acceleration is input force vector to each domain via wetted surface in frequency response analysis.
2. Both fluid and structure grid points can be selected. The particle accelerations of the grid points not on wetted surface will be zero.
3. The selected frequency must be part of the excitation frequencies. If not, the nearest excitation frequency will be selected.
4. Only SORT1 form is supported.

## **PAGE**

## Page Eject

Causes a page eject in the echo of the Case Control Section.

### **Format:**

PAGE

### **Example:**

PAGE

### **Remarks:**

1. PAGE appears in the printed echo prior to the page eject.
2. PAGE is used to control paging in large Case Control Sections.

## PARAM Parameter Specification

Specifies values for parameters. Parameters are described in [Parameters](#).

### Format:

PARAM,n,V1,V2

### Examples:

PARAM,GRDPNT,0  
PARAM,K6ROT,1.0

Descriptor	Meaning
n	Parameter name (one to eight alphanumeric characters, the first of which is alphabetic).
V1, V2	Parameter value based on parameter type, as follows:

Type	V1	V2
Integer	Integer	Blank
Real, single precision	Real	Blank
Character	Character	Blank
Real, double precision	Real, Double Precision	Blank
Complex, single precision	Real or Blank	Real or Blank
Complex, double precision	Real, Double Precision	Real, Double Precision

### Remarks:

1. The PARAM command is normally used in the Bulk Data Section and is described in the [Bulk Data Entries](#).
2. The parameter values that may be defined in the Case Control Section are described in [Parameters](#). Case Control PARAM commands in user-written DMAPs requires the use of the PVT module, described in the [MSC Nastran DMAP Programmer's Guide](#).

## **PARTN** Partitioning Vector Specifications

Specifies a list of grid point identification numbers that will be partitioned with the DMAP module MATMOD (Option 17).

### **Format:**

PARTN=n

### **Example:**

PARTN=10

<b>Describer</b>	<b>Meaning</b>
n	Set identification number of a previously appearing SET command (Integer > 0).

### **Remarks:**

1. The PARTN command and the DMAP module MATMOD provide a convenient method for building a partitioning vector for use in DMAP modules such as PARTN and MERGE.
2. The PARTN command is no longer applicable to coupled fluid-structure analysis. It has been replaced by the FSLPOUT command.

**PEAKOUT**

Control peaks identification process for frequency response analysis

**Format:**

PEAKOUT NPEAK = p, NEAR = q, LFREQ = r, HFREQ = s,

$$RTYPE = \left\{ \begin{array}{l} \text{DISP} \\ \text{VELO} \\ \text{ACCE} \end{array} \right\}, PSCALE = \left\{ \begin{array}{l} \text{NONE} \\ \text{DB} \\ \text{DBA} \end{array} \right\}$$

**Example:**

PEAKOUT NPEAK=4, NEAR=2.0, LFREQ=10.0, HFREQ=200.0, RTYPE=DISP, PSCALE=DBA

Describer	Meaning
NPEAK	Requests the desired number of peaks to extract. See remark 2. (Integer, Default=5).
NEAR	Minimum allowed frequency between two peaks. If two peaks are closer than this value, the lower frequency peak will be ignored. (Real, Default=0.01 Hz)
LFREQ	Lowest frequency used in peak identification. (Real, Default=lowest forcing frequency or 0.0 Hz)
HFREQ	Highest frequency used in peak identification. (Real, Default=highest forcing frequency or 1.0e10 Hz)
RTYPE	Results type for peak identification in structural domain. (Default=DISP)
PSCALE	Scaling method for acoustic pressure results in fluid domain. See remark 3. (Default=NONE)

**Remarks:**

1. This command is meaningful only in frequency response analysis (SOLs 108 and 111) and SOL 200 with DFREQ and MFREQ. It is ignored in all other analyses.
2. The actual number of peaks found may be fewer than the desired number.
3. When requesting dB or dBA, the parameter PREFDB is used as a reference pressure for dB calculation, see ACOUT parameter.
4. All GRIDs referenced on any setdof of PFMODE, PFGRID and PFPANEL requests are required (but not limited to) on a DISP output command. The DISP command must be placed above the SUBCASE level.
5. If non sparse data recovery is requested using PARAM,SPARSEDR,NO, then also PARAM,DDRRMM,-1 is required. Sparse Data recovery is default.
6. External super elements are not supported
7. PARAM,PTHRES can be used to request the PEAKOUT result that exceeds a prescribed frequency-dependent threshold value. Refer the User Parameter Description of [PTHRES](#) for more details.

## PFGRID

## Acoustic Grid Participation Factor Output Request

Requests the form and type of acoustic grid participation factor output.

### Format:

$$PFGRID \left[ \left( \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \text{GRIDS} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setg} \end{array} \right\} \right] \right), \right. \\ \left. \left[ \begin{array}{c} \text{SOLUTION} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setf} \\ \text{PEAK} \\ \text{NONE} \end{array} \right\} \right] \right] = \left\{ \begin{array}{c} \text{setdof} \\ \text{NONE} \end{array} \right\}$$

### Example:

```
SET 10 = 11217
SET 20 = 25., 30., 35.
PFGRID (PHASE, SOLUTION=20) = 10
SET 40 = 11217
PEAKOUT NPEAK=4, NEAR=2.0,
PFGRID (PLOT, PHASE, SOLUTION=PEAK) = 40
```

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

- REAL or IMAG Real and imaginary part of complex results will be output (Default).
- PHASE Magnitude and phase of complex results will be output.
- GRIDS Keyword selecting the structural grid points to be processed; the default is all structural grid points.
- setg Identifier of a set containing the identifiers of the structural grid points to be processed.

Describer	Meaning
SOLUTION	Keyword selecting a set of excitation frequencies for which the participation factors will be processed. Default is all excitation frequencies. PEAK activates the PEAKOUT automatic peak frequency extraction. See PEAKOUT Case Control Command for detailed description of PEAK parameters.
setf	Identifier of a set of excitation frequencies.
setdof	Identifier of a set of fluid degrees of freedom for which the participation factors are to be processed.

**Remarks:**

1. All PFMODE(FLUID), PFPANEL, and PFGRID Case Control commands must reference the same set of fluid degrees of freedom.
2. Acoustic grid participation factors are available in a coupled frequency response analysis (SOL 108 and SOL 111).
3. The SOLUTION keyword can be used to select a subset of solutions available. If set setf is specified, the items in the set are excitation frequencies.

## PFMODE

### Modal Participation Factor (MPF) Output Request

Requests the form and type of modal participation factor (MPF) output.

#### Format:

$$\begin{aligned}
 & \text{PFMODE} \left[ \left( \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \end{array} \right), \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] [\text{PRTMSG}], \right. \\
 & \left. [\text{SORT} = \text{sorttype}], [\text{KEY} = \text{sortitem}], \left[ \text{ITEMS} = \left\{ \begin{array}{c} \text{ALL} \\ (\text{itemlist}) \end{array} \right\} \right], \right. \\
 & \left[ \text{FLUIDMP} = \left\{ \begin{array}{c} \text{ALL} \\ m_f \\ \text{NONE} \end{array} \right\} \right], \left[ \text{STRUCTMP} = \left\{ \begin{array}{c} \text{ALL} \\ m_s \\ \text{NONE} \end{array} \right\} \right], \\
 & \left[ \text{PANELMP} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setp} \\ \text{NONE} \end{array} \right\} \right], \left[ \text{SOLUTION} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setf} \\ \text{PEAK} \\ \text{NONE} \end{array} \right\} \right], [\text{FILTER} = \text{fratio}], \\
 & \left. [\text{NULL} = \text{ipower}]] = \left\{ \begin{array}{c} \text{setdof} \\ \text{NONE} \end{array} \right\}
 \end{aligned}$$

#### Examples:

SET 20 = 11/T3, 33/T3, 55/T3

SET 30 = 420., 640., 660.

PFMODE (STRUCTURE, SOLUTION = 30, FILTER = 0.01, SORT = ABSD) = 20

SET 40 = 1222, 1223

SET 50 = 10., 12.

PFMODE (FLUID, STRUCTMP=ALL, PANELMP=ALL, SOLUTION=50, SORT=ABSD) = 40

PEAKOUT NPEAK=4, NEAR=2.0,

PFMODE (FLUID, STRUCTMP=ALL, PANELMP=ALL, SOLUTION=PEAK) = 40

Describer	Meaning
STRUCTURE	Requests output of MPFs for the response of structural degrees of freedom. See Remark 8. (Default).
FLUID	Requests output of MPFs for the response of acoustic grid points (one degree of freedom per point). See Remark 9.

Describer	Meaning
-----------	---------

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

PRMSG	Request generation of diagnostic messages for badly-defined output sets during PF computations. These badly defined sets generally produce no output. See Remark 15.
SORT	Keyword selecting the sort type. Default is sorting by increasing natural mode number. See Remark 7.
sorttype	Sort option:  ABSA    output will be sorted by absolute value in ascending order. ABSD    output will be sorted by absolute value in descending order. ALGA    output will be sorted by algebraic value in ascending order. ALGD    output will be sorted by algebraic value in descending order.
KEY	Keyword selecting the output item to be used for sorting; default is FRACTION. See Remark 7.
sortitem	Item from the item list, see the following table, on which the sort operation is performed.
ITEMS	Keyword specifying data selected for output to the .pch file
itemlist	One or more of the items in the following table:

Table 5-1 Item List Table

Item Identifier	Description
RESPONSE	Modal participation factor.
PROJECTION	Projected modal participation factor.
FRACTION	Normalized projected modal participation factor.
SCALED	Projected modal participation factor divided by largest magnitude of all modal participation factors.
MODEDISP	Real and imaginary part of modal participation factors. See Remark 7.
MODERESP	Magnitude and phase relative to total response of modal participation factors. See Remark 7.

	If more than one item is selected, the list must be enclosed in parentheses.
FLUIDMP	Keyword to select output of fluid MPFs. See Remarks 2. and 9.
$m_f$	Number of lowest fluid modes for which MPFs will be computed. See Remark 9.
STRUCTMP	Keyword to select output of structural MPFs. See Remarks 8. and 9.
$m_s$	Number of lowest structural modes for which MPFs will be computed. See Remarks 8. and 9.
PANELMP	Keyword to select output of panel MPFs. See Remark 2.
setp	Identifier of a set of panels.
SOLUTION	Selects a set of excitation frequencies for which MPFs will be processed. Default is all excitation frequencies. PEAK activates the PEAKOUT automatic peak frequency extraction. See PEAKOUT Case Control Command for detailed description of PEAK parameters. See Remark 10.
setf	Identifier of a set of excitation frequencies. See Remark 10.
FILTER	Keyword specifying the value of a filter to be applied to the printed output. See Remark 11.
fratio	Filter value (Default is 0.001). See Remark 11.
NULL	Keyword specifying the power of ten used to detect a null response. See Remark 12.
ipower	Power of ten used to detect a null response (Default is 12). See Remark 12.
setdof	Identifier of a set of structural degrees of freedom or acoustic grid points (one degree of freedom per point) for which MPFs are to be processed. See Remark 3.

**Remarks:**

1. All PFMODE(FLUID), PFPANEL, and PFGRID Case Control commands must reference the same set of acoustic grid points.
2. Keywords FLUIDMP and PANELMP are only valid if FLUID is specified.
3. If STRUCTURE is specified, *setdof* must reference a set of structural degrees of freedom. If FLUID is specified, *setdof* must reference a set of acoustic grid points.
4. Acoustic MPFs are available in a coupled modal frequency response analysis (SOL 111) only.
5. Printed output includes results for ALL the data items described in the Item List Table.
6. Punched output includes results for only the data items selected by the ITEMS keyword.
7. MPFs are sorted by increasing order of mode number unless the SORT keyword specifies a different sorting order. If a sorting order is specified, the KEY keyword selects the item that is used for sorting. When MODEDISP is selected, sorting is based on the magnitude. When MODERESP is selected, sorting is based on the real part.
8. The STRUCTURE option selects MPF calculations for structural degrees of freedom. The STRUCTMP value defines the number of lowest structural modes used in final output preparation prior to any filtering. The default is ALL. If STRUCTMP=NONE, no structural MPF is generated.
9. The FLUID option selects MPF calculations for acoustic grid points (one degree of freedom per point). The STRUCTMP value defines the number of lowest structural modes used in final output preparation of acoustic structure MPFs prior to any filtering. The default is NONE. The FLUIDMP value defines the number of lowest fluid modes used in final output preparation of acoustic fluid MPFs prior to any filtering. The default is NONE.
10. The SOLUTION keyword can be used to select a subset of solutions available. If *setf* is specified, the items in the set are excitation frequencies.
11. The filter is applied to the real part of the normalized projected participation factors. Only participation factors that pass the filter are output.
12. If the magnitude of the total response at a selected response degree of freedom is less than  $10^{-ipowr}$ , then no MPFs are processed. If *ipowr* is not in the range of 1 to 31, the default of 12 is used.
13. Acoustic panel MPFs are normalized using the panel response instead of the total response.
14. If present, only the output of acoustic structural MPFs will include the load participation factor. The load participation factor has a mode number of 0 and a resonance frequency of 0. Structural MPFs will not include the load participation factor.
15. Output sets that define no valid model degrees of freedom for data recovery produce no PF output. This condition is usually discovered prior to actual computations and an informational message is generated. Occasionally, when multiple subcases are involved and one of the subcases references an invalid set, the PF calculations are still performed for any valid combinations. PRTMSG can be used to aid in identification of invalid set data under these conditions.

## PFPANEL

## Acoustic Panel Participation Factor Output Request

Requests the form and type of acoustic panel participation factor output.

### Format:

$$\begin{aligned}
 & \text{PFPANEL} \left( \left( \left[ \begin{array}{c} \text{FLUID} \\ \text{STRUCTURE} \end{array} \right] \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \text{PRTMSG} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \right. \\
 & \left. \left[ \text{PANEL} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setp} \end{array} \right\} \right], \left[ \text{SORT} = \text{sorttype} \right], \left[ \text{KEY} = \text{sortitem} \right], \left[ \text{ITEMS} = \left\{ \begin{array}{c} \text{ALL} \\ (\text{itemlist}) \end{array} \right\} \right], \\
 & \left. \left[ \begin{array}{c} \text{SOLUTION} = \left\{ \begin{array}{c} \text{ALL} \\ \text{setf} \\ \text{PEAK} \\ \text{NONE} \end{array} \right\}, \left[ \text{FILTER} = \text{fratio} \right], \left[ \text{NULL} = \text{ipower} \right] \right) \right. \\
 & \left. = \left\{ \begin{array}{c} \text{setdof} \\ \text{NONE} \end{array} \right\} \right)
 \end{aligned}$$

### Example:

```

SET 10 = 10., 12.
SET 20 = 1222, 1223
PFPANEL (SOLUTION=10, FILTER=0.01, SORT=ABSD) = 20
SET 30 = 5001/T2, 6502/T3
PFPANEL (STRUCTURE, SOLUTION=10) = 30
SET 40 = 11217
PEAKOUT NPEAK=4, NEAR=2.0,
PFPANEL (SOLUTION=PEAK, FILTER=0.01, SORT=ABSD) = 40
    
```

Describer	Meaning
FLUID	Request output of MPFs for the response of acoustic grid points (one degree of freedom per point). See Remark 11. (Default)
STRUCTURE	Request output of MPFs for the response of structure degrees of freedom. See Remark 12.
PRINT or (blank)	
PUNCH	
PLOT	

Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
X		X*
	X	X*
		X*

Describer	Meaning
	* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.
PRTMSG	Request generation of diagnostic messages for badly-defined output sets during PF computations. These badly defined sets generally produce no output. See Remark 12..
REAL or IMAG	Real and imaginary part of complex results will be output (Default).
PHASE	Magnitude and phase of complex results will be output.
PANEL	Keyword to select the panels to be processed; default is all panels.
setp	Identifier of a set of panels.
SORT	Keyword selecting the sort type. Default is alphabetic sorting by panel name.
sorttype	Sort option:  ABSA     Output will be sorted by absolute value in ascending order.  ABSD     Output will be sorted by absolute value in descending order.  ALGA     Output will be sorted by algebraic value in ascending order.  ALGD     Output will be sorted by algebraic value in descending order.
KEY	Keyword selecting the output item to be used for sorting; default is FRACTION.
sortitem	Item from the item list, see the following table, on which the sort operation is performed.
ITEMS	Keyword specifying data selected for output to the .pch file.
itemlist	One or more of the items in the following table:

Table 5-2 Item List Table

Item Identifier	Description
RESPONSE	Modal participation factor.
PROJECTION	Projected modal participation factor.
FRACTION	Normalized projected modal participation factor.
SCALED	Projected modal participation factor divided by largest magnitude of all modal participation factors.
MODEDISP	Real and imaginary part of modal participation factors.
MODERESP	Magnitude and phase relative to total response of modal participation factors.

	If more than one item is selected, the list must be enclosed in parentheses.
SOLUTION	Keyword selecting a set of excitation frequencies for which the participation factors will be processed. Default is all excitation frequencies. PEAK activates the PEAKOUT automatic peak frequency extraction. See PEAKOUT Case Control Command for detailed description of PEAK parameters.
setf	Identifier of a set of excitation frequencies.
FILTER	Keyword specifying the value of a filter to be applied to the printed output.
fratio	Filter value (Default is 0.001), see Remark 7.
NULL	Keyword specifying the power of ten used to detect a null response, see Remark 8.
ipower	Power of ten used to detect a null response (Default is 12), see Remark 8.
setdof	Identifier of a set of fluid degrees of freedom for which the participation factors are to be processed.

**Remarks:**

1. All PFMODE(FLUID), PFPANEL, and PFGRID Case Control commands must reference the same set of fluid degrees of freedom.
2. Acoustic panel participation factors are available in a coupled frequency response analysis (SOL 108 and SOL 111).
3. Printed output includes results for all the data items described in the itemlist table.
4. Punched output includes results for only the data items selected by the ITEMS keyword.
5. Panel participation factors are alphabetically sorted by panel names unless the SORT keyword specifies a different sorting order. If a sorting order is specified, the KEY keyword selects the item that is used for sorting. When MODEDISP is selected, sorting is based on the magnitude. When MODERESP is selected, sorting is based on the real part.

6. The SOLUTION keyword can be used to select a subset of solutions available. If set setf is specified, the items in the set are excitation frequencies.
7. The filter is applied to the real part of the normalized projected participation factors. Only participation factors that pass the filter are output.
8. If the magnitude of the total response at a selected response degree of freedom is less than  $10^{-ipowr}$ , then no modal participation factors are processed. If ipower is not in the range of 1 to 31, the default of 12 is used.
9. If present, output includes the load participation factor. The panel name of the load participation factors is -LOAD-.
10. The FLUID option selects panel PF calculation for acoustic grid points (one degree of freedom per point) and setdof should be identification numbers.
11. The STRUCTURE option selects panel PF calculation for structure grid points and setdof should be identification numbers and component codes.
12. Output sets that define no valid model degrees of freedom for data recovery produce no PF output. This condition is usually discovered prior to actual computations and an informational is generated. Occasionally, when multiple subcases are involved and one of the subcases references an invalid set, the PF calculations are still performed for any valid combinations. PRTMSG can be used to aid in identification of invalid set data under these conditions.

**PLOTID**

## Plotter Identification

Defines a character string that will appear on the first frame of any plotter output.

**Format:**

PLOTID=title

**Example:**

```
PLOTID=BLDG. 125 BOX 91
```

Describer	Meaning
title	Any character string.

**Remarks:**

1. PLOTID must appear before the OUTPUT(PLOT) or OUTPUT(XYOUT) Case Control commands.
2. The presence of PLOTID causes a special header frame to be plotted, with the supplied identification plotted several times. The header frame allows plotter output to be identified easily.
3. If no PLOTID command appears, no ID frame will be plotted.
4. The PLOTID header frame will not be generated for the table plotters.

## POST Postprocessor Data Specifications

Controls selection of data to be output for postprocessing functions via the OUTPUT2 module interface for selected commercial postprocessor products.

### Format:

$$\text{POST} \left\{ \begin{array}{l} \text{TOFILE} \\ \text{TOCASE} \end{array} \right\} \left\{ \begin{array}{l} \text{furn} \\ \text{filename} \end{array} \right\} [\text{ppname}][\text{ENHOP2}][\text{oplist}]$$

### Examples:

```
POST PATRAN TOFILE 51 NOSTRESS
POST TOFILE SUBCASE8
POST TOCASE SUFNAME1
```

Descriptor	Meaning
TOFILE	Keyword to specify the destiny of .op2 output files (No default if it appears above all subcases).
TOCASE	Keyword to specify the destiny of subcase results to user-defined .f06 output files. (No default if it appears above all subcases.)
furn	Fortran file unit reference number where data will be written (Integer > 0).
filename	Suffix filename (see Remark 8., 9. and 11.) (Char8)
ppname	Name of the target post-processor program for TOFILE option (Default = PATRAN).
ENHOP2	If ppname='PATRAN' then request enhanced op2 format-same as with PARAM,POST,1. The enhanced op2 format includes Nastran version information and qualifier values.
oplist	Names of output items to be processed.

### Remarks:

1. The POST Case Control command controls the placement of output data on external FORTRAN files for use by commercial postprocessors. Use of the POST command generates the proper value for the POST DMAP parameter associated with the particular postprocessor. All of the other parameter controls related to the POST DMAP parameter remain in effect, and are described in [Parameters, 793](#). The products supported are identified in the following table. PATRAN is the default postprocessor name used for ppname. DBC output (POST=0) cannot be controlled by the POST command.

ppname	Product	PARAM,POST,Value
PATRAN	MSC Patran V3	-1
PATRAN with ENHOP2	MSC Patran V3	+1
SDRC	Siemens I-DEAS	-2
NF	MSC/LMS NF	-4
FEMTOOLS	DDS/FemTools	-5
UNIGRAHICS	Siemens/Unigraphics	-6

- The TOFILE descriptor is followed by the specification of either a FORTRAN unit reference number, or a file name associated with the external file that receives the output data. If a FORTRAN unit number is used, the file must be associated with it via the ASSIGN File Management Statement. If POST appears above all subcases, TOFILE must be used to specify either a FORTRAN unit reference number or a file name. The default value of TOFILE, which appears under a subcase, will inherit from the value given in the POST above all subcases. If the unit reference number is associated with a form=formatted file, changes in unit numbers across subcases are not allowed.
- The data that can be controlled for each postprocessor product is limited, and is identified under the description of the POST and related DMAP parameters as described in [Parameters, 793](#). The keywords that can be used for the oplist options are shown in the following table. If an output item supported by a particular postprocessor is described in [Parameters, 793](#) but is not listed here, then the POST command cannot be used to control its output to the external file.

Output Item	oplist Keyword	Case Command
Displacements	[NO]DISPLACE	DISP
Forces of single point constraint	[NO]SPCFORCE	SPCFORCE
Element forces	[NO]FORCES	ELFO/FORCE
Element stresses	[NO]STRESS	ELST/STRESS
Element strain energy	[NO]ESE	ESE
Grid point force balance	[NO]GPFORCE	GPFORCE
Stress at grid points	[NO]GPSIGMA	STRESS
Strain/curvature at grid points	[NO]GPEPSILON	STRAIN
Composite element failure indices	[NO]PLYFAILURE	STRESS
Element kinetic energy	[NO]EKE	EKE
Element energy loss	[NO]EDE	EDE
Multi-point constraint forces	[NO]MPCFORCE	MPCFORCE
Composite lamina stresses	[NO]PLYSIGMA	STRESS
Composite lamina strains	[NO]PLYEPSILON	STRAIN

Output Item	oplist Keyword	Case Command
Element strains	[NO]STRAIN	STRAIN
Grid point stresses	[NO]GPSTRESS	GPSTRESS
Grid point strains	[NO]GPSTRAIN	GPSTRAIN
Applied loads	[NO]LOAD	OLOAD
No items to be output	NONE	-----
Structure mode participation factors	[NO]SMPF	PFMODE

- Output data items must have been generated via the appropriate Case Control command for the data to be available for postprocessing options. For example, the specification of SPCF in the oplist of the POST command will not produce forces of single point constraint on the POST output file unless there is a SPCF Case Control command present. Refer to the tables under the POST parameter description in [Parameters, 793](#) for a list of the output items supported by each postprocessor.
- Any data generated by a Case Control command is automatically included in the oplist of the POST command. If output data is not wanted for a particular case, then the characters “NO” should be the first two characters of the keyword in the oplist. For example, NODISP specifies that displacements are not to be posted to the output file, even though they have been requested via the DISP Case Control command. Alternatively, the related POST parameters may be used. For example, to avoid outputting any displacements whatsoever to the .op2 file, use a PARAM, OUG, NO Bulk Data entry.
- Certain data (e.g., geometry) is always generated and is not dependent upon the presence of a Case Control command in the input data. The POST command affects the placement of this data on the external file only insofar as the selection of the postprocessor defines the value of the POST DMAP parameter value. The actions described in [Parameters, 793](#) under the POST parameter description will prevail for the particular value of POST associated with the selected postprocessor. The primary purpose of the POST command is to give the user more control over subcase-dependent output data being stored on the external OUTPUT2 file.
- If a POST command is present within any subcase, a POST command must also be present above the subcase level. The placement of the POST command above the subcase level causes a cumulative effect on POST commands in subsequent subcases. Any options specified above the subcase level propagate down into the POST command within a subsequent subcase. Thus, if a POST command specifies NODISP (no displacement output wanted) above the subcase level, then a POST command with the DISP option would be required within a subcase to generate any output to the OUTPUT2 file for displacements. This also implies that changing the OUTPUT2 file unit reference number with the TOFILE option in a subcase causes all output quantities currently scheduled for output to be switched to the new unit number, not just those in the oplist for the current POST command.
- When the name of an output file is specified by keyword TOFILE, the ASSIGN statement in the File Management Section (FMS) can be used to specify the full path of its root name. The logical-keyword for the root name is OUTPUT2F. The default root name is the Nastran job name. FORTRAN unit reference number 19 has been reserved by Nastran for OUTPUT2F, although the user can assign other FORTRAN unit number to it. The full file name is in the form of <root name>.<suffix filename>.

9. When the name of an output file is specified by keyword TOCASE, the ASSIGN statement in the File Management Section can be used to specify the full path of its root name. The logical-keyword for the root name is OPCASE. The default root name is the Nastran job name. FORTRAN unit reference number 22 has been reserved by Nastran for OPCASE, although the user can assign other FORTRAN unit numbers to it. The full file name is in the form of <root name>.<suffix filename>. Also, ppname and oplist are not required. If ppname and oplist are specified, they will be ignored. Suffix filename must be specified with keyword TOCASE.
10. POST commands using TOCASE for structure mode participation factor output (SMPF) are not supported and will be ignored.
11. The TOFILE option lets you control the output results (per the table in Remark 3) that are placed on the specified file in OP2 format. The "POST TOFILE SUBASE8" example directs output to the file named <root name>.subcase8.op2. The TOCASE option directs standard printed output requested for a subcase to the specified file in .f06 format. The "POST TOCASE SUFNAM1" example directs output to the file named <root name>.sufnam1.f06. The TOCASE and TOFILE descriptors are independent of one another. POST commands using each descriptor may be present in a subcase to specify different output destinations for both .op2 and .f06 outputs at the same time. For both the TOCASE and TOFILE options, the resulting file name will not have the .op2 or the .f06 file extension automatically appended if the file suffix name contains a period (".").
12. The TOCASE keyword is not supported for printout in the f06 file coming from X-Y Plot commands.

**PRESSURE**

## Pressure Output Request

Requests form and type of pressure output. Analogous to the DISPLACEMENT Case Control command. See the description of the DISPLACEMENT Case Control command, [DISPLACEMENT \(Case\)](#).

## RANDOM

### Random Analysis Set Selection

Selects the RANDPS and RANDT1 Bulk Data entries to be used in random analysis.

#### Format:

$$\text{RANDOM} = \left\{ \begin{array}{c} n \\ i \end{array} \right\}$$

#### Examples:

```
RANDOM=177
```

```
SET 10=100 110 120  
RANDOM=10
```

Describer	Meaning
n	Set identification number of a previously appearing SET command, which in turn references multiple RANDPS/RANDT1 Bulk Data entries with different set identification numbers.
i	Set identification number of RANDPS and RANDT1 Bulk Data entries to be used in random analysis (Integer > 0).

#### Remarks:

1. RANDOM must select RANDPS Bulk Data entries to perform random analysis.
2. RANDOM must appear in the first subcase of the current loop. RANDPS Bulk Data entries may not reference subcases in a different loop. Loops are defined by a change in the FREQUENCY command, or changes in the K2PP, M2PP, or B2PP commands.
3. If RANDPS entries are used in a superelement analysis, the RANDOM command may be specified above the subcase level if a condensed subcase structure (SUPER=ALL) is used. If a condensed subcase structure is not used, then a unique RANDOM selection of a unique RANDPS entry must be specified within each of the desired superelement subcases.
4. If a SET is referenced by n, then the SET identification number must be unique with respect to all RANDPS/RANDT1 set identification numbers.

**RCROSS**

## Cross-Power Spectral Density and Cross-Correlation Function Output Request

Requests computation and output of cross-power spectral density and cross-correlation functions in random analysis.

**Format:**

$$\text{RCROSS} \left( \left( \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) \left[ \begin{array}{c} \text{PRINT} \\ \text{NOPRINT} \end{array} \right], [\text{PUNCH}], [\text{PSDF}, \text{CORF}, \text{RALL}] \right) = n$$
**Example:**

```
RCROSS (PHASE, PSDF, CORF) = 10
RCROSS (RALL, NOPRINT, PUNCH) = 20
RCROSS = 30
```

Descriptor	Meaning
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output for cross-power spectral density function. Use of either REAL or IMAG yields the same output (Default).
PHASE	Requests polar format (magnitude and phase) of complex output for cross-power spectral density function. Phase output is in degrees.
PRINT	Write output to print file (Default).
NOPRINT	Do not write output to print file.
PUNCH	Write output to punch file.
PSDF	Requests the cross-power spectral density function be calculated and output for random analysis postprocessing (Default).
CORF	Requests the cross-correlation function be calculated and output for random analysis postprocessing.
RALL	Requests both the cross-power spectral density function and cross-correlation function be calculated and output for random analysis postprocessing.
n	Identification number of the RCROSS Bulk Data entry to be used in random analysis (Integer > 0).

**Remarks:**

1. Case Control command RCROSS must be used along with Case Control command RANDOM. See Remarks under the [RANDOM \(Case\)](#) Case Control command description.

2. Response quantities such as DISPLACEMENT, STRESS, and FORCE must be requested by corresponding Case Control commands in order to compute cross-power spectral density and cross-correlation functions between the two response quantities specified by the RCROSS Bulk Data entry. It is recommended that those requests be put above the subcase level to avoid the situation that some response quantities are missing when it comes to the random analysis postprocessing.
3. The response quantities must belong to the same superelement. The cross-power spectral density and cross-correlation functions between the two responses, which belong to the different superelements, are not supported.

**RELDISP**

## Relative Displacement Output Request

Requests the form and type of relative displacement output with respect to a structural grid point in SOL 101, 103, 105, 108, 109, 111, 112, 200 and SOL 400 only.

**Format:**

$$\text{RELDISP} \left[ \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], [\text{REFSET} = m] \right) \right] = \left\{ \begin{array}{l} \text{ALL} \\ \text{NONE} \\ n \end{array} \right\}$$

**Example:**

```
RELDISP (REAL, PUNCH, PRINT, REFSET=10) =20
```

```
RELDISP (REFSET=10) =20
```

Describer	Meaning		
SORT1	Output will be presented as a tabular listing of grid points for each frequency.		
SORT2	Output will be presented as a tabular listing of frequency for each grid point.		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with "PARAM,POST, X" (or the POST Case Control command), while the .h5 binary database file will be generated with "MDLPRM,HDF5, X" specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REFSET (=m)	Set number of the previously appearing SET command having Reference Structural Grid ID present in the main bulk data w.r.t relative displacement is requested.
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Relative displacement for all points will be output. See Remarks 2.

Describer	Meaning
NONE	No relative displacement will be output
n	Set identification of a previously appearing SET command. Only relative displacements of points with identification numbers that appear on this SET command will be output. (Integer >0).

**Remarks:**

1. RELDISP is available for SOL 101, 103, 105, 108, 109, 111, 112, 200 and SOL400 only.
2. RELDISP can be requested against only one grid for all the different subcases. The reference set should be same for all the subcases.
3. REFSET entry needs to be defined for getting the relative displacement.
4. See Remark 1. under [DISPLACEMENT \(Case\)](#), for a discussion of SORT1 and SORT2.
5. RELDISP (refset =m) =NONE suppresses the generation of relative displacement output.
6. Relative Displacement between two grids is the algebraic difference of the displacement of both the grids.
7. S points or E points are not supported as reference point against which relative displacement can be calculated.
8. For superelements, the reference grid can be only in residual structure and relative displacement output can be requested for residual structure only.
9. The reference set grid should be a structural grid only with respect to which the relative displacement is requested.
10. The reference set grid should be present in the main bulk data section only.

**REPCASE**

## Repeat Output Subcase Delimiter

Delimits and identifies a repeated output subcase.

**Format:**

REPCASE=*n*

**Example:**

REPCASE=1 3 7

Describer	Meaning
<i>n</i>	Subcase identification number. (Integer > 1)

**Remarks:**

1. *n* must be strictly increasing (i.e., must be greater than all previous subcase identification numbers).
2. REPCASE defines a subcase that is used to make additional output requests for the previous real subcase. This command is required because multiple output requests for the same item are not permitted in the same subcase.
3. One or more repeated subcases (REPCASEs) must immediately follow the subcase (SUBCASE) to which they refer.
4. REPCASE may be used only in statics and normal modes analysis. In normal modes analysis, output for only one mode is obtained. This output corresponds to the SUBCASE preceding the REPCASE.
5. If the referenced subcases contain thermal loads or element deformations, the user must define the temperature field in the REPCASE with a TEMP(Load) Case Control command, or the element deformation state with a DEFORM command.
6. Repcase is not applicable to SOLs 400, 600, and 700.

## RESVEC

### Controls Residual Vectors

Specifies options for and calculation of residual vectors.

#### Format:

$$\text{RESVEC} \left( \left( \begin{array}{c} \text{INRLOD} \\ \text{NOINRL} \end{array} \right), \left( \begin{array}{c} \text{APPLOD} \\ \text{NOAPPL} \end{array} \right), \left( \begin{array}{c} \text{ADJLOD} \\ \text{NOADJLOD} \end{array} \right) \left( \begin{array}{c} \text{RVDOF} \\ \text{NORVDO} \end{array} \right), \left( \begin{array}{c} \text{DAMPLOD} \\ \text{NODAMP} \end{array} \right), \left( \begin{array}{c} \text{DYNRSP} \\ \text{NODYNRSP} \end{array} \right) \right) =$$

$$\left\{ \begin{array}{c} \text{SYSTEM/NOSYSTEM} \\ \text{COMPONENT/NOCOMPONENT} \\ \text{BOTH or YES} \\ \text{NO} \end{array} \right\}$$

$$\text{RESVEC}(\text{FLUID}) = \{\text{YES|NO}\}$$

#### Examples:

```
RESVEC=SYSTEM
RESVEC (NOINRL) =COMPONENT
RESVEC=NO
RESVEC (FLUID) =NO
```

Descriptor	Meaning
INRLOD/ NOINRL	Controls calculation of residual vectors based on inertial forces due to rigid-body motion (Default =INRLOD).
APPLOD/ NOAPPL	Controls calculation of residual vectors based on applied loads (Default = APPLD).
ADJLOD/ NOADJLOD	Controls calculation of residual vectors based on adjoint load vectors (SOL 200 only; Default = ADJLOD).
RVDOF/ NORVDOF	Controls calculation of residual vectors based on RVDOFi entries (Default = RVDOF).
DAMPLOD/ NODAMP	Controls calculation of residual vectors based on viscous damping (Default = DAMPLOD).
DYNRSP/ NODYNRSP	Controls whether the residual vectors will be allowed to respond dynamically in the modal transient or frequency response solution. See Remark 5. (Default = DYNRSP).
SYSTEM/ NOSYSTEM	Controls calculation of residual vectors for system (a-set) modes. For NOSYSTEM, descriptors inside the parentheses are ignored. See Remark 2. for default.
COMPONENT/ NOCOMPONENT	Controls calculation of residual vectors for component (superelement or o-set) modes. For NOCOMPONENT, descriptors inside the parentheses are ignored. See Remark 2. for default.

Describer	Meaning
BOTH or YES	Requests calculation of residual vectors for both system modes and component modes. See Remark 2. for default.
NO	Turns off calculation of residual vectors for both system and component modes, and describers inside the parentheses are ignored. See Remark 2. for default.
FLUID	Requests residual vector calculation for the fluid model (Default = YES).

**Remarks:**

1. RESVEC=SYSTEM/NOSYSTEM and RESVEC=COMPONENT/NOCOMPONENT may be specified in the same subcase.
2. RESVEC=BOTH is the default in all solution sequences except SOLs 103, 106, (with PARAM,NMLOOP), and 115, wherein RESVEC=COMPONENT is the default.
3. If the RESVEC command is specified then the user parameters PARAM,RESVEC and PARAM,RESVNER are ignored.
4. The lower frequency cutoff on the EIGR or EIGRL Bulk Data entries should be left blank or set to a value below the minimum frequency. Residual vectors may not be calculated if all modes below the maximum frequency cutoff are not determined. If low frequency modes are to be excluded from the analysis, use the MODESELECT Case Control command or PARAM,LFREQ.
5. Caution needs to be exercised when allowing the residual vectors to respond dynamically in a modal solution. The best approach is to always include enough normal modes to capture the dynamics of the problem, and rely on the residual vectors to help account for the influence of the truncated modes on the quasistatic portion of the response. This is not the default setting for this capability. When choosing to allow the residual vectors to respond dynamically, it is important to be aware of the frequency content of the excitation, as it will have the ability to excite these augmentation modes. If this is undesirable, then the forcing function should be filtered in advance to remove any undesired frequency content, or specify the NODYNRSP keyword.
6. Residual vectors are normalized with respect to MASS if possible. Massless residual vectors are normalized with respect to STIFFNESS. Residual vectors are not normalized by the requested method of the NORM field of the selected EIGR or EIGRL entry.
7. The maximum number of applied loads that may be used for residual vector calculations is controlled by PARAM,MAXAPL. Note that if the number of applied loads is large, the cost can become prohibitive. If the number of applies loads exceeds MAXAPL, residual vectors are disabled.

## RGYRO

### Activates Gyroscopic Effects and Selects RGYRO or UNBALNC Entries

The RGYRO Case Control command activates the rotodynamics capability, and selects the RGYRO Bulk Data entry for use in complex modes, frequency response, and static analysis. For transient response, the RGYRO command selects the UNBALNC Bulk Data entry. If the UNBALNC entry is not required, setting RGYRO to YES will include the gyroscopic effects in the transient response calculation. Setting RGYRO to NO will deactivate gyroscopic effects in all solutions.

#### Format:

For complex modes, frequency response, and static analysis:

RGYRO = n or YES/NO

#### Examples:

RGYRO = 100

#### For Transient Response:

RGYRO = YES

or

RGYRO = 200

**RIGID**

## Rigid Element Method

Selects rigid elements processing method for RBAR, RBAR1, RJOINT, RROD, RTRPLT, RTRPLT1, RBE1, RBE2, and RBE3.

**Format:**

$$\text{RIGID} = \left\{ \begin{array}{l} \text{LINEAR} \\ \text{LAGRAN} \\ \text{LGELIM} \end{array} \right\}$$

**Example:**

RIGID=LAGRAN

Describer	Meaning
LINEAR	Selects the linear elimination method.
LAGRAN	Selects the Lagrange multiplier method.
LGELIM	Selects the Lagrange multiplier method with elimination.

**Remarks:**

1. The RIGID command must be above the SUBCASE level.
2. The RIGID command can be used in SOLs 101, 103, 105, and 400 only. For all other solution sequences, only RIGID=LINEAR is available.
3. If the RIGID command is not specified in the Case Control Section, RIGID=LINEAR is used for all solution sequences except SOL 400. For SOL 400, RIGID=LAGRAN is used. If the RIGID command is specified, the full command must be specified, including the right hand side.
4. RIGID=LGELIM is not available for SOL 400.
5. LINEAR processing will not compute thermal loads. Also, for SOLs 103 and 105, LINEAR processing will not compute differential stiffness. In order to compute thermal load or differential stiffness, the LAGRAN or LGELIM methods must be used.
6. For SOL 400, the LINEAR rigid elements are valid for small rotation only. The LAGRAN method is valid for both small and large rotation (parameter LGDISP=1).
7. For the LINEAR method, the dependent DOFs are eliminated and placed in the mp-set. For the LAGRAN method, both independent and dependent DOFs are placed in the l-set. Lagrange multiplier DOFs are created internally for the dependent DOFs and placed in l-set. For the LGELIM method, the LAGRAN rigid elements are created first. Then, both the Lagrange DOFs and the dependent DOFs are eliminated, and the dependent DOFs are placed in the mr-set. Both the mp-set and mr-set are subsets of the m-set. See [Degree-of-Freedom Set Definitions](#).

8. Between LAGRAN and LGELIM, LAGRAN is the preferred method. LGELIM is a backup method if difficulty is encountered using the LAGRAN method.
9. The parameters LMFACT and PENFN can be used as scale factor and penalty function, respectively, for the LAGRAN method of processing.
10. In a SOL 400 analysis with CWELD, CFAST, and/or CSEAM elements Nastran internally creates RBE3 elements. These internal RBE3 elements respond in the same way to the RIGID command as any other rigid body elements that may have been defined in the model. Therefore the RIGID command also has an effect on the behavior of CWELD and CFAST elements in a SOL 400 analysis. For "ANALYSIS=NLSTAT" or "ANALYSIS=NLTRAN", the generated RBE3 constraints become Lagrange elements and will undergo large rotation. For "ANALYSIS=NLTRAN" with initial conditions (IC=n) in case control that cause large initial stresses in the structure at time t=0, the case control entry RIGID needs to have the value "RIGID=LINEAR." If "PARAM, OLDWELD, YES" is specified, the CSEAM is considered a linear element.
11. For external superelements, both the Case Control Command EXTSEOUT and the PARAM, EXTOUT, REQUIRE a value of RIGID=LINEAR (the default for non SOL400 solution sequences) when running non SOL 400 jobs.
12. When creating superelements in SOL 400, RIGID=LAGRAN produces incorrect answers, RIGID=LINEAR should be used or put the rigid elements into the residual.
13. When RIGID=LAGRAN is used, one may observe SWM 4968, indicating negative terms on multiple DOF which is due to the Lagrange multiplier. This message may be ignored and an accurate solution will be obtained.
14. When RIGID=LAGRAN is used, the CASI iterative solver may fail to converge or terminate, one should switch to a direct solver.
15. For the Lagrange method, the thermal expansion effect will be computed, if user supplies the thermal expansion coefficient ALPHA, and the thermal load is requested by the TEMPERATURE(INITIAL) and TEMPERATURE(LOAD) Case Control commands. The average temperature of the connected grid points is used as the temperature of the rigid body element. In this case, for the Lagrange method, PARAM, BAILOUT, -1 is activated within the solver.
16. For coupled thermal-mechanical analysis, only RIGID=LINEAR is available.

**ROTBENT**

## Specifying rotor initial deformation

Specifies rotor initial deformation (kink and offset) parameters.

**Format:**

ROTBENT = n

**Example:**

ROTBENT = 10

**Remarks:**

1. ROTBENT option is only supported for SOL400 analysis. ROTBENT analysis will require 2 step analysis, with step 1 being NLSTATIC and step 2 being rotordynamics analysis.

## ROTSEKE

## Rotor Modal Strain and Kinetic Energies Output Request

Requests rotor modal strain and kinetic energies at selected rotors and sort method.

### Format:

$$\text{ROTSEKE} \left[ \left( \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{MODE} \\ \text{ROTOR} \end{array} \right] \right) \right] = \left\{ \begin{array}{l} \text{ALL} \\ \text{NONE} \\ n \end{array} \right\}$$

### Examples:

```
SET 50 = 10, 20, 25 - Rotor ID set
ROTSEKE = 50
ROTSEKE (PLOT, MODE) = 50
ROTSEKE (PUNCH, MODE) = ALL
ROTSEKE (PRINT, PUNCH, ROTOR] = 50
```

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X**		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously.

\*\* Rotor kinetic and strain energies .f06 in the output file will NOT be generated with PARAM,ROTSEKE, X, specified in Bulk Data Section, and an UFM will be printed. PARAM,ROTSEKE has been removed from MSC NASTRAN release 2021.3

MODE or (blank)	Output will be presented as a tabular listing by mode number.
ROTOR	Output will be presented as a tabular listing by rotor ID according to SET n.
All	Rotor energies for all rotors will be output.
n	Set identification number of a previously appearing SET command. Only rotor IDs that appear on this SET command will be included in the rotor energies output (Integer >0).

**Remarks:**

1. ROTSEKE is only available for direct or modal complex eigenvalue analysis in SOLs 107/110/200/400.
2. For a model with one rotor only, the strain and kinetic energy percentages will always be 100%.

## RSDAMP

### Specifying Damping for the Residual Structure

Requests parameter and hybrid damping for the residual structure.

#### Format:

$$\text{RSDAMP} \left[ \begin{array}{c} \text{STRUCTURE} \\ \text{FLUID} \\ \text{BOTH} \end{array} \right] = n$$

#### Example:

RSDAMP (STRUCTURE, FLUID, or BOTH) = n

Describer	Meaning
n	Identification number of a DAMPING Bulk Data entry (Integer > 0).

#### Remarks:

1. For modal solutions, this entry adds to the modal damping that may be specified by the SDAMPING Case Control command.
2. This command can be different in each residual structure subcase.

## SACCELERATION

## Solution Set Acceleration Output Request

Requests the form and type of solution set acceleration output.

### Format:

$$\text{SACCELERATION} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \text{PRINT}, \text{PUNCH}, \left( \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

### Examples:

SACCELERATION=ALL

SACCELERATION (PUNCH, IMAG) = 1 4 2

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point (or mode number).
PRINT	The printer will be the output medium.
PUNCH	The punch file will be the output medium.
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Acceleration for all solution set points (modes) will be output.
NONE	Acceleration for no solution set points (modes) will be output.
n	Set identification number of a previously appearing SET command. Only accelerations of points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. Acceleration output is only available for transient and frequency response problems.
2. The defaults for SORT1 and SORT2 depend on the type of analysis, and are discussed in Remark 1 under the [DISPLACEMENT \(Case\)](#) Case Control command. If SORT1 is selected for any of the commands SACC, SDIS, and SVEL, then the remaining commands will also be SORT1.
3. SACCELERATION=NONE allows an overall output request to be overridden.

**SDAMPING**

## Structural Damping Selection

Requests modal damping as a function of natural frequency in modal solutions or viscoelastic materials as a function of frequency in direct frequency response analysis.

**Format:**

$$\text{SDAMPING} \begin{bmatrix} \text{STRUCTURE} \\ \text{FLUID} \\ \text{COUPLED} \end{bmatrix} = n$$
**Example:**

```
SDAMPING=77
SDAMPING (COUPLED)=100
```

Describer	Meaning
STRUCTURE or FLUID	Modal damping is requested for the structural or fluid portion of the model.
COUPLED	Modal damping is requested for the structure and fluid coupled portion of the model.
n	Set identification number of a TABDMP1 or TABLEDi Bulk Data entry (Integer>0).

**Remarks:**

1. In the modal solutions (e.g., SOLs 110, 111, 112, 145, 146, and 200), SDAMPING must reference a TABDMP1 entry.
2. In direct frequency response analysis (e.g., SOL 108), SDAMPING must reference a TABLEDi entry which defines viscoelastic (frequency-dependent) material properties. See [Viscoelastic Material Properties](#) in the *MSC Nastran Dynamic Analysis User's Guide*. TABLEDi,n and TABLEDi,n+1 must be specified in the Bulk Data to define the complex moduli of the viscoelastic materials.
3. When SDAMPING is defined for a superelement, PARAM,SESDAMP must be placed either in the SUBCASE for the superelement or in the superelement's BEGIN SUPER section in order to activate the modal damping for the superelement. The default for superelements is to place all boundary points in the B set; in this case, PARAM,SESDAMP,AUG is recommended. Alternatively, place all boundary points in the C set and set PARAM,SESDAMP,YES.
4. When SDAMPING is used during FRF component generation, PARAM,KDAMP,-1 is recommended in order to place the modal damping terms in the imaginary part of the stiffness matrix. The default for KDAMP is 0, which places the modal damping terms in the damping matrix, leading to a marginally under or over damped response. When hybrid damping is used during FRF component generation, it is recommended to set the KDAMP field to YES on the HYBDAMP entry.

5. When SDAMPING is used with METHOD(COUPLED), SDAMPING(COUPLED) should be used. For the real coupled mode computation, structural modes and fluid modes are not separated. So SDAMPING(STRUCTURE) or SDAMPING(FLUID) cannot be used properly. When SDAMPING(STRUCTURE/FLUID) is used with METHOD(COUPLED), it returns fatal out.

## SDISPLACEMENT

## Solution Set Displacement Output Request

Requests the form and type of solution set displacement output.

### Format:

$$\text{SDISPLACEMENT} \left[ \left( \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right), \text{PRINT}, \text{PUNCH}, \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

### Examples:

SDISPLACEMENT=ALL

SDISPLACEMENT (SORT2, PUNCH, PHASE) =NONE

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point (or mode number).
PRINT	The printer will be the output medium.
PUNCH	The punch file will be the output medium.
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Displacements for all solution set points (modes) will be output.
NONE	Displacements for no solution set points (modes) will be output.
n	Set identification number of a previously appearing SET command. Only displacements on points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. The defaults for SORT1 and SORT2 depend on the type of analysis, and is discussed in Remark 1 under the [DISPLACEMENT \(Case\)](#) Case Control command. If SORT1 is selected for any of the commands SACC, SDIS, and SVEL then the remaining commands will also be SORT1.
2. SDISPLACEMENT=NONE allows an overall output request to be overridden.
3. The SDISPLACEMENT command is required to output normalized complex eigenvectors.

**SEALL**

## Superelement Generation and Assembly

Specifies the superelement identification numbers of Phase 1 processing in which all matrices and loads are generated and assembled. Controls execution of the solution sequence.

**Format:**

$$\text{SEALL} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

**Examples:**

```
SEALL=ALL
SEALL=7
```

Descriptor	Meaning
ALL	Generate and assemble all superelements.
n	Set identification number of a previously appearing SET command. Only superelements with identification numbers that appear on this SET command will be generated and assembled (Integer > 0).
i	Identification number of a single superelement that will be generated and assembled (Integer > 0).

**Remarks:**

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number of the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. This command combines, in one command, the functions of the SEMG, SELG, SEKR, SELR, and SEMR commands.
6. This command does not control superelement data recovery (Phase 3). See the [SEDR \(Case\) Case Control](#) command description.
7. SEALL=ALL is the default but can be overridden by specifying any of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

## SEDAMP

### Specifying Damping for Superelements

Requests parameter and hybrid damping for superelements.

#### Format:

SEDAMP=n

#### Example:

Describer	Meaning
n	Identification number of a DAMPING Bulk Data entry (Integer > 0).

#### Remarks:

1. This command adds to the modal damping that may be specified by the Case Control command SDAMPING, used in conjunction with PARAM,SESDAMP,YES.
2. Multiple SEDAMP requests per superelement are not allowed. If more than one SEDAMP request is specified per superelement, the second and subsequent requests will be ignored.

## SEDR Superelement Data Recovery

Specifies the superelement identification numbers for which data recovery will be performed.

### Format:

$$\text{SEDR} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

### Examples:

SEDR=ALL  
 SEDR=7

Descriptor	Meaning
ALL	Performs data recovery for all superelements.
n	Set identification number of a previously appearing SET command. Data recovery will be performed for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which data recovery will be performed (Integer > 0).

### Remarks:

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number for the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. If this command is not present, data recovery is performed for all superelements for which there are output requests (i.e., the default for this command is SEDR=ALL).
6. The presence of the EXTDROUT Case Control command or the user PARAMeter EXTDROUT forces SEDR=ALL.

**SEDV**

## Superelement Design Variable Processing

Specifies the superelement identification numbers for which the design variables will be processed.

**Format:**

$$\text{SEDV} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{i} \end{array} \right\}$$

**Examples:**

```
SEDV=ALL
SEDV=18
```

Describer	Meaning
ALL	Requests design variable processing for all superelements. This is the default value if SEDV is missing in the file.
n	Set identification number of a previously appearing SET command. Design variable processing will be performed for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which design variable processing will be performed (Integer > 0).

**Remarks:**

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number of the residual structure, and can only appear as a member of a SET.
3. For a further discussion of superelement sensitivity analysis, see the *MSC.Nastran Design Sensitivity and Optimization User's Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. If both the SEDV and SERESP commands are not present, then the design variable processing and design sensitivity matrix generation will be performed for all superelements.

**SEEXCLUDE**

## Superelement Matrix and Load Assembly Exclusion

Specifies the superelement identification numbers for which all matrices and loads will not be assembled into the downstream superelement.

**Format:**

$$\text{SEEXCLUDE} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{i} \end{array} \right\}$$

**Examples:**

```
SEEXCLUDE=ALL
SEEXCLUDE=18
```

Descriptor	Meaning
ALL	All upstream superelements will be excluded.
n	Set identification number of a previously appearing SET command. Only those superelements with identification numbers that appear on this SET command will be excluded (Integer > 0).
i	Identification number of a single superelement for which matrices will be excluded (Integer > 0).

**Remarks:**

1. This command, if present, must be located before the first SUBCASE command.
2. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
3. This command is not meaningful when applied to the residual structure.
4. For a further discussion of this command, see the *MSC Nastran Handbook for Superelement Analysis*.
5. If the SEEXCLUDE command is specified in a restart of SOLs 101 through 200, then PARAM,SERST,MANUAL must be specified. Also, the SEKR command must be specified for the superelement immediately downstream from the excluded superelement. For example, if superelement 10 is excluded in the following superelement tree:

then the user must specify the following commands in the Case Control Section:

```
SEKR = 30
```

PARAM, SERST, MANUAL

**SEFINAL**

## Final Superelement for Assembly

Specifies the superelement identification number for the final superelement to be assembled.

**Format:**

$$\text{SEFINAL} = \left\{ \begin{array}{c} \text{n} \\ \text{i} \end{array} \right\}$$

**Example:**

SEFINAL=14

Describer	Meaning
n	Set identification of a previously appearing SET command. Each superelement identification number appearing on the SET command must belong to a disjoint model (Integer > 0).
i	Identification number of the final superelement to be assembled (Integer > 0).

**Remarks:**

1. If this command is not present, the program selects the order of the superelements for assembly operations.
2. This command, if present, must be located before the first SUBCASE command.
3. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
4. This command can be used on restarts to ensure that minor modeling changes do not also change the processing order. For this usage, inspect the SEMAP table to determine which superelements were final superelements on the prior run.
5. See the *MSC Nastran Handbook for Superelement Analysis* for a further discussion of this command.

## SEKREDUCE

## Superelement Stiffness Matrix Assembly and Reduction

Specifies the superelement identification numbers for which stiffness matrices are assembled and reduced.

### Format:

$$\text{SEKREDUCE} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

### Examples:

SEKREDUCE=ALL  
 SEKREDUCE=9

Descriptor	Meaning
ALL	Assembles and reduces matrices for all superelements.
n	Set identification number of a previously appearing SET command. Matrices will only be assembled for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which the stiffness matrix will be assembled and reduced (Integer > 0).

### Remarks:

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number for the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. SEKREDUCE is an alternate form, and is entirely equivalent to the obsolete command SEMASSEMBLE.
5. SEALL=ALL is the default, but can be overridden by specifying any of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

## SELGENERATE

## Superelement Load Generation

Specifies the superelement identification numbers for which static loads will be generated.

### Format:

$$\text{SELGENERATE} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

### Examples:

```
SELGENERATE=ALL
SELGENERATE=1 8
```

Descriptor	Meaning
ALL	Generates static loads for all superelements.
n	Set identification number of a previously appearing SET command. Static load matrices will only be generated for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which load matrices will be generated (Integer > 0).

### Remarks:

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number of the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. SEALL=ALL is the default, but can be overridden by specifying any of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

## SELREDUCE

## Superelement Load Assembly and Reduction

Specifies the superelement identification numbers for which the static load matrices will be assembled and reduced.

### Format:

$$\text{SELREDUCE} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

### Examples:

```
SELREDUCE=ALL
SELREDUCE=9
```

Descriptor	Meaning
ALL	Assembles and reduces matrices for all superelements.
n	Set identification number of a previously appearing SET command. Matrices will be assembled only for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which the load matrices will be assembled and reduced (Integer > 0).

### Remarks:

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number for the residual structure, and can only be appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. This command is used on restarts to selectively assemble and reduce load matrices.
5. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
6. In superelement static analysis, SELREDUCE is equivalent to SELASSEMBLE.
7. In dynamic analysis, SELASSEMBLE combines the functions of SELREDUCE and SEMREDUCE.
8. SEALL=ALL is the default, but can be overridden by specifying and of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

**SEMGENERATE**

## Superelement Matrix Generation

Specifies the superelement identification numbers for which stiffness, mass, and damping matrices will be generated.

**Format:**

$$\text{SEMGENERATE} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

**Examples:**

```
SEMGENERATE=ALL
SEMGENERATE=7
```

Descriptor	Meaning
ALL	Generates structural matrices for all superelements.
n	Set identification number of a previously appearing SET command. Structural matrices will only be generated for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which structural matrices will be generated (Integer > 0).

**Remarks:**

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number for the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. SEALL=ALL is the default, in the structured SOLs 101 through 200. This default can be overridden by specifying any of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

## SEMREDUCE

## Superelement Mass and Damping Assembly and Reduction

Specifies the superelement identification numbers for which the mass and damping matrices will be assembled and reduced. In buckling analysis, the differential stiffness matrices will be assembled and reduced.

### Format:

$$\text{SEMREDUCE} = \left\{ \begin{array}{c} \text{ALL} \\ n \\ i \end{array} \right\}$$

### Examples:

```
SEMREDUCE=ALL
SEMREDUCE=9
```

Descriptor	Meaning
ALL	Assembles and reduces matrices for all superelements.
n	Set identification number of a previously appearing SET command. Matrices will only be assembled for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which the load matrices or the mass and damping matrices will be assembled and reduced (Integer > 0).

### Remarks:

1. This command, if present, must be located before the first SUBCASE command.
2. Zero (0) is the identification number for the residual structure, and can only appear as a member of a set.
3. This command is used on restart to selectively assemble and reduce mass and damping matrices. For a further discussion of this command, see [Superelement Analysis](#) in the *MSC Nastran Reference Guide*.
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. In dynamic analysis, SELASSEMBLE combines the functions of SELREDUCE and SEMREDUCE.
6. This command has no function in static analysis.
7. SEALL=ALL is the default but can be overridden by specifying any of the following Phase 1 commands: SEALL, SEMG, SELG, SEKR, SELR, or SEMR.

**SERESP**

## Superelement Response Sensitivity

Specifies the superelement identification numbers for which the design sensitivity matrices will be generated.

**Format:**

$$\text{SERESP} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{i} \end{array} \right\}$$

**Examples:**

```
SERESP=ALL
```

```
SERESP=18
```

Describer	Meaning
ALL	Requests design sensitivity matrix generation for all superelements. This is the default value if SERESP is missing.
n	Set identification number of a previously appearing SET command. Design sensitivity matrices will be generated for superelements with identification numbers that appear on this SET command (Integer > 0).
i	Identification number of a single superelement for which the design sensitivity matrix will be generated.

**Remarks:**

1. This command, if present, then it must be located before the first SUBCASE command.
2. Zero (0) is the identification number of the residual structure, and can only appear as a member of a SET.
3. For a further discussion of this command, see the [MSC Nastran Reference Guide](#).
4. If i is used, the superelement identification number must be unique with respect to any SET identification numbers used.
5. If both the SEDV and SERESP commands are not present, then the design variable processing and design sensitivity matrix generation will be performed for all superelements.

**SET** Set Definition, General Form

Sets are used to define the following lists:

1. Identification numbers (point, element, or superelement) for processing and output requests.
2. Frequencies for which output will be printed in frequency response problems, or times for transient response, using the OFREQ and OTIME commands, respectively.
3. Surface or volume identification numbers to be used in GPSTRESS or STRFIELD commands.
4. DRESP1 entries that are used in the spanning of subcases.
5. Grid point number and component type code to be used by the MCFRACTION command.

**Formats:**

$$\text{SET } n = \{i_1[,i_2, i_3, \text{THRU } i_4, \text{EXCEPT } i_5, i_6, i_7, i_8, \text{THRU } i_9]\}$$

$$\text{SET } n = \{r_1[,r_2, r_3, r_4]\}$$

$$\text{SET} = \text{ALL}$$

$$\text{SET } n = \{i_1/c_1[,i_2/c_2, i_3/c_3, i_4/c_4]\}$$

$$\text{SET } n = \{l_1, [l_2, l_3]\}$$
**Examples:**

```
SET 77=5
```

```
SET 88=5, 6, 7, 8, 9, 10 THRU 55 EXCEPT 15, 16, 77, 78, 79, 100 THRU 300
```

```
SET 99=1 THRU 100000
```

```
SET 101=1.0, 2.0, 3.0
```

```
SET 105=1.009, 10.2, 13.4, 14.0, 15.0
```

```
SET 1001=101/T1, 501/T3, 991/R3
```

```
SET 2001=M1, M2
```

Describer	Meaning
n	Set identification number. Any set may be redefined by reassigning its identification number. SETs specified under a SUBCASE command are recognized for that SUBCASE only (Integer > 0).
$i_1, c_1$	Grid point identification numbers and component codes. The $c$ values must be of T1, T2, T3, R1, or R3.
$l_1, l_2$ etc.	Identification names of literals used for matrix or group selection.
$i_1, i_2$ etc.	Identification numbers. If no such identification number exists, the request is ignored (Integer $\geq 0$ ).

Describer	Meaning
$i_3$ THRU $i_4$	Identification numbers ( $i_4 > i_3$ ) (Integer > 0).
EXCEPT	Set identification numbers following EXCEPT will be deleted from output list as long as they are in the range of the set defined by the immediately preceding THRU. An EXCEPT list may not include a THRU list or ALL.
$r_1, r_2, \text{ etc.}$	Frequencies or times for output. The nearest solution frequency or time will be output. EXCEPT and THRU cannot be used. If an OFREQ or OTIME command references the set then the values must be listed in ascending sequences, $r_1 < r_2 < r_3 < r_4 \dots$ etc., otherwise some output may be missing. If an OFREQ or OTIME command is not present, all frequencies or times will be output (Real > 0.0).
ALL	All members of the set will be processed.

**Remarks:**

1. A SET command may be more than one physical command. A comma at the end of a physical command signifies a continuation command. Commas may not end a set. THRU may not be used for continuation. Place a number after the THRU.
2. Set identification numbers following EXCEPT within the range of the THRU must be in ascending order.
3. In SET 88 above, the numbers 77, 78, etc., are included in the set because they are outside the prior THRU range.
4. SET commands using the grid point/component code format cannot contain THRU. SETs using this format should be selected only by the MCFRACTION Case Control command.
5. SET commands using literals apply only to direct matrix input such as K2PP etc. or FLSPOUT panel grouping.

**SETP**

## Process Set Definition

Process sets are used to define lists of SET identifications to be processed individually for data recovery:

**Formats:**

$$\text{SETP } n = \{i_1[i_2, i_3 \text{ THRU } i_4 \text{ EXCEPT } i_5, i_6, i_7, i_8 \text{ THRU } i_9]\}$$
**Examples:**

```
SETP 77=5, 6
```

```
SETP 88=5, 6, 7, 8, 9, 10 THRU 55
```

Describer	Meaning
n	SETP identification number. Any SETP may be redefined by reassigning its identification number. SETPs specified under a SUBCASE command are recognized for that SUBCASE only (Integer > 0).
$i_1, i_2, \dots, i_n$	SET identification numbers $i_1, i_2$ , etc. If no such identification number exists, the request is ignored (Integer > 0).
EXCEPT	Set identification numbers following EXCEPT will be deleted from output list as long as they are in the range of the set defined by the immediately preceding THRU. An EXCEPT list may not include a THRU list or ALL.

**Remarks:**

1. A SETP command may be more than one physical command. A comma at the end of a physical command signifies a continuation command. Commas may not end a set. THRU may not be used for continuation—place a number after the THRU.
2. Set identification numbers following EXCEPT,k within the range of the THRU, must be in ascending order.
3. SETP usage is limited to the EDE, EKE and ESE Case Control commands.

## SETS DEFINITION

## Case Control Processing Delimiter

Delimites the various type of commands under grid point stress. This command is synonymous with OUTPUT(POST).

**Format:**

SETS DEFINITION

**Example:**

SETS DEFINITION

**Remark:**

1. Either SETS DEFINITION or OUTPUT(POST) may be specified, but not both.

## SKIP

### Case Control Processing Delimiter

Activates or deactivates the execution of subsequent commands in Case Control (including plot commands).

#### Format:

$$\text{SKIP} \left\{ \begin{array}{l} \text{ON} \\ \text{OFF} \end{array} \right\}$$

#### Example:

```
SKIPOFF
```

#### Remarks:

1. SKIPON and SKIPOFF commands may appear as many times as needed in the Case Control Section.
2. Commands that are skipped will be printed.
3. SKIPON ignores subsequent commands until either a SKIPOFF or BEGIN BULK command is encountered. This allows the user to omit requests without deleting them from the data. In the following example, plot commands will be skipped.

```
TITLE=EXAMPLE  
SPC=5  
LOAD=6  
SKIPON$SKIP PLOT REQUEST  
OUTPUT (PLOT)  
SET 1 INCLUDE ALL  
FIND  
PLOT  
BEGIN BULK
```

**SMETHOD**

## Iterative Solver Method Selection

Selects iterative solver method and parameters.

**Format:**

$$\text{SMETHOD} \left\{ \begin{array}{c} \text{ELEMENT} \\ n \\ \text{MATRIX} \end{array} \right\}$$
**Example:**

```
SMETHOD = ELEMENT $ selects element-based iterative solver defaults.
SMETHOD = MATRIX $ selects matrix based iterative solver defaults.
SMETHOD = 1000 $ specifies ID of ITER Bulk Data entry to select
iterative.
```

Describer	Meaning
ELEMENT	Selects the element-based iterative solver with default control values.
MATRIX	Selects the matrix-based iterative solver with default control values.
n	Sets identification of an ITER Bulk Data entry (Integer > 0).

**Remarks:**

1. The matrix-based iterative solver is available in SOLs 101, 106, 108, 111, 153, and 400 and allows use of all features.
2. The element-based iterative solver is only available in SOLs 101, 200 and 400. SMETHOD must be placed above all SUBCASEs in this case. It is intended primarily for very large solid element models. See the ITER Bulk Data entry for a list of restrictions in addition to details on setting the convergence parameter epsilon.
3. The element-based iterative solver can be used with SMP by setting smp=number on the command line. Please refer to [smp, 11](#) of this manual for correct usage.
4. For SOL 600, the iterative solver is activated using the MARCSOLV PARAM.
5. GPGPU devices are not supported for iterative methods.

## SOLUTION

### Solution ID Selection

Selects the solution ID for a 3<sup>rd</sup> step external superelement data recovery restart in SOL 400.

#### Format:

SOLUTION = n

#### Example:

SOLUTION=10

Describer	Meaning
n	Solution identification number.

#### Remarks:

1. SOLUTION command is used only in SOL 400 for 3<sup>rd</sup> step external superelement data recovery restart.
2. See Remark 8. under EXTDRIN Case Control command's description for a further explanation and example.

**SPC**

## Single Point Constraint Set Selection

Selects a single point constraint set to be applied.

**Format:**

SPC = n

**Example:**

SPC=10

Describer	Meaning
n	Set identification number of a single-point constraint that appears on an SPC, SPC1, SPC2 (SOL 700), FRFSPC1 (in FRF Based Assembly or FBA process) or SPCADD Bulk Data entry (Integer > 0).

**Remarks:**

1. In cyclic symmetry analysis, this command must appear above the first SUBCASE command.
2. Multiple boundary conditions are only supported in SOLs 101, 103, 105, 145, and 200. Multiple boundary conditions are not allowed for upstream superelements. The BC command must be specified to define multiple boundary conditions for the residual structure in SOLs 103, 105, 145, and 200.

## SPCFORCES

## Single Point Forces of Constraint Output Request

Requests the form and type of single point force of constraint vector output.

### Format:

$$\text{SPCFORCES} \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{c} \text{REAL or NOZPRINT} \\ \text{PHASE} \end{array} \right] \left[ \begin{array}{c} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{array} \right], \right. \\ \left. \left[ \begin{array}{c} \text{RPRINT} \\ \text{NORPRINT} \end{array} \right], \text{RPUNCH}, [\text{CID}] \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Examples:

```
SPCFORCES = 5
SPCFORCES (SORT2, PUNCH, PRINT, IMAG) = ALL
SPCFORCES (PHASE) = NONE
SPCFORCES (SORT2, PRINT, PSDF, CRMS, RPUNCH) = 20
SPCFORCES (PRINT, RALL, NORPRINT) = ALL
```

Descriptor	Meaning	
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.	
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.	
PRINT or (blank)	Printer File (.f06)	
PUNCH	Punch File (.pch)	
PLOT	Plot File (.op2/.h5)	
	X	X*
	X	X*
		X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.

Describer	Meaning
NOZPRINT	Print only nonzero SPC forces appearing in SORT2 output. This keyword does not affect SORT1 output.
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. The request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
PRUNCH	Writes random analysis results in the punch file.
CID	Request to print output coordinate system ID in printed output file (.f06).
ALL	Single point forces of constraint for all points will be output. See Remarks 1. and 4.
NONE	Single point forces of constraint for no points will be output.
n	Set identification of a previously appearing SET command. Only single point constraint forces for points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2. In the SORT1 format, only nonzero values will be output.
2. In a statics problem, a request for SORT2 causes loads at all points (zero and nonzero) to be output.
3. SPCFORCES=NONE overrides an overall output request.
4. In SORT1 format, SPCFORCES recovered at consecutively numbered scalar points are printed in groups of six (sextets) per line of output. However, if a scalar point is not consecutively numbered, it will begin a new sextet on a new line of output. If a sextet can be formed and all values are zero, then the line will not be printed. If a sextet cannot be formed, then zero values may be output.
5. SPCFORCES results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
6. In SOLs 129 and 159, SPCFORCES results do not include the effects of mass and damping elements.

7. In all solution sequences except SOLs 129 and 159, SPCFORCES results do include the effects of mass and damping, except damping selected by the SDAMPING Case Control command. PARAM,DYNSPCF,OLD may be specified to obtain SPCFORCES results, which do not include mass and damping effects.
8. In inertia relief analysis, the SPCFORCES output is interpreted differently for SOLs 1, 101, and 200:
  - a. In SOL 1, the SPCFORCE output reflects the effects due to the applied loads only, and not the inertial loads.
  - b. In SOLs 101 and 200, the SPCFORCE output includes both the effects due to inertial loads and applied loads.
9. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
10. Note that the CID keyword affects only grid point related output such as DISP, VELO, ACCE, OLOAD, SPCF and MPCF. In addition, the CID keyword needs to appear only once in a grid-related output command, anywhere in the Case Control Section, to turn on the printing algorithm.
11. For axisymmetric elements, SPCFORCES results are obtained by integrating over 1 radian of the circumference. Before 2012 release, it is total reaction over the whole circumference.

## SPLINOUT

### Export of Spline Matrix

Requests output of the spline matrix for external use.

#### Format:

$$\text{SPLINOUT} \left[ \left[ \begin{array}{c} \text{BOTH} \\ \text{DISP} \\ \text{FORCE} \end{array} \right], \left\{ \begin{array}{c} (\text{OP2} = \textit{unit}) \\ \text{DMIPCH} \end{array} \right\} \right]$$

#### Examples:

Descriptor	Meaning
BOTH	Requests output of the force and displacement splines (Default).
DISP	Requests output of only the displacement splines.
FORCE	Requests output of only the force splines.
OP2	Requests output to an .op2 file
unit	Unit the .op2 file is assigned to
DMIPCH	Requests output to a .pch file.

#### Remarks:

1. Matrices are output in external sort.
2. If displacement and force splines are identical, only displacement splines are output.
3. Option FACTORS is only allowed together with option OP2.
4. If OP2 = *unit* is specified, a table relating the matrix columns to structural degrees of freedom, and the matrix rows to aerodynamic degrees of freedom, will be written to the .op2 file.
5. If OP2 = *unit* is specified, an appropriate ASSIGN OP2 statement must be present in the File Management Section for this unit.
6. If DMIPCH is specified, DMI entries are written to the.pch file.

**STATSUB**

## Static Solution Selection for Differential Stiffness

Selects the static solution to use in forming the differential stiffness for static analysis, buckling analysis, normal modes, complex eigenvalue, frequency response and transient response analysis.

**Format:**

$$\text{STATSUB} \left( \begin{bmatrix} \text{BUCKLING} \\ \text{PRELOAD} \end{bmatrix} \right) = n$$

**Examples:**

```
STATSUB=23
```

```
STAT=4
```

```
STATSUB (PREL) =7
```

Describer	Meaning
BUCKLING	Subcase ID number corresponding to static subcase of buckling or varying load (Default in buckling analysis).
PRELOAD	Subcase ID number corresponding to static subcase of preload or constant load (Default in dynamic analysis).
n	Subcase identification number of a prior subcase specified for static analysis (Integer > 0).

**Remarks:**

1. STATSUB may be used in SOLs 101,103, 105, 107 through 112, 115, 116, 200 and SOL 400 (ANALYSIS = BUCKLING only in SOL 200 and SOL 400).
2. STATSUB must be specified in the same subcase that contains the METHOD selection for buckling or normal modes, CMETHOD for complex eigenvalue analysis, TSTEP for transient response, and FREQ for frequency response.
3. In SOL 105, if it is intended that results from the first static subcase are used to compute the differential stiffness, then the STATSUB command is not required. That is, the default for STATSUB is the first static subcase identification. In SOLs 101, 103 and 107 through 112, 115, and 116, STATSUB must reference a separate static subcase.
4. In dynamic analysis, only one STATSUB command may be specified in each dynamic subcase. In buckling analysis with a preload, both STATSUB (BUCKLING) and STATSUB(PRELOAD) must be specified in each buckling subcase. STATSUB(PRELOAD) is not supported in SOL 200 or SOL 400. Buckling Analysis with a preload is not supported in SOL 200 and SOL 400.
5. In dynamic analysis, any subcase that does not contain a CMETHOD command in SOLs 107 and 110, a FREQUENCY command in SOLs 108 and 111, and a TSTEP command in SOLs 109 and 112, will be treated as a static subcase.
6. SOL 200 and SOL 400 support linear buckling analysis only, but do not support post-buckling (nonlinear buckling analysis)

7. In versions prior to 2018, if it was desired to have a dynamic subcase **with** the effects of preload and another subcase **without** the effects of preload, then a static subcase with null load was required and its ID was referenced by STATSUB in the dynamic subcase **without** the effects of preload. In version 2018, STATSUB in the dynamic subcase **without** the effects of preload is no longer required. If the STATSUB is not removed and still references the static subcase with null load, then User Fatal Message 9244 will be issued.

**STEP****Step Delimiter**

Delimits and identifies a nonlinear analysis step for SOL 400.

**Format:**

STEP=n

**Examples:**

STEP=10

Describer	Meaning
n	Step identification number (Integer > 0).

**Remarks:**

1. The STEP command can only be used in nonlinear solution sequence SOL 400 (NONLIN).
2. The STEP command is to be used below the SUBCASE Case Control command. If no SUBCASE is specified, MSC Nastran creates a default SUBCASE 1.
3. The STEP identification number n in a SUBCASE must be in increasing order, and less than 9999999.
4. The following example illustrates a typical application of SUBCASE and STEP:

```

SUBCASE 1
  STEP 1
    LOAD = 1
  STEP 2
    LOAD = 2
SUBCASE 2
  STEP 10
    LOAD = 10
  STEP 20
    LOAD = 20

```

5. The solutions of all SUBCASEs are independent of each other. However, the solution of any STEP is a continuation of the solution of the previous STEP.

## STOCHASTICS

### Randomization of Model Parameters

Request randomization of all or selected subsets of model parameters.

#### Format:

$$\text{STOCHASTICS} = \left\{ \begin{array}{c} \text{ALL} \\ n \end{array} \right\}$$

#### Examples:

STOCHASTICS=10

Descriptor	Meaning
ALL	All real values of C-entries, M-entries, P-entries, loading entries, and SPCD entries are to be randomized.
n	Set identification number of a STOCHAS Bulk Data entry (Integer > 0).

#### Remarks:

1. Only one STOCHASTICS command may appear in the Case Control Section and should appear above all SUBCASE commands.
2. The STOCHASTICS = n command may be used to request randomizing a set of analysis model parameters with user specified statistics. (See Remark 1 of the STOCHAS Bulk Data entry.)
3. The default (STOCHASTICS = all) randomizes all scalar analysis model parameters that are real values on the C-entries, M-Entries, P-entries, all loading entries, and SPCD entries with default coefficients of variance (0.05) and multipliers of standard deviations (m=3.).
4. This command will only invoke a single Nastran randomization run. Separate runs can be submitted to achieve different randomizations.

## STRAIN Element Strain Output Request

Requests the form and type of strain output.

### Format:

$$\text{STRAIN} \left( \left( \begin{matrix} \text{SORT1} \\ \text{SORT2} \end{matrix} \right), \left[ \begin{matrix} \text{PRINT, PUNCH} \\ \text{PLOT} \end{matrix} \right] \left[ \begin{matrix} \text{REAL or IMAG} \\ \text{PHASE} \end{matrix} \right], \left[ \begin{matrix} \text{VONMISES} \\ \text{MAXS or SHEAR} \end{matrix} \right], \left[ \begin{matrix} \text{STRCUR} \\ \text{FIBER} \end{matrix} \right], \right. \\ \left. \left[ \begin{matrix} \text{CENTER} \\ \text{CORNER or BILIN} \\ \text{SGAGE} \\ \text{CUBIC} \end{matrix} \right], \left[ \begin{matrix} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{matrix} \right] \left[ \begin{matrix} \text{RPRINT} \\ \text{NORPRINT} \end{matrix}, \text{RPUNCH} \right] \right) = \left\{ \begin{matrix} \text{ALL} \\ \text{n} \\ \text{NONE} \end{matrix} \right\}$$

### Examples:

```
STRAIN=5
STRAIN (CORNER) =ALL
STRAIN (PRINT, PHASE) =15
STRAIN (PLOT) =ALL
STRAIN (PRINT, PSDF, CRMS, RPUNCH) =20
STRAIN (PRINT, RALL, NORPRINT) =ALL
```

Describer	Meaning
-----------	---------

SORT1	Output will be presented as a tabular listing of elements for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each element.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

Describer	Meaning
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. The request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. The request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
CRMS	Requests the cumulative root mean square function to be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 9.
VONMISES	von Mises strains are output.
MAXS or SHEAR	Maximum shear strains are output.
STRCUR	Strain at the reference plane and curvatures are output for plate elements.
FIBER	Strain at locations Z1, Z2 are computed for plate elements.
CENTER	Output CQUAD4 element strains at the center only.
CORNER or BILIN	Output CQUAD4 element strains at the center and grid points. Using strain gage approach with bilinear extrapolation.
SGAGE	Output CQUAD4 element strains at center and grid points using strain gage approach.
CUBIC	Output CQUAD4 element strains at center and grid points using cubic bending correction.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
ALL	Strain for all elements will be output.
n	Set identification of a previously appearing SET command. Only strain for elements with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	No element strain will be output.

**Remarks:**

1. Fully accurate nonlinear strains for nonlinear elements are requested by the STRESS command and appear in the nonlinear stress output. In SOLs 106 and 129, if LGDISP > 0 the center, and if requested for CQUAD4 the corner, strains are computed from the displacements alone and are only approximate. If LGDISP = -1 and material nonlinear then no STRAIN output will be created. In SOL 400, if enhanced material options are used, the computed strains are accurate and in this case a CQUAD4 corner request is ignored.
2. In SOLs 106 and 129, the STRAIN request pertains only to linear elements and only if the parameter LGDISP is -1, which is the default. Nonlinear strains for nonlinear elements are requested by the STRESS command and appear in the nonlinear stress output.
3. STRAIN=NONE overrides an overall output request.
4. Definitions of stress, strain, curvature, and output locations are given in the [Structural Elements](#) in the *MSC Nastran Reference Guide*.
5. If the STRCUR option is selected, the values of Z1 will be set to 0.0. and Z2 will be set to -1.0 on the output.
6. The VONMISES, MAXS, and SHEAR options are ignored in the complex eigenvalue and frequency response solution sequences.
7. The options CENTER, CORNER, CUBIC, SGAGE, and BILIN are recognized only in the first subcase, and determine the option to be used in all subsequent subcases with the STRESS, STRAIN, and FORCE commands. (In superelement analysis, the first subcase refers to the first subcase of each superelement. Therefore, it is recommended that these options be specified above all subcases.) Consequently, options specified in subcases other than the first subcase will be ignored. See also Remark 8 under the [FORCE \(Case\)](#) Case Control command for further discussion.
8. See Remark 1 under the [DISPLACEMENT \(Case\)](#) Case Control command for a discussion of SORT1 and SORT2.
9. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
10. Random response for complex strain in composites plates or shells, and layered solid composites and layered solid shell composites will be available for each ply.
11. Element type CBEAM3 is not supported for random response.

**STRESS**

## Element Stress Output Request

Requests the form and type of element stress output. Note: ELSTRESS is an equivalent command.

**Format:**

$$\text{STRESS} \left( \left[ \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right], \left[ \begin{array}{l} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \begin{array}{l} \text{VONMISES} \\ \text{MAXS or SHEAR} \end{array} \right], \right. \\ \left. \left[ \begin{array}{l} \text{CENTER} \\ \text{CUBIC} \\ \text{SGAGE} \\ \text{CORNER or BILIN} \end{array} \right], \left[ \begin{array}{l} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{array} \right] \left[ \begin{array}{l} \text{RPRINT} \\ \text{NORPRINT, RPUNCH} \end{array} \right] \right) = \left\{ \begin{array}{l} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

```
STRESS=5
STRESS (CORNER) =ALL
STRESS (SORT1, PRINT, PUNCH, PHASE) =15
STRESS (PLOT) =ALL
STRESS (PRINT, PSDF, CRMS, RPUNCH) =20
STRESS (PRINT, RALL, NORPRINT) =ALL
```

Describer	Meaning
SORT1	Output will be presented as a tabular listing of elements for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each element type.
PRINT or (blank)	
PUNCH	
PLOT	

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

Describer	Meaning
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 11.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 11.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 11.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 11.
VONMISES	Requests von Mises stresses.
MAXS or SHEAR	Requests maximum shear in the plane for shell elements and octahedral stress for solid elements.
CENTER	Requests CQUAD4, CQUADR and CTRIAR element stresses at the center only. The default for CQUAD4 is CENTER. The default for CQUADR and CTRIAR is CORNER.
CUBIC	Requests CQUAD4 element stresses at the center and grid points using strain gage approach with cubic bending correction.
SGAGE	Requests CQUAD4 element stresses at center and grid points using strain gage approach.
CORNER or BILIN	Requests CQUAD4, CQUADR, and CTRIAR element stresses at center and grid points using bilinear extrapolation.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
ALL	Stresses for all elements will be output.
n	Set identification of a previously appearing SET command. Only stresses for elements with identification numbers that appear on this SET command will be output (Integer > 0).
NONE	No element stress will be output.

**Remarks:**

1. ALL should not be used in a transient problem due to excessive output.
2. See Remark 1 under the [DISPLACEMENT \(Case\)](#) Case Control command description for a discussion of SORT1 and SORT2.
3. ELSTRESS is an alternate form and is equivalent to STRESS.
4. STRESS=NONE overrides an overall output request.
5. Prior to MSC Nastran 2014, in nonlinear analysis, the nonlinear stresses will still be printed unless NLSTRESS(PLOT) is specified.
6. The VONMISES option is ignored for ply stresses.
7. The VONMISES, MAXS, and SHEAR options are ignored in the complex eigenvalue and frequency response solution sequences.
8. The options CENTER, CORNER, CUBIC, SGAGE, and BILIN are recognized only in the first subcase, and determine the option to be used in all subsequent subcases with the STRESS, STRAIN, and FORCE commands. (In superelement analysis, the first subcase refers to the first subcase of each superelement. Therefore, it is recommended that these options be specified above all subcases.) Consequently, options specified in subcases other than the first subcase will be ignored. See also Remark 8 under the [FORCE \(Case\)](#) Case Control command for further discussion.
9. For composite ply output, the grid point option for CQUAD4 elements will be reset to the default option (CENTER).
10. MAXS for shell elements is not an equivalent stress.
11. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
12. Random response for complex stress in composites plates or shells, and layered solid composites and layered solid shell composites will be available for each ply.
13. Element type CBEAM3 is not supported for random response.

**STRFIELD**

## Grid Point Stress Output Request

Requests the computation of grid point stresses for graphical postprocessing and mesh stress discontinuities.

**Format:**

$$\text{STRFIELD} = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \end{array} \right\}$$

**Examples:**

```
STRFIELD=ALL
STRFIELD=21
```

Describer	Meaning
ALL	Grid point stress requests for all surfaces and volumes defined in the OUTPUT(POST) Section will be saved for postprocessing.
n	Set identification number of a previously appearing SET command. Only surfaces and volumes with identification numbers that appear on this SET command, and in the OUTPUT(POST) Section, will be included in the grid point stress output request for postprocessing (Integer > 0).

**Remarks:**

1. The STRFIELD command is required for the graphical display of grid point stresses in postprocessors that use the .xdb file (PARAM,POST,0), or when the GPSDCON or ELSDCON commands are specified, and does not provide printed output. The GPSTRESS command can be used to obtain printed output.
2. Only grid points connected to elements used to define the surface or volume are output. See the SURFACE and VOLUME Case Control commands.
3. Element stress output (STRESS) must be requested for elements referenced on requested SURFACE and VOLUME Case Control commands.
4. In nonlinear static and transient analysis, grid point stresses are computed only if parameter LGDISP is -1, which is the default. Also, in nonlinear transient analysis, grid point stresses are computed only for elements with linear material properties.

**SUBCASE**

## Subcase Delimiter

Delimits and identifies a subcase.

**Format:**

SUBCASE=*n*

**Example:**

SUBCASE=101

Descriptor	Meaning
<i>n</i>	Subcase identification number (9999999 > Integer > 0).

**Remarks:**

1. The subcase identification number, *n*, must be greater than all previous subcase identification numbers.
2. Plot requests and RANDPS requests refer to *n*.
3. See the MODES Case Control command for use of this command in normal modes analysis.
4. If a comment follows *n*, then the first few characters of the comment will appear in the subcase label in the upper right-hand corner of the output.
5. Note that in nonlinear statics (SOL106/129), SUBCASE's are not stand-alone solutions like in other solution sequences. They act as a load-progression, and the ending conditions of one SUBCASE become the initial conditions of the next SUBCASE.

**SUBCOM**

## Combination Subcase Delimiter

Delimits and identifies a combination subcase.

**Format:**

SUBCOM = n

**Example:**

SUBCOM = 125

Describer	Meaning
n	Subcase identification number (Integer > 2).

**Remarks:**

1. The subcase identification number, n, must be greater than all previous subcase identification numbers.
2. A SUBSEQ command must follow this command.
3. SUBCOM may only be used in SOL 101 (statics) or SOL 144 (static aeroelasticity) and in SOL 200 with ANALYSIS=STATICS or ANALYSIS=SAERO.
4. Output requests above the subcase level will be used.
5. If the referenced subcases contain thermal loads or element deformations, the user must define the temperature field in the SUBCOM with a TEMP(Load) command, or the element deformations with a DEFORM command.
6. SUBCOMs may be specified in superelement analysis with the following recommendations:
  - a. For each superelement, specify its SUBCASE(s) consecutively, directly followed by its SUBCOM(s).
  - b. Specify a SUPER command with a new load sequence number under each SUBCOM command.

The following example demonstrates a model with one superelement and one load combination:

```

SUBCASE 101
SUPER=1,1
LOAD=100
SUBCASE 102
SUPER=1,2
LOAD=200
SUBCOM 110
LABEL=COMBINE SUBCASES 101 AND 102
SUPER=1,3
SUBSEQ=1.,1.
SUBCASE 1001
SUBCASE 1002
SUBCOM 1010
LABEL=COMBINE SUBCASES 1001 AND 1002
SUBSEQ=1.,1.

```

7. For static aeroelasticity, only the displacement/element responses are combined. Trim, stability derivative and monitor point results are not combined.
8. SUBCOMs are not allowed in external superelement creation runs and are ignored in external superelement data recovery in assembly runs.
9. For SOL 200, a compliance response is not combined. SUBCASE/DRSPAN must be used for combining compliance response.

**SUBSEQ**

## Subcase Sequence Coefficients

Gives the coefficients for forming a linear combination of the previous subcases.

**Format:**

SUBSEQ=R1 [, R2, R3, ..., Rn]

**Example:**

SUBSEQ=1.0, -1 .0, 0.0, 2.0

Descriptor	Meaning
Ri	Coefficients of the previously occurring subcases. See Remark 4. (Real).

**Remarks:**

1. The SUBSEQ command can only appear after a SUBCOM command.
2. SUBSEQ may be only used in SOL 101 (statics) or SOL 144 (static aeroelasticity) and in SOL 200 with ANALYSIS=STATICS or ANALYSIS=SAERO.
3. This command list is limited to a maximum of 200 numbers.
4. R1 to Rn refer to the immediately preceding subcases. In other words, Rn is applied to the most recently appearing subcase, R(n - 1) is applied to the second most recently appearing subcase, and so on. The embedded comments (\$) describe the following example:

```
DISPL = ALL
SUBCASE 1
SUBCASE 2
SUBCOM 3
SUBSEQ = 1.0, -1.0 $ SUBCASE 1 - SUBCASE 2
SUBCASE 11
SUBCASE 12
SUBCOM 13
SUBSEQ = 0.0, 0.0, 1.0, -1 .0 $ SUBCASE 11 - SUBCASE 12
or
SUBSEQ = 1.0, - 1.0 $ EQUIVALENT TO PRECEDING COMMAND. USE ONLY ONE.
```

**SUBSEQ1**

## Subcase Factors for Combination

Gives the factors for linear combination of a specific group of SUBCASEs.

**Format:**

SUBSEQ1= s0, s1, sub1, s2, sub2, [sn, subn]

**Example:**

SUBSEQ1= 1.0, 1.0, 101, -1.0, 102

Describer	Meaning
S0	Factor for all SUBCASEs involved. (No default; Real<>0.).
Sn	Factor applicable to SUBn only (Real; No default).
SUBn	SUBCASE ID (No default; Integer>0).

**Remarks:**

1. The SUBSEQ1 command can only appear after a SUBCOM command.
2. SUBSEQ1 may only be used in SOL 101 (Statics) or SOL 144 (Static Aeroelasticity) and in SOL 200 with ANALYSIS=STATIC or ANALYSIS=SAERO.
3. SUBSEQ1 and SUBSEQ are mutually exclusive and can't both appear under a SUBCOM.
4. S0, S1 and SUB1 are required input for SUBSEQ1. S2, SUB2 to Sn, SUBn pair are optional.

## SUBSTEP

### SUBSTEP Delimiter

Delimits and identifies a nonlinear analysis SUBSTEP for COUPLED analysis in SOL 400.

#### Format:

SUBSTEP=n

#### Examples:

```
STEP=50
NLSTEP=10
SUBSTEP=1
ANALYSIS=HSTAT
SUBSTEP=2
ANALYSIS=NLSTAT
```

Describer	Meaning
n	Substep identification number. (Integer > 0)

#### Remarks:

1. The SUBSTEP command can only be used in nonlinear solution sequence SOL 400 (NONLIN).
2. The SUBSTEP command can only be used in a STEP command.
3. When used in a STEP command two or more SUBSTEP commands must occur.
4. Each SUBSTEP must contain a *unique* ANALYSIS=type statement. Currently there is a limitation of only two SUBSTEPS per STEP with the following options:
  - ANALYSIS=HSTAT for the first SUBSTEP and ANALYSIS=NLSTAT for the second SUBSTEP.
  - ANALYSIS=HTRAN for the first SUBSTEP and ANALYSIS=NLTRAN for the second SUBSTEP
  - ANALYSIS=HTRAN for the first SUBSTEP and ANALYSIS=NLSTAT for the second SUBSTEP
  - ANALYSIS=HSTAT for the first SUBSTEP and ANALYSIS=NLTRAN for the second SUBSTEP
5. Within a STEP the SUBSTEP identification number n must be in increasing order and not greater than 9999999.
6. The following example illustrates a typical application of SUBCASE, STEP, and SUBSTEPS

Subcase 100

```
STEP 10
STRESS= ALL
NLSTRESS=ALL
SET 1456 = list
NLSTEP=84
SubSTEP 1
```

```

ANALYSIS=HSTAT
THERMAL=ALL
FLUX=ALL
SPC=35
LOAD=11
SubSTEP 2
ANALYSIS=NLSTAT
SPC=2
LOAD=110
DISP (PLOT) =1456

```

7. The solutions of all SUBCASEs are independent of each other. The solution of any STEP is a continuation of the solution of the previous STEP. *The solutions of the SUBSTEPs occur simultaneously within a STEP.*
8. In coupled analysis, TEMP(LOAD)=m will be ignored as the temperature loading from the thermal substep is automatically transferred to the mechanical substep. Note that in this multi-physics coupled framework, both the heat transfer and structural physics are executed on the same mesh with the same time steps.
9. In coupled analysis, TEMP(INIT)=n will be honored. It should be noted that when a thermo-mechanical static analysis is defined, TEMP(INIT) defines the initial temperature for both the thermal and mechanical substeps. Note that when a transient thermal-static mechanical analysis is define, IC=n should be used to define the initial temperature for the thermal substep and TEMP(INIT)=n (the same ID n) should be used to define the initial temperature for the structural substep. Then an initial thermal strain is defined as:

$$\varepsilon T = A(T) \cdot (T - TREF) - A(T_o) \cdot (T_o - TREF)$$

where  $T_o$  comes from TEMP(INIT) and TREF comes from the material entry.

10. The LOADSET Case Control Command *is not allowed* with this command. All dynamic loading must be applied through the use of the DLOAD Case Control command.
11. For coupled analysis, i.e., when two or more sub-steps are defined, a *single* Bulk Data entry NLSTEP must be included in the STEP command containing the SUBSTEP commands. It must occur above or in the STEP command and above the first SUBSTEP command.

The loads and constraints can be independently defined for each physics under the relevant SUBSTEP. The commands that are normally used for single physics are applicable. For, e.g., for a HTRAN-NLSTAT coupled analysis, DLOAD should be used n the HTRAN substep while LOAD should be used in the NLSTAT substep.

12. Any case control command will apply to all SUBSTEPs when and only when it is above all the SUBSTEPs of the STEP.

**SUBTITLE**

## Output Subtitle

Defines a subtitle that will appear on the second heading line of each page of printer output.

**Format:**

SUBTITLE=subtitle

**Example:**

SUBTITLE=PROBLEM NO. 5-1A

Describer	Meaning
subtitle	Any character string.

**Remarks:**

1. SUBTITLE appearing under a SUBCASE command will appear in the output for that subcase only.
2. SUBTITLE appearing before all SUBCASE commands will appear in the output for all subcases except those in Remark 1.
3. If no SUBTITLE command is present, the subtitle line will be blank.
4. The subtitle also appears on plotter output.

**SUPER**

## Superelement Subcase Assignment

Assigns a subcase(s) to a superelement or set of superelements.

**Format:**

$$\text{SUPER} = \left\{ \begin{array}{c} \text{ALL} \\ \left\{ \begin{array}{c} n \\ i \end{array} \right\} [ , l ] \end{array} \right\}$$

**Examples:**

SUPER=17, 3

SUPER=15

SUPER=ALL

Descriptor	Meaning
i	Superelement identification number (Integer > 0).
ALL	The subcase is assigned to all superelements and all loading conditions (Default).
n	Set identification number of a previously appearing SET command. The subcase is assigned to all superelements with identification numbers that appear on this SET command (Integer > 0).
l	Load sequence number (Integer > 0; Default=1).

**Remarks:**

1. All subcases with requests for specific superelement(s) must contain the SUPER command. If no SUPER command is specified in the Case Control Section, then all subcases will be assigned to all superelements; i.e., SUPER=ALL is the default.
2. All subcases associated with superelements must precede those for the residual structure except when SUPER=ALL or SUPER=n and the selected set includes the residual structure.
3. The load sequence number is only used in static analysis and frequency response analysis when there are multiple loading conditions. Also, the residual structure must have a subcase specified for each unique load condition. This is required because the number of residual structure subcases is used to determine the number of load conditions for all superelements.
4. The load sequence number is associated with the order of the subcases for the residual structure; i.e., the third loading condition is associated with the third subcase for the residual structure.
5. Subcases are required for superelements when there is a load, constraint, or output request.
6. If a set is referenced by n, then the SET identification number must be unique with respect to any superelement identification numbers. In addition, the same sets must be used for all loading conditions.

7. If the ALL option is used, it must be used for all loading conditions.
8. If there are no superelements in the model then the SUPER command will be ignored except in 3-step external superelement data recovery restarts in SOL 400. See Remarks 9 and 10 under the EXTDRIN Case Control command description.

**SUPPORT1**

## Fictitious Support Set Selection

Selects the fictitious support set (SUPPORT1 or SUPPORT6 entries only) to be applied to the model.

**Format:**

SUPPORT1=n

**Examples:**

SUPPORT1=15

SUPO=4

Describer	Meaning
n	Set identification of fictitious support set defined on the SUPPORT1 or SUPPORT6 Bulk Data entries. See Remark 1. (Integer > 0).

**Remarks:**

1. SUPPORT1 or SUPPORT6 Bulk Data entries will not be used unless selected in the Case Control Section by the SUPPORT1 command.
2. SUPPORT entries will be applied in all subcases.
3. For SOL 600, Case Control command SUPPORT1 must reference a SUPPORT6 Bulk Data entry with ID = N.

## SVECTOR

## Solution Set Eigenvector Output Request

Requests the form and type of solution set eigenvector output.

### Format:

$$\text{SVECTOR} \left( \begin{array}{c} \text{PRINT,PUNCH} \\ \text{PLOT} \end{array} \right) = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Examples:

SVECTOR=ALL  
SVECTOR (PUNCH) =NONE

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Displacements for all points (modes) will be output.
NONE	Displacements for no points (modes) will be output.
n	Set identification of a previously appearing SET command. Only displacements of points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. SVECTOR=NONE overrides an overall output request.
2. Output will be presented as a tabular listing of grid points for each eigenvector.

**SVELOCITY**

## Solution Set Velocity Output Request

Requests the form and type of solution set velocity output.

**Format:**

$$\text{SVELOCITY} \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \text{PRINT}, \text{PUNCH}, \left( \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

SVELOCITY=5

SVELOCITY (SORT2, PUNCH, PRINT, PHASE) =ALL

Descriptor	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point (or mode number).
PRINT	The printer will be the output medium.
PUNCH	The punch file will be the output medium.
REAL or IMAG	Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.
PHASE	Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.
ALL	Velocity for all solution points (modes) will be output.
NONE	Velocity for no solution points (modes) will be output.
n	Set identification of a previously appearing SET command. Only velocities of points with identification numbers that appear on this SET command will be output (Integer > 0).

**Remarks:**

1. Velocity output is only available for transient and frequency response problems.
2. The defaults for SORT1 and SORT2 depend on the type of analysis, and is discussed in Remark 1 under the [DISPLACEMENT \(Case\)](#) Case Control command. If SORT1 is selected for any of the commands SACC, SDIS, and SVEL, then the remaining commands will also be SORT1.
3. SVELOCITY=NONE overrides an overall output request.

## **SYM** Symmetry Subcase Delimiter

Delimits and identifies a symmetry subcase.

### **Format:**

SYM=n

### **Example:**

SYM=123

<b>Describer</b>	<b>Meaning</b>
n	Subcase identification number (Integer > 0).

### **Remarks:**

1. The subcase identification number n must be greater than all previous subcase identification numbers.
2. Plot commands should refer to n.
3. Overall output commands will not propagate into a SYM subcase (i.e., any output desired must be requested within the subcase).
4. SYM may only be used in statics or inertia relief problems.

**SYMCOM**

## Symmetry Combination Subcase Delimiter

Delimits and identifies a symmetry combination subcase.

**Format:**

SYMCOM=n

**Example:**

SYMCOM=123

Describer	Meaning
n	Subcase identification number (Integer > 2).

**Remarks:**

1. The subcase identification number n must be greater than all previous subcase identification numbers.
2. SYMCOM may only be used in statics problems.
3. If the referenced subcases contain thermal loads or element deformations, the user must define the temperature field in the SYMCOM by use of a TEMP(LOAD) command, or the element deformations by a DEFORM command.
4. An alternate command is the SUBCOM command.
5. SYMCOMs may be specified in superelement analysis with the following recommendations:
  - a. For each superelement, specify its SUBCASEs consecutively, directly followed by its SYMCOM(s).
  - b. Specify a SUPER command with a new load sequence number under each SYMCOM command.

The following example represents a model with one superelement and one load combination:

```

SUBCASE 101
SUPER=1,1
LOAD=100
SUBCASE 102
SUPER=1,2
LOAD=200
SYMCOM 110
LABEL=COMBINE SUBCASES 101 AND 102
SUPER=1,3
SYMSEQ=1.,1.
SUBCASE 1001
SUBCASE 1002
SYMCOM 1010
LABEL=COMBINE SUBCASES 1001 AND 1002
SYMSEQ=1.,1.

```

**SYMSEQ**

## Symmetry Sequence Coefficients

Specifies the coefficients for combining symmetry subcases into the total structure.

**Format:**

SYMSEQ=R1 [,R2,R3,..., Rn]

**Example:**

SYMSEQ=1.0, -2.0, 3.0, 4.0

Describer	Meaning
Ri	Coefficients of the previously occurring n SYM subcases. (Real)

**Remarks:**

1. SYMSEQ may only appear after a SYMCOM command.
2. The default value for the coefficients is 1.0 if no SYMSEQ command appears.
3. SYMSEQ may only be used in static analysis or inertia relief.
4. Ri is limited to a maximum of 200 numbers.

**TACCELERATION**

## Acceleration Output Request for trim components, TRMC

Requests the form and type of acceleration output for TRMC.

**Format:**

$$TACCELERATION \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Example:**

```
SET 20 = 3/103, 5/0, 12/ALL $
TACCELERATION=ALL
TACC (REAL, PUNCH, PRINT)=20
TACCE=20
TACCELE (SORT2, PRINT)=20
```

Describer	Meaning
SORT1	Output will be presented as a tabular listing of grid points for each load and frequency.
SORT2	Output will be presented as a tabular listing of frequency for each grid point.
PRINT or (blank)	
PUNCH	
PLOT	

Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
X		X*
	X	X*
		X*

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.

ALL TRMC acceleration for all points of all TRMCs will be output. See Remarks 2.

Describer	Meaning
NONE	No TRMC acceleration will be output.
n	Set identification of a previously appearing SET command. Only points with identification numbers that appear on this SET command will be output (Integer > 0). SET 20 in above examples section is to request SET 103(not present) for TRMC 3, none for TRMC 5 and ALL for TRMC 12.

**Remarks:**

1. Refrain from using ALL which may produce voluminous output.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. TACC=NONE suppresses the generation of TRMC acceleration output.
4. TACCELERATION is supported only with PARAM,TRMBIM,PHYSICAL
5. TACCELERATION is available for PEM jobs of SOL 108, 111 and SOL 200 with ANALYSIS=DFREQ and MFREQ. Note that TACCELERATION is available for output only and cannot be utilized as design response.
6. For restart PEM job, TACCE request must remain the same as cold start PEM job.

**TDISPLACEMENT**

## Displacement Output Request for trim components, TRMC

Requests the form and type of displacement output for TRMC.

**Format:**

$$TDISPLACEMENT \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Example:**

```
SET 20 = 3/103, 5/0, 12/ALL $
TDISPLACEMENT=ALL
TDIS (REAL, PUNCH, PRINT)=20
TDISP=20
TDISPLACE (SORT2, PRINT)=20
```

Describer	Meaning																
SORT1	Output will be presented as a tabular listing of grid points for each load and frequency.																
SORT2	Output will be presented as a tabular listing of frequency for each grid point.																
	<table border="1"> <thead> <tr> <th></th> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td></td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td></td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td></td> <td>X*</td> </tr> </tbody> </table>		Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X		X*	PUNCH		X	X*	PLOT			X*
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)														
PRINT or (blank)	X		X*														
PUNCH		X	X*														
PLOT			X*														

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.

ALL TRMC displacement for all points of all TRMCs will be output. See Remarks 2.

Describer	Meaning
NONE	No TRMC displacement will be output.
n	Set identification of a previously appearing SET command. Only points with identification numbers that appear on this SET command will be output (Integer > 0). SET 20 in above examples section is to request SET 103(not present) for TRMC 3, none for TRMC 5 and ALL for TRMC 12.

**Remarks:**

1. Refrain from using ALL which may produce voluminous output.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. TDISP=NONE suppresses the generation of TRMC displacement output.
4. TDISPLACEMENT is supported only with PARAM,TRMBIM,PHYSICAL
5. TDISPLACEMENT is available for PEM jobs of SOL 108, 111 and SOL 200 with ANALYSIS=DFREQ and MFREQ. Note that TDISPLACEMENT is available for output only and cannot be utilized as design response.
6. For each grid in a TRMC, it has 3 or 6 DOFs for solid phase and 1 DOF for fluid phase. TDISPLACEMENT output results for both solid phase DOFs and fluid phase DOF.
7. The 3 DOFs of solid phase takes T1, T2 and T3 locations of a regular 6 DOFs structural grid and set R1, R2 and R3 locations to 0.0. The 1 DOF of fluid phase is reported as acoustic pressure.
8. For restart PEM job, TDISP request must remain the same as cold start PEM job.

## TEMPERATURE

## Temperature Set Selection

Selects the temperature set to be used in either material property calculations or thermal loading in heat transfer and structural analysis.

### Format:

$$\text{TEMPERATURE} \left[ \left[ \begin{array}{c} \text{INITIAL} \\ \text{MATERIAL} \\ \text{LOAD} \\ \text{BOTH} \end{array} \right] \right], \text{HSCASE} = i \left[ \right], \text{HSTEP} = j \left[ \right], \text{HTIME} = \left[ \begin{array}{c} t \\ \text{ALL} \end{array} \right] \left[ \right] \left[ \right] \left[ \right]$$

$$\left[ \begin{array}{c} \text{GRID} \\ \text{ELEMENT} \\ \text{BOTH} \\ \text{NONE} \end{array} \right] = n$$

### Examples:

TEMPERATURE (LOAD) =15

TEMPERATURE (MATERIAL) =7

TEMPERATURE=7

TEMPERATURE (LOAD, HSCASE=20, HTIME=12.0) =39

Descriptor	Meaning
MATERIAL	The selected temperature set will be used to determine temperature-dependent material properties indicated on MATTi Bulk Data entries. See Remarks 6., 7., and 8.
LOAD	The selected temperature set will be used to determine an equivalent static load and to update material properties in a nonlinear analysis. See Remarks 2., 5., 6., 7. and 14.
BOTH	Both MATERIAL and LOAD will use the same temperature set.
n	Set identification number of TEMP, TEMPD, TEMPP1, TEMPB3, TEMPRB, or TEMPAX Bulk Data entries (Integer > 0).
INITIAL	The selected temperature table will be used to determine initial temperature distribution in nonlinear static analysis. See Remarks 4., 6., 7., 8., 9., and 12.
HSCASE	Specifies a SUBCASE executed in the selected thermal job. See Remark 14.
i	Identification number of a SUBCASE executed in the selected thermal job. (Integer ≥ 0, Default = 0 is the first SUBCASE) See Remark 14.
HSTEP	Specifies a STEP executed in the selected thermal job. See Remark 14.
j	Identification number of a STEP executed in the selected thermal job. (Integer ≥ 0, Default = 0 is the first STEP) See Remark 14.

Describer	Meaning
HTIME	Specifies the time of a time step executed in the selected nonlinear transient thermal job. See Remark 14.
t	Time of a time step executed in the selected nonlinear transient thermal job. (Real $\geq 0.0$ , Default is the last time of the specified SUBCASE and/or STEP) See Remark 14.
ALL	Selects all time steps executed in the selected nonlinear transient thermal job. See Remark 14.
VERIFY	Output temperature verification data output requested
GRID	Output grid temperature verification data
ELEMENT	Output element temperature verification data
BOTH	Output both grid and element temperature verification data
NONE	Do not output any verification data

### Remarks:

1. In linear analysis, only one TEMP(MATE) may be made in any problem and should be specified above the subcase level. If there are multiple subcase and TEMP(MATE) is not above the first subcase, then it must appear in the last subcase or it will be ignored. See also Remarks 6. and 7.
2. The total load applied will be the sum of external (LOAD command), thermal (TEMP(LOAD) command), element deformation (DEFORM command), and constrained displacement (SPC command) loads.
3. Static, thermal, and element deformation loads should have unique set identification numbers.
4. INITIAL is used in steady state heat transfer analysis for conduction material properties, and provides starting values for iteration. In structural analysis, TEMP(INIT) is used to specify an initial temperature. It may appear above or in the first subcase. In SOL 400, it may appear above or in the first STEP.
5. In superelement data recovery restarts, TEMPERATURE(LOAD) requests must be respecified in the Case Control Section.
6. In linear static analysis, temperature strains are calculated by

$$\varepsilon_T = A(T_o) \cdot (T - T_o)$$

where  $A(T_o)$  is the thermal expansion coefficient defined on the MATi Bulk Data entries,  $T$  is the load temperature defined with TEMPERATURE(LOAD), and  $T_o$  is the initial temperature defined as follows. The following rules apply for TEMPERATURE(INITIAL), TEMPERATURE(MATERIAL), and TREF on the MATi entries:

- a. If TEMPERATURE(INITIAL) and TREF are specified, then the TEMPERATURE(INITIAL) set will be used as the initial temperature to calculate both the loads and the material properties.

- b. If TEMPERATURE(MATERIAL) and TREF are specified, then TREF will be used as the initial temperature in calculating the load and the TEMPERATURE(MATERIAL) set will be used for the calculation of material properties.
  - c. If neither TEMPERATURE(INITIAL), TEMPERATURE(MATERIAL), nor TEMPERATURE(BOTH) is present, TREF will be used to calculate both the load and the material properties and will be obtained from the MATi entry. The MATi is not used in this case.
7. In nonlinear static analysis, temperature strains are calculated with

$$\varepsilon_T = A(T) \cdot (T - \text{TREF}) - A(T_o) \cdot (T_o - \text{TREF})$$

where  $A(T)$  is the thermal expansion coefficient defined on the MATi Bulk Data entries,  $T$  is the load temperature defined with TEMPERATURE(LOAD), and  $T_o$  is the initial temperature defined with TEMPERATURE(INITIAL). The following rules apply:

- a. The specification of TEMPERATURE(MATERIAL) or TEMPERATURE(BOTH) will cause a fatal error.
- b. If a subcase does not contain a TEMPERATURE(LOAD) request, then the thermal load set will default to the TEMPERATURE(INITIAL) set.
- c. TEMPERATURE(LOAD) will also cause the update of temperature-dependent material properties due to the temperatures selected in the thermal load set. Temperature-dependent material properties are specified with MATi, MATTi, MATS1, and/or TABLEST Bulk Data entries.
- d. If TREF and TEMPERATURE(INITIAL) are specified, then the TEMPERATURE(INITIAL) set will be used as the initial temperature to calculate both the loads and the material properties. Both are used in the definition of thermal strain.

For SOL 600, TREF and TEMP(INIT) must be consistent (the same values) or unexpected results may occur.

- 8. TEMPERATURE(MATERIAL) and TEMPERATURE(INITIAL) cannot be specified simultaneously in the same run.
- 9. TEMP(INIT) is not used with TEMPAX.
- 10. Temperature loads cause incorrect element forces and stresses in all the dynamic analysis except SOL 400 nonlinear transient analysis with the elements having nonlinear capability.

It should be noted that:

- a. For nonlinear dynamics analysis with SOL 400, TEMPERATURE/THERMAL load can't be applied by TEMP/DLOAD (Case Control) and TEMPD/TLOADi (Bulk Data), this load should be applied by TEMP(Case Control) and TTEMP(Bulk Data);
  - b. For pure linear analysis with SOL 400, the TEMP/DLOAD (Case Control) and TEMPD/TLOADi (Bulk Data) has to be used to apply the temperature load.
11. In linear analysis, TEMPERATURE(MATERIAL) is not supported for hyperelastic elements (MATHP). TEMP(INIT) must be placed above the subcase level, and TEMP(LOAD) placed within the subcase.

12. For layered composites, neither the TREF specified on the material entries, nor TEMP(INIT) nor TEMP(MATE) are used to determine ply reference temperature. The TREF on the PCOMP or PCOMPG entries is used for all plies of the element. This is true for both linear and nonlinear analysis. If TEMP(INIT) is defined, the TREF on the PCOMP or PCOMPG entries is only used for determining the material properties and TEMP(INIT) is used for thermal strains. If TEMP(INIT) is not defined, the TREF on the PCOMP or PCOMPG entries is used for determining the material properties and thermal strains.
13. For SOL 600, in a thermal stress analysis where the temperatures were produced in a previous SOL 600 simulation, the use of MCHSTAT is preferred.
14. For TEMPERATURE(LOAD) requests in SOL 400, HSUBCASE, HSTEP, and HTIME are used to retrieve the temperature results from an existing thermal database. This feature allows user to select either steady state or transient thermal results for nonlinear structural analysis, with the flexibility of different time steps and dissimilar mesh sizes between thermal and structural runs. The following rules apply for using this capability:
  - HSUBCASE, HSTEP, and HTIME keywords must follow a LOAD keyword.
  - Although all three keywords have default values, at least one keyword must exist to apply this uncoupled multi-physics feature in analysis.
  - HTIME=ALL is used in nonlinear transient structural analysis to perform real time temperature interpolations. In this case, the nodal temperatures of nonlinear elements are updated at each time step. These temperatures are equal to the temperature results of the selected thermal database at current time.
  - The set IDs of TEMP(LOAD) must be different from the set IDs of TEMP(INIT).
  - To save temperature results of thermal analysis in MASTER nastran database, use the following command.

```
nastran thermal_job_name scratch=no
```

In addition, the user must specify the following Bulk Data entry:

```
PARAM,NLPACK,-1
```

for transient thermal models with number of time steps greater than the default NLPACK output time steps.

- The following File Management Statements are required in the current structural model to select the thermal database.

```
ASSIGN hrun='thermal_job_name.MASTER'
```

```
DBLOC DATABLEK=(HEATDB) LOGI=hrun
```

- Contact body integrity is not maintained while doing the thermal mapping. While this would not be a restriction for bodies that are not physically in contact or in glued thermal contact, it could lead to undesirable temperature mapping for bodies that are in regular thermal contact with temperature gradients across the contact interface.

**TERMIN**

## Conditions to Terminate in SOL 600

Selects a TERMIN Bulk Data entry which specifies criteria such that a SOL 600 analysis can be terminated, for example, if the displacement at a certain grid exceeds a specified value.

**Format:**

TERMIN=N

**Example:**

TERMIN=5

Describer	Meaning
N	ID of a matching TERMIN Bulk Data entry specifying the termination conditions for a particular analysis.

**Remarks:**

1. This entry may only be used within subcases (it may not be placed above the first subcase entry). If there are no subcase entries, it may be placed anywhere in the Case Control Section.
2. Most SOL 600 analyses do not require TERMIN entries.
3. If some subcases have TERMIN entries and others do not, only those that do will check for termination conditions.
4. TERMIN criteria may be different for different subcases.

## TFL Transfer Function Set Selection

Selects the transfer function set(s) to be added to the direct input matrices.

### Format:

TFL=n

### Example:

TFL=77

TFL = 1, 25, 77

Describer	Meaning
n	Set identification of a TF Bulk Data entry (Integer > 0).

### Remarks:

1. Transfer functions will not be used unless selected in the Case Control Section.
2. Transfer functions are supported in dynamics problems only.
3. Transfer functions are described in the [MSC Nastran Dynamic Analysis User's Guide](#).
4. It is recommended that PARAM,AUTOSPC,NO be specified when using transfer functions. See [Constraint and Mechanism Problem Identification in SubDMAP SEKR](#) in the *MSC Nastran Reference Guide*.
5. The transfer functions are additive if multiple TF values are referenced on the TFL command.

**THERMAL**

## Temperature Output Request

Requests the form and type of temperature output.

**Format:**

$$\text{THERMAL} \left( \left( \begin{array}{l} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) \right) = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Examples:**

THERMAL=5

THER (PRINT, PUNCH) =ALL

Descriptor	Meaning
SORT1	Output is presented as a tabular listing of point temperatures for each load or time step.
SORT2	Output is presented as a tabular listing of loads or time steps for each.

	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Temperatures for all points will be output.
NONE	Temperatures for no points will be output.
n	Set identification of a previously appearing SET command. Only temperatures of points with identification numbers that appear on this SET command will be output (Integer > 0).

**Remarks:**

1. The THERMAL output request is designed for use with the heat transfer option. The printed output will have temperature headings. The PUNCH option produces TEMP Bulk Data entries, and the SID on the entries will be the subcase number (=1 if no SUBCASES are specified).

2. SORT1 is the default in steady state heat transfer analysis. SORT2 is the default in transient heat transfer analysis.
3. In a transient heat transfer analysis, the SID on the punched TEMP Bulk Data entries equal the time step number.

**TITLE**                      Output Title

Defines a character string to appear on the first heading line of each page of MSC Nastran printer output.

**Format:**

TITLE=title

**Example:**

TITLE=RIGHT WING, LOAD CASE 3.

Describer	Meaning
title	Any character string.

**Remarks:**

1. If this command appears under a SUBCASE command, then the title appears in the output for that subcase only.
2. If this command appears before all SUBCASE commands, then the title is used in all subcases without a TITLE command.
3. If no TITLE command is present, then the title line will contain data and page numbers only.
4. The title also appears on plotter output.

**TIRE**

## Tire Set Selection

The TIRE case control entry defines the tires to be included in the analysis by selecting the TIRE bulk data entry. This case control command can be used in solutions sequences SOLs 103, 107-112, 200 and 400.

**Format:**

TIRE = n

**Example:**

TIRE = 100

Descriptor	Meaning
n	Set ID of a TIRE bulk data entry (Integer > 0).

**Remarks:**

1. The TIRE case control command must occur above subcase level.
2. Using a particular combination of tires in the analysis only requires selection of the tires by referencing the TIRE bulk data entry.

**TRIM**

## Aerodynamic Trim Variable Constraint Selection

Selects trim variable constraints in static aeroelastic response.

**Format:**

TRIM = n

**Example:**

TRIM=1

Describer	Meaning
n	Set identification number of a TRIM Bulk Data entry (Integer > 0).

**Remark:**

1. Aerodynamic extra points (trim variables) not constrained by a TRIM Bulk Data entry will be free during the static aeroelastic response solution.

## TRIMF

### Trim Load Output Specification

Specifies options for the output of trim loads from a static aeroelastic analysis as FORCE/MOMENT Bulk Data entries.

#### Format:

TRIMF([UNIT = i], [LOADSET = n], [LARGE], [INERTIA], [APPLIED], [AIR]

[NOSUM][RIGID],[NOELASTIC], [QNORM] )=  $\left\{ \begin{array}{c} \text{ALL} \\ n \end{array} \right\}$

#### Example:

TRIMF (LOADSET=10001, LARGE) =ALL  
TRIMF (UNIT=59, INERTIA, NOSUM) =1

Descriptor	Meaning
UNIT	Fortran unit to which data are written. (Optional; Default = 7) (punch file).
LOADSET	Load set id for output bulk data entries. If the TRIMF specification results in multiple load sets, then the defined ID will be used for the first and each subsequent load set has an ID incremented by 1. (Optional; Default = 1)
LARGE	Write the output data in large field format (16 characters per field). The default is 8 characters per field.
INERTIA	Write out inertial loads as a separate load set. By default, the separate load set will not be written.
APPLIED	Write out applied loads as a separate load set. By default, the separate load set will not be written.
AIR	Write out aerodynamic loads as a separate load set. By default, the separate load set will not be written.
NOSUM	By default, the sum of the inertial, applied, and aerodynamic loads will be written as a separate load set. This option suppresses the writing of that set of loads.
RIGID	Write out rigid instances of the selected loads (Inertial, Applied, Air and/or Sum) as separate load sets. By default, the separate load set will not be written.
NOELASTIC	By default, the sum of the rigid and elastic increment loads will be written as a separate load set. This option suppresses the writing of that set of loads.
QNORM	Normalize the load by the dynamic pressure used in the trim analysis. By default, the loads are not normalized.
ALL	Loads for all points will be output
n	Set identification of a previously appearing SET command. Only loads on points with identification numbers that appear on this SET command will be output (Integer > 0)

**Remark:**

1. By default, the loads are written to the punch file (Fortran unit 7). If the user specifies an alternate Fortran unit number on the TRIMF entry, by default the loads will be written to a file name that is machine specific (i.e. 'fort.53' on many LINUX platforms). The user may connect the Fortran unit to a user-defined file name by using an ASSIGN entry in the FMS Section of the input file. For example:

```
ASSIGN USERFILE='load13.inc', STATUS=UNKNOWN, FORMATTED, UNIT=53
```

2. Up to eight loads sets are available: Rigid Inertial, Rigid Applied, Rigid Air, Rigid Sum and four more with the sum of the rigid and elastic increment. This table indicates how the describers invoke each of these sets:

	INERTIAL	APPLIED	AIR	SUM
RIGID	O	O	O	O
ELASTIC	O	O	O	DEFAULT

where O = Optional. For a load to appear, both the row and column in the table above have to be set.

3. Care must be taken if LOADSET is specified in a run with multiple subcases. There are no checks that the load set IDs which are generated by one subcase are not also used for another subcase. For example, consider the following Case Control commands:

```
SUBCASE 1
  TRIM = 1
  TRIMF(RIGID) = ALL $
SUBCASE 2
  TRIM = 2
  TRIMF(LOADSET=2) = ALL
```

Subcase 1 will generate two load sets with set IDs 1 and 2. Subcase 2 will also output a load set ID 2.

4. The LOADSET option should not be specified above the subcase level when there are multiple subcases. If it is, each subcase will start numbering its load ID's from LOADSET.

**TRIMGRP**

## Selection of Trim Component(s)

Selects a set of trim components for analysis.

**Format:**

$$\text{TRIMGRP} \left[ \begin{matrix} (ALLTRMC) \\ (SLTTRMC) \end{matrix} \right] = \begin{bmatrix} sid \\ ALL \\ NONE \end{bmatrix}$$

**Example:**

TRIMGRP=101

Describer	Meaning
ALLTRMC	Process all TRMCs defined under 'BEGIN BULK TRMC=trimid' regardless if it is been selected in sid. This is the default option.
SLTTRMC	Process only those TRMCs whose ID is selected in sid. It can be equal to or less than what are been defined under 'BEGIN BULK TRMC=trimid'.
sid	Set identification of a previously appearing SET command or TRIMID. (Integer>0).
ALL	All trim components present in the model are included in the analysis.
NONE	This is the default of TRIMGRP. No trim component is involved in the analysis.

**Remark:**

1. TRIMGRP is used to select a group of trim components for analysis, including the calculation of trim component boundary coupling matrices.:
2. PEM capability is available in SOL 108, SOL 111 and SOL 200 with analysis=mfreq.
3. SUBCASEs without TRIMGRP will have the equivalent effect of TRIMGRP=none even with the presence of 'BEGIN TRMC' in the deck.
4. To run PEM job with multiple processors, additional information is available in 'Running PEM jobs' section of [Using PEM Functions in MSC Nastran](#) in the *MSC Nastran Installation and Operations Guide*.
5. For restart PEM job, TRIMGRP must remain the same as cold start PEM job and no changes to any TRMC should be observed. Otherwise, the PEM job should be run as cold start.
6. Collapsed logic is introduced to improve performance of large PEM jobs satisfy following requirements:
  - a. Same TRIMGRP for all SUBCASEs and
  - b. same master frequencies for all TRMCs. The activation of collapsed logic is automatic if requirements are met. With collapsed logic activated, restart job is restricted to the same TRIMGRP as cold start.

7. Following TRIMGRP case control commands have same effect which is to process all defined TRMCs:
  - a. TRIMGRP = ALL
  - b. TRIMGRP(alltrmc)=ALL
  - c. TRIMGRP(sltrmc)=ALL
8. If TRIMGRP is used in multiple SUBCASEs, SLTTRMC/ALLTRMC on TRIMGRP of above subcase level or first subcase will be utilized. SLTTRMC/ALLTRMC on TRIMGRP of second subcase and onwards will be ignored. Note that SLTTRMC on TRIMGRP of first subcase may be ignored if the union of all TRIMGRP means ALL TRMCs.

## TSTEP

### Transient Time Step Set Selection

Selects integration and output time steps for linear or nonlinear transient analysis.

#### Format:

TSTEP=n

#### Example:

TSTEP=7 3 1

Describer	Meaning
n	Set identification number of a TSTEP or Bulk Data entry (Integer > 0).

#### Remarks:

1. A TSTEP entry must be selected to execute a linear transient analysis (SOLs 109 or 112) and for a nonlinear transient analysis (SOLs 129 and 159).
2. A entry must be selected in each subcase to execute a nonlinear transient problem.
3. For the application of time-dependent loads in modal frequency response analysis (SOLs 111 and 146), the TSTEP entry must be selected by the TSTEP command. The time-dependent loads will be recomputed in frequency domain by a Fourier transform.
4. In one subcase or STEP for SOL 400, users should only specify one of TSTEP, TSTEPNL or NLSTEP.

**TSTEPNL**

## Transient Time Step Set Selection for Nonlinear Analysis

See the description of the [TSTEP \(Case\)](#). (The TSTEP Case Control entry can be used to select a TSTEPNL Bulk Data entry, however, a Bulk Data TSTEP is completely different from a Bulk Data Entry TSTEPNL.)

## TSTRU

## Temperature Set ID for a Structures Run

Defines a temperature set ID for a structures run based on a heat transfer subcase.

### Format:

TSTRU=n

### Example:

TSTRU=999

Describer	Meaning
n	Set identification for use on TEMP(LOAD)=n or TEMP(INIT)=n

### Remarks:

1. TSTRU should be placed in a heat transfer subcase.
2. If TSTRU does not explicitly appear in the heat transfer subcase, it is defaulted to TSTRU=heat transfer subcase ID.
3. In a structures run, a temperature set generated from a heat transfer run will override an existing temperature set with identical set ID defined with TEMP, TEMPD, TEMPP1, TEMPRB, or any combination.
4. TSTRU may be placed in the first subcase of a PARAM,HEATSTAT,YES run.
5. TSTRUs may be placed in each subcase of an APPHEAT run. The associated structural analysis then requires the following:

```
ASSIGN heat_run='heat transfer job name.MASTER'  
DBLOC DATABLK=(UG,EST,BGPDTS,CASECCR/CASEHEAT) LOGICAL=heat_run
```

6. Heat transfer runs and structural runs must have the same mesh.
7. For nonlinear heat transfer SOL 106 or SOL 153, the INOUT field on the NLPARM Bulk Data entry must be blank or NO if the results of the run are to be transferred to a linear structures run.

```
PARAM,NLHTLS,-1
```

The above parameter should be placed in the nonlinear heat run. This will place UG heat transfer on the database.

**TVELOCITY**

## Velocity Output Request for trim components, TRMC

Requests the form and type of velocity output for TRMC.

**Format:**

$$TVELOCITY \left( \left( \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right), \left[ \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right] \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$

**Example:**

```
SET 20 = 3/103, 5/0, 12/ALL $
TVELOCITY=ALL
TVEL (REAL, PUNCH, PRINT)=20
TVELO=20
TVELOCI (SORT2, PRINT)=20
```

Describer	Meaning												
SORT1	Output will be presented as a tabular listing of grid points for each load and frequency.												
SORT2	Output will be presented as a tabular listing of frequency for each grid point.												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.

ALL TRMC velocity for all points of all TRMCs will be output. See Remarks 2.

Describer	Meaning
NONE	No TRMC velocity will be output.
n	Set identification of a previously appearing SET command. Only points with identification numbers that appear on this SET command will be output (Integer > 0). SET 20 in above examples section is to request SET 103(not present) for TRMC 3, none for TRMC 5 and ALL for TRMC 12.

**Remarks:**

1. Refrain from using ALL which may produce voluminous output.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. TVELO=NONE suppresses the generation of TRMC velocity output.
4. TVELOCITY is supported only with PARAM,TRMBIM,PHYSICAL
5. TVELOCITY is available for PEM jobs of SOL 108, 111 and SOL 200 with ANALYSIS=DFREQ and MFREQ. Note that TVELOCITY is available for output only and can not be utilized as design response.
6. For restart PEM job, TVELO request must remain the same as cold start PEM job.

## UNGLUE

### Contact Body Unglue Selection

Selects the grids should use standard contact instead of glued contact in glued bodies in SOL 400.

**Format:**

UNGLUE=*n*

**Example:**

UNGLUE=10

Describer	Meaning
<i>n</i>	Set identification number of the UNGLUE Bulk Data entry (Integer > 0).

**Remarks:**

1. This command is used only in SOL 400 for 3D Contact analysis.
2. The default SID of UNGLUE Bulk Data entry is defined on BCONTACT Case Control command if applicable; however, the SID on UNGLUE Case Control command can overwrite it.

## VCCT

## Virtual Crack Closure Technique for SOLs 400/600 Analysis

Selects grid sets to be used for virtual crack closure analysis in SOL 600 and SOL 400.

### Format:

VCCT=N

### Example:

VCCT=0

VCCT=1

Describer	Meaning
N	ID of a matching Bulk Data VCCT entry specifying the crack.

### Remarks:

1. This entry can only be used in SOLs 400/600.
2. Different sets of cracks can be selected for different subcases using this option.
3. For SOL 600, N=0 may be entered above any subcases; then, the Bulk Data entry VCCT with ID=0 will be used in the Marc model definition section. The fracture mechanics calculations will be performed for all subcases. Otherwise, if  $N > 0$ , the matching Bulk Data entry VCCT will be used in Marc's history definition section for the applicable subcase, and all subsequent subcases, until a new VCCT is activated.

**VECTOR**

## Displacement Output Request

Requests the form and type of displacement vector output.

See the description of the [DISPLACEMENT \(Case\)](#).

## VELOCITY

### Velocity Output Request

Requests the form and type of velocity vector output.

#### Format:

$$\text{VELOCITY} \left( \left[ \begin{array}{c} \text{SORT1} \\ \text{SORT2} \end{array} \right], \left[ \text{PRINT}, \text{PUNCH}, \text{PLOT} \right], \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], \left[ \begin{array}{c} \text{PSDF, ATOC, CRMS} \\ \text{or RALL} \end{array} \right], \right. \\
 \left. \left[ \begin{array}{c} \text{RPRINT} \\ \text{NORPRINT} \end{array} \right], \text{RPUNCH} \right], [\text{CID}] \\
 = \left\{ \begin{array}{c} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

#### Examples:

VELOCITY=5

VELOCITY (SORT2, PHASE, PUNCH) =ALL

VELOCITY (SORT2, PRINT, PSDF, CRMS, RPUNCH) =20

VELOCITY (PRINT, RALL, NORPRINT) =ALL

Descriptor	Meaning												
SORT1	Output will be presented as a tabular listing of grid points for each load, frequency, eigenvalue, or time, depending on the solution sequence.												
SORT2	Output will be presented as a tabular listing of frequency or time for each grid point.												
	<table border="1"> <thead> <tr> <th>Printer File (.f06)</th> <th>Punch File (.pch)</th> <th>Plot File (.op2/.h5)</th> </tr> </thead> <tbody> <tr> <td>PRINT or (blank)</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PUNCH</td> <td>X</td> <td>X*</td> </tr> <tr> <td>PLOT</td> <td></td> <td>X*</td> </tr> </tbody> </table>	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)	PRINT or (blank)	X	X*	PUNCH	X	X*	PLOT		X*
Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)											
PRINT or (blank)	X	X*											
PUNCH	X	X*											
PLOT		X*											

\* The .op2 binary database file will be generated with "PARAM,POST, X" (or the POST Case Control command), while the .h5 binary database file will be generated with "MDLPRM,HDF5, X" specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

REAL or IMAG Requests rectangular format (real and imaginary) of complex output. Use of either REAL or IMAG yields the same output.

PHASE Requests polar format (magnitude and phase) of complex output. Phase output is in degrees.

Describer	Meaning
PSDF	Requests the power spectral density function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 5.
ATOC	Requests the autocorrelation function be calculated and stored in the database for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 5.
CRMS	Requests the cumulative root mean square function be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 5.
RALL	Requests all of PSDF, ATOC, and CRMS be calculated for random analysis postprocessing. Request must be made above the subcase level, and RANDOM must be selected in Case Control. See Remark 5.
RPRINT	Writes random analysis results in the print file (Default).
NORPRINT	Disables the writing of random analysis results in the print file.
RPUNCH	Writes random analysis results in the punch file.
CID	Request to print output coordinate system ID in printed output (.f06) file.
ALL	Velocity for all solution points will be output.
NONE	Velocity for no solution points will be output.
n	Set identification of a previously appearing SET command. Only velocities of points with identification numbers that appear on this SET command will be output (Integer > 0).

### Remarks:

1. Velocity output is only available for transient and frequency response problems.
2. See Remark 1 under [DISPLACEMENT \(Case\)](#) for a discussion of SORT1 and SORT2.
3. VELOCITY=NONE overrides an overall output request.
4. Velocity results are output in the global coordinate system (see field CD on the GRID Bulk Data entry).
5. The option of PSDF, ATOC, CRMS, and RALL, or any combination of them, can be selected for random analysis. Here PSDF, ATOC and CRMS output is always in SORT2 format.
6. Note that the CID keyword affects only grid point related output, such as DISP, VELO, ACCEL, OLOAD, SPCF and MPCF. In addition, the CID keyword needs to appear only once in a grid point-related output request anywhere in the Case Control Section to turn on the printing algorithm.

## VINTENSITY

## Vibration Intensity, VI, Output Request

Request output of vibration intensity for structural elements in SOLs 108 and 111 only.

### Format:

$$\text{VINTENSITY} \left( \begin{array}{l} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right) = \left\{ \begin{array}{l} \text{ALL} \\ \text{n} \\ \text{NONE} \end{array} \right\}$$

### Examples:

VINTENSITY = ALL

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST, X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5, X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

ALL	Vibration Intensities will be computed for all supported structural elements.
n	Set identification of a previously defined set of structural elements. Vibration Intensities will be computed for the structural elements in this set only.
NONE	Vibration intensity will not be processed.

### Remarks:

1. VINTENSITY = NONE overrides an overall request.
2. This Case Control command can be used in SOL 108 and SOL 111 only
3. Structural element types covered for VI computations are BAR, BEAM, QUAD4, TRIA3, QUADR, TRIAR, QUAD8, TRIA6, HEXA, PENTA and TETRA.
4. For BAR/BEAM element types, VI is computed in element axial direction using following equation

$$VI_x = \text{Real}[-(F_x v_x^* + V_1 v_y^* + V_2 v_z^* + T \omega_x^* - M_2 \omega_y^* + M_1 \omega_z^*)] / \text{Area},$$

- Where
- $F_x$  = axial force in element x direction,
  - $V_1$  = shear force in element y direction,
  - $V_2$  = shear force in element z direction,
  - $T$  = torsion about element x direction,
  - $M_2$  = Bending moment in element y direction,
  - $M_1$  = Bending moment in element z direction,
  - $v_i$  = Translational velocity about element i direction,
  - $\omega_i$  = Rotational velocity about element i direction,

'\*' superscript denotes complex conjugate of the complex value.  $VI_x$  is computed at both end of BAR/BEAM element and the average of ends VI is presented as element  $VI_x$ .

5. For 2D element types, such as QUAD4/TRIA3, VI is computed in element coordinate system using following equations

$$VI_x = \text{REAL}[-(V_x v_z^* - M_x \omega_y^* + M_{xy} \omega_x^* + F_x v_x^* + F_{xy} v_y^*)] / \text{Areax},$$

$$VI_y = \text{REAL}[-(V_y v_z^* + M_y \omega_x^* - M_{xy} \omega_y^* + F_y v_y^* + F_{yx} v_x^*)] / \text{Areay},$$

- Where
- $V_x, V_y$  = transverse shear forces,
  - $M_x, M_y$  = Bending moments,
  - $M_{xy}$  = twisting moment,
  - $F_x, F_y$  = Membrane forces,
  - $F_{xy}, F_{yx}$  = Membrane shear,
  - $\text{Areax}, \text{Areay}$  = Area in the corresponding element axes,
  - $v_i$  = Translational velocity about element i direction,
  - $\omega_i$  = Rotational velocity about element i direction,

'\*' superscript denotes complex conjugate of the complex value.  $VI_x, VI_y$  are computed in element coordinate system using average corner velocities and the element forces at the element center.

6. For 3D element types, VI is computed in basic coordinate system using following equations

$$VI_x = \text{REAL}[-(\sigma_x v_x + \tau_{xy} v_y + \tau_{xz} v_z)]$$

$$VI_y = \text{REAL}[-(\sigma_y v_y + \tau_{yx} v_x + \tau_{yz} v_z)]$$

$$VI_z = \text{REAL}[-(\sigma_z v_z + \tau_{zx} v_x + \tau_{zy} v_y)]$$

Where  $VI_x, VI_y, VI_z = VI$  in basic coordinate system,  
 $\sigma_x, \sigma_y, \sigma_z =$  Normal stresses,  
 $\tau_{xy}, \tau_{yz}, \tau_{xz} =$  Shear stresses,  
 $v_i =$  Translational velocity in basic i direction,

7. VI for all element types is presented in basic coordinate system in print and/or punch output.

**WEIGHTCHECK**

## Rigid Body Mass Reduction Check

At each stage of the mass matrix reduction, compute rigid body mass and compare with the rigid body mass in the g-set.

**Format:**

$$\text{WEIGHTCHECK} \left( \left( \begin{array}{l} \text{PRINT} \\ \text{NOPRINT} \end{array} \right) \text{PUNCH}, \text{SET} = \left( \begin{array}{l} \text{G}, \text{N}, \text{N} + \text{AUTOSPC}, \text{F}, \text{A}, \text{V} \\ \text{ALL} \end{array} \right) \right) = \begin{cases} \text{YES} \\ \text{NO} \end{cases}$$

$$\left[ \text{GRID} = \text{gid}, \text{CGI} = \begin{array}{l} \text{YES} \\ \text{NO} \end{array}, \begin{array}{l} \text{WEIGHT} \\ \text{MASS} \end{array} \right)$$

**Examples:**

WEIGHTCHECK=YES

WEIGHTCHECK (GRID=12, SET=(G, N, A), MASS)=YES

Describer	Meaning
PRINT	Write output to the print file (Default).
NOPRINT	Do not write output to the print file.
PUNCH	Write output to the punch file.
SET	Selects degree of freedom set(s) (Default SET=G).
gid	Reference grid point for the calculation of rigid body motion. The default is the origin of the basic coordinate system.
CGI	For SET ≠ G, CGI = YES requests output of center of gravity and mass moments of inertia (Default: CGI = NO).
WEIGHT/MASS	Selects output in units of weight or mass (Default = WEIGHT).

**Remarks:**

1. WEIGHTCHECK must be specified above the subcase level.
2. For SET=N, N+AUTOSPC, F, or A, the WEIGHTCHECK command also outputs a percentage loss or gain in the reduced rigid body mass matrix (e.g., MAA) as compared to the g-set rigid body mass matrix (e.g., MGG). G must also be requested to obtain this comparison; e.g., WEIGHTCHECK(SET=(G,A))=YES.
3. SET=N+AUTOSPC uses the mass matrix for the n-set with the rows corresponding to degrees of freedom constrained by the PARAM, AUTOSPC operation zeroed out. If AUTOSPC was not performed, then this check is redundant with respect to SET=N.
4. WEIGHTCHECK is available in all SOLs. However for the residual structure in SOLs 101, 105, 114, and 116, because no mass reduction is performed, only WEIGHTCHECK(SET=J) is available. The 'J' set does not include upstream superelements.

5. If Lagrange multipliers are present via RIGID=LAGRAN or LGELIM then for degree-of-freedom sets N, N+AUTOSPC, F, and A the check will be performed on degree-of-freedom sets NL, NL+AUTOSPC, FL, and AL. The output will also be labeled accordingly.

**WETSENS**

## Sensitivity Wetted Grids for SOL 108/111

Select SOLUTION frequencies and RESPONSE DOFs for the generation of sensitivity for wetted grids.

**Format:**

$$WETSENS \left( \begin{array}{c} \text{PRINT, PUNCH} \\ \text{PLOT} \end{array} \right), \left[ \begin{array}{c} \text{REAL or IMAG} \\ \text{PHASE} \end{array} \right], [\text{THRESH} = P], \text{RESPONSE} = r,$$

$$\left[ \text{SOLUTION} = \left\{ \begin{array}{c} \text{ALL} \\ \text{self} \end{array} \right\} \right],$$

$$[\text{WETTED, SQWETT}] = \left\{ \begin{array}{c} \text{ALL} \\ n \\ \text{NONE} \end{array} \right\}$$
**Example:**

```
SET 81 = 100.0, 120.0
SET 91 = 11240/T3, 4001/T1
SET 95 = 9000000 THRU 9000050
$
WETSENS (RESPONSE=91,solution=81,WETTED) = 95
```

Describer	Meaning		
	Printer File (.f06)	Punch File (.pch)	Plot File (.op2/.h5)
PRINT or (blank)	X		X*
PUNCH		X	X*
PLOT			X*

\* The .op2 binary database file will be generated with “PARAM,POST,X” (or the POST Case Control command), while the .h5 binary database file will be generated with “MDLPRM,HDF5,X” specified in Bulk Data Section. Both .op2 and .h5 file can be created simultaneously. Note .xdb file is being deprecated.

Descriptor	Meaning
THRESH	The magnitude of element sensitivity less than p will be suppressed in all output files: print, punch, plot, .op2, and .xdb. (Default = 0.0).
RESPONSE	Adjoint load response will be computed for unit load applied at grid point components in SET r.
SOLUTION	Frequency responses at these forcing frequencies, defined in setf, will be used for element sensitivity computation. (Default=all forcing frequencies)
WETTED	Sensitivity for wetted grids will be computed and output.
SQWETT	Squared sensitivity for wetted grids will be computed and output.
ALL	Sensitivities for all elements will be calculated.
n	Set identification number. Sensitivity for all elements specified on the SET n command will be calculated. The SET n command must be specified in the same subcase as the ELSENS command, or above all subcases ( Integer > 0 ). The IDs in set n must be GID (grid ID).
NONE	Elemental sensitivity will not be output.

**Remarks:**

1. Set r for RESPONSE on WETSENS is default to set r on ELSSENS. If no ELSSENS in the deck, set r for WETSENS must be provided.
2. The equations for various options of WETSENS

$$\text{WETSENS(WETTED)} = [U_{\text{setf}}]^t [\text{AGG}] [U_r]$$

$$\text{WETSENS(SQWETT)} = [U_{\text{setf}}]^t [\text{AGG}] [U_r] + [U_{\text{setf}}]^{*t} [\text{AGG}]^* [U_r]^*$$

where  $[U_{\text{setf}}]$  is the displacement of SOLUTION  
 $[U_r]$  is the displacement of RESPONSE  
 $[\text{AGG}]$  is Fluid/Structure Coupling matrix  
 superscript \* means complex conjugate of the term.

## Case Control Applicability Tables

The following tables describe the applicability of Case Control commands to Solution Sequences:

<a href="#">Table 5-3</a> and <a href="#">Table 5-4</a>	SOLs (101 through 200) -- Subcase Definition, Superelement Control, and Auxiliary Model Control
<a href="#">Table 5-5</a> and <a href="#">Table 5-6</a>	SOLs (101 through 200) -- Data Selection
<a href="#">Table 5-7</a> and <a href="#">Table 5-8</a>	SOLs (101 through 200) -- Output Selection

## X-Y PLOT Commands

The X-Y output request packet of the Case Control Section includes all commands between either OUTPUT(XYPLOT) or OUTPUT(XYOUT), and either BEGIN BULK or OUTPUT(PLOT). The remainder of this section describes the X-Y output commands.

A single set of plotted X-Y pairs is known as a curve. Curves are the entities to be plotted. The surface (paper, microfilm frame, etc.) on which one or more curves is plotted is known as a frame. Curves may be plotted on a whole frame, an upper-half frame, or a lower-half frame. Grid lines, tic marks, axes, axis labeling, and other graphic control options may be chosen by the user. The program will select defaults for parameters not selected by the user.

Only two commands are required for an X-Y output request.

1. Only one of OUTPUT(XYPLOT) or OUTPUT(XYOUT) at the beginning of the X-Y output command packet.
2. At least one of the commands XYPLOT, XYPEAK, XYPRINT, XYPUNCH, XYPAPLOT.

The commands OUTPUT(XYPLOT) and OUTPUT(XYOUT) are equivalent. If the X-Y output is to be printed and/or punched, a PLOTTER command is not required.

If only the required commands are used, the graphic control options will all assume default values. Curves using all default parameters have the following general characteristics.

1. Tic marks are drawn on all edges of the frame. Five spaces are provided on each edge of the frame.
2. All tic marks are labeled with their values.
3. Linear scales are used.
4. Scales are selected such that all points fall within the frame.
5. The plotter points are connected with straight lines.
6. The plotted points are not identified with symbols.

The above characteristics may be modified by inserting any of the parameter definition commands in the next section, ahead of the XY\_\_\_\_\_ command(s). The use of a parameter definition command sets the value of that parameter for all following command operation commands unless the CLEAR command is inserted. If grid lines are requested, they will be drawn at the locations of all tic marks that result from defaults or user request. The locations of tic marks (or grid lines) for logarithmic scales cannot be selected by the user. Values for logarithmic spacing are selected by the program. The values for the number of tic marks (or grid lines) per cycle depend on the number of logarithmic cycles required for the range of the plotted values.

The definition and rules for the X-Y output commands follow. The form of X-Y output commands differ in many instances from that of similar commands used in the OUTPUT(PLOT) section.

### X-Y Output Command Summary

	Commands Applied To All Curves
PLOTTER	Selects format of plot file for interpretation by plotter postprocessor.
CAMERA	Selects plotter media.

Commands Applied To All Curves	
PENSIZE	Selects pen number.
DENSITY	Selects the line density for microfilm plotters only.
XPAPER	Defines the size of the paper in x-direction.
YPAPER	Defines the size of the paper in y-direction.
XMIN	Specifies the minimum value on the x-axis.
XMAX	Specifies the maximum value on the x-axis.
XLOG	Selects logarithmic or linear x-axis.
YAXIS	Controls the plotting of the y-axis on all curves.
XINTERCEPT	Specifies the location of the x-axis on the y-axis.
UPPER TICS	Specifies how to draw tic marks on upper edge.
LOWER TICS	Specifies how to draw tic marks on lower edge.
CURVELINESYMBOL	Selects lines and/or symbols to be drawn through the x-y points.
XDIVISIONS	Specifies spacing of tic marks on the x-axis for all curves.
XVALUE PRINT SKIP	Specifies how often to print the x-values alongside the x-axis tic marks.
CLEAR	Resets X-Y Plot commands to their default value.
XTITLE	Defines a character string that will appear along the x-axis.
TCURVE	Defines a character string that will appear at the top of the plot frame.
LONG	Controls amount of curve's summary printout.
CSCALE	Defines scale factor for characters in the plot frame.

Commands Applied to Whole Frame Curves Only	
YMIN	Specifies the minimum value on the y-axis.
YMAX	Specifies the maximum value on the y-axis.
XAXIS	Controls the plotting of the x-axis.
YINTERCEPT	Specifies the location of the y-axis on the x-axis.
YLOG	Selects logarithmic or linear y-axis.
LEFT TICS	Specifies how to draw tic marks on left edge.
RIGHT TICS	Specifies how to draw tic marks on right edge of the frame.
ALLEDGE TICS	Specifies how to draw tic marks on all edges of the frame.
YDIVISIONS	Specifies spacing of tic marks on the y-axis.
YVALUE PRINT SKIP	Specifies how often to print the y-values alongside the y-axis tic marks applies.

Commands Applied to Whole Frame Curves Only	
XGRID LINES	Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks.
YGRID LINES	Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks.
YTITLE	Defines a character string that will appear along the y-axis

Commands Applied to Upper Half Frame Curves Only	
YTMIN	Specifies the minimum value on the y-axis.
YTMAX	Specifies the maximum value on the y-axis.
YTAXIS	Controls the plotting of the y-axis.
YTINTERCEPT	Specifies the location of the y-axis on the x-axis.
YTLOG	Selects logarithmic or linear y-axis.
TLEFT TICS	Specifies how to draw tic marks on the left edge.
TRIGHT TICS	Specifies how to draw tic marks on the right edges.
TALL EDGE TICS	Specifies how to draw tic marks on all edges.
YTDIVISIONS	Specifies spacing of tic marks on the y-axis.
YTVALUE PRINT SKIP	Specifies how often to print the y-values alongside the y-axis tic marks.
XTGRID LINES	Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks.
YTGRID LINES	Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks.
YTTITLE	Defines a character string that will appear along the y-axis.

Commands Applied to Lower Half Frame Curves Only	
YBMIN	Specifies the minimum value on the y-axis.
YBMAX	Specifies the maximum value on the y-axis.
XBAXIS	Controls the plotting of the x-axis.
YBINTERCEPT	Specifies the location of the y-axis on the x-axis.
YBLOG	Selects logarithmic or linear y-axis.
BLEFT TICS	Specifies how to draw tic marks on left edge.
BRIGHT TICS	Specifies how to draw tic marks on right edge.
BALL EDGE TICS	Specifies how to draw tic marks on all edges.
YBDIVISIONS	Specifies spacing of tic marks on the y-axis.

Commands Applied to Lower Half Frame Curves Only	
<a href="#">YBVALUE PRINT SKIP</a>	Specifies how often to print the y-values alongside the y-axis tic marks.
<a href="#">XBGRID LINES</a>	Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks.
<a href="#">YBGRID LINES</a>	Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks.
<a href="#">YBTITLE</a>	Defines a character string that will appear along the y-axis.

X-Y Plot Generation Commands	
<a href="#">XYPAPLOT</a>	Generate X-Y plots for a printer.
<a href="#">XYPEAK</a>	Print only the summary for all curves.
<a href="#">XYPLOT</a>	Generate X-Y plots for a plotter.
<a href="#">XYPRINT</a>	Generate table of X-Y pairs for a printer.
<a href="#">XYPUNCH</a>	Generate table of X-Y pairs for the PUNCH file

## ALLEEDGE TICS

### Controls Drawing of Tic Marks on All Edges

Specifies how to draw tic marks on all edges of the frame.

Format:

ALLEEDGE TICS tic

Example:

ALLEEDGE -1

Describer	Meaning
tic	Specifies how to draw tic marks (Integer, Default= 0).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values (Default).
1	Draw tic marks and associated values.

Remarks:

1. ALLEEDGE TICS applies to whole frame curves only.
2. To determine if on any given edge (a) tic marks will be drawn without values, (b) no tic marks or values will be drawn, or (c) tic marks with values will be drawn, the following sum must be computed by the user. Add the tic values of the edge in question to its associated ALLEEDGE TICS, TALL EDGE TICS, or BALL EDGE TICS tic values. If the resulting value is less than zero, tic marks will be drawn without values. If the resulting value is zero, no tic marks or values will be drawn. If the resulting value is greater than zero, tic marks with values will be drawn. The user should be careful in the use of the ALLEEDGE TICS, TALL EDGE TICS, or BALL EDGE TICS commands. For example, the use of only the ALLEEDGE TICS = -1 command will result in no tic marks or values being drawn, since the default values for individual edges is +1. Tic values input may only be -1, 0, or 1.

## BALL EDGE TICS

## Controls Drawing of Tic Marks on Lower Half

Specifies how to draw tic marks on lower half of frame.

Format:

BALL EDGE TICS tic

Example:

BALL EDGE TICS -1

Describer	Meaning
tic	Specifies how to draw tic marks (Integer, Default = 0).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values (Default).
1	Draw tic marks and associated values.

Remarks:

1. BALL EDGE TICS applies to lower frame curves only.
2. See Remark 2 under [ALLEDGE TICS, 670](#).

## BLEFT TICS

### Controls Drawing of Tic Marks on Left Edge

Specifies how to draw tic marks on left edge of lower half of frame.

Format:

BLEFT TICS tic

Example:

BLEFT TICS -1

Describer	Meaning
tic	Specifies how to draw tic marks (Integer; Default= 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. BLEFT TICS applies to lower frame curves only.
2. See Remark 2 under [ALLEDGE TICS, 670](#).
3. See related command [BRIGHT TICS, 673](#).

**BRIGHT TICS****Controls Drawing of Tic Marks on Right Edge**

Specifies how to draw tic marks on right edge of lower half of frame.

Format:

BRIGHT TICS tic

Example:

BRIGHT TICS -1

Describer	Meaning
tic	Specifies how to draw tic marks (Integer; Default = 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. BRIGHT TICS applies to lower frame curves only.
2. See Remark 2 under [ALLEDGE TICS, 670](#).

## CAMERA

### Plotter Media Selection

Selects plotter media.

Format:

CAMERA ctype

Example:

CAMERA 1

Describer	Meaning
ctype	Camera type (Integer 1, 2, or 3; Default= 2).
1	Film
2	Paper (Default)
3	Both

Remark:

1. If the CAMERA command is not specified then CAMERA 2 is assumed.

**CLEAR****Resets X-Y Plot Commands**

Resets X-Y Plot commands to their default values.

Format

CLEAR

Remark:

1. All commands except XTITLE, YTITLE, YTTITLE, YBTITLE, and TCURVE will revert to their default values.

## CSCALE

### Character Scale Factor

Defines scale factor for characters in the plot frame. See the command [CSCALE, 755](#) in the OUTPUT(PLOT) Section.

**CURVELINESYMBOL**

## Curve, Line and Symbol Selection

Selects lines and/or symbols to be drawn through the x-y points.

Format:

CURVELINESYMBOL symtype

Example:

CURV 4

Describer	Meaning
symtype	Specifies the symbol drawn at the x-y points. If symtype is 0 then only lines will be drawn through the points with no symbol. If symtype is less than zero then only the symbol and not the lines will be drawn. If symtype is greater than zero then both the symbol and the lines will be drawn ( $-9 \leq \text{Integer} \leq 9$ ; Default= 0).

symtype	Symbol
0	none
1	X
2	*
3	+
4	-
5	.
6	×
7	[ ]
8	<>
9	/\

Remark:

1. If more than one curve is plotted per frame, then the symbol number is incremented by 1 for each curve.

## DENSITY

### Microfilm Plotter Line Density

Selects the line density for microfilm plotters only.

Format

DENSITY d

Example

DENS 3

Describer	Meaning
d	Specifies line density scale factor for microfilm plotters. A line density of d is d times heavier than a line density of 1 (Integer $\geq 0$ ; Default = 1).

## LEFT TICS

### Controls Drawing of Tic Marks on Left Edge

Specifies how to draw tic marks on left edge of whole frame curves.

Format:

LEFT TICS tic

Example:

LEFT -1

Describer	Meaning
tic	Specifies how to draw tic marks (Integer; Default = 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. LEFT TICS applies to whole frame curves only.
2. See Remark 2 under [ALLEDGE TICS, 670](#).
3. See related command [RIGHT TICS, 684](#).

## LONG

## Summary Print Control

Controls amount of curve's summary printout.

Format:

LONG { YES }  
      { NO }

Describers	Meaning
YES	One page for each curve's summary (Default).
NO	Condensed curve summary.

Remark:

1. If LONG is not specified, then LONG=NO is assumed.

## LOWER TICS

## Controls Drawing of Tic Marks on Lower Edge

Specifies how to draw tic marks on lower edge.

Format:

LOWER TICS tic

Example:

LOWER -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default= 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. LOWER TICS applies to all curves.
2. See Remark 2 under [ALLEDGE TICS](#).

## PENSIZE

### Pen Selection

Selects pen number.

Format:

PENSIZE p

Example:

```
PENS 3
```

Describer	Meaning
p	Specifies pen number to be used to generate the plot (Integer > 0; Default = 1).

## PLOTTER

### X-Y Plot File Format

See the command [PLOTTER](#) in the OUTPUT(PLOT) Section.

## RIGHT TICS

### Controls Drawing of Tic Marks on Right Edge

Specifies how to draw tic marks on right edge of the frame.

Format:

RIGHT TICS tic

Example:

RIGHT -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default = 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. RIGHT TICS applies to whole frame curves only.
2. See Remark 2 under [ALLEDGE TICS](#).
3. See related command [LEFT TICS](#).

## SEPLOT

### Superelement Plot Delimiter

Assigns the subsequent PLOT or XYPLOT commands to one or more superelements.

Format:

```
SEPLOT seid1 [ seid2 ... ]
```

Examples:

```
SEPLOT 5
SEPLOT 0 3 7 200
```

Describer	Meaning
seidi	Superelement identification number (Integer $\geq 0$ ).

Remarks:

1. See also related command SEUPPLOT.
2. Any PLOT or XYPLOT commands appearing above all SEPLOT (or SEUPPLOT) commands will apply in all SEPLOT (or SEUPPLOT) packets.
3. For multiple PLOT or XYPLOT commands, there should be a SEPLOT command with each PLOT. For the special case where the PLOTs or XYPLOTs refer to the same superelements and use the same FIND, a single SEPLOT followed by a single FIND may be placed above all commands.

## SEUPPLOT

### Superelement Plot Delimiter

Assigns the subsequent PLOT or XYPLOT commands to a superelement and all of its upstream superelements.

Format:

SEUPPLOT seid

Example:

SEUPPLOT 7

Describer	Meaning
seid	Superelement identification number (Integer $\geq 0$ ).

Remarks:

1. See also related command SEPLOT.
2. Any PLOT or XYPLOT commands appearing above all SEUPPLOT (or SEPLOT) commands will apply in all SEUPPLOT (or SEPLOT) packets.
3. For multiple PLOT or XYPLOT commands, there should be a SEUPPLOT command with each PLOT. For the special case where the PLOTs or XYPLOTs refer to the same superelements and use the same FIND, a single SEUPPLOT followed by a single FIND may be placed above all the commands.

## TALL EDGE TICS

## Controls Drawing of Tic Marks on All Edges

Specifies how to draw tic marks on all edges of the upper half of the frame.

Format:

TALL EDGE TICS tic

Example:

TALL -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default = 0).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values (Default).
1	Draw tic marks and associated values.

Remarks:

1. TALL EDGE TICS applies to upper half frame curves only.
2. See Remark 2 under [ALLEDGE TICS](#).

## TCURVE Curve Title

Defines a character string that will appear at the top of the plot frame.

Format:

TCURVE ctitle

Example:

```
TCUR RIGHT WING -- LOAD CASE 3
```

Describer	Meaning
ctitle	Any character string (Character; Default = blank).

Remark:

1. TCURVE may not be continued to the next command line.

## TLEFT TICS

### Controls Drawing of Tic Marks on All Edges

Specifies how to draw tic marks on the left edge of the upper half of the frame.

Format:

TLEFT TICS tic

Example:

TLEFT -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default=1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. TLEFT TICS applies to upper half frame curves only.
2. See Remark 2 under [ALLEDGE TICS](#).
3. See related command [TRIGHT TICS](#).

## TRIGHT TICS

## Controls Drawing of Tic Marks on the Right Edge

Specifies how to draw tic marks on all edges of the upper half of the frame.

Format:

TRIGHT TICS tic

Example:

TRIGHT -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default = 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. TRIGHT TICS applies to upper half frame curves only.
2. See Remark 2 under [ALLEDGE TICS](#).
3. See related command [TLEFT TICS](#).

## UPPER TICS

### Controls Drawing Of Tic Marks On Upper Edge

Specifies how to draw tic marks on upper edge.

Format:

UPPER TICS tic

Example:

UPPER -1

Describers	Meaning
tic	Specifies how to draw tic marks (Integer; Default= 1).
-1	Draw tic marks only.
0	Do not draw tic marks or associated values.
1	Draw tic marks and associated values (Default).

Remarks:

1. UPPER TICS applies to all curves.
2. See Remark 2 under [ALLEDGE TICS](#).
3. See related command [LOWER TICS](#).

## XAXIS

### X-Axis Plot Control

Controls the plotting of the x-axis on whole frame curves only.

Format:

XAXIS { YES  
NO }

Describers	Meaning
YES	Plot the x-axis.
NO	Do not plot the x-axis (Default).

Remarks:

1. XAXIS applies to whole frame curves only.
2. See related command [YAXIS](#).

**XBAXIS****X-Axis Plot Control**

Controls the plotting of the x-axis on lower half frame curves only.

Format:

XBAXIS { YES }  
          { NO }

Describers	Meaning
YES	Plot the x-axis.
NO	Do not plot the x-axis (Default).

Remark:

1. XBAXIS applies to lower half frame curves only.

## **XBGRID LINES**

### Plot X-Axis Grid Lines

Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks on lower half frame curves only.

Format:

XBGRID LINES { YES  
NO }

Describers	Meaning
YES	Plot the x-axis grid lines.
NO	Do not plot the x-axis grid lines (Default).

Remarks:

1. XBGRID applies to lower half frame curves only.
2. See related command [YBGRID LINES](#).

**XDIVISIONS**

## Tic Spacing on Y-Axis

Specifies spacing of tic marks on the x-axis for all curves.

Format:

XDIVISIONS *xd*

Example:

XDIV 10

Describer	Meaning
<i>xd</i>	Number of spaces between tic marks on x-axis (Integer > 0; Default = 5).

Remarks:

1. XDIVISIONS applies to all curves and to the commands: UPPER TICS, LOWER TICS, and YINTERCEPT.
2. XDIVISIONS is ignored for a logarithmic x-axes.

## XGRID LINES

### Plot X-Axis Grid Lines

Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks on whole frame curves only.

Format:

XGRID LINES { YES }  
                  { NO }

Describers	Meaning
YES	Plot the x-axis grid lines.
NO	Do not plot the x-axis grid lines (Default).

Remarks:

1. XGRID applies to whole frame curves only.
2. See related command [YGRID LINES](#).

## XINTERCEPT

### Location of X-Axis on Y-Axis

Specifies the location of the x-axis on the y-axis.

Format:

XINTERCEPT xi

Example:

XINT 50 .

Describer	Meaning
xi	Location of x-axis on the y-axis (Real; Default = 0.0).

## XLOG                      Logarithmic or Linear X-Axis

Selects logarithmic or linear x-axis.

Format:

XLOG { YES  
       NO }

Describers	Meaning
YES	Plot a logarithmic x-axis.
NO	Plot a linear x-axis (Default).

Remarks:

1. XLOG applies to all curves.
2. The default value for tic division interval depends on the number of log cycles. The default values for tic divisions are given as follows but will range over whole cycles:

Number of Cycles	Intermediate Values
1, 2	2., 3., 4., 5., 6., 7., 8., 9.
3	2., 3., 5., 7., 9.,
4	2., 4., 6., 8.,
5	2., 5., 8.
6, 7	3., 6.
8, 9, 10	3.

## XMAX      Maximum X-Axis Value

Specifies the maximum value on the x-axis.

Format:

XMAX xmax

Example:

XMAX 100 .

Describer	Meaning
xmax	Maximum value on the x-axis. (Real)

Remarks:

1. If XMAX is not specified, then the maximum value is set to the highest value of x.
2. See related commands [XMIN](#), [YMIN](#), and [YMAX](#).

## XMIN Minimum X-Axis Value

Specifies the minimum value on the x-axis.

Format:

XMIN xmin

Example:

XMIN 100 .

Describer	Meaning
xmin	Minimum value on the x-axis (Real).

Remarks:

1. XMIN applies to all curves.
2. If XMIN is not specified, then the minimum value is set to the lowest value of x.
3. See related commands [XMAX](#), [YMIN](#), and [YMAX](#).

**XPAPER**

## Paper Size in X-Direction

Defines the size of the paper in x-direction.

Format:

XPAPER *xsize*

Example:

XPAP 10 .

Describer	Meaning
<i>xsize</i>	Size of paper in x-direction and in inches (Real; Default = 20.0).

Remarks:

1. The default paper size is 20 by 20 inches.
2. See related command [YPAPER](#).

## XTAXIS

### X-Axis Plot Control

XYAXIS applies to upper half frame curves only.

Format:

XTAXIS { YES  
NO }

Describers	Meaning
YES	Plot the x-axis.
NO	Do not plot the x-axis (Default).

## XTGRID LINES

### Plot X-Axis Grid Lines

Controls the drawing of the grid lines parallel to the x-axis at the y-axis tic marks on upper half frame curves only.

Format:

XTGRID LINE { YES }  
                  { NO }

Describers	Meaning
YES	Plot the x-axis grid lines.
NO	Do not plot the x-axis grid lines (Default).

Remarks:

1. XTGRID applies to upper half frame curves only.
2. See related command [YTGRID LINES](#)

**XTITLE** X-Axis Title

Defines a character string that will appear along the x-axis.

Format:

```
XTITLE xtit
```

Example:

```
XTIT RIGHT WING CASE 3 - TIME
```

Describer	Meaning
xtit	Any character string (Character; Default = Blank).

Remarks:

1. XTITLE may not be continued to the next command line.
2. XTITLE applies to all curves.

## XYPAPLOT

### Generate X-Y Plots for a Printer

Generates X-Y plots for a printer.

See [XYPLOT](#) for format, describers, and additional remarks.

#### Remarks:

1. The x-axis moves vertically along the page and the y-axis moves horizontally along the page.
2. An asterisk (\*) identifies the points associated with the first curve of a frame, and then for successive curves on a frame the points are designated by symbols O, A, B, C, D, E, F, G, and H.

## XYPEAK

## Print Curve Summary

Print only the summary for all curves. The summary output is titled:

```
"X Y - O U T P U T S U M M A R Y"
```

and is also printed under XYPLOT, XYPUNCH, XYPRINT, and XYPAPLOT. This output contains the maximum and minimum values of y for the range of x.

See [XYPLOT](#) for format, descriptors, and additional remarks.

**XYPLOT****Generate X-Y Plots for a Plotter**

Generates X-Y Plots for a plotter.

**Format:**

```
XYPLOT          yvtype ptype [ i1, i2, i3,... ] /
                id11 (itemu11 [, iteml11] ) , id12 (itemu12 [, iteml12] ) , ... /
                id21 (itemu21 [, iteml21] ) , id22 (itemu22 [, iteml22] ) , ... / ....
```

**Examples:**

BEGIN BULK or OUTPUT(PLOT) commands are shown as a reminder to place X-Y output request packets properly in the Case Control Section; i.e., at the end of the Case Control Section, or just ahead of any structure plot requests.

**Example 1:**

```
OUTPUT (XYPLOT)
CSCALE = 1.8
XYPLOT SDISP/16 (T1)
BEGIN BULK
```

This sequence causes a single whole frame to be plotted for the T1 displacement component of solution set point 16 using the default parameter values. If 16(T1) is not in the solution set, a warning message will be printed and no plot will be made. The plot will be generated for the NASTRAN plotter on file PLT, which must be available.

**Example 2:**

```
OUTPUT (XYOUT)
CSCALE = 1.8
XYPLOT, XYPRINT VELO RESPONSE 1,5 /3 (R1, ) , 5 (, R1)
OUTPUT (PLOT)
```

This sequence causes two frame plots (each consisting of an upper half frame and a lower half frame) to be plotted, one for subcase 1 and one for subcase 5, using the default parameter values. The velocity of the first rotational component of grid point 3 will be plotted on the upper half frame, and that of grid point 5 will be plotted on the lower half frame. Tabular printer output will also be generated for both curves.

**Example 3:**

```
OUTPUT (XYPLOT)
CSCALE = 1.8
YDIVISIONS = 20
XDIVISIONS = 10
SGRID LINES = YES
YGRID LINES = YES
XYPLOT DISP 2,5/10 (T1) , 10 (T3)
BEGIN BULK
```

This sequence causes two whole frame plots to be generated, one for subcase 2 and one for subcase 5. Each plot contains the T1 and T3 displacement component for grid point 10. The default parameters will be modified to include grid lines in both the x-direction and y-direction, with 10 spaces in the x-direction and 20 spaces in the y-direction. The plot will be generated for the NASTRAN plotter on file .plt.

#### Example 4

```
OUTPUT (XYPLOT)
CSCALE = 1.8
XAXIS = YES
YAXIS = YES
XPAPER = 40.
YPAPER = 20.
XYPLOT STRESS 3/ 15 (2) / 21 (7)
OUTPUT (PLOT)
```

This sequence causes two whole frame plots to be generated using the results from subcase 3. The first plot is the response of the axial stress for rod element number 15. The second plot is the response of the major principal stress at Z1 for CTRIA3 element number 21. The default parameters will be modified to include the x-axis and y-axis drawn through the origin. Each plot will be initially scaled to fit on 40 x 20 inch paper. The plots will be generated for the NASPLT postprocessor and NASTRAN file .plt2 which must be defined. NASPLT will redefine the plot to 14 x 7-inch paper (with default options).

#### Example 5

```
OUTPUT (XYPLOT)
CURVELINESYMBOL = -1
XYPLOT XYPAPLOT VG / 1 (G, F) 2 (G, F) 3 (G, F) 4 (G, F)
OUTPUT (PLOT)
```

This sequence is an example of plotting in a flutter analysis for which a split frame plot is made; the upper half is V-g and the lower half is V-f. Data from the first four loops will be plotted. Distinct symbols are used for data from each loop, and no lines are drawn between points (since the flutter analyst must sometimes exercise judgement about which points should be connected). The plots will also be printed in the normal output. These plots will not have all the features of the external plots, but can be very useful in getting a quick picture of the curves.

#### Example 5

```
XTITLE=EXCITATION FREQUENCY FROM 2.5 TO 250 HERTZ SC 200
YTITLE=FLUID MODE PF AT FLUID POINT 204 FOR NATURAL MODE 2
XYPLOT,XYPEAK FMPF(2) MODE 200/204
```

#### Example 6

```
YTITLE=EXCITATION FREQUENCY FROM 2.5 TO 250 HERTZ
YTITLE=PSD MPF FOR FLUID GRID 204 FOR NATURAL MODE 2
XYPLOT,XYPEAK FMPF(2) PSDF /204
```

#### Example 7

```
XYPLOT CSIG PSDF / 4 (2003)
```

This is an example of plotting Composite Stress value of stress quantity given by Item Code 3 for layer with ID 2 of element with ID 4.

This can also be equivalently written as (see Remark 9 for explanation)

XYPLOT CSIG PPDF / 4 (-2,3)

Describers	Meaning
yvtype	Type of y-value to be plotted: (Character).
ACCE	Acceleration in the physical set.
BOUT	Slideline contact output.
DISP	Displacement in the physical set.
ELFORCE	Element force.
ENTHALPY	Enthalpy in the physical set.
FLUX	Element heat flux.
FMPF (mode_id or frequency_id)	Fluid mode participation factors. See Remark 8.
GMPF (mode_id or frequency_id, panel_name, panel_grid_id)	Panel grid mode participation factors. See Remark 8.
HDOT	Rate of change of enthalpy in the physical set.
MPCF	Multipoint force of constraint.
LMPF	Load mode participation factors. See Remark 8.
NONLINEAR	Nonlinear applied load.
OLOAD	Applied load.
PMPF (mode_id or frequency_id, panel_name)	Panel mode participation factors. See Remark 8.
PRESSURE	Pressure of fluid-structure body.
SACCE	Acceleration in the solution set.
SDISP	Displacement in the solution set.
SMPF (mode_id or frequency_id)	Structural mode participation factors. See Remark 8.
SPCF	Single-point force of constraint.
STEMP	Temperature in the solution set.

Describers	Meaning
	STRAIN Element strain.
	STRESS Element stress.
	SVELO Velocity in the solution set.
	TEMP Temperature in the physical set.
	VECTOR Displacement in the physical set.
	VELO Velocity in the physical set.
	VG Flutter analysis.
	CSIG Composite Stress
	CEPS Composite Strain
	CFAI Composite Failure Index
	CSRS Composite Strength Ratio
p <sub>type</sub>	Plot type defining the meaning of i <sub>1</sub> , i <sub>2</sub> , ... etc., i <sub>di</sub> , i <sub>temui</sub> , and i <sub>temli</sub> (Character, Default="RESPONSE").
	AUTO Autocorrelation function on whole frame curves only.
	FREQ Frequency—for given excitation frequency plot mode participation versus natural frequency—Oxx2E tables—point plot only. See Remark 8.
	MODE Mode - for given fluid mode plot mode participation versus excitation frequency - Oxx2M tables.
	PSDF Power spectral density function on whole frame curves only.
	RESPONSE Time or frequency in SORT2 format, or grid point identification numbers in SORT1 format (Default) .
	SPECTRAL Response spectrum on whole frame curves only.
i <sub>1</sub> , i <sub>2</sub> ,...	Subcase identification numbers for p <sub>type</sub> =RESPONSE. The list must be specified in ascending order. For p <sub>type</sub> =SPECTRAL, the subcase refers to the RECNO in the DTI,SPSEL Bulk Data entry. The list is ignored for p <sub>type</sub> =AUTO and PSDF (Integer ≥ 0, Default is all subcases).

Describers	Meaning
idij	Element, grid, scalar, or extra point identification number for y-value for frame i. For yvtype=VG, idij refers to the loop count of a flutter analysis (Integer > 0).
itemuij,	<p>Item code for y-value. itemuij is for upper half or whole itemlij curves on frame i, and itemlij is for lower half curves only on frame i. If itemlij is not specified, then whole frame curves will be plotted with itemuij. itemlij is ignored for ptype=“AUTO”, “PSDF”, and “SPECTRAL” (Character or Integer &gt; 0).</p> <p>For elements, the code represents a component of the element stress, strain, or force and is described in <a href="#">Table 7-1</a> and <a href="#">Table 7-5</a> of the Guide. For ptype=“AUTO” and “PSDF”, the complex stress or strain item codes need to be used. Since the output quantities are real, you can use either the real or the imaginary item code. Both will give the same result.</p> <p>For grid points and pty=“RESPONSE”, the code is one of the mnemonics T1, T2, T3, R1, R2, R3, T1RM, T2RM, T3RM, R1RM, R2RM, R3RM, T1IP, T2IP, T3IP, R1IP, R2IP, or R3IP, where Ti stands for the i-th translational component, Ri stands for the i-th rotational component, RM means real or magnitude, and IP means imaginary or phase. For scalar or extra points, or heat transfer analysis, use T1, T1RM, or T1IP. The output format of results in PCH file is dictated by the case control request for DISP, STRESS. For example for SOL111:</p> <pre data-bbox="458 892 928 968">DISP (PLOT, phase, SORT2) = 1 OUTPUT (XYOUT) XYPUNCH DISP RESP /3 (T3RM)</pre> <p>This will punch results in PCH file in Mag/phase format. If the DISP command is missing results will shift to Real/Imaginary the default format for SOL111 displacement.</p> <p>For grid points and ptype=“AUTO” or “PSDF”, the code is one of the mnemonics T1, T2, T3, R1, R2, R3. For scalar or extra points, use T1.</p> <p>For yvtype=VG, itemui and/or itemli can be “F” for frequency or “G” for damping.</p>

#### Remarks:

1. Multiple XYPLOT, XYPUNCH, XYPRINT, XYPEAK, and/or XYPAPLOT commands may be specified in the OUTPUT(XYPLOT) section.
2. Solution set requests are more efficient, because the time-consuming recovery of the dependent displacements can be avoided.
3. The item codes also appear in printed summaries as “CURVE ID” for grid points as well as element data.

4. The information after each slash ( / ) specifies the curve(s) that are to be plotted on the same frame. The descriptor idij identifies the grid point j or element j associated with the frame number i. All plot requests on one command are sorted on idij to improve the efficiency of the plotting process. Symbols are assigned in order by idij.
5. If any of the item codes, itemlij or itemuij, are not specified; e.g., (8) or (5), the corresponding half frame curve is not plotted. If both the comma ( , ) and itemlij not specified; e.g., (8), then whole frame curves will be plotted. Also, for any single frame, the specifications of “(itemuij,itemlij)” must be consistently half frame (upper and/or lower) or whole frame. For example on half frame curves, if iteml11 and the comma is not specified then either iteml12 or itemu12 must not be specified and on whole frame curves, the commas, iteml11, and iteml12 must not be specified. In other words, the curves on each plot frame must be all whole or half (upper and/or lower).
6. The XYPLOT command may be continued on the next line as long as “XYPLOT yvtype ptype [ i1, i2, i3,... ] /” is specified on the first line.
7. Specifying a nonexistent grid point may cause the program to exit in the XYTRAN module and missing plots to occur.
8. mode\_id is used for natural frequency selection of Oxx2m participation versus excitation frequency output.  
frequency\_id is used for excitation frequency selection of Oxx2E participation versus natural frequency output. frequency\_id is an integer value; e.g., (2) would represent the second frequency calculated.
9. For yvtype = CSIG, CEPS, CFAI and CSRS, we can have (itemuij, itemlij) or (itemuij) formats. For the (itemuij, itemlij) format, itemuij will be a negative integer and its absolute value indicates the Ply ID; itemlij indicates the composite stress item code. For the (itemuij) format, itemuij will be an integer  $I = \text{PLYID} * 1000 + \text{ITEM\_CODE}$ .
10. Printout in the f06 file coming from X-Y plot commands is not supported by the POST TOCASE command.

## XYPRINT

### Generate Table of X-Y Pairs for a Printer

Generates tabular printer output of the X-Y pairs.

See [XYPLOT](#) for format, descriptors, and additional remarks.

## XYPUNCH

### Generate Table of X-Y Pairs for the PUNCH File

Generates tabular punch output of the X-Y pairs. Same as XYPRINT except the output is written to the PUNCH file.

See [XYPLOT](#) for format, describers, and additional remarks.

## XVALUE PRINT SKIP

### Print Values on X-Axis Tic Marks

Specifies how often to print the x-values alongside the x-axis tic marks.

Format:

```
XVALUE PRINT SKIP xyps
```

Example:

```
XVAL 5
```

Describer	Meaning
xyps	Number of tic marks to be skipped between labeled tic marks with their corresponding values (Integer $\geq 0$ ).

Remark:

1. XVALUE applies to all curves.

## YAXIS

### Y Axis Plot Control

Controls the plotting of the y-axis on all curves.

Format:

YAXIS { YES  
NO }

Describers	Meaning
YES	Plot the y-axis.
NO	Do not plot the y-axis (Default).

## YBDIVISIONS

## Tic Spacing on Y-Axis

Specifies spacing of tic marks on the y-axis for lower half frame curves only.

Format:

YBDIVISIONS ybd

Example:

YBDI 10

Describer	Meaning
ybd	Number of spaces between tic marks on y-axis (Integer > 0; Default = 5).

Remarks:

1. YBDIVISIONS applies to lower half frame curves only.
2. YBDIVISIONS is ignored for a logarithmic y-axis.

## YBINTERCEPT

### Location of Y Axis on X Axis

Specifies the location of the y-axis on the x-axis for lower half frame curves only.

Format:

YBINTERCEPT ybi

Example:

YBINT 50

Describer	Meaning
ybi	Location of y-axis on the x-axis (Real; Default = 0.0).

Remark:

1. YBINTERCEPT applies to lower half frame curves only.

## YBGRID LINES

### Plot Y Axis Grid Lines

Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks on lower half frame curves only.

Format:

YBGRID LINES { YES }  
                  { NO }

Describers	Meaning
YES	Plot the y-axis grid lines.
NO	Do not plot the y-axis grid lines (Default).

Remarks:

1. YBGRID applies to lower half frame curves only.
2. See related command [XBGRID LINES](#)

## YBLOG

## Logarithmic or Linear Y Axis

Selects logarithmic or linear y-axis for lower half frame curves only.

Format:

YBLOG { YES }  
          NO }

Describers	Meaning
YES	Plot a logarithmic y-axis.
NO	Plot a linear y-axis (Default).

Remarks:

1. YBLOG applies to lower half frame curves only.
2. See Remark 2 under [XLOG](#).

**YBMAX**

## Maximum Y Axis Value

Specifies the maximum value on the y-axis for lower half frame curves only.

Format:

YBMAX ymax

Example:

YBMAX 100

Describer	Meaning
ymax	Maximum value on the y-axis (Real).

Remarks:

1. YBMAX applies to lower half frame curves only.
2. If YBMAX is not specified, then the maximum value is set to the highest value of y.
3. See related command [YBMIN](#).

## YBMIN Minimum Y Axis Value

Specifies the minimum value on the y-axis for lower half frame curves only.

Format:

YBMIN ymin

Example:

YBMIN 100

Describer	Meaning
ymin	Minimum value on the y-axis (Real).

Remarks:

1. YBMIN applies to lower half frame curves only.
2. If YBMIN is not specified then the minimum value is set to the lowest value of y.
3. See related command [YBMAX](#).

**YBTITLE****Y-Axis Title**

Defines a character string that will appear along the y-axis for lower half frame curves only.

Format:

YBTITLE ytit

Example:

YBTIT RIGHT WING LOADS - CASE 3

Describer	Meaning
ytit	Any character string (Character; Default= Blank).

Remarks:

1. YBTITLE may not be continued to the next command line.
2. YBTITLE applies to lower half frame curves only.

## YBVALUE PRINT SKIP

## Print Values on Y Axis Tic Marks

Specifies how often to print the y-values alongside the y-axis tic marks applies on lower half frame curves only.

Format:

YBVALUE PRINT SKIP *yvps*

Example:

YBVAL 5

Describer	Meaning
<i>yvps</i>	Number of tic marks to be skipped between labeled tic marks with their corresponding values (Integer $\geq 0$ ).

Remark:

1. YBVALUE applies to lower half frame curves only.

## YDIVISIONS

## Tic Spacing on Y Axis

Specifies spacing of tic marks on the y-axis for whole frame curves only.

Format:

YDIVISIONS yd

Example:

YDIV 10

Describer	Meaning
yd	Number of spaces between tic marks on y-axis (Integer > 0; Default=5).

Remarks:

1. YDIVISIONS applies to whole frame curves only and to the commands: LEFT TICS, RIGHT TICS, and XINTERCEPT.
2. YDIVISIONS is ignored for a logarithmic y-axis.

## YINTERCEPT

### Location of Y Axis on X Axis

Specifies the location of the y-axis on the x-axis for whole frame curves only.

Format:

YINTERCEPT yi

Example:

YINT 50

Describer	Meaning
yi	Location of y-axis on the x-axis. (Real; Default = 0.0)

Remark:

1. YINTERCEPT applies to lower half frame curves only.

## YGRID LINES

### Plot Y Axis Grid Lines

Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks on whole frame curves only.

Format:

YGRID LINES { YES }  
                  { NO }

Describers	Meaning
YES	Plot the y-axis grid lines.
NO	Do not plot the y-axis grid lines (Default).

Remarks:

1. YGRID applies to whole frame curves only.
2. See related command [XGRID LINES](#)

## YLOG

## Logarithmic or Linear Y Axis

Selects logarithmic or linear y-axis for whole frame curves only.

Format:

YLOG { YES }  
      { NO }

Describers	Meaning
YES	Plot a logarithmic y-axis.
NO	Plot a linear y-axis (Default).

Remarks:

1. YLOG applies to whole frame curves only.
2. See Remark 2 under [XLOG](#).

**YMAX**      Maximum Y Axis Value

Specifies the maximum value on the  $y$ -axis.

Format:

YMAX  $y_{\max}$

Example:

YMAX 100

Describer	Meaning
$y_{\max}$	Maximum value on the $y$ -axis (Real).

Remarks:

1. If YMAX is not specified, then the maximum value is set to the highest value of  $y$ .
2. See related command [YMIN](#).

## YMIN Minimum Y Axis Value

Specifies the minimum value on the y-axis.

Format:

YMIN ymin

Example:

YMIN 100

Describer	Meaning
ymin	Minimum value on the y-axis (Real).

Remarks:

1. YMIN applies to all curves.
2. If YMIN is not specified, then the minimum value is set to the lowest value of y.
3. See related command [YMAX](#).

**YPAPER**

## Paper Size in Y-Direction

Defines the size of the paper in y-direction.

Format:

YPAPER ysize

Example:

```
YPAP 10
```

Describer	Meaning
ysize	Size of paper in y-direction and in inches (Real; Default = 20.0).

Remarks:

1. The default paper size is 20 by 20 inches.
2. See related command [XPAPER](#).

## YTAXIS

### Y Axis Plot Control

Controls the plotting of the y-axis on upper half frame curves only.

Format:

YTAXIS { YES }  
          { NO }

Describers	Meaning
YES	Plot the x-axis.
NO	Do not plot the x-axis (Default).

Remark:

1. YTAXIS applies to upper half frame curves only.

## YTDIVISIONS

## The Spacing on Y Axis

Specifies spacing of tic marks on the y-axis for upper half frame curves only.

Format:

YTDIVISIONS ytd

Example:

YTDI 10

Describer	Meaning
ytd	Number of spaces between tic marks on y-axis (Integer > 0; Default = 5).

Remarks:

1. YTDIVISIONS applies to upper half frame curves only.
2. YTDIVISIONS is ignored for a logarithmic y-axis.

**YTGRID LINES**

## Plot Y Axis Grid Lines

Controls the drawing of the grid lines parallel to the y-axis at the x-axis tic marks on upper half frame curves only.

Format:

YTGRID LINES { YES }  
                  { NO }

Describers	Meaning
YES	Plot the y-axis grid lines.
NO	Do not plot the y-axis grid lines (Default).

Remarks:

1. YTGRID applies to upper half frame curves only.
2. See related command [XTGRID LINES](#)

**YTINTERCEPT**

## Location of Y Axis on X Axis

Specifies the location of the y-axis on the x-axis for upper half frame curves only.

Format:

YTINTERCEPT yti

Example:

YTINT 50

Describer	Meaning
yti	Location of y-axis on the x-axis (Real; Default= 0.0).

Remark:

1. YTINTERCEPT applies to upper half frame curves only.

**YTITLE**            Y Axis Title

Defines a character string that will appear along the y-axis for whole frame curves only.

Format:

YTITLE ytit

Example:

YTIT RIGHT WING LOADS - CASE 3

Describer	Meaning
ytit	Any character string (Character; Default = Blank).

Remarks:

1. YTITLE may not be continued to the next command line.
2. YTITLE applies to whole frame curves only.

**YTLOG**

## Logarithmic or Linear Y Axis

Selects logarithmic or linear y-axis for upper half frame curves only.

Format:

$$YT(LOG) \left\{ \begin{array}{l} YES \\ NO \end{array} \right\}$$

Describers	Meaning
YES	Plot a logarithmic y-axis.
NO	Plot a linear y-axis (Default).

Remarks:

1. YTLOG applies to upper half frame curves only.
2. See Remark 2 under [XLOG](#).

## YTMAX Maximum Y Axis Value

Specifies the maximum value on the y-axis for upper half frame curves only.

Format:

YTMAX ymax

Example:

YTMAX 100

Describer	Meaning
ymax	Maximum value on the y-axis (Real).

Remarks:

1. YTMAX applies to upper half frame curves only.
2. If YTMAX is not specified, then the maximum value is set to the highest value of y.
3. See related command [YTMIN](#).

**YTMIN**

## Minimum Y Axis Value

Specifies the minimum value on the y-axis for upper half frame curves only.

Format:

YTMIN ymin

Example:

YTMIN 100

Describer	Meaning
ymin	Minimum value on the y-axis (Real).

Remarks:

1. YTMIN applies to upper half frame curves only.
2. If YTMIN is not specified then the minimum value is set to the lowest value of y.
3. See related command [YTMAX](#).

**YTTITLE**

## Y-Axis Title

Defines a character string that will appear along the y-axis for upper half frame curves only.

Format:

YTTITLE ytit

Example:

```
YTTIT RIGHT WING LOADS - CASE 3
```

Describer	Meaning
ytit	Any character string (Character; Default = Blank).

Remarks:

1. YTTITLE may not be continued to the next command line.
2. YTTITLE applies to upper half frame curves only.

## YTVALUE PRINT SKIP

## Print Values on Y Axis Tic Marks

Specifies how often to print the  $y$ -values alongside the  $y$ -axis tic marks applies on upper half frame curves only.

Format:

YTVALUE PRINT SKIP  $yvps$

Example:

YTVAL 5

Describer	Meaning
$yvps$	Number of tic marks to be skipped between labeled tic marks with their corresponding values (Integer $\geq 0$ ).

Remark:

1. YTVALUE applies to upper half frame curves only.

## YVALUE PRINT SKIP

## Print Values on Y Axis Tic Marks

Specifies how often to print the y-values alongside the y-axis tic marks applies on whole frame curves only.

Format:

YVALUE PRINT SKIP *yvps*

Example:

YVAL 5

Describer	Meaning
<i>yvps</i>	Number of tic marks to be skipped between labeled tic marks with their corresponding values (Integer $\geq 0$ ).

Remark:

1. YVALUE applies to whole frame curves only.

## OUTPUT(POST) Commands

### SURFACE Surface Definition

Defines a surface for the calculation of grid point stresses, strains, or mesh stress discontinuities.

Format:

$$\text{SURFACE id SET sid, FIBRE } \left\{ \begin{array}{l} \text{ALL} \\ \text{Z1} \\ \text{Z2} \\ \text{MID} \end{array} \right\},$$

$$\left[ \text{SYSTEM } \left\{ \begin{array}{l} \text{ELEMENT} \\ \text{BASIC} \\ \text{CORD cid} \end{array} \right\} \right], \left[ \text{AXIS } \left\{ \begin{array}{l} \text{X1} \\ \text{X2} \\ \text{X3} \end{array} \right\} \right], \left[ \text{NORMAL [M]} \left\{ \begin{array}{l} \text{R} \\ \text{X1} \\ \text{X2} \\ \text{X3} \end{array} \right\} \right],$$

$$\left[ \text{TOPOLOGICAL} \right] \left[ \text{GEOMETRIC} \right] \left[ \text{TOLERANCE } \{ \text{THETA } \} \right],$$

$$\left[ \text{BRANCH } \left[ \left[ \left\{ \begin{array}{l} \text{MESSAGE} \\ \text{NOMESSAGE} \end{array} \right\} \right], \left[ \left\{ \begin{array}{l} \text{BREAK} \\ \text{NOBREAK} \end{array} \right\} \right] \right] \right]$$

Example:

```
SURFACE 10 SET 9 NORMAL X3
```

Descriptor	Meaning
id	Surface identification number (Required).
SET	References a SET command that defines the elements in the surface (required). Either form of the SET command may be used.
sid	Set identification number.
FIBRE	Specifies the fiber location at which stresses will be calculated.
ALL	Requests output at all fiber locations; i.e., z=Z1, Z2, and MID.
Z1	Requests output z = Z1 only.
Z2	Requests output z = Z2 only.

Describer	Meaning
MID	Requests output $z = (Z1+Z2)/2$ only.
SYSTEM	Specifies the coordinate system to be used as the output coordinate system.
ELEMENT	Specifies the element coordinate system for output.
CORD cid	Specifies the coordinate system defined on a CORDij Bulk Data entry for output.
BASIC	Specifies the basic coordinate system for output.
AXIS	Specifies the axis of the coordinate system to be used as the x output axis and the local x-axis when geometric interpolation is used.
X1, X2, X3	Specifies the direction of the axis or the normal. X, Y, and Z may be substituted for X1, X2, and X3, respectively.
NORMAL	Specifies the reference direction for positive fiber and shear stress output, but has no effect when ELEMENT is specified.
M	Specifies the reverse of the direction given by R, X1, X2, or X3 and must be entered as MR, MX1, MX2, or MX3 with no space between the M and the following letter.
R	Specifies the radius vector from the origin of reference coordinate system to the grid point.
TOPOLOGICAL GEOMETRIC	Specifies the method to calculate the average grid point stress or strain. The default is TOPOLOGICAL.
theta	Specifies the interelement slope difference tolerance (in degrees) to detect stress discontinuity between elements (not used with TOPOLOGICAL) (Real; Default = 0.0).
BRANCH	Selects whether multiple element intersections (BREAK/NOBREAK) are to be treated as discontinuities, and if warning messages (MESSAGE/NOMESSAGE) are to be issued.
BREAK NOBREAK	Multiple element intersections are (or are not) to be treated as stress discontinuities.
MESSAGE NOMESSAGE	A warning message will (or will not) be issued when multiple element intersections are encountered.

#### Remarks:

1. SURFACE commands must be specified after OUTPUT(POST).
2. The surface identification number must be referenced on a SET command appearing after OUTPUT(POST). The SET identification number may then be referenced on GPSTRESS, GPSTRAIN, STRFIELD, ELSDCON, and GPSDCON commands. The sid on the surface entry must reference a SET defined after OUTPUT(POST).

3. The surface normal is also used in the definition of the local reference surface for geometric interpolation. Two options are available. In the first option, the radius vector ( $R$ ) from the origin of the reference coordinate system to the grid point is used. In the second option, one axis ( $X1$ ,  $X2$ , or  $X3$ ) of the coordinate system is used. The direction can be reversed using the modification parameter  $M$ . The positive side of an element is defined as a side from which the **NORMAL** direction emerges, rather than the side determined by the connection specified on the element connection entries.
4. When the parameter **ELEMENT** is present, the element stresses or strains are used unmodified (defaults to output stresses in output system). The **CORD** keyword references a **CORDij** Bulk Data entry with coordinate system identification number *cid*.
5. When  $\theta = 0$ , no testing is made. When  $\theta$  is negative, grid point stresses will be calculated for each element connected to an exception point; otherwise, the best estimation of the grid point stress will be output.
6. **BREAK** is the default if  $\theta$  is nonzero.
7. For all elements defined in SET 9 of the preceding example,
  - All fiber locations are output;
  - The basic output system is used;
  - The x-axis is x-axis of the basic system;
  - The surface normal direction point is z-axis of the basic system;
  - The topological interpolation method is used;
  - No tolerance test is made; and
  - No branch test is made.

The example illustrates a good choice for regular two-dimensional problems in the x-y plane.

## VOLUME Volume Definition

Defines a volume for the calculation of grid point stresses, strains, or mesh stress discontinuities.

Format:

VOLUME id SET sid, [PRINCIPAL, DIRECT STRESS], [SYSTEM { ELEMENT  
CORD cid  
BASIC } ]

Example:

VOLUME 21 SET 2

Descriptor	Meaning
id	Volume identification number.
sid	Set identification number of a SET command that defines the elements in the volume. Either form of the SET command may be used. The default is all elements.
PRINCIPAL	Requests principal stresses or strains, direction cosines, mean pressure, and von Mises equivalent stresses or strains to be calculated. If neither PRINCIPAL nor DIRECT is specified, then the default is to output both.
DIRECT	Requests direct stress or strains, mean pressure stress, and von Mises equivalent stress to be calculated. If neither PRINCIPAL nor DIRECT is specified, then the default is to output both.
SYSTEM	Used to specify the reference coordinate system used to define the output stress orientation coordinate system.
ELEMENT	Specifies the element coordinate system.
CORD cid	Specifies the coordinate system defined on a CORDij entry.
BASIC	Specifies the basic coordinate system.

Remarks:

- VOLUME commands must be specified after OUTPUT(POST).
- The volume identification number must be referenced on a SET command appearing after OUTPUT(POST). The SET identification number may then be referenced on GPSTRESS, GPSTRAIN, STRFIELD, ELSDCON, and GPSDCON Case Control commands.
- If ELEMENT is specified, element stresses or strains are not transformed.
- In the preceding example, for all elements in SET 2:
  - Both PRINCIPAL and DIRECT stress are output.

- The BASIC output system is used.

## OUTPUT(PLOT) Commands

The PLOT command requests the generation of undeformed, deformed, or contour plots. All other commands specify how the model will be plotted, type of projection, view angles, scales, etc. All commands have default actions if not specified by the user. The FIND command may be used to calculate an optimal SCALE, ORIGIN, and/or VANTAGE POINT to allow the construction of a plot in a user-specified region of the paper or film. All the commands used in the generation of the various plots will be printed out as part of the output, whether they are directly specified, defaulted or established using the FIND command. Initialization of commands to default values occurs only once. Subsequently, these values remain until altered by direct command input. The only exceptions are the view angles, scale factors, vantage points, and the origins. Whenever the plotter or the method of projection is changed, the view angles are reset to the default values, unless they are respecified by the user. In addition, the scale factors, vantage points, and the origin must be respecified by the user.

The commands are listed here in a logical sequence; however, they need not be so specified. Any order may be used, but if a command is specified more than once, the value or choice stated last will be used.

PLOTTER	Selects format of plot file for interpretation by plotter postprocessor.
ORTHOGRAPHIC, etc.	Selects orthographic projection.
PERSPECTIVE	Selects perspective projection.
STEREOSCOPIC	Selects stereoscopic projection.
AXES	Assigns axes of the basic coordinate system to the observer's coordinate system.
VIEW	Defines the angular relationship between the observer's coordinate system (r, s, and t axes specified on the AXES command) and the basic coordinate system.
MAXIMUM DEFORM	Defines the magnification of the maximum displacement.
SCALE	Defines reduction, as a scale factor, of the model's dimensions so that the model fits on a plot frame.
DISTORTION	Specifies the distortion scale factors of axes in the basic coordinate system.
CSCALE	Defines scale factor for characters in the plot frame.
ORIGIN	Defines the origin of the plot frame with respect to the origin of the (r, s, t) coordinate system defined on the AXES command.
VANTAGE POINT	Defines the location of the observer with respect to the model in the (r, s, t) coordinate system defined on the AXES command for perspective and stereoscopic projections only.
PROJECTION	Defines the separation, along the r-axis, between the observer and the projection plane if not already specified on the VANTAGE POINT command. Used by stereoscopic projections only.
OCULAR SEPARATION	Defines the separation of the left and right eye vantage points along the s-axis for stereoscopic projections.
CAMERA	Specifies microfilm plotter options.

PAPER SIZE	Defines the size and type of the paper.
PEN	Generates a message on the printed output to inform the plotter operator as to what size and color pen point to mount in the various pen holders.
PTITLE	Defines a character string that will appear at the top of the plot frame on the line below the sequence number.
SET	Defines a set of elements and/or grid points to be plotted.
FIND	Requests the plotter to optimally compute any of the parameters that can be specified on the SCALE, ORIGIN i, and/or VANTAGE POINT commands.
CONTOUR	Specifies contour plot options for stress, displacement, or temperature.
PLOT	Generates an undeformed plot or a deformed plot per subcase, mode number, frequency, or time step. A contour plot may also be requested with an undeformed or deformed plot.

## AXES

### Orientation of Observer's Coordinate System

Assigns axes of the basic coordinate system to the observer's coordinate system.

Format:

AXES r s t  $\begin{bmatrix} \text{SYMMETRIC} \\ \text{ANTISYMMETRIC} \end{bmatrix}$

Example 1: View toward negative x-axis of model.

AXES MX, Y, MZ

Example 2: Mirror image of model.

AXES Y X Z

Describers	Meaning
r,s,t	Assigns axes of basic coordinate system to axes of observer's coordinate system (Default=X, Y, Z). X X-direction of basic coordinate system (Default for r). Y Y-direction of basic coordinate system (Default for s). Z Z-direction of basic coordinate system (Default for t). MX Negative X-direction of basic coordinate system. MY Negative Y-direction of basic coordinate system. MZ Negative Z-direction of basic coordinate system.
SYMMETRIC	Specifies a symmetric orientation of the view. See Remark 5. (Default).
ANTISYMMETRIC	Specifies an antisymmetric orientation of the view. See Remark 5.

Remarks:

1. If no AXES command is specified, then AXES X, Y, Z is the default.
2. The direction of view is in the negative r-direction; i.e., the projection plane is parallel to the s-t plane.
3. The VIEW command depends on the AXES command specification and defines the angular relationship between observer's coordinate system and the basic coordinate system.
4. The AXES command can be used to preposition the object in 90° increments in such a manner that only rotations less than 90° are required by the VIEW command to obtain the desired orientation. MX, MY, MZ can be used to define left-handed coordinate systems. Note that the default system is right-handed.

5. An undeformed or deformed plot of the symmetric portion of an object can be obtained by reversing the sign of the axis that is normal to the plane of symmetry. In the case of multiple planes of symmetry, the signs of all associated planes should be reversed. The ANTISYMMETRIC option should be specified when a symmetric model is loaded in an unsymmetric manner. This will cause the deformations to be plotted antisymmetrically with respect to the specified plane or planes. Since the AXES command applies to all parts (SETs) of a single frame, symmetric and antisymmetric combinations cannot be made with this command (see the symmetry option on the [PLOT, 766](#) command in this section).
6. To avoid a mirror image, ensure that the r, s, and t axes obey the right-hand rule.

## CAMERA

## Microfilm Plotter Options

Specifies microfilm plotter options.

Format:

```

CAMERA [ PAPER
        FILM BLANK FRAME n
        BOTH ]

```

Example:

```
CAMERA FILM
```

Describers	Meaning
FILM	Requests 35 mm or 16 mm film and positive or negative images.
PAPER	Requests positive prints.
BOTH	Requests positive prints and 35 mm or 16 mm film.

Remarks:

1. If the CAMERA command is not specified, then CAMERA PAPER BLANK FRAMES 0 is assumed.
2. If FILM or BOTH is specified, then these options must be communicated to the plotter operator through normal means of communications at the installation.
3. If FILM or BOTH are specified and if n is greater than 0 then n blank frames will be inserted between plots. The plotter must be operated in the manual mode in order to have blank frames inserted between positive prints. If blank frames are desired only on film, and not on paper, the plotter must be operated in the automatic mode.

## CONTOUR

### Contour Plot Options

Specifies contour plot options for stress, displacement, or temperature.

Format:

$$\text{CONTOUR component} \left\{ \begin{array}{l} \text{EVEN } n \\ \text{LIST } a, b, \dots \end{array} \right\} \left\{ \begin{array}{l} Z1 \\ Z2 \\ \text{MAX} \\ \text{MID} \end{array} \right\} \left\{ \begin{array}{l} \text{COMMON} \\ \text{LOCAL} \end{array} \right\}$$

Example:

CONTOUR MAGNIT LIST 2., 4., 6., 8., 10.

Describers	Meaning
component	Name of stress, displacement or temperature component (Character, Default="MAJPRIN").
MAJPRIN	Major principal stress. Not available for nonlinear elements (Default).
MINPRIN	Minor principal stress. Not available for nonlinear elements.
EQUIVAL	von Mises stress. When STRESS(MAXS) is requested in the Case Control Section, von Mises stress is used for plotting. For nonlinear analysis, Mohr-Coulomb or Drucker-Prager stress may also be plotted in conjunction with the MATS1 command.
XNORMAL	X component of normal stress.
YNORMAL	Y component of normal stress.
ZNORMAL	Z component of normal stress.
XYSHEAR	XY component of shear stress.
XZSHEAR	XZ component of shear stress.
YZSHEAR	YZ component of shear stress.
XDISP	T1 component of displacement in global coordinate system.
YDISP	T2 component of displacement in global coordinate system.
ZDISP	T3 component of displacement in global coordinate system.
MAGNIT	Magnitude of displacement or temperature.
EVEN n	Number of contours ( $50 \geq \text{Integer} > 0$ , Default is EVEN 10).
LIST a, b, ...	List of stresses, displacements or temperatures which define the contours (Real).

Describers	Meaning
Z1	Stresses at Z1 from neutral plane (Default).
Z2	Stresses at Z2 from neutral plane.
MAX	Maximum of stress at Z1 and Z2.
MID	Average of stress (membrane stress) at Z1 and Z2.
COMMON	Plot stress contours in basic coordinate system (Default).
LOCAL	Plot stress contours in element coordinate system. This is the coordinate system used in printed output.

#### Remarks:

1. The CONTOUR command should be specified immediately before its associated PLOT command.
2. A STRESS command must appear in the Case Control Section for all elements included in a CONTOUR request. If printed output is not desired, then STRESS(PLOT)=sid should be specified.
3. In linear analysis, stress contour plots are available for the following elements: CTRIA3, CQUAD4, CSHEAR, and CTRIAX6. In nonlinear analysis, stress contour plots are available for CQUAD4 and CTRIA3 elements. The Bulk Data element connection entries for all elements must list the grid points in either clockwise or counterclockwise order. Mixing the order will result in meaningless or confusing plots.
4. When selecting contour options, note that
  - MAJPRIN, MINPRIN, EQUIVAL are the same in COMMON and LOCAL.
  - ZNORMAL, XZSHEAR, YZSHEAR, if selected in LOCAL, will be changed to COMMON.
  - CSHEAR elements only have the MAXSHEAR value.
5. The CTRIAX6 element stress contour plots are different in that they must be selected as COMMON. Also, the following equivalences apply:

```

XNORMAL is radial
YNORMAL is azimuthal
ZNORMAL is axial
XYSHEAR is shear
XZSHEAR is maximum principal
YZSHEAR is von Mises
EQUIVAL is octahedra

```

**CSCALE**

## Character Scale Factor

Defines scale factor for characters in the plot frame.

Format:

CSCALE cs

Example:

CSCA 2.0

Describer	Meaning
cs	Scale factor applied to characters in the plot frame (Default = .5).

Remarks:

1. CSCALE is used to control the spacing of characters when plots are made with the NASTRAN plotter and postprocessed with the MSC/NASPLOT routine. For example, if the SCALE FACTOR on the NASPLOT data command is 2.0, a value for cs of 0.5 will result in characters of default size (.07 inches) at the regular spacing. A value of 1.8 produces good spacing when using the postprocessing plotter programs NASTPLT, TEKPLT, and NEUPS. On the other hand, to double the size of both the plot and the characters, the SCALE FACTOR and the CSCALE FACTOR on the NASPLOT data command should both be set equal to 2.0.
2. The CSCALE command must immediately precede the PLOTTER command. If a second CSCALE command is specified, then a second PLOTTER command must also be specified.

## DISTORTION

### Distortion Scale Factors

Specifies the distortion scale factors of the axes in the basic coordinate system.

Format:

```
DISTORTION dx dy dz
```

Example:

```
DIST 0.5 1.0 1.0
```

Describers	Meaning
dx	Distortion scale factor of the basic coordinate system's x-axis (Default=1.0).
dy	Distortion scale factor of the basic coordinate system's y-axis (Default=1.0).
dz	Distortion scale factor of the basic coordinate system's z-axis (Default=1.0).

Remarks:

1. If no DISTORTION command is specified, then no distortion is applied.
2. If DISTORTION is specified, then all three values for dx, dy, and dz must be specified even though one or two will use the default.
3. The distortion factors are applied prior to any other scaling commands: SCALE, MAXIMUM DEFORMATION, CSCALE, etc.

**FIND****Automatic Calculation of Scale, Origin, and Vantage Point**

Requests the plotter to optimally compute any of the parameters that can be specified on the SCALE, ORIGIN i, and/or VANTAGE POINT commands.

Format:

```
FIND [ SCALE ORIGIN oid VANTAGE POINT SET setid ,
      REGION { le be re te } ]
```

Example:

```
FIND SCALE ORIGIN 5 SET 2
```

Describers	Meaning
oid	Origin identification number (Integer>0).
setid	Set identification number etc. (Integer>0).
le	Fractional distance of left edge of plot region from the lower left corner of the image area (Real, Default=0.0).
be	Fractional distance of bottom edge of plot region from the lower left corner of the image area (Real, Default=0.0).
re	Fractional distance of right edge of plot region from the lower left corner of the image area (Real, Default=1.0).
te	Fractional distance of top edge of plot region from the lower left corner of the image area (Real, Default=1.0).

Remarks:

1. The FIND command is recommended over the specification of SCALE, ORIGIN, and VANTAGE POINT commands, and should be specified prior to its associated PLOT or CONTOUR command.
2. The FIND command requests the plotter to optimally compute any of the parameters that can be specified on the SCALE, ORIGIN, and/or VANTAGE POINT commands and based on the specification of the
  - PLOTTER command;
  - PROJECTION PLANE command;
  - SET and REGION specifications on the FIND command;
  - VIEW and/or AXES commands;
  - MAXIMUM DEFORMATION command; and
  - PAPER SIZE command. All of these commands must precede the associated FIND command.
3. The FIND command can be used to compute any or all of SCALE, ORIGIN, or VANTAGE POINT as long as they have not been previously specified.
4. If SET is not specified, then the first defined SET will be used.

5. If no options are specified on the FIND command, a SCALE and VANTAGE POINT are selected and an ORIGIN is located, using the first defined SET, so that the plotter object is located within the image area.
6. The plot region is defined as some fraction of the image area (image area = 0.0, 0.0, 1.0, 1.0 and first quadrant = 0.5, 0.5, 1.0, 1.0). The image area is located inside the margins on the paper.

**MAXIMUM DEFORM****Length of Maximum Displacement**

Defines the magnification of the maximum displacement. All other displacements are scaled accordingly.

Format:

MAXIMUM DEFORMATION d

Example:

Magnify the displacements such that the maximum displacement is equal to two units of length of the model.

MAXI DEFO 2.

Describer	Meaning
d	Specifies the length, in units of the model and not of the plot frame, to which the maximum displacement is scaled. (Default=5% of the largest dimension of the model represented by the elements in the SET specification on the PLOT command.)

Remarks:

1. If no MAXIMUM DEFORMATION command is specified, then the previously described default is assumed.
2. If you wish the FIND command to use the d value, a MAXIMUM DEFORMATION command should precede the FIND command.
3. If you wish the plot deformation scaling to be different then the FIND scaling, a different MAXIMUM DEFORMATION command can appear first before the PLOT command.
4. For nonlinear plotting, MAXIMUM DEFORMATION d and the MAXIMUM DEFORMATION field on the PLOT command should have the same value.

## OCULAR SEPARATION

## Separation of the Vantage Points

Defines the separation of the left and right eye vantage points along the s-axis for stereoscopic projections.

Format:

OCULAR SEPARATION os

Example:

OCULAR SEPARATION 2.0

Describer	Meaning
os	Separation, in inches, of the two vantage points along the s-axis (Real, Default=2.756 inches).

Remark:

1. The default value is the separation used in the standard stereoscopic cameras and viewers (70 mm). The default value is recommended.

**ORIGIN****Origin of Plot Frame**

Defines the origin of the plot frame with respect to the origin of the (r, s, t) coordinate system defined on the AXES command.

Format:

ORIGIN oid u v

Example:

ORIG 3 -1. -2.

Describers	Meaning
oid	Origin identification number which may be specified after the ORIGIN describer on the PLOT command (Integer > 0).
u	Horizontal displacement of plot frame origin from the rst origin (Real, Default = 0.0).
v	Vertical displacement of paper origin from the rst origin (Real, Default = 0.0).

Remarks:

1. In the transformation performed for any of the three projections, the origins of both the basic coordinate system and the observer's coordinate system are coincident. The ORIGIN command may be used to locate the plot frame origin (lower left hand corner) from the rst origin. The units are inches, and are not subject to the scaling of the plotted object.
2. The ORIGIN command is not recommended for general use. See the [FIND](#) command to have the origin optimally located so as to place the plotted object in the center of the plot frame.
3. Ten origins may be specified at one time. However, any one can be redefined at any time. An eleventh origin is also provided if more than ten origins are erroneously defined; i.e., only the last of these surplus origins will be retained.
4. If a projection; e.g., ORTHOGRAPHIC, STEREOSCOPIIC, or PERSPECTIVE, is changed in the plot packet, or the PLOTTER command is changed, then all previously defined origins are deleted.

## ORTHOGRAPHIC, etc.

## Type of Projection

Selects type of projection.

Format:

```
[
  ORTHOGRAPHIC
  PERSPECTIVE
  STEROSCOPIC ]
```

Describers	Meaning
ORTHOGRAPHIC	Selects orthographic projection (Default).
PERSPECTIVE	Selects perspective projection.
STEREOSCOPIC	Selects stereoscopic projection.

Remark:

1. If none of the preceding projections are specified, then ORTHOGRAPHIC is used.

## PAPER SIZE

## Paper Dimensions

Defines the size and type of the paper.

Format:

```
PAPER SIZE h X or BY v [TYPE ptype]
```

Example:

```
PAPER SIZE 10. BY 10.
```

Describers	Meaning
h	Horizontal size of paper in inches (Real, Default = 20.0).
v	Vertical size of paper in inches (Real, Default= 20.0).
ptype	Paper type (Character, Default = "VELLUM").

Remarks:

1. The default paper size for the PLOTTER NAST is 20 by 20 inches which is converted to a 7 by 7 inch plot frame by the NASPLOT postprocessor.
2. PAPER SIZE can be specified along with the NASPLOT postprocessor to create rectangular plots. For example, the command will result in a 14 by 7 inch plot frame if the default value of 1.0 is used for the SCALE FACTOR on the NASPLOT command. The SCALE FACTOR on the NASPLOT data command can be used to make larger plots having the shape defined with PAPER SIZE.
3. PAPER SIZE also affects the raster count for the NASTRAN plotter. The default raster count is 1000 for a paper size of 20 by 20. Doubling the paper size to 40 by 40 will double the raster count to 2000.

## PEN Pen Color and Size Assignments

Generates a message on the printed output which may be used to inform the plotter operator as to what size and color pen point to mount in the various pen holders.

Format:

```
PEN pn [ COLOR cname ]
```

Example:

```
PEN 2 COLOR RED
```

Describers	Meaning
pn	Pen identification number (Integer > 0).
COLOR	Flag indicating the next word is a color name.
cname	Pen color (Character).

Remarks:

1. The actual number of pens available will depend on the plotter hardware configuration at each installation.
2. The PEN command does not control the pen used in generating the plot. See the PEN describer on the [PLOT](#) command.
3. The PEN command is optional and is not appropriate for microfilm plotters.

## PERSPECTIVE

Selects Perspective Projection

See the description of the [ORTHOGRAPHIC](#), etc..

## PLOT Undeformed or Deformed Plot Request

Generates an undeformed plot of the model or a deformed plot for a subcase, mode number or time step.

Format:

PLOT [analysis][dtype][CONTOUR][i1, i2 THRU i3, i4, etc.]  $\left\{ \begin{array}{l} \text{RANGE f1, f2} \\ \text{TIME t1, t2} \end{array} \right\}$ ,

$\left\{ \begin{array}{l} \text{PHASE LAG } \phi \\ \text{MAGNITUDE} \end{array} \right\}$  [MAXIMUM DEFORMATION d] ,

[SET sid1] [ORIGIN oid1]  $\left\{ \begin{array}{l} \text{SYMMETRY} \\ \text{ANTISYMMETRY} \end{array} \right\}_w \left[ \left\{ \begin{array}{l} \text{PEN} \\ \text{DENSITY} \end{array} \right\}_p \right]$  [SYMBOLS m[,n]] ,

[LABEL label]  $\left[ \left[ \begin{array}{l} \text{SHAPE} \\ \text{OUTLINE} \end{array} \right] \right]$  [VECTOR v] , [PRINT] ,

[SHRINK t, o] [NORMALS] ,  
[SET sid2] [ORIGIN oid2] etc.

Examples:

See after Remarks Section.

Describers	Meaning
analysis	Type of analysis results (Character, default results in an undeformed plot or undeformed underlay for contour plots). STATIC Plot static deformations. MODAL Plot mode shapes or eigenvectors. CMODAL Plot complex mode shapes or eigenvectors. TRANSIENT Plot transient solutions. FREQUENCY Plot frequency solutions. SENOMOVE Plot undeformed superelements in their original position; i.e., ignore SELOC Bulk Data entry.
dtype	Specifies plot quantity (Character, Default = "DEFORMATION").

Describers	Meaning
DEFORMATI ON	Plot displacements or temperatures in the Z direction (Default).
VELOCITY	Plot velocities.
ACCELERATI ON	Plot accelerations.
CONTOUR	Request for contour plot.
i1, i2,...	Subcase identification numbers. See SHAPE and VECTOR for use of "0" (underlay) command. See Remark 3. (Integer $\geq 0$ , Default is all subcases).
RANGE f1 f2	Specifies range of natural frequencies, eigenvalues, excitation
TIME t1,t2	frequencies, time steps, or load factors. Used to minimize the amount of plotted data. See Remark 4. (Real).
PHASE LAG $\phi$	Specified phase lag, in degrees, for plotting complex quantities. See Remark 5. (Real, Default = 0.0).
MAGNITUDE	Requests magnitude of complex quantities.
MAXIMUM DEFORMATION d	Specifies the magnification of the maximum displacement. See Remark 6. (Real).
SET sid	Set identification number which defines the set of elements or grid points to be plotted (Default is first SET command).
ORIGIN oid	Origin identification number (Default is first origin defined by the ORIGIN or FIND command).
SYMMETRY w ANTISYMMETRY w	Request plot of the symmetric portion of the symmetrically or antisymmetrically loaded model. This symmetric portion will be located in the space adjacent to the region originally defined by ORIGIN oid, and will appear as a reflection of the antisymmetrically deformed model about the plane whose normal is oriented parallel to the coordinate direction w. See Remark 7. (Default is no action).
PEN p	Specifies pen number that is used to generate the plot (Integer $> 0$ ).
DENSITY d	Specifies line density scale factor for film plotters which is d times heavier than a line density of 1 (Integer $> 0$ ).

Describers	Meaning
------------	---------

SYMBOLS m[,n] All the grid points associated with the specified set will have symbol m overprinted with symbol n printed at its location. If n is not specified, only symbol m will be printed. See Remark 8.

m or n	Symbol
0	none
1	X
2	*
3	+
4	-
5	.
6	×
7	[ ]
8	< >
9	/ \

LABEL label

Specifies labeling options at elements and grid points:

- GRID All the grid points included in the specified set have their identification number printed to the right of the undeformed or deformed location (undeformed location in the case of superimposed plots) (Default).
- ELEMENTS All the elements included in the specified set are identified by the element identification number and type at the center of each element (undeformed location in the case of superimposed plots). See Remarks 11. and 12.
- BOTH Both GRID and ELEMENT options.
- GSPC Label those degrees-of-freedom that are constrained to zero through permanent single point constraints on GRID and GRDSET Bulk Data entries, or are constrained through SPC and SPC1 Bulk Data entries. The label consists of the grid point ID number and the constrained degrees-of-freedom.
- EPID Label elements with their respective property identification (PID) numbers. The label consists of the standard element labels and element PID.

Describers	Meaning												
SHAPE	All the elements included in the specified set are shown by connecting the associated grid points in a predetermined manner. See Remark 9.												
OUTLINE	Only the outline of all the elements in the specified set is shown. Elements not supported by contour plots are ignored. Outlines are always drawn with PEN 1. See Remark 9.												
VECTOR $v$	A line will be plotted at the grid points of the set representing by length and direction the deformation of the point. See Remark 10. Possible values of $v$ are: <table border="0" style="margin-left: 20px;"> <tr> <td>X, Y, or Z</td> <td>Requesting individual components.</td> </tr> <tr> <td>XY, XZ, or YZ</td> <td>Requesting two specified components.</td> </tr> <tr> <td>XYZ</td> <td>Requesting all three components.</td> </tr> <tr> <td>RXY, RXZ, or RYZ</td> <td>Requesting vector sum of two components.</td> </tr> <tr> <td>R</td> <td>Requesting total vector deformation.</td> </tr> <tr> <td>N</td> <td>Used with any of the preceding combinations to request no underlay shape be drawn.</td> </tr> </table>	X, Y, or Z	Requesting individual components.	XY, XZ, or YZ	Requesting two specified components.	XYZ	Requesting all three components.	RXY, RXZ, or RYZ	Requesting vector sum of two components.	R	Requesting total vector deformation.	N	Used with any of the preceding combinations to request no underlay shape be drawn.
X, Y, or Z	Requesting individual components.												
XY, XZ, or YZ	Requesting two specified components.												
XYZ	Requesting all three components.												
RXY, RXZ, or RYZ	Requesting vector sum of two components.												
R	Requesting total vector deformation.												
N	Used with any of the preceding combinations to request no underlay shape be drawn.												
PRINT	List of the average stresses at the interior grid points in the set will be printed for contour stress plots.												
SHRINK $t, o$	<p><math>t</math> is the ratio of the reduction to the original dimensions of all two-dimensional elements except the CQUAD8 and CTRIA6 (<math>0.0 \leq t \leq 1.0</math>) (Real, Default = 0.1 which results in a 10% reduction).</p> <p><math>o</math> is the ratio of the reduction in length to the original length for one-dimensional elements. There is no default value for <math>o</math>. <math>t</math> must be specified to shrink one-dimensional elements.</p>												
NORMALS	Plot vector normal to CHBDYP and CHBDYG elements.												

#### Remarks:

1. If PLOT is specified with no describers, then a picture of the undeformed model will be prepared using the first defined set and the first defined origin.
2. Describers analysis through PHASE LAG must be specified in the order shown above.
3. The following should be noted when using subcase numbers for plotting eigenvectors.
  - a. If subcase numbers are specified, then the convention for displacement vectors is that the list of subcases must refer to subcase IDs whenever the number of modes recovered is equal to or less than the number of subcases defined. If the number of modes recovered is more than the subcases defined, the plot request for those modes associated with the subcases must refer to subcase IDs. After the mode associated with the last defined subcase, higher modes will be identified by incrementing the last defined subcase ID by one for each such higher mode.

- b. For the display of element quantities in contour plots, the automatic incrementing beyond the last defined subcase does not occur. All subcase numbers to be plotted must be defined. A MODES command in the Case Control Section may be used for this purpose.
  - c. In problems using cyclic symmetry solution sequences, the plot requests for segments of the model must refer to the coded subcase identification numbers (see [Theory](#) in the *MSC Nastran Reference Guide*). All eigenvectors recovered for the segment will be plotted. The RANGE option can be used to select a subset of all eigenvectors for plotting without use of coded subcase IDs.
  - d. RANGE does not require the use of subcase numbers.
4. RANGE specifies the range of values using requested subcases for which plots will be prepared. If only one number is input, it is used as the lower bound and the upper bound is set to the highest value computed. Unless otherwise noted, the default range is all values computed.
- a. In real eigenvalue analysis, the values are natural frequencies, in units of cycles per unit time.
  - b. In buckling analysis, the values are eigenvalues.
  - c. In frequency response, the values are excitation frequencies in units of cycles per unit time.
  - d. In transient response, the values are in units of time.
  - e. In static nonlinear analysis (SOLs 106 and 153), the values are load factors. The default range is the highest load factor of each subcase.
  - f. In transient nonlinear analysis (SOLs 129 and 159), the values are in units of time. The default range is the last time step for each subcase.
5. PHASE LAG  $\phi$  is used in the equation:

$$u_R \cos \phi - u_I \sin \phi$$

where  $u_R$  and  $u_I$  are the real and imaginary parts of the response quantity, respectively. The printed output for magnitude and phase uses the convention of a phase lead.

6. MAX DEFO is not recommended for general use. Each subcase is separately scaled according to its own maximum if this item is absent. If d is omitted, the set will be scaled to the maximum within the set being plotted.
7. w specifies the basic coordinates X, Y, or Z, or any combination thereof. This option allows the plotting of symmetric and/or antisymmetric combinations, provided that an origin is selected for the portion of the model defined in the Bulk Data Section that allows sufficient room for the complete plot. This does not permit the combination of symmetric and antisymmetric subcases, as each plot must represent a single subcase. In the case of a double reflection, the figure will appear as one reflected about the plane whose normal is parallel to the first of the coordinates w, followed by a reflection about the plane whose normal is oriented parallel to the second of the coordinates w. This capability is primarily used in the plotting of models that are loaded in a symmetric or an antisymmetric manner. The plane of symmetry must be one of the basic coordinate planes.
8. Grid points excluded from the set will not have a symbol. Grid points in an undeformed underlay will be identified with symbol 2.

9. In order to get a deformed shape, either SHAPE or OUTLINE must be present in the PLOT command. Both deformed and undeformed shapes or outlines may be specified. All the deformed shapes relating to the subcases listed may be underlaid on each of their plots by including "0" with the subcase string on the PLOT command. The undeformed plot will be drawn using PEN 1 or DENSITY 1 and symbol 2 (if SYMBOLS is specified).
10. All plots requesting the VECTOR option will have an underlay generated of the undeformed shape using the same sets, PEN 1 or DENSITY 1, and symbol 2 (if SYMBOLS is specified). If SHAPE and VECTOR are specified, the underlay will depend on whether "0" is used along with the subcases with DEFORMATION. It will be the deformed shape when not used, and will be both deformed and undeformed shapes when it is used. The part of the vector at the grid point will be the tail when the underlay is undeformed, and the head when it is deformed. If v="N" then no shape will be drawn, but other options such as SYMBOLS will still be valid.
11. Element type labels are: (Plot labels QH and TH indicate hyperelastic elements)

Element Type	Plot Label	Element Type	Plot Label
CAERO1	AE	PLOTEL	PL
CAXIF2	A2	CQUAD	QH
CAXIF3	A3	CQUAD4	Q4 or QH
CAXIF4	A4	CQUAD8	Q8 or QH
CBAR	BR	CQUADR	QR
CBEAM	BM	CQUADX	QH
CBEND	BD	CROD	RD
CBUSH	BU	CSHEAR	SH
CONEAX	CN	CSLOT3	S3
CONROD	CR	CSLOT4	S4
CDUMI	Di	CTETRA	TE
CFLUID2	F2	CTRIAX6	D1
CFLUID3	F3	CTRIA3	T3 or TH
CFLUID4	F4	CTRIA6	T6 or TH
CHBDYG	HB	CTRIAR	TR
CHBDYP	HB	CTRIAX	TH
CHEXA	HA	CTUBE	TU
CPENTA	HA	CVISC	VS

12. The heat transfer boundary condition elements CHBDYG and CHBDYP can be plotted for undeformed plots. There are several types of CHBDYi elements, as follows:

Type	No. of Primary Grid Points	Normals Available
POINT	1	yes
LINE	2	yes
AREA3	3	yes
AREA4	4	yes
REV	2	no
ELCYL	2	no
TUBE	2	yes
FTUBE	2	yes
AREA6	6	yes
AREA6	8	yes

The secondary grid points are used for ambient conditions and are ignored by the plotter. Type POINT must have a nonzero associated area (see AF on the associated PHBDY entry) and a defined normal direction (see V1, V2, V3 on the CHBDYP entry) to be plotted. It is plotted as a hexagon with approximately the correct area. Type LINE must have a nonzero width (see AF on the associated PHBDY entry) and a defined normal in order to plot.

13. To assign PLOT command to superelements it requires an SEUPPLOT or a SEPLOT command.

#### Examples:

- Undeformed SHAPE using first defined SET, first defined ORIGIN and PEN 1 (or DENSITY 1).  
PLOT
- Undeformed SHAPE using SET 3, ORIGIN 4, PEN 2 (or DENSITY 2) with each grid point of the set having a + placed at its location, and its identification number printed adjacent to it.  
PLOT SET 3 ORIGIN 4 PEN 2 SHAPE SYMBOLS 3 LABEL
- Modal deformations as defined in subcase 5 using first defined SET, first defined ORIGIN, and PEN 1 (or DENSITY 1).  
PLOT MODAL DEFORMATION 5 SHAPE
- STATIC deformations as defined in subcases 3, 4, 5, and 8 deformed SHAPE; drawn with PEN 4, using first defined SET and ORIGIN, underlaid with undeformed SHAPE drawn with PEN 1. This command will cause four plots to be generated.  
PLOT STATIC DEFORMATION 0, 3 THRU 5, 8 PEN 4, SHAPE

5. Deformations as defined in subcases 1, 2, 3, 4, and 5 undeformed underlay with PEN 1, consisting of SET 2 at ORIGIN 3, SET 2 at ORIGIN 4 (with a < placed at each grid point location), and SET 35 at ORIGIN 4. Deformed data as follows: SHAPE using SET 2 at ORIGIN 3 (PEN 3) and SET 35 at ORIGIN 4 (PEN 4); 3 VECTORS (X, Y and Z) drawn at each grid point of SET 2 at ORIGIN 4 (PEN 4) (less any excluded grid points), with o placed at the end of each vector.

```
PLOT STATIC DEFORMATION 0 THRU 5,
  SET 2 ORIGIN 3 PEN 3 SHAPE,
  SET 2 ORIGIN 4 PEN 4 VECTORS XYZ SYMBOLS 0,
  SET 35 SHAPE
```

6. Static deformations as defined in subcases 3 and 4, both halves of a problem solved by symmetry using the X-Y principal plane as the plane of symmetry. SET 1 at ORIGIN 2 and SET 2 at ORIGIN 3, with the deformed shape plotted using DENSITY 3 and the undeformed model plotted using DENSITY 1. The deformations of the “opposite” half will be plotted to correspond to symmetric loading. This command will cause two plots to be generated.

```
PLOT STATIC DEFORMATIONS 0, 3, 4,
  SET 1 ORIGIN 2 DENSITY 3 SHAPE,
  SET 1 SYMMETRY Z SHAPE,
  SET 2 ORIGIN 3 SHAPE,
  SET 2 SYMMETRY Z SHAPE
```

7. Transient deformations as defined in subcase 1 for time = 0.1 to time = 0.2, using SET 1 at ORIGIN 1. The undeformed SHAPE using PEN or DENSITY 1 with an \* at each grid point location will be drawn as an underlay for the resultant deformation vectors using PEN or DENSITY 2 with an < typed at the end of each vector drawn. In addition, a plotted value of 2.0 will be used for the single maximum deformation occurring on any of the plots produced. All other deformations on all other plots will be scaled relative to this single maximum deformation. This command will cause a plot to be generated for each output time step which lies between 0.1 and 0.2.

```
PLOT TRANSIENT DEFORMATION, TIME 0.1, 0.2,
  MAXIMUM DEFORMATION 2.0, SET 1, ORIGIN 1, PEN 2, SYMBOLS 2,
  VECTOR R
```

8. Contour plot of x-component of normal stress for elements in SET 2 in basic coordinate system at a distance Z1 from neutral plane with 10 contour lines, an outline of elements in SET 2, and using

```
ORIGIN 4.
CONTOUR XNORMAL
PLOT CONTOUR, SET 2, ORIGIN 4, OUTLINE
```

Contour plot of magnitude of displacements at grid points associated with elements in SET 5 with 5 contours having values of 2., 4., 6., 8., 10., and an outline of the elements in SET 5 using

```
ORIGIN 4.
CONTOUR MAGNIT, LIST 2., 4., 6., 8., 10.
PLOT CONTOUR, SET 5, OUTLINE
```

9. Plot the imaginary part of the complex eigenvector in SET 1.

```
PLOT CMODAL DEFORMATION PHASE LAG 90. SET 1 VECTOR R
```

## PLOTTER

### Plot File Format

Selects format of plot file for interpretation by plotter postprocessor.

Format:

$$\text{PLOTTER} \left\{ \begin{array}{c} \text{NAST} \\ \text{SC} \end{array} \right\}$$

Example:

PLOTTER NAST

Describers	Meaning
NAST	Specifies format suitable for Postscript plotters (Default).
SC	Specifies Stromberg-Carlson microfilm plotter format.

Remark:

1. If no PLOTTER command is specified, then PLOTTER NAST is the default.
2. If “PLOTTER NAST” is specified (or taken by default) and if the format of the PLOT file has been changed to formatted through the use of an ASSIGN statement, plot data will be generated in PostScript mode directly instead of being generated in binary mode. PostScript plot control information may be specified using the SYS= describer on the ASSIGN statement or by using the SYSFIELD= command-line keyword, specifying the control information using the PLOT (keyword=value, . . .) options. The valid keywords are the same as those that can be specified for the PLOTPS or MSCPLOTPS utility programs except that the “begin”, “debug”, “dump”, “end”, “format” and “output” keywords are not allowed.

## PROJECTION

### Separation Between Projection Plane and Observer

Defines the separation along the r-axis, and between the observer and the projection plane, if not already specified on the VANTAGE POINT command. Used by stereoscopic projections only.

Format:

PROJECTION PLANE SEPARATION do

Example:

PROJ PLAN SEPA 1.5

Describer	Meaning
do	Separation of the observer and the projection plane on the r-axis in model units. The VANTAGE POINT command may also specify the separation (Real, Default = 2.0).

Remarks:

1. The PROJECTION PLANE SEPARATION command is not recommended. The FIND command is recommended because it automatically calculates the optimum separation.
2. A theoretical description of projection plane separation is contained in [Plotting](#) in the *MSC Nastran Reference Guide*.

**PTITLE** Plot Frame Title

Defines a character string that will appear at the top of the plot frame on the line below the sequence number.

Format:

PTITLE ptitle

Example:

```
PTITLE RIGHT WING -- LOAD CASE 3
```

Describer	Meaning
ptitle	Any character string (Character, Default= blank).

Remarks:

1. PTITLE may not be continued to the next command line.
2. Up to four lines of title information will be printed in the lower left-hand corner of each plot. The text for the top three lines is taken from the TITLE, SUBTITLE, and LABEL commands in the Case Control Section. (See the [Case Control Commands](#) for a description of the TITLE, SUBTITLE, and LABEL commands). The text for the bottom line may be of two forms depending on the type plot requested. One form contains the word UNDEFORMED SHAPE. The other form contains the type of plot (statics, modal, etc.) subcase number, load set or mode number, frequency or eigenvalue or time, and (for complex quantities) the phase lag or magnitude. The sequence number for each plot is printed in the upper corners of each frame. The sequence number is determined by the relative position of each PLOT execution command in the plot package. The information on the PTITLE command will be printed on the line below the sequence number. The date and (for deformed plots) the maximum deformation are also printed at the top of each frame.

**SCALE****Scale Factor**

Defines reduction, as a scale factor, of model's dimensions so that model fits on a plot frame.

Format:

SCALE a [ b ]

Example:

SCALE 0.5

Describers	Meaning
a	Scale factor (Default=1.0).
b	Ratio of model size/real object size for stereoscopic projection only.

Remarks:

1. The SCALE command is not recommended. The FIND command is recommended because it automatically calculates the optimum scale factor.
2. For orthographic or perspective projections, a is the ratio of the plotted object, in inches, to the real object in the units of model; i.e., one inch of paper equals one unit of model.
3. For stereoscopic projections, the stereoscopic effect is enhanced by first reducing the real object to a smaller model according to b, and then applying a. The ratio of plotted/real object is then the product of a and b.
4. If the NASTRAN general purpose plotter is used in combination with the PLOTTPS postprocessing routine, a scale factor can be computed as follows:

$$a = p \cdot \frac{20}{7} \cdot K$$

where:

$p$  = ratio of plot size to object size. For instance, if the model is 100 inches long and the plot size is 7 inches, then

$$p = \frac{7}{100} = .007$$

$\frac{20}{7}$  = ratio of default PAPER SIZE to default PLOTTPS frame size.

$K$  = SCALE value on PLOTTPS command (Default=1.0). See [Using the Utility Programs](#) in the *MSC Nastran Installation and Operations Guide*.

## SEPLOT

### Superelement Plot Delimiter

Assigns the subsequent PLOT or XYPLOT commands to one or more superelements.

Format:

```
SEPLOT seid1 [ seid2 ... ]
```

Examples:

```
SEPLOT 5  
SEPLOT 0 3 7 200
```

Describer	Meaning
seidi	Superelement identification number (Integer $\geq 0$ ).

Remarks:

1. See also related command SEUPPLOT.
2. Any PLOT or XYPLOT commands appearing above all SEPLOT (or SEUPPLOT) commands will apply in all SEPLOT (or SEUPPLOT) packets.
3. For multiple PLOT or XYPLOT commands, there should be a SEPLOT command with each PLOT. For the special case where the PLOTs or XYPLOTs refer to the same superelements and use the same FIND, a single SEPLOT followed by a single FIND may be placed above all commands.

## SET Set Definition Under OUTPUT(PLOT)

Defines a set of elements or grid point numbers to be plotted.

The SET command specifies sets of elements or grid points, corresponding to portions of the model, which may be referenced by PLOT and FIND commands. The SET command is required. Each set of elements defines, by implication, a set of grid points connected by those elements. The set may be modified by deleting some of its grid points. The elements are used for creating the plot itself and element labeling, while the grid points are used for labeling, symbol printing, and drawing deformation vectors.

Format:

$$\text{SET } n = \left[ \text{ALL} \left[ \begin{array}{c} \text{ELEMENTS} \\ \text{GRID POINTS} \end{array} \right] \left[ \text{EXCEPT} \left\{ \begin{array}{c} \text{type1 type2 ... typej} \\ k1 \quad k2 \quad \dots \quad kj \text{ THRU } kk \text{ BY } \text{incj} \end{array} \right\} \right] \right],$$

$$\left[ \left[ \begin{array}{c} \text{INCLUDE} \\ \text{EXCLUDE} \end{array} \right] \left[ \begin{array}{c} \text{ELEMENTS} \\ \text{GRID POINTS} \end{array} \right] \left\{ \begin{array}{c} \text{type1 type2 ... typej} \\ k1 \quad k2 \quad \dots \quad kj \text{ THRU } kk \text{ BY } \text{incj} \end{array} \right\} \right],$$

$$\left[ \text{EXCEPT} \left\{ \begin{array}{c} \text{type1 typem ... typen} \\ k1 \quad km \quad \dots \quad kn \text{ THRU } ko \text{ BY } \text{incn} \end{array} \right\} \right]$$

Examples:

- SET 1 consists of elements 1, 5, 10, 11, 13, 14, 15, 20, 22, 24, and 26.  
`SET 1=INCLUDE 1, 5, 10 THRU 15 EXCEPT 12, INCLUDE 20 THRU 26 BY 2`
- SET 2 consists of all CTRIA3 and CQUAD4 elements except element 21.  
`SET 2=QUAD4 TRIA3 EXCEPT 21`
- SET 10 includes all CTRIAR elements plus elements 70 through 80.  
`SET 10 TRIAR INCLUDE ELEMENTS 70 THRU 80`
- SET 15 includes all elements from 15 to 20 and 26 to 100.  
`SET 15=15 THRU 100 EXCEPT 21 THRU 25`
- SET 2 includes all elements except CTETRA elements.  
`SET 2=ALL EXCEPT TETRA`

Descriptor	Meaning
n	Sets identification number (0 < Integer < 999999).
ALL	Selects all elements or grid points. See typei.
ELEMENTS	Specifies that all identification numbers refer to elements.
GRID POINTS	Specifies that all identification numbers refer to grid points.

Descriptor	Meaning
INCLUDE	Includes specified element or grid point identification numbers or elements in the set.
EXCLUDE	Excludes specified element or grid point identification numbers or element types in the set.
EXCEPT	Modifies a prior ALL, INCLUDE, or EXCLUDE specification.
typei	Element types. The allowed element types are (Character):

Element Type	typei on SET Command		Element Type	typei on SET Command
CAXIF2	AXIF2		CQUAD	QUAD
CAXIF3	AXIF3		CQUAD4	QUAD4
CAXIF4	AXIF4		CQUAD8	QUAD8
CBAR	BAR		CQUADR	QUADR
CBEAM	BEAM		CQUADX	QUADX
CBEND	BEND		CROD	ROD
CBUSH	BUSH		CSHEAR	SHEAR
CONEAX	CONE		CSLOT3	SLOT3
CONROD	CONROD		CSLOT4	SLOT4
CDUMi	DUMi		CTETRA	TETRA
CFLUID2	FLUID2		CTRIAX6	TRIAX6
CFLUID3	FLUID3		CTRIA3	TRIA3
CFLUID4	FLUID4		CTRIA6	TRIA6
CHBDYG	HBDY		CTRIAR	TRIAR
CHBDYP	HBDY		CTRIAX	TRIAX
CHEXA	HEXA		CTUBE	TUBE
CPENTA	PENTA		CVISC	VISC
PLOTEL	PLOTEL			

THRU	Specifies a range of identification numbers.
BY	Specifies an increment for a THRU specification.
inci	Increment for THRU range (Integer > 0).

**Remarks:**

1. This form of the SET command can only be specified after an OUTPUT(PLOT) delimiter.
2. The INCLUDE, EXCLUDE, and EXCEPT specifications may be specified more than once in the same set. See previous examples.
3. Commas or spaces may be used as separators.
4. Not all of the identification numbers in a THRU range have to correspond to elements or grid points. For example, elements 2, 4, 7, and 9 may be selected with 2 THRU 9, even if elements 3, 5, 6, and 8 do not exist. This is called an open set. Note that large open sets can cause higher computational costs.

## SEUPPLOT

### Superelement Plot Delimiter

Assigns the subsequent PLOT or XYPLOT commands to a superelement and all of its upstream superelements.

Format:

```
SEUPPLOT seid
```

Example:

```
SEUPPLOT 7
```

Describer	Meaning
seid	Superelement identification number (Integer $\geq 0$ ).

Remarks:

1. See also related command SEPLOT.
2. Any PLOT or XYPLOT commands appearing above all SEUPPLOT (or SEPLOT) commands will apply in all SEUPPLOT (or SEPLOT) packets.
3. For multiple PLOT or XYPLOT commands, there should be a SEUPPLOT command with each PLOT. For the special case where the PLOTs or XYPLOTs refer to the same superelements and use the same FIND, a single SEUPPLOT followed by a single FIND may be placed above all the commands.

## STEREOSCOPIC

Selects Stereoscopic Projection

See the description of the [ORTHOGRAPHIC, etc.](#)

**VANTAGE POINT****Location of the Observer**

Defines the location of the observer with respect to the model in the (r, s, t) coordinate system defined on the AXES command for perspective and stereoscopic projections only.

Format:

VANTAGE POINT ro so to do sor

Example:

VANT 100.

Describers	Meaning
ro	Location of the observer on the r-axis in model units (Real).
so	Location of the observer and left eye of the observer on the s-axis, in model units, for perspective and stereoscopic projections, respectively (Real).
to	Location of the observer on the t-axis in model units (Real).
do	Separation of the observer and the projection plane on the r-axis in model units. The PROJECTION PLANE SEPARATION command may also specify the separation (Real).
sor	Location of the of the observer's right eye for stereoscopic projections in model units (Real).

Remarks:

1. VANTAGE POINT or the FIND command must be specified if the PERSPECTIVE or STEREOSCOPIC command is also specified.
2. The VANTAGE POINT command is not recommended. The FIND command is recommended because it automatically calculates the optimum vantage point.
3. A theoretical description of the vantage point is contained in [Plotting](#) in the *MSC Nastran Reference Guide*.

## VIEW Angular Relationship of Observer's Coordinate System

Defines the angular relationship between observer's coordinate system (r, s, and t axes specified on the AXES command) and basic coordinate system.

Format:

VIEW gamma beta alpha

Example 1:

View the model from the r-axis.

VIEW 0. 0. 0.

Example 2:

View the model midway between the r- and s-axes.

VIEW 45. 0. 0.

Describers	Meaning
gamma	Angle of rotation, in degrees, of t axis specified on AXES command (Default = 34.27).
beta	Angle of rotation, in degrees, of s axis specified on AXES command (Default = 23.17 if ORTHOGRAPHIC or STEREOSCOPIC command is specified and 0.0 if PERSPECTIVE command is specified).
alpha	Angle of rotation, in degrees, of r axis specified on AXES command (Default = 0.0).

Remarks:

1. If no VIEW command is specified, then VIEW 34.27 23.17 0.0 is assumed for orthographic and stereoscopic projections; and VIEW 34.27 0.0 0.0 is assumed for perspective projections. The default values produce a plot in which unit vectors on the axes of the basic coordinate system have equal lengths.
2. The angles are rotated in sequence: gamma rotates the t-axes, followed by beta which rotates the s-axes, followed by alpha which rotates the r-axes.

(a) g-rotation about T-axis.

(b) b-rotation about S-axis.

(c) a-rotation about R-axis.

- The VIEW command specifies the position of the model with respect to the s-t plane. Gamma and beta represent the angles of turn and tilt. Alpha is normally not used since it does not affect the orientation of the s-t plane, but only its orientation on the plot frame.

# 6

## Parameters

- Parameter Descriptions
- Parameter Applicability Tables

## Parameter Descriptions

Parameters are used extensively in the solution sequences for input of scalar values and for requesting special features. Parameters values are specified on PARAM Bulk Data entries or PARAM Case Control commands. The PARAM Bulk Data entry is described in the [Bulk Data Entries](#). The PARAM Case Control command is described in the [PARAM \(Case\)](#). PARAMs may also be used in `.rc` and `.ini` files as described in [Specifying Parameters](#) in the *MSC Nastran Installation and Operations Guide*. A complete alphabetical list of PARAMeter names and their functions is given in this section.

If the Bulk Data involves the use of part superelements or external superelements, the following points should be noted regarding the use of the PARAM Bulk Data entry:

1. PARAM entries specified in the Main Bulk Data portion of the input data apply *only to the residual and not to the part superelements or external superelements*.
2. PARAM entries specified in the BEGIN SUPER portion of the Bulk Data for a part superelement or an external superelement apply *only to that superelement*.
3. The most convenient way of ensuring that PARAM entries apply not only to the residual, but also to all part superelements and external superelements is to specify such PARAM entries in Case Control, not in the Main Bulk Data. This is particularly relevant for such PARAMs as POST.

### ACEXTMTD

ACEXTMTD is used to select a different solver for solving exterior acoustic model. Valid options are ITER for selecting iterative solver and KRYLOV for selecting Krylov solver.

### ACEXTSET

ACEXTSET is used to select ITER bulk data entry for PARAM,ACEXTMTD,ITER.

### ACMPF

Default = -1

ACMPF specifies a Fortran unit number to import the acoustic load modal participation factors provided by Actran in OP4 file to Nastran SOL 111 to perform stress and strain recovery, random and fatigue analyses. This parameter is compatible with multiple acoustic load cases.

The Fortran unit must be a valid one which should not conflict with Nastran reserved Fortran unit numbers.

### ACOUT

Default = PEAK

ACOUT specifies the type of output to be used with the FORCE Case Control command in coupled fluid-structural analysis. ACOUT=RMS requests root-mean-square output.

To obtain sound pressure level in units of dB and dBA given by the FORCE command, a peak reference pressure must be specified with PARAM, PREFDB. The dB level is defined as:

$$\text{dB} = 20 \cdot \log\left(\frac{P}{\text{PREFDB}}\right)$$

Instead of ACCELERATION, suffix INT can be utilized to generate INTENSITY. See also the Case Control command [FLSTCNT \(Case\)](#).

## ACOWEAK

Default = NO

ACOWEAK controls the execution of weakly coupled acoustic formulation logic. PARAM,ACOWEAK,YES will activate weakly coupled acoustic formulation which will solve exterior acoustic model along with CACINFX separately using load generated from structural response and coupling matrix. ACOWEAK,YES is available only in SOL 111 and SOL 200 with ANALYSIS=MFREQ.

In the cases where loading is on exterior acoustic only, PARAM,ACOWEAK,YESR will solve for exterior acoustic model first and generates loading at coupling nodes for structural and interior acoustic model. In addition, PARAM, ACOWEAK, YESR can be used to force NASTRAN to solve exterior acoustic model first if loading is on both structural and exterior acoustic models.

Note that the detailed knowledge on the loading is not required to use ACOWEAK, and with PARAM, ACOWEAK, yes, the Automated logic will determine which part of FSI to solve first.

The ACOWEAK solution technique supports trim components via TRIMGRP or ACTRIM between structure and interior cavity only. If there are trim components situated between the structure and exterior cavity, fully coupled solution techniques should be utilized.

With ACOWEAK solution scheme, the exterior acoustic portion of the model is solved in physical coordinates. Therefore, acoustic structural modal participation factor will not be possible since acoustic field eigenvalues and/or eigenvectors are missing or incomplete.

## ACSYM

Default = YES

By default, the dynamic equations for coupled fluid-structure analysis in frequency response are symmetrized for efficiency. PARAM,ACSYM,NO requests the pre-Version 69 formulation which involves no symmetrization and will require more CPU time. See [Formulation of Dynamic Equations in SubDMAP GMA](#) in the *MSC Nastran Reference Guide*. See also the Case Control command [FLSTCNT \(Case\)](#).

If the iterative solver is selected (see the Case Control command, [SMETHOD \(Case\)](#)) then the external work diagnostic will be different between ACSYM=YES and ACSYM=NO.

## ACTDMP

Default=0

This parameter can be used to specify DMP processors for Actran. By default(ACTDMP=0), it will be set to DMP of Nastran job submittal.

## ACTSMP

Default=0

This parameter can be used to specify SMP processors for Actran. By default(ACTSMP=0), it will be set to SMP of Nastran job submittal.

## ACTMEM

Default=0

This parameter can be used to specify TOTAL amount memory for all processors for Actran via DMP or PARAM,ACTDMP in 4 bytes mega-words. By default (ACTMEM=0), Actran get the memory assigned to parent node only. An example, for 'memorymax=64gb mem=max', use PARAM,ACTMEM,16000 which get ACTRAN same amount of TOTAL memory as NASTRAN.

## ADJMETH

Default = 0

This parameter selects the processing method used in a triple matrix product in module DSADJ. The default is usually preferred, but ADJMETH=1 can be used when disk space is critical. ADJMETH=2 only holds the active solution vectors.

## ADMEXTU

Default = 0

ADMEXTU is a file unit number used by the SOL 111/112 restart run along with ADMPOST=1 or 2. This file unit no is assigned to external super element op2 file. See the Case Control command [ADAMSMNF\\* \(Case\)](#), footnote and Remark 20.

## ADMPOST

Default = 0

This parameter allows the user to bring an ADAMS results file into Nastran for modal data recovery in SOL 111 and SOL 112. A value of 1 brings in the ADAMS results without consideration of rigid body motion in the display of the results. A value of 2 brings in the ADAMS results with consideration of rigid body motion in the display of the results. See the Case Control command [ADAMSMNF\\* \(Case\)](#) footnote and Remark 19. for more details on restrictions and required file assignments.

## ADPCON

Default = 1.0

Initial penalty values used in contact analysis are calculated automatically by the program and are given by  $k \cdot \text{SFAC} \cdot |\text{ADPCON}|$  where k is a number selected for each secondary node based on the diagonal stiffness matrix coefficients that are in the contact region, and SFAC is the value specified by the user in the SFAC field of the BCONP Bulk Data entry. The ADPCON value applies to all the contact regions in the model. During the analysis, if convergence problems are encountered, penalty values are automatically reduced. Still there may be some problems where convergence can not be achieved with default values. In such cases, analysis may be restarted with a lower value of ADPCON.

In some cases the default penalty values may be low. In such situations analysis may be restarted with a higher value of ADPCON.

Generally, penalty values are recalculated every time there is a change in stiffness. However, if ADPCON is negative, penalty values are calculated only at the beginning of each subcase, and penalty values are not adjusted during analysis. This is useful if the contact between two elastic bodies is being analyzed.

## ADSTAT

Character; Default = YES

In transient analysis (SOLs 109 and 112) or static analysis SOL101, if there is a preload (see Case Control command [STATSUB \(Case\)](#)) and ADSTAT=YES, the static displacements, SPC forces, and MPC forces will be included in the transient output. There is a limitation that OLOAD is not included. Another limitation is that element stress and force recover will neglect thermal strains and, hence will be wrong if there is a TEMP(LOAD) request. For any other value of ADSTAT the preload effects will not be included in the output, hence the output will be the perturbation displacements, SPC forces and MPC forces.

## AERODOF

Default=35

Digits 1 through 6 indicate which k-set degrees of freedom are to be output. This is only for Double Lattice lifting surfaces that provide output in the plunge (3) and pitch (5) degrees of freedom by default. If additional digits are specified (e.g. AERODOF=1235), then the k-set aerodynamic matrices are padded with null columns for the additional degrees of freedom. Nastran will not create aerodynamic data for these added degrees of freedom. This parameter is only useful to the user that knows how to augment the existing aerodynamic data from an external source. Degrees of freedom 3 and 5 may not be omitted.

## AESDISC

Default = 1.E-8

Tolerance for discarding generalized coordinates in the RITZ method (see Case Control command, [AESMETH](#)) which are not linearly independent.

## AESMAXIT

Default = 15

Maximum number of iterations for the ITER method (see Case Control command, [AESMETH](#)).

## AESMETH

Default = SELECT

Solution method for static aeroelastic analysis.

- |        |   |
|--------|---|
| SELECT | selects the DIRECT method on models with less than 50000 DOF in the solution set; otherwise selects AUTO.             |
| AUTO   | selects the reduced basis method for an approximate solution, which is used as starting vectors for an ITER solution. |
| DIRECT | selects the direct solution.  |
| RITZ   | selects the reduced basis approximate solution.   |
| ITER   | selects the iterative solution.   |

## AESRNDM

Default = 2

Number of random vectors to use as generalized functions in the RITZ method (see Case Control command, [AESMETH](#)).

## AESTOL

Default = 1.E-10

Convergence criteria for the iterative solver.

## AGGROT

Default = YES

PARAM, AGGROT, YES (Default) produces both translation and rotational terms in the structure-fluid interface matrix AGG. PARAM, AGGROT, NO produces only translational terms in the structure-fluid interface matrix AGG. Since fluid elements see no rotational degrees of freedom, AGGROT YES or NO should have no significant effect on the results of the fluid cavity. Results on the structural side may change especially near unconstrained boundaries where there may be a reversal in the signs of some acceleration terms.

## ALPHA1, ALPHA2

Default = 0.0, 0.0

In frequency and transient response analysis, if PARAM,ALPHA1 and/or ALPHA2 are not equal to zero, then Rayleigh damping is added to the viscous damping. ALPHA1 is the scale factor applied to the mass matrix and ALPHA2 to the structural stiffness matrix. In SOL400, ALPHA1 and ALPHA2 are supported for both the linear and nonlinear elements. In SOL 129, Alpha1 scales the mass matrix, and ALPHA2 is not used.

$$[B'] = [B] + \text{ALPHA1} \cdot [M] + \text{ALPHA2} \cdot [K]$$

If  $\xi_j$  is the damping ratio for the  $i$ -th mode  $\omega_i$  (radians/unit time), then ALPHA1 ( $\alpha_1$ ) and ALPHA2 ( $\alpha_2$ ) may be computed as

$$\begin{Bmatrix} \alpha_1 \\ \alpha_2 \end{Bmatrix} = \frac{2\omega_i\omega_j}{\omega_j^2 - \omega_i^2} \begin{bmatrix} \omega_j & -\omega_i \\ -1 & 1 \\ \omega_j & \omega_i \end{bmatrix} \begin{Bmatrix} \xi_i \\ \xi_j \end{Bmatrix}$$

and the damping ratio for any other  $\xi_l$  mode becomes

$$\xi_l = \frac{\omega_i\omega_j}{\omega_j^2 - \omega_i^2} \left[ \left( \frac{\omega_j}{\omega_l} - \frac{\omega_l}{\omega_j} \right) \xi_i - \left( \frac{\omega_i}{\omega_l} - \frac{\omega_l}{\omega_i} \right) \xi_j \right]$$

**Note:** The use of Rayleigh damping with non-zero values of ALPHA1 may not be appropriate for enforced motion problems involving large mass since the resulting damping matrix may essentially violate the assumption of large mass in the problem and thus give wrong answers.

Similarly, the use of Rayleigh damping with non-zero values of ALPHA2 may not be appropriate for enforced motion problems involving large stiffness since the resulting damping matrix may essentially violate the assumption of large stiffness in the problem and thus give wrong answers.

Since Version 2005r3, the ALPHA1, ALPHA2 parameters apply only to stationary structural components. Prior to this version, the parameters applied to both stationary and rotating structural components. With the introduction of Version 2005r3, new parameters ALPHAR1, ALPHAR2 are defined on the RSPINR and RSPINT bulk data entry for the rotating component, see Remark 8. of the DAMPING bulk data description for a comment on this item.

Rayleigh damping is designed to be applied only at Superelement, Part Superelement, or External Superelement residual assembly time. It is not applied in individual Parts or External superelements.

### ALPHA1FL, ALPHA2FL

Default = 0.0, 0.0

In frequency and transient response analysis, if PARAM,ALPHA1FL and/or ALPHA2FL are not equal to zero, then Rayleigh damping is added to the viscous damping. ALPHA1FL is the scale factor applied to the mass matrix and ALPHA2FL to the fluid stiffness matrix.

$$[B'] = [B] + \text{ALPHA1FL} \cdot [M] + \text{ALPHA2FL} \cdot [K]$$

If  $\xi_i$  is the damping ratio for the  $i$ -th mode  $\omega_i$  (cycles/unit time), then ALPHA1FL ( $\alpha_1$ ) and ALPHA2FL ( $\alpha_2$ ) may be computed as

$$\begin{Bmatrix} \alpha_1 \\ \alpha_2 \end{Bmatrix} = \frac{2\omega_i\omega_j}{\omega_j^2 - \omega_i^2} \begin{bmatrix} \omega_j & -\omega_i \\ -1 & 1 \\ \omega_j & \omega_i \end{bmatrix} \begin{Bmatrix} \xi_i \\ \xi_j \end{Bmatrix}$$

and the damping ratio for any other  $\xi_l$  mode becomes

$$\xi_l = \frac{\omega_i\omega_j}{\omega_j^2 - \omega_i^2} \left[ \left( \frac{\omega_j}{\omega_l} - \frac{\omega_l}{\omega_j} \right) \xi_i - \left( \frac{\omega_i}{\omega_l} - \frac{\omega_l}{\omega_i} \right) \xi_j \right]$$

**Note:** The use of Rayleigh damping with non-zero values of ALPHA1FL may not be appropriate for enforced motion problems involving large mass since the resulting damping matrix may essentially violate the assumption of large mass in the problem and thus give wrong answers.

Similarly, the use of Rayleigh damping with non-zero values of ALPHA2FL may not be appropriate for enforced motion problems involving large stiffness since the resulting damping matrix may essentially violate the assumption of large stiffness in the problem and thus give wrong answers.

Rayleigh damping is designed to be applied only at Superelement, Part Superelement, or External Superelement residual assembly time. It is not applied in individual Parts or External superelements.

## ALTRED

Default = NO

ALTRED=YES requests the alternate stiffness and load reduction technique for superelement analysis in SOLs 101 and 114. This technique is described in [Static Solutions in SubDMAP SEKRRS](#), [Static and Dynamic Load Generation](#), and [Data Recovery Operations in SubDMAP SEDISP](#) in the *MSC Nastran Reference Guide*.

## ARBMASP

Default = 2

ARBMASP defines the maximum aspect ratio of CQUAD4 generated for CP/OP options of PBMSECT if ARBMSTYP=timoshen. Since the thickness of a ply is usually the small dimension, ARBMASP affects the size of CQUAD4 lengthwise along a segment.

## ARBMFEM

Default = YES

ARBMFEM controls the generation of .bdf file which contains the Finite Element Model of the arbitrary beam cross section. This parameter is functional for PBRSECT and PBMSECT only. To turn off the capability, set value of ARBMFEM to 'NO'.

## ARBMNOW

Default = 0

ARBMNOW controls the overwrite of segment property for PBMSECT, arbitrary beam cross section. With default value of ARBMNOW, segment property overwrite will occur during the process of assigning the property for each segment. To turn off segment property overwrite, use PARAM,ARBMNOW,1.

## ARBMPS

Default = YES

ARBMPS controls the generation of outline plot for arbitrary beam cross section in PostScript format. This parameter is functional for PBRSECT and PBMSECT only. To turn off capability, set value of ARBMPS to 'NO'.

## ARBMS

Default = NO

ARBMS controls the stress recovery for the whole arbitrary beam cross section and the companion ‘screened’ stresses. The stress recovery for the whole cross section is available in ‘OP2’ format and suitable for post-processing. The ‘screened’ stresses for CBAR and CBEAM elements is available in print file (f06) and can be utilized for design optimization via RTYPE=ABSTRESS on DRESP1. This parameter is functional for PBRSECT and PBMSECT only. To turn on the capability, set value of ARBMS to ‘YES’.

**Note:** The recovery of ‘screened’ stresses will be turned on automatically if RTYPE=ABSTRESS is in use on DRESP1.

## ARBMSTYP

Default = TIMOSHEN

ARBMSTYP controls the solution algorithm for composite arbitrary beam cross-section. Other valid option is ‘TIMOFORC’. This parameter is functional for PBRSECT and PBMSECT only.

## ARF

Default = 0.95

See [FLUIDMP](#).

## ARS

Default = 0.95

See [FLUIDMP](#).

## ASCOUP

Default = YES

In coupled fluid-structure analysis, by default, the coupling between the fluid and structure is computed. This interaction will be ignored if PARAM,ASCOUP,NO is specified. See also the Case Control command [FLSTCNT \(Case\)](#) for alternative selections.

## ASING

Default = 0

ASING specifies the action to take when singularities (null rows and columns) exist in the dynamic matrices (or  $[K_{II}]$  in statics). If ASING=-1, then a User Fatal Message will result.

If ASING=0 (the Default), singularities are removed by appropriate techniques depending on the type of solution being performed. The procedures used are described in [Data Recovery Operations in SubDMAP SEDRCVR](#) and [Real Eigenvalue Analysis in SubDMAPs SEMR3 and MODERS](#) in the *MSC Nastran Reference Guide*.

## AUNITS

Default = 1.0

AUNITS is used in SOL 144 to convert accelerations specified in units of gravity on the TRIM Bulk Data entry to units of distance per time squared. Accelerations are divided by this parameter. To convert accelerations input in g's into physical, consistent units, set AUNITS to 1/g.

## AUTOADJ

Default = YES

In SOL 200, a value of yes will automatically choose the direct or adjoint sensitivity analysis based on the performance criteria. Other options for this parameter are:

NO - the adjoint method will not be selected.

NOSTAT - the adjoint method will not be selected for static analysis subcases, but may be selected for frequency response subcases based on the performance criteria.

NOFREQ - the adjoint method will not be selected for frequency responses subcases, but may be selected for static analysis subcases based on the performance criteria.

The default should be preferred in all cases. However, the other options allow investigation of the alternative of using direct sensitivity methods.

## AUTOGOUT

Default = NO

PARAM,AUTOGOUT,YES simplifies grid point data recovery requests when only a set of elements is specified. In other words, given a set of elements the program will automatically determine all connected grid points and honor the data recovery requests for both grid points and elements. See also PARAM,OELMOPT description.

If PARAM,AUTOGOUT,YES is specified then the program assumes that SET 2 defines the set of desired elements and SET 1 defines the additional grids **not** connected to the elements in SET 2. If no additional grids are desired then the user need only specify SET 1=0. For example, in Case Control,

```
Param,autogout,yes
Set 2 = 27,35,25,41234,123,thru,134,9701,9901 $ elements
Set 1 = 0 $ additional grids
Displ=1
Gpfor=1
Stres=2
```

If the user prefers to use different set IDs then user PARAMs OSETELE and OSETGRD may be used to change the set ids used by this feature. For example:

```
Param,autogout,yes
Param,osetele,200
Param,osetgrd,100
Set 200 = 27,35,25,41234,123,thru,134,9701,9901 $ elements
Set 100 = 0 $ additional grids
Displ=100
Gpfor=100
Stres=200
```

And if the user wants to add more grids that are not connected to the element set:

```
Param, autogout, yes
Param, osetele, 200
Param, osetgrd, 100
Set 200 = 27, 35, 25, 41234, 123, thru, 134, 9701, 9901 $ elements
Set 100 = 29 $ additional grids
Displ=100
Gpfor=100
Stres=200
```

## AUTOMSET

Character, Default = NO (Except in SOL 400 with ANALYSIS=STATICS)

The relationship between dependent and independent degrees-of-freedom for rigid elements and MPCs may be altered from the user's input specification via PARAM,AUTOMSET,YES or PARAM,AUTOMSET,LUSOL. For PARAM, AUTOMSET,YES, or PARAM,AUTOMSET, LUSOL, dependent degrees-of-freedom of the model, the M-set are automatically determined by employing a rectangular decomposition of the RMG matrix.

- |       |  |
|-------|--|
| YES   | For solutions other than SOL 600, the rectangular decomposition is performed via UMFPACK, which is used by permission. Copyright (c) 2002 by Timothy A. Davis. All rights reserved. Availability: <a href="http://faculty.cse.tamu.edu/davis/suitesparse.html">http://faculty.cse.tamu.edu/davis/suitesparse.html</a>  |
| LUSOL | The rectangular decomposition is performed via LUSOL, which is capable of Rook or full pivoting during rectangular decomposition. LUSOL option is especially suitable for ill conditioned RMG matrix or problems with redundant multi-point constraints. Availability: <a href="http://web.stanford.edu/group/SOL/software/lusol/">http://web.stanford.edu/group/SOL/software/lusol/</a> |

### Notes:

- When used in SOL 600, AUTOMSET=Yes maps to Marc's AUTOMSET. By default or if PARAM,AUTOMSET,NO is entered, Marc's AUTOMSET will be omitted. See Volume C of Marc for further details.
- PARAM,AUTOMSET,YES is not supported for SOL 200.
- RSSCON is not supported with AUTOMSET.

## AUTOQSET

Default = NO

AUTOQSET=YES requests the automatic calculation of component modes without the need to define a q-set (generalized coordinates).

1. The calculation of component modes is attempted on all superelements including the residual structure.

2. All component modes are treated like SPOINTs which means that all component modes are “brought down” to and assigned to the q-set in the residual structure. In other words, component modes may not be assigned interior to a superelement.
3. Selected component modes may not be removed (constrained).
4. Since the generalized coordinates are automatically defined, the following entries may not be specified: QSETi, SEQSETi, SENQSET, or PARAM,NQSET.
5. This feature is not supported with:
  - a. Design optimization (SOL 200)
  - b. Aerodynamic analyses (SOLs 144, 145, 146)
  - c. Cyclic symmetry analyses (SOLs 114, 115, 116, 118)
  - d. SECSETi and SEBSETi Bulk Data entries that result in a fixed-free or free-free superelement. This restriction also applies to BSETi/BNDFIXi and CSETi/BNDFREE/BNDFRE1 entries in part (BEGIN SUPER) superelements.

PARAM,SQSETID may be used to specify the starting identification number of the automatically generated q-set degrees-of-freedom except when the EXTSEOUT command is present (see Remark 17. of the EXTSEOUT Case Control command). The default is 99000001.

## AUTOSPC

Default = YES

This parameter is obsolete and replaced by the Case Control command [AUTOSPC \(Case\)](#). It is ignored for the residual structure in all nonlinear analysis solution sequences. SOL 400 only support the AUTOSPC Case Control command. For the residual structure in SOLs 106 and 129 see the description of parameter AUTOSPCR. AUTOSPC and the related parameters EPPRT, EPZERO, PRGPST, and SPCGEN are analogous to and described under the AUTOSPC Case Control command under the EPSING, EPS, PRINT, and PUNCH keywords, respectively. The specification of the AUTOSPC Case Control command overrides the specification of PARAM,AUTOSPC and its related parameters EPPRT, EPZERO, PRGPST, and SPCGEN.

## AUTOSPCR

Default = NO (SOLs 106 and 129 only)

In SOLs 106 and 129 only, AUTOSPCR specifies the action to take when singularities exist in linear stiffness matrix of the residual structure after multipoint constraints are processed. AUTOSPCR=YES means that singularities will be constrained and AUTOSPCR=NO means they will not be constrained. It is recommended that all degrees-of-freedom attached to nonlinear elements be specified on ASETi entries. Parameters EPPRT, EPZERO, PRGPST, and SPCGEN may be used with AUTOSPCR.

## AUTOSPRT

Default = YES

By default, free-free models will be automatically constrained for calculation of residual vectors (RESVEC Case Control command) as long as  $F1 \leq 0.0$  on the EIGR (or EIGRL) Bulk Data entry. The auto-SUPPORT method may be deactivated by specifying a SUPORTi entry, PARAM,AUTOSPRT,NO, or  $F1 > 0.0$ .

FZERO is the maximum frequency assumed for a rigid body mode. FZERO is used by the auto-SUPPORT method to extract the rigid body frequencies. The default is 1.0.

## BAILOUT

Default = 0

See [MAXRATIO](#).

## BEAMBEA

Real, Default = 1000.0

Value           Equivalent radius to be used for beam-beam contact problems. For tubes or round bars, use the outer radius. If the radii are different enter the largest outer radius. For beams, enter an equivalent radius calculated as follows:

$$I=0.5*(I_x+I_y)$$

$$R=\sqrt{A/\pi^2+2*I/A}$$

where A, I<sub>x</sub>, I<sub>y</sub> are the cross-section properties and  $\pi^2 = \Pi^2$ .

## BEIGRED

Default = YES

PARAM, BEIGRED, YES requests a more efficient method to reduce viscous damping matrices. CPU and disk space savings may be significant if there is a small number of viscous damping elements. BEIGRED is automatically disabled if the number of DOF connected to viscous dampers exceeds the value specified by PARAM, MAXDAMP.

MAXDAMP (default=1000) specifies the maximum number of DOF connected to viscous damping elements, such that an alternate reduction method is employed. When there are relatively few viscous dampers, an alternate reduction method is chosen automatically for efficiency. The efficiency is lost however if the number of viscous damping DOF exceeds about 1000. If the number of viscous damper DOF exceeds MAXDAMP, User Warning Message 9166 is printed and the alternate damping reduction logic is disabled. Also note that if MAXDAMP is exceeded, FASTFR is disabled.

## BIGER, BIGER1, BIGER2, BIGER3

Default = 0.0

See S1.

## BUCKLE

Default = -1

BUCKLE=1 requests a nonlinear buckling analysis in a restart run of SOLs 106 or 153. See the *MSC Nastran Handbook for Nonlinear Analysis*. (Not supported for SOL 600.)

BUCKLE=2 requests buckling in a SOL 106 cold start run. (Must be in Bulk Data for SOL 600.)

## BUSHNM

Default = YES

BUSHNM =NO - If the only frequency dependencies are CBUSH/PBUSH/PBUSHT, (CELAS1 or CELAS3)/PELAS/PELAST, or (CDAMP1 or CDAMP3)/PDAMP/PDAMPPT, or CAABSF/PAABSF or any combination of these, then the DMAP will execute the original DMAP path designed for these elements.

The original DMAP path designed for the above elements does not make use of the concept of master frequencies controlled by the Case Control Command MFREQ=n. To obtain the same forcing frequency selection, and hence the same results, with PARAM,BUSHNM,YES that is in effect, with PARAM,BUSHNM,NO, the user should either set MFREQ to the same set as defined on the Case Control Command FREQ=n, or set MFREQ=NOAUTO.

PARAM,BUSHNM,NO in conjunction with a GPFORCE request will cause a Nastran fatal error at the beginning of the Nastran run. The reason is that the stiffness, structural damping, and viscous damping matrices are non-standard in form for the old path and represent incremental changes between nominal and current frequency.

If the user is currently running Porous Elastic Material (PEM), PARAM, BUSHNM is internally set to: PARAM, BUSHNM, NO and overrides any input value.

## CASIEMA

Default = NO, SOL 400 CASI Solver only

When the CASI element-based iterative solver is specified (see the Case Control command [SMETHOD \(Case\)](#)) SOL 400 skips various processes associated with the global structure stiffness matrix. The absence of a complete assembled stiffness matrix and its sub-sets can lead to a termination of the solution process in the NLSOLV module if the CASI solver detects a singularity. If the parameter is set to YES, SOL 400 performs all assembly and displacement set reduction operations involving the complete stiffness matrix allowing the NLSOLV module to select either the matrix-based iterative solver or the sparse direct solver to continue in the event CASI detects a singularity.

Use a value of YES with caution as it adversely affects run-time performance. Substantial additional disk space could be required as well as longer run times. Keep in mind that invocation of the sparse direct solver for large solid element models may degrade performance even further.

This parameter only applies to SOL 400 usage of the CASI solver.

## CASIMEST

Default = Yes

This parameter controls the memory estimation inside CASI iterative solver. (SOL 101, SOL 400 and SOL 200)

= No; Turns off memory estimation.

## CASPIV

Default = 1.0e-10

Input DMAP parameter to the SOLVIT and NLSOLV modules for the CASI iterative solver. It is the pivot threshold for the CASI PCG (Preconditioned Conjugate Gradient) factorization. Pivot value less than CASPIV will exit with an error message.

## CB1, CB2

Default = (1.0, 0.0)

CB1 and CB2 specify factors for the total damping matrix. The total damping matrix is:

$$[B_{jj}] = CB1 \cdot [B_{jj}^x] + CB2 \cdot [B_{jj}^2]$$

where  $[B_{jj}^2]$  is selected via the Case Control command B2GG and  $[B_{jj}^x]$  comes from CDAMPi or CVISC element Bulk Data entries. These parameters are effective only if B2GG is selected in the Case Control Section.

## CDIF

Default = YES for shape optimization with or without property optimization.

Default = NO for property optimization only.

CDIF may be used to override the default finite difference scheme used in the calculation of pseudo loads in SOL 200. PARAM,CDIF,YES forces the selection of the central difference scheme used in the semianalytic approach regardless of the type of optimization requested. PARAM,CDIF,NO forces the selection of the forward difference scheme.

## CDITER

Default = 0

If CDITER > 0, perform constrained displacement iterations in SOL 101. The value is the maximum number of iterations. If CDPRT=YES, print those negative displacements and tension forces which do not satisfy constraints. If CDPCH=YES, punch DMIG CDSHUT entries for final state; by default all gaps are closed. These can be used for initial conditions for restart. Potential contact points must be specified on the SUPORTi entries. The SUPORTi points must be in the residual structure. Optional DMIG entries to define the initial shut vector may be specified. Degrees-of-freedom that are specified on the SUPORT entry and have a value of 1.0 defined on the DMIG,CDSHUT entry will be considered closed initially.

If the DMIG,CDSHUT entry is not supplied, then all degrees-of-freedom specified on the SUPORT entries will be considered shut initially. A fatal message will be issued if this parameter is used and PARAM,INREL is specified. Constrained displacement iteration (PARAM,CDITER,YES) does not support parallel processing (DMP).

## CDPCH

Default = NO

See [CDITER](#), 807.

## CDPRT

Default = YES

See [CDITER](#), 807.

## CFDIAGP

Default = NO

If YES, randomly deleted CFAST elements will be printed. (See [CFRANDEL](#))

## CFRANDEL

Default = 0.

Represents a percent, expressed as a decimal fraction, of the number of CFAST elements to be randomly deleted.

## CHECKOUT

Default = NO

CHECKOUT=YES requests a model checkout in SOLs 101 through 200. See [Geometry Processing in SubDMAP PHASE0](#) in the MSC Nastran Reference Guide. The run will terminate prior to phase 1 of superelement analysis. The PARAM,POST options are also available with PARAM,CHECKOUT,YES. The following options and their user parameters are also available with PARAM,CHECKOUT,YES:

1. PARAM,PRTGPL,YES

Prints a list of external grid and scalar point numbers in internal sort. It also lists external grid and scalar point numbers along with the corresponding sequence numbers in internal sort. The sequence numbers are defined as (1000\*external number) and will reflect any user-requested resequencing.

2. PARAM,PRTEQXIN,YES

Prints a list of external and internal grid and scalar numbers in external sort. It also lists external grid and scalar numbers with the corresponding coded SIL number in external sort. The coded SIL numbers are defined as:

$$10 \cdot \text{SIL} + \begin{cases} 1 & \text{for grid point} \\ 2 & \text{for scalar point} \end{cases} \quad (1)$$

The SIL numbers correspond to degrees-of-freedom, i.e., one SIL number for scalar point and six SIL numbers for a grid point.

3. PARAM,PRTGPDT,YES

Prints, for each grid and scalar point, the following information in internal sort:

- Coordinate system ID in which grid point geometry is defined (ID=-1 for scalar points).
- Spatial location of grid points in the “CP” coordinate system. For scalar points, all entries are zero.
- Coordinate system ID for grid point displacements, forces, and constraints (ID=0 for scalar points).
- Permanent single-point constraints defined on GRID Bulk Data entries. A zero is entered for scalar points.

4. PARAM,PRTCSTM,YES  
Prints for each coordinate system type the transformation matrix from the global to the basic coordinate system, and the origin of the indicated coordinate system in the basic coordinate system. Coordinate system types are: 1 = rectangular; 2 = cylindrical; 3 = spherical.
5. PARAM,PRTBGPDT,YES  
Prints all grid and scalar points listed in internal sort with their x, y, and z coordinates in the basic coordinate system. In addition, the coordinate system ID for grid point displacements, forces, and constraints is indicated for each grid point (ID=-1 for scalar points). The x, y, and z coordinates of scalar points are zero.
6. PARAM,PRTGPTT,YES  
Prints, for each temperature load set, information on element and grid point temperatures.
7. PARAM,PRTMGG,YES  
Prints the g-size mass matrix labeled by grid point/degree-of-freedom.
8. PARAM,PRTPG,YES  
Prints the g-size load vectors labeled by grid point/degree-of-freedom.
9. The summation of forces and moments of applied loads in the basic coordinate system is automatically output for each loading condition requested in the Case Control Section. Related to parameters GPECT and PROUT, and Case Control command ELSUM.

### CK1, CK2

Default = (1.0, 0.0)

CK1 and CK2 specify factors for the total stiffness matrix. The total stiffness matrix (exclusive of GENEL entries) is

$$[K_{jj}^x] = CK1 \cdot [K_{jj}^z] + CK2 \cdot [K_{jj}^2]$$

where  $[K_{jj}^2]$  is selected via the Case Control command K2GG and  $[K_{jj}^z]$  is generated from structural element (e.g., CBAR) entries in the Bulk Data. These are effective only if K2GG is selected in Case Control. A related parameter is CK3.

**Note:** Stresses and element forces are not factored by CK1, and must be adjusted manually.

### CK3

Default = (1.0, 0.0)

CK3 specifies a factor for the stiffness derived from GENEL Bulk Data entries. The total stiffness matrix is

$$[K_{jj}] = [K_{jj}^x] + CK3 \cdot [K_{jj}^y]$$

where  $[K_{jj}^y]$  comes from the GENEL Bulk Data entries and  $[K_{jj}^x]$  is derived using PARAMs CK1 and CK2. CK3 is effective only if GENEL entries are defined. Related parameters include CK1 and CK2.

## CLOSE

Default = (1.0)

A value of 1.05 will set natural frequencies within 5% of each other as close. See SCRSPEC.

## CM1, CM2

Default = (1.0, 0.0)

CM1 and CM2 specify factors for the total mass matrix. The total mass matrix is

$$[M_{jj}] = CM1 \cdot [M_{jj}^x] + CM2 \cdot [M_{jj}^2]$$

where  $[M_{jj}^2]$  is selected via the Case Control command M2GG and  $[M_{jj}^x]$  is derived from the mass element entries in the Bulk Data Section. These are effective only if M2GG is selected in the Case Control Section.

## COMPMA TT

Default = NO, SOL 106 and SOL 400 only

In nonlinear statics (SOLs 106, 400 ANALYSIS=NLSTAT), composite materials compute temperature-dependent properties for the plies only at the reference temperature given on the PCOMP Bulk Data entry. The ply properties are smeared and used for all load steps, regardless of whether the temperature is changing through application of thermal loads.

If the parameter is set to YES, the temperature-dependent properties for the plies are updated and smeared at the current temperature for each load step. For CQUAD4 and CTRIA3 elements with offsets, the large rotation offset method specified by "MDLPRM,OFFDEF,LR OFF" in SOL 400 must be used.

If the parameter is set to NONSMEAR, the temperature-dependent properties for the plies are updated at the current temperature for each load step. This option, only available for the CQUADR and CTRIAR elements, is an alternative to the smeared approach.

This parameter only applies to SOLs 106 and 400 ANALYSIS=NLSTAT, and only applies to composite CQUAD4, CTRIA3, CQUADR and CTRIAR elements that are not associated with the enhanced nonlinear materials (PSHLN1).

Prior to Nastran version 2019, when COMPMA TT was set to YES, material nonlinear was assumed even when no composite plies had temperature-dependent materials or when there was no MATTi type entries associated with temperature dependent plies. This has caused confusion as to when SOL106 or SOL400 is doing linear or nonlinear material solutions. Starting in V2019, PARAM, COMPMA TT, YES will only turn on material nonlinear if there are active MATTi entries as well.

Additionally, prior to Nastran version 2019, when PARAM, COMPMA TT, YES was used in conjunction with TEMPP1 entries, ply stress computation used only the reference plane temperature. Starting in V2019, ply stress computation will use reference plane temperature plus the thermal gradient term applied at the

center of each ply. (To revert to the old method, NASTRAN SDRCMPTP=1 may be added to the Nastran section.) The enhanced nonlinear materials (PSHLN1) do not support the TEMPP1 entry.

## CONFAC

Default = 1.E-5

In superelement analysis, CONFAC specifies the tolerance factor used in checking the congruence of the location and displacement coordinate systems of the boundary points between image superelements and their primaries (see the Bulk Data entry, CSUPER). Specification of this parameter is recommended instead of DIAG 37 (DIAG 37 ignores User Fatal Messages 4277 and 4278).

## COSUBCYC

Default = 1, SOL 700 only

Controls the growth of the subcycling interval in the coupling surface.

### Example:

```
PARAM,COSUBCYC,2
```

### Remarks:

1. The subcycling algorithm automatically estimates the number of subcycles to be used. This is updated throughout the calculation. This parameter controls how much the number of subcycles can grow. For example, COSUBCYC is set to 1, and the current number of time steps between updates of the coupling geometry is 4. If the solver estimates that the subcycling interval should be 7, the subcycling interval is increased by 1 until a value of 7 is reached.
2. There is no control on the amount by which the subcycling interval can decrease.

## COSUBMAX

Default = 0, SOL 700 only

Defines the maximum number of subcycles that can occur in Euler/Lagrange coupling. During a subcycle, the geometry of the coupling surface is not updated.

### Example:

```
PARAM,COSUBMAX,10
```

### Remarks:

1. Updating the coupling geometry takes a lot of CPU time. Subcycling gives substantial savings in CPU time for coupled calculations.
2. The smaller the value of this parameter, the greater the accuracy of the analysis and the greater the cost. Conversely, larger values offer significant CPU savings, but very large values give incorrect results.
3. If the geometry of the coupling surface is changing rapidly, smaller values of PARAM,COSUBMAX should be used.

## COUPMASS

Default = -1

COUPMASS > 0 Requests the generation of coupled rather than lumped mass matrices for elements with coupled mass capability, as listed in [Table 3-1](#) in the *MSC Nastran Reference Guide*. This option applies to both structural and nonstructural mass for the following elements: CBAR, CBEAM, CONROD, CQUAD4, CHEXA, CPENTA, CPYRAM, CQUAD8, CROD, CTETRA, CTRIA3, CTRIA6, CTRIAX6, CTUBE.

COUPMASS < 0 (Default) causes the generation of lumped mass matrices (which may include torsion inertia for beam elements, and some coupling if there are beam offsets) for all of the above elements. However, if SYSTEM(414) is greater than zero, (Default = 0) then the lumped mass matrices will contain translational components only for the CBAR and CBEAM elements.

## CP1, CP2

Default = (1.0, 0.0)

The load vectors are generated from the equation

$$\{P_j\} = CP1 \cdot \{P_j^x\} + CP2 \cdot \{P_j^2\}$$

where  $\{P_j^2\}$  is selected via the Case Control command P2G, and  $\{P_j^x\}$  comes from Bulk Data static load entries. These parameters are effective only if P2G is selected in the case control section.

## CQC

Default = -1

See [SCRSPEC](#).

## CURV

Default = -1

PARAM,CURV,1 requests that the CTRIA3 and CQUAD4 element stress and/or strain output be computed in a material coordinate system (normal output is in the element or basic coordinate system) and/or to interpolate it to grid points. (CQUAD4 element corner stress output is not supported.)

The integer parameter OG controls the calculation of stress and/or strain data at grid points. If OG is set to -1, the calculation for stresses and/or strain data at grid points is not performed. The default value of zero provides the calculation of these quantities at those grid points to which the selected elements connect.

User parameters S1G, S1M, S1AG, and S1AM, set to 1, request the printout of stresses at grid points, stresses in the material coordinate system, strains at grid points and strains in the material coordinate system, respectively.

The integer parameter OUTOPT may be set in accordance with the below options to select print, punch, and/or plotter output for stress and/or strain data that are computed in user-defined material coordinate systems.

OUTOPT Value	Description
0	Default-standard MSC Nastran device codes are used.
1	Print only
2	Plot only
4	Punch only

The above values may be combined additively to select two or more forms of output. For example, OUTOPT=6 requests both plot and punch output. Related parameters include BIGER, CURVPLOT, DOPT, NUMOUT, NINTPTS, S1G, S1M.

For stress and/or strain/curvature output in a user-defined material coordinate system MCSID must be defined on MAT1 and MAT2 Bulk Data entries. The values of MCSID reference CORDiR, CORDiC, and CORDiS Bulk Data entries. A value of zero for MCSID does not imply the basic coordinate and will eliminate all elements which reference the MATi from the subject calculations.

1. If these data are requested at the element centers, the program will compute the unit vector  $\hat{i}_m$  along the T1 or x-axis of the material coordinate system, and compare

$$|\bar{n} \cdot \hat{i}_m|$$

for each element that references the material coordinate system, where n is the normal to the surface of the element. If

$$|\bar{n} \cdot \hat{i}_m|^2 \geq .4$$

the projection of the y-axis on the surface of element is taken as the reference axis. Otherwise, the projection of the x-axis on the surface of the element is taken as the reference axis. The angle between the x-axis of the element coordinate system and the projection of the selected reference axis of the material coordinate system is used to transform the stress and/or strain data into the material coordinate system at the element centers.

2. If, on the other hand, the user requests these data at the grid points to which the elements connect the program will interpolate the results from (a) to the grid points to which the elements connect. The parameter NINTPTS=N, the stress and/or strain data at the N closest element centers to the grid point in question will be used in the interpolation. The program may include more than N points in the interpolation if the distance of other element centers is not more than 10% greater than the closest N element centers.

The following specifies the output headings for stresses and/or strains in the material coordinate system.

### Element stresses (PARAM,S1M,1)

1. Available in CQUAD4 and CTRIA3 elements
2. Page headings:  
STRESSES IN QUADRILATERAL ELEMENTS (CQUAD4)  
STRESSES IN TRIANGULAR ELEMENTS (CTRIA3)
3. Under the column FIBER DISTANCE:  
Z1 is replaced by MCSID.  
Z2 is replaced by 1.0 if the x-axis of the material coordinate system is selected as the reference axis, and by 2.0 if the y-axis of the material coordinate system is selected as the reference axis.

### Grid point stresses (PARAM,S1G,1 and PARAM,OG,1)

1. Available for CQUAD4 and CTRIA3 elements
2. Page heading:  
STRESSES AT GRID POINTS
3. Under the column are:

$$\left\{ \begin{array}{l} \text{MAT1 - COORD1 - ID} \\ \text{PROJ-CODE} \end{array} \right\}$$

Z1 is replaced by MCSID.

Z2=A+10\*N where A is 1.0, 2.0, or 3.0, depending on whether the x-, y-, or z-axis of the material coordinate system is most nearly normal to the projected plane of the field of elements involved in the calculation.

### Element strains (PARAM,S1AM,1)

1. Available for CQUAD4 and CTRIA3 elements
2. Page headings:  
STRAINS IN QUADRILATERAL ELEMENTS (CQUAD4)  
STRAINS IN TRIANGULAR ELEMENTS (CTRIA3)
3. Under the column FIBER DISTANCE:  
Z1 is replaced by MCSID.  
Z2 is replaced by 1.0 if the x-axis of the material coordinate system is selected as the reference axis, and by 2.0 if the y-axis of the material coordinate system is selected as the reference axis.

### Grid point strains (PARAM,S1AG,1 and PARAM,OG,1)

1. Available for CQUAD4 and CTRIA3 elements.

2. Page heading:

$Z2=A+10*N$  where A is 1.0, 2.0, or 3.0, depending on whether the x-, y-, or z-axis of the material coordinate system is most nearly normal to the projected plane of the field of elements involved in the calculation.

#### STRAINS AND CURVATURES AT GRID POINTS

3. Under the column are:

$$\left\{ \begin{array}{l} \text{MAT1 - COORD1 - ID} \\ \text{PROJ-CODE} \end{array} \right\}$$

Z1 is replaced by MCSID.

### CURVPLOT

Default = -1

PARAM,CURVPLOT,1 requests that x-y (or curve) plots whose abscissas are a sequence of grid points and whose ordinates may be displacements, loads, SPC forces, or grid point stresses. To obtain stress plots, set the CURV parameter to +1. The default for DOPT is the length between grid points.

Specify the XYOUTPUT Case Control command in the usual manner, replacing the point ID with the SID of SET1 Bulk Data entries.

The SET1 Bulk Data entries must contain unique SIDs for each set of grid points to be plotted.

User requests for xy-plots of output quantities appear in the Case Control Section in the standard form. For example,

```
.
.
.
OUTPUT (XYOUT)
.
.
XYPLOT DISP 1/4 (T3)
.
.
XYPLOT SPCF 2/5 (T1)
.
.
BEGIN BULK
```

The first XYPLOT command will produce an xy-plot from the displacement output of subcase 1. The abscissa of the curve will reflect the grid point IDs listed on the SET1 entry with an SID of 4, and the ordinate will reflect the T3 component of displacement at these grid points. The second XYPLOT command will produce an xy-plot whose ordinates are the T1 components of the forces of constraint in subcase 2 at the grid points listed on the SET1 entry with an SID of 5.

The user has some degree of control over the scaling of the abscissas on these xy-plots. This control is exercised through the parameter DOPT on a PARAM Bulk Data entry. The legal values of this parameter provide the following scaling options for the abscissas.

Value of DOPT	Scaling for Abscissa
0 (Default)	$\ g_j - g_i\ $
1	$ x_j - x_i $
2	$ y_j - y_i $
3	$ z_j - z_i $
4	1.

Thus, the default value of DOPT will place the first grid point listed on the referenced SET1 entry at the origin, and subsequent grid points will be located along the abscissa at intervals proportional to the distance between that grid point and its predecessor. Values of DOPT equal to 1, 2, or 3 will scale the abscissa so that the interval between adjacent grid points is proportional to the difference in the X, the Y, and the Z components of the subject grid points respectively. DOPT=4 will space the grid points equally along the abscissa.

### CWDIAGP

Default = NO

For CWELD element: prints elements randomly deleted if set to yes.

### CWRANDEL

Default = 0.0

For CWELD element: if not zero, then it specifies as a decimal percent for the number of fasteners to randomly delete.

### DBALL

Default = DBALL

By default, all data to be stored on the database for restart purposes will be located on the DBALL database set (DBset). These parameters permit the storage of some data blocks on DBsets other than DBALL, which are defined by the user and specified on the INIT File Management statement. Any or all of these parameters may be set to SCRATCH in order to reduce overall disk space usage; e.g., PARAM,DBUP,SCRATCH or PARAM,DBALL,SCRATCH. However, automatic restarts will be less efficient because data normally assigned to a permanent DBset will have to be recomputed.

A unique value for each superelement may be specified in the Case Control Section for the parameters DBALL, DBDN, DBRCV, and DBUP. Certain DBsets may be taken offline depending on which phase (see [Summary of Solution Sequence Operations](#) in *the MSC Nastran Reference Guide*) of superelement analysis is being performed. PARAM,DBALL specifies the default value for parameters DBDN, DBUP, and DBRCV.

The DBDN DBset contains data blocks necessary for “downstream” processing. For example, the stiffness, mass, damping, and static loads matrices that have been reduced to the boundary of the superelement are stored in this DBset.

The DBRCV DBset contains data blocks that must be online during the first pass through data recovery (Phase 3). These data blocks are used to recover the total displacement vector  $u_g$  of the superelement. This operation is performed by the SSG3 and SDR1 modules. On subsequent data recovery restarts, this DBset may be taken offline. Its default is determined from the value of DBUP.

The DBUP DBset contains data blocks necessary for “upstream” processing. For example, the geometry and property tables along with the stiffness, mass, damping, and static loads matrices related to the interior grid points of the superelement are stored in this DBset. These matrices and tables must be online during the reduction (Phase 1) and data recovery (Phase 3) of the superelement.

The IFP DBset contains data blocks that are required for all phases of the analysis. These data blocks are related to the entire model; examples are Bulk Data, superelement map, IFP module outputs, and resequenced grid points. This DBset must be online for all runs.

PARAM,DBALL also specifies the default value for PARAMs DBEXT and DSO described below.

### **DBC CONV**

Default = XL

See POST=0.

### **DBC DIAG**

Default = 0

See POST=0.

### **DBC OVWRT**

Default = YES

See POST.

### **DBDICT**

Default = -1

Controls the printout of the database directory at the beginning and end of the run. See DBDICT FMS statement description in Section 2. If DBDICT=0, then the database directory will be printed at the start of the run. If DBDICT=1, then the directory will be printed at the end of the run. If DBDICT $\geq$ 2, then it will be printed at the beginning and end of the run. If DBDICT=-1 (the default), the directory is not printed at the beginning or end of the run.

If multiple versions and/or projects exist on the database, then the parameters DBDRPRJ and DBDRVER allow the user to select the desired project and version, respectively. The appropriate values may be found in the Project/Version Table that is printed upon restart. If DBDRVER=0 (or DBDRPRJ=0), then the current version (or project) is selected. If DBDRPRJ=-1 (or DBDRVER=-1), then all projects (or versions) are selected.

### **DBDN**

Default = value of PARAM,DBALL.

See DBALL.

### **DBDRPRJ**

Default = 0

Specifies the desired project-identification number. See DBDICT.

### **DBDRVER**

Default = 0

Specifies the desired version-identification number. See DBDICT.

### **DBEXT**

Default = value of PARAM,DBALL

Specifies the DBset location to store the external superelement information. External superelement information is generated by the EXTSEOUT Case Control command.

### **DBRCV**

Default = value of PARAM,DBUP.

See DBALL.

### **DBUP**

Default = value of PARAM,DBALL.

See DBALL.

### **DDRMM**

Default = 0

DDRMM is only recognized if PARAM,SPARSEDR,NO is specified.

By default, the matrix method of data recovery is used in the modal transient and frequency response solutions. DDRMM=-1 will force calculation of complete g-set solution vectors by the mode displacement method and is required for FATIGUE analysis using SOL 108 or SOL 111 if PARAM,SPARSEDR,no is also specified.

### **DELCLUMP**

Default = 0.5, SOL 700 only

#### **Format:**

PARAM,DELCLUMP,VALUE

#### **Example:**

PARAM,DELCLUMP,0.1

Prevents small clumps in the Euler mesh from determining the time step and prevents the leakage of small masses to isolated regions.

VALUE Value of DELCLUMP. See Remark 1. (Real  $\geq 0.0$ )

**Remarks:**

1. Material in Eulerian elements of a clump with:  

$$fvunc < DELCLUMP \cdot fblend$$
is eliminated
2. See also parameter FBLEND.

**DESPCH**

Default = 0

For sizing and shape topography optimization, DESPCH specifies in SOL 200 when the optimized (updated) bulk data entries are written to the PUNCH file. Currently, all the property entries, material entries, and connectivity entries that can be designed and DESVAR, DRESP1, and GRID entries can be written. Notice that the DRESP1 entries will be written if only when a mode tracking is performed and the DRESP1 responses have type FREQ or EIGN.

For topology/topometry optimization, DESPCH specifies when the topology optimized element density values (or topometry optimized values) are written to the element result file jobname.des. This file can be directly read in PATRAN or third party post-processor to displace and animate the topology/topometry optimization results.

< 0	Never
= 0	at the last design cycle only (Default)
> 0	at every design cycle that is a multiple of DESPCH and the last design cycle. For example, if n=2 and the maximum number of design cycles is 5 (DESMAX=5 on the DOPTPRM entry), then, DESVAR and GRID entries at design cycle 2, 4, and 5 are written in the punch file.

**DESPCH1**

Default = 6

DESPCH1 specifies in SOL 200 the amount of data to be written to the .pch and .des file. A positive DESPCH1 value request large field formats while a negative value requests small field formats. For a shape optimization job, if DESPCH1 <>0, the updated GRID entries of the whole model will be written in the .pch file.

Descriptions of various DESPCH1 values are given below:

- 0 Write no data.
- ±1 Write the property entries that are designed.
- ±2 Write all the property entries of a given type when one or more property of that type is designed.
- ±4 Write DESVAR and DRESP1 entries.

- $\pm n$  Write combine quantities by summing the DESPCH1 values. For example,  $n=1+4=5$  requests writing all the designed property entries, DESVAR and DRESP1 entries to the .pch file for normal modes analysis.
- $> 0$  Write all (topology designed and non-designed) element density values to the topology element density history file jobname, des.
- $< 0$  Write topological designed element density values to the topology element density history file jobname.des.

## DFREQ

Default =  $10^{-5}$

DFREQ specifies the threshold for the elimination of duplicate frequencies on all FREQ*i* Bulk Data entries. Two frequencies,  $f_1$  and  $f_2$ , are considered duplicated if

$$|f_1 - f_2| < \text{DFREQ} \cdot |f_{MAX} - f_{MIN}|$$

where  $f_{MAX}$  and  $f_{MIN}$  are the maximum and minimum excitation frequencies of the combined FREQ*i* entries.

## DIROUT

Default = NO

See CQC under SCRSPEC.

## DOPT

Default = 0

See CURVPLOT.

## DPEPS

Default = 1.0E-4

In SOL 200, if any difference between the property value on the property entries and the value calculated from the design variable values on the DESVAR entry (through DVCREL*i*, DVMREL*i*, DVPREL*i* relations) is greater than DPEPS, the design model values override the analysis values. If all the differences are less than DPEPS, analysis results from a previous run are accepted in a subsequent sensitivity/optimization task, thereby avoiding a reanalysis. The PTOL parameter on the DOPTPRM entry is a related parameter that checks the maximum difference.

## DPHFLG

Integer  $\geq 0$ ; Default = 0

Select the method for performing eigenvector sensitivity analysis. Unless repeated eigenvalues are anticipated, the default value is recommended.

DPHFLG	0	Nelson's method (Default)
	1	Subspace iteration method. Recommended when there are repeated roots.
	2	High's method, # of modes for iteration = $\min(2n, n+8, m)$ n: the highest constrained mode m: the number of modes request by EIGR
	3	High's method will all modes requested by EIGR used in the iterator. DPHFLG = 2 and 3 have further control parameters
ITERATE	yes	Do iteration, for improved sensitivity value. (Default)
	no	No iteration, equivalent to Fox's method and provides the most efficient method, but not the most accurate.
ITMAX		Maximum number of iteration. (Default = 10)
TOL		Tolerance for convergence in iteration. (Default = $1.0e-4$ )
LAMBDAS		Shift factor. (Default = 0.0)
KORTHO	no	Use mass for Gram Schmidt orthogonalization. (Default)
	yes	Use stiffness K for Gram Schmidt orthogonalization.
ITRPRNT	no	Do not print sensitivity for each iteration. (Default)
	yes	Print sensitivity for each iteration.
ITFPRNT	no	Do not print final sensitivity, leave print to SOL 200.
	yes	Print final sensitivity inside High's method computation
MDOF	no	Do not reduce DPHI to USET 'U6' DOF. (Default)
	yes	Reduce DPHI to USET 'U6' DOF.

## DSNOKD

Default = 0.0

DSNOKD specifies a scale factor to the differential stiffness matrix in buckling design sensitivity analysis. If  $DSNOKD > 0.0$ , the effect of the differential stiffness matrix is included in buckling the design sensitivity analysis.

If `PARAM,DSNOKD,1.0` is specified in SOL 200, the differential stiffness sensitivity calculation is performed more accurately; i.e., the change in the stiffness matrix due to the changes in the displacements are computed. However, the calculation is more expensive than with `PARAM,DSNOKD,0.0`.

Non-zero values of `PARAM,DSNOKD` cannot be used in SOL 200 with multiple buckling design subcases less each subcase contains the same `STATSUB` command.

## DSO

Default = value of `PARAM,DBALL`

Specifies the DBset location to store datablocks created for design sensitivity and optimization in SOL 200.

## DSZERO

Default = 0.0

DSZERO specifies the minimum absolute value for the printout of design sensitivities.

## DV3PASS

Integer, Default = 1 for SOL 200 with nonlinear property sensitivity evaluation.

DV3PASS controls the number of optimizer internal cycles must pass before the re-evaluation of sensitivity of nonlinear properties, such as I1/I2/J of PBARL/PBEAML/PBRSECT/PBMSECT. With default value of 1, the sensitivity of nonlinear properties is computed for every internal cycle of optimizer. Setting DV3PASS to 10 causes the sensitivity to be evaluated at optimizer internal cycles of 1, 11, 21 and etc. The sensitivity of nonlinear properties is considered as invariants if a sufficiently large number, such as 100, is assigned to DV3PASS.

## DYNSPCF

Default = NEW

PARAM,DYNSPCF,NEW requests that mass and damping coupled to ground be included in the SPCForce calculations for the linear dynamic solutions: SOLs 103, 107 through 112, 115, 118, 145, 146, and 200. OLD neglects these effects and gives the same SPCForce results obtained in versions prior to Version 68.

**Note:**

Some versions of Dytran have trouble with permanent constraints and issue a bogus error message in the d3hsp file. This is the case for MSC Nastran 2005 r2.

## EIGFILT

Default=1.0E-13

Threshold for zero-frequency eigenvalue for ACMS VERSION=NEW (module ACMS1).

## ENFMETH

Default = TOTAL or ABS

This parameter controls the *solution method* when dynamic enforced motion analysis via SPC/SPCD is used in SOLs 108, 109, 111, 112, 146 and 200.

The total solution of a dynamic enforced motion analysis using SPC/SPCD can be regarded as a combination of a static enforced motion solution (similar to what is done in SOL 101) and a dynamic enforced motion solution that is relative to this static-based solution. The default value of TOTAL/ABS implies that the program solves directly, *in one step*, for the TOTAL solution of the dynamic analysis which includes both the static-based solution and the dynamic solution that is relative to the static-based solution. If the value is specified as REL, then the program obtains the total solution of the dynamic analysis *in two steps*, by first solving for the static-based solution and then solving separately for the dynamic solution RELATIVE to the static-based solution. In general, the TOTAL/ABS and REL solution methods both yield essentially the same results.

The TOTAL/ABS solution method is computationally more efficient. This is also the only method that is meaningful and that should be employed when a problem involves the use of NOLINi or NLRGAP entries. An important point to note regarding this method is that, for modal dynamic analysis, residual vectors are absolutely critical in order for this method to get correct answers.

The REL solution method, though less efficient, may be more accurate for transient solutions and for modal frequency response solutions at very low forcing frequencies. Also, for modal dynamic analysis, this method is not as critically dependent on residual vectors as the TOTAL/ABS solution method. In addition, the current implementation of the REL solution method does not support fluid DOFs with enforced motion. So, if fluid DOF are among the DOFs with enforced motion, the job will be switched to the ABS solution method automatically.

It should be emphasized here that PARAM,ENFMETH and PARAM,ENFMOTN are completely separate, distinct and independent of each other and should not to be confused with each other. The former controls the *solution method* when dynamic enforced motion analysis via SPC/SPCD is used while the latter controls how the results of such an analysis are *output*.

### ENFMOTN

Default = TOTAL or ABS

This parameter controls how the results of the analysis are *output* when dynamic enforced motion analysis via SPC/SPCD is used in SOLs 108, 109, 111, 112, 146 and 200.

The total solution of a dynamic enforced motion analysis using SPC/SPCD can be regarded as a combination of a static enforced motion solution (similar to what is done in SOL 101) and a dynamic enforced motion solution that is relative to this static solution. The default value of TOTAL/ABS implies that the output results of the analysis represent the TOTAL solution of the dynamic analysis which includes both the static solution and the dynamic solution that is relative to this static solution. If the value is specified as REL, then the output results represent the dynamic solution RELATIVE to the static solution.

It should be noted that, in general, the static solution mentioned above may *not* be a stress-free solution. Therefore, in general, the usage of PARAM,ENFMOTN,TOTAL (or ABS) and PARAM,ENFMOTN,REL in an SPC/SPCD enforced motion analysis may give *different results not only for displacements, but also for stresses*.

In general, it is not easy to identify all cases wherein the static solution represents a stress-free solution. However, one can give examples of such cases.

Thus, for instance, if the SPC/SPCD enforced motion is specified at a single grid point and there are no constraints at any other grid point, then the static solution will be a stress-free solution.

Similarly, if the SPC/SPCD enforced motion is specified at more than one grid point for a specific grid point component, but the magnitude and direction of the enforced motion is the same for all of the enforced motion points and there are no other constraints in the model, then all of the enforced motion points will move in unison and the static solution will be a stress-free solution.

In contrast to the above, consider the situation in which the SPC/SPCD enforced motion is specified at more than one grid point for a specific grid point component, but the magnitude and direction of the specified enforced motion is *different* for the various enforced motion points. In this case, the static solution will *not* be a stress-free solution.

If the static solution represents a stress-free solution, then it can be regarded as the base motion of the model. In such cases, the usage of PARAM,ENFMOTN,TOTAL (or ABS) and PARAM,ENFMOTN,REL will give *different* displacements, but the same stresses. Further, in modal dynamic analysis for such cases, the results using PARAM,ENFMOTN,TOTAL (or ABS) will give the *same* results as those obtained by using the large mass approach with all zero (or nearly zero) frequency modes included and the results using PARAM,ENFMOTN,REL will give the same results as those obtained by using the large mass approach with all zero (or nearly zero) frequency modes excluded.

If the static solution does *not* represent a stress-free solution, the usage of PARAM,ENFMOTN,TOTAL (or ABS) and PARAM,ENFMOTN,REL will give *different results not only for displacements, but also for stresses*. In this case, the results from the usage of PARAM,ENFMOTN,REL do not have the same significance as in the case of the stress-free static solution except for the fact that these results represent the dynamic solution RELATIVE to the static solution.

**Note:** Currently, the usage of PARAM,ENFMOTN,REL is not supported when PARAM,ENFMETH,ABS is specified (or implied). If this usage is employed, the program terminates the execution with an appropriate fatal message.

## EPVRT

Default = 1.E-8

EPVRT is analogous to and described under the EPSSING keyword on the AUTOSPC Case Control command. The specification of the AUTOSPC command overrides the specification of PARAM,EPVRT.

## EPSILON

Default = SECANT

In nonlinear statics (SOL 106 and SOL 400), thermal loads are computed using the secant method:

$$\varepsilon_T = \alpha_{\text{load}}(T_{\text{load}} - T_{\text{ref}}) - \alpha_{\text{init}}(T_{\text{init}} - T_{\text{ref}})$$

If the parameter is set to INTEGRAL, thermal loads are computed using the integral method:

$$\varepsilon_T = \int_{T_{\text{init}}}^{T_{\text{load}}} \alpha(T) dT$$

This parameter only applies to SOLs 106 and 400 ANALYSIS=NLSTAT, and only applies to CQUAD4, CTRIA3, CQUADR, and CTRIAR elements that are not associated with the enhanced nonlinear materials (PSHLN1).

## EPZERO

Default = 1.E-8

EPZERO is analogous to and described under the EPS keyword on the AUTOSPC Case Control command. The specification of the AUTOSPC command overrides the specification of PARAM,EPZERO.

## ERPC

Default = 1.0

This parameter represents the phase speed of the fluid for Equivalent Radiated Power (ERP) analysis. This parameter may alternatively be set using the ERP Case Control command.

## ERPREFDB

Default = 1.0

This parameter represents a peak reference ERP value used in the computation of ERP in units of dB. The dB level is defined as:

$$\text{ERPdB} = 10\log\left(\text{RHOCP} \cdot \frac{\text{ERP}}{\text{ERPREFDB}}\right)$$

This parameter may alternatively be set using the ERP Case Control command.

## ERPRHO

Default = 1.0

This parameter represents the fluid density for Equivalent Radiated Power (ERP) analysis. This parameter may alternatively be set using the ERP Case Control command.

## ERPRLF

Default = 1.0

This parameter represents a Radiation Loss Factor scale factor for the Equivalent Radiated Power (ERP) analysis. This parameter may alternatively be set using the ERP Case Control command.

## ERROR

Default = -1

For SOLs 111-112, when the constraint modes have non-zero generalized force the parameter ERROR set to 0 causes the fatal error exit to be branched over and the dynamic response is computed and output. This option is intended for model checkout work, where bad results are better for diagnostic work than no results at all. This parameter is a traditional feature also used in other, similar circumstances.

## ESLFSAV

Character, Default = NO

ESLFSAV = YES requests that all the intermediate files from an ESLNRO job be saved on disk. The destination of these files can be directed with the 'sdir=' option on a Nastran submittal command line.

## ESLMOVE

Integer, Default = 0

ESLMOVE = 0 selects a move limit scheme that poses restrict lower and upper bounds on design variables during the linear response optimization. The range of the bounds is determined by

$$X_k^L = \max(X_o^L, X_{k-1} - \text{MOVE})$$

$$X_k^U = \min(X_o^U, X_{k-1} + \text{MOVE})$$

$$\text{MOVE} = \max(\text{DXMIN}, \text{abs}(X_{k-1}) \cdot \text{DELXESL})$$

ESLMOVE = 1 selects a move limit scheme that scales back the design move proposed from a linear response optimization. The amount of scaling back is determined by

$$X_k^* = X_{k-1} + (X_{k-1}^1 - X_{k-1}) \cdot \text{DELXESL}$$

where  $X_k^*$  is the scaled design variable for the k-th design cycle,  $X_{k-1}$  is the design variable at (k-1)th design cycle,  $X_{k-1}^1$  is the proposed design from the linear optimization solution at (k-1)th design cycle.

Parameters DXMIN and DELXESL can be specified on the DOPTPRM entry.

## ESLLCOMP

Default = No

ESLLCOMP selects types of compliance response to be included in the design task. The nonlinear compliance response is defined using a DRESP1 entry with RTYPE=COMP for the ESLNRO topology optimization tasks. As the default, it is computed by the product of the applied nonlinear loads and corresponding nonlinear displacement components. Alternatively, ESLLCOMP=YES selects a linear compliance response that computed as the total work done by the equivalent static loads on the linear system.

## ESLMPC1

Default = 0

This parameter applies only to the ESLNRO jobs with 3D contact. Its default has different meanings depending on the type of contact applications. As the default, for a glued contact ESLNRO job, a linear response optimization task will include a set of MPC entries that are created from the nonlinear analysis. For a touching contact ESLNRO job, the linear response optimization task will not include the MPC entries by default. Setting ESLMPC1 to a positive number will turn on the MPC inclusion.

- 1 uses the MPC entries created from the nonlinear analysis at the converged nonlinear analysis.
- 2 uses the MPC entries created at the beginning of the very first nonlinear analysis.

## ESLOPTEX

Default = 0

This parameter allows the user to perform an ESLNRO job at a targeted exit point. The allowable values of ESLOPTX are listed below with their description.

- 0 Do not exit. Proceed with ESLNRO nonlinear response optimization.
- 1 Exit after the initialization of the analysis and design model but before nonlinear FE analysis begins.
- 2 Exit after nonlinear FE analysis ends.
- 3 Exit after design constraint evaluation and screening.

## ESLPRT

Default = 0

ESLPRT specifies how often the ESLNRO results are printed in the .f06 file and saved in the .xdb file. By default, the program will print the results to the .f06 file at the first and the last design cycles and save the results to .xdb (or .op2) at the first and last design cycles on the disk. (See ESLPRT1 for selection of result contents.)

- > 0 then the results are printed at the first design cycle; at every design cycle that is a multiplier of ESLPRT; and the last design cycle.
- < 0 the no results are printed and saved.

## ESLPRT1

Default = 7

ESLPRT1 specifies what type of results to be written to the .f06 and to .xdb (or .op2). It may take any of the following base values or a combination of these base values:

- 0 write no data
- 1 write the nonlinear analysis results to the .f06 file.
- 2 write the optimization data controlled by P1 and P2 to the .f06 file.
- 4 save the nonlinear analysis results to the .xdb (or .op2) file.
- 8 save the linear response optimization results to the .xdb (or .op2) file.

For example, by default, results from the nonlinear analysis, the optimization data will be written to the .f06 file and result data will be written to .xdb or .op2.

## ESLRCF,user\_rc\_file

Character\*8, must be lower case. Default = blank

ESLRCF, user\_rc\_file allows a user to define a custom RC file for the internally spawned jobs.

### Example:

```
PARAM,ESLRCF,myrc
```

The contents of the *myrc* file are:

```
mem=200m
exe=-local_path/MSCNASTRAN
del=-local_path/SSS
```

The example shows the user-defined RC file, myrc, specifies its own memory allocation and its local Nastran executable and local DMAP database.

## ESLTOPCV

Default = 80

ESLTOPCV specifies an alternate convergence tolerance for an ESLNRO's topology optimization job. An ESLNRO's topology optimization job will be terminated when the percentage of design variables whose changes are less than a given value, CONV DV specified on the DOPTPRM Bulk Data entry is greater than ESLTOPCV.

## ESLUNT2

Default = 54

ESLUNT2 is a file unit number used by the nonlinear analysis and the linear response optimization runs in an ESLNRO's topology optimization job for the access of design variables and designed properties. It only needs to be changed if there is a conflict with the default.

## ESLUNT1

Default = 53

ESLUNT1 is a file unit number used by the linear response optimization run in an ESLNRO's topology optimization job for the storage of design variables and designed properties. It only needs to be changed if there is a conflict with the default.

## EST

Replaced by the ELSUM Case Control command.

## EULBND

Default = ELEMENT, SOL 700 only

Defines boundary treatment for Euler boundaries.

### Format:

PARAM,EULBND,option

- |          |   |
|----------|---|
| EXTRAPOL | The pressure that a wall or coupling surface exerts on the adjacent Euler element is obtained from extrapolating the element pressure toward this boundary. (Character) |
| ELEMENT  | The pressure that a wall or coupling surface exerts on the adjacent Euler element equals the pressure inside this element. (Character)                                  |

**Remarks:**

1. The finite volume representation in general assumes that element values are constant within each element. While this assumption is adequate for the large majority of applications, fluid models involving hydrostatic pressure gradients require that the pressure gradient be also recognized to exist within the element. When element-internal hydrostatic gradients are not accounted for, the calculation will be less accurate and will suffer from numerical symptoms like pair forming of element pressures. By activating the option EXTRAPOL hydrostatic gradients inside the element are taken into account. For meshes without bias, option EXTRAPOL only modifies the numerical schemes along the boundary.
2. When coupling surfaces are used DYPARAM,FASTCOUP has to be activated as well.

**EULSTRES**

Default = VOLUME, SOL 700 only

Defines the update logic for stresses when material is transported in Euler elements.

**Format:**

PARAM,EULSTRES,option

- VOLUME The pressure that a wall or coupling surface exerts on the adjacent Euler element is obtained from extrapolating the element pressure toward this boundary. (Character)
- MASS The pressure that a wall or coupling surface exerts on the adjacent Euler element equals the pressure inside this element.

**Remarks:**

1. Only used for the MMSTREN solver.
2. Stresses are a material property and when material flows in or out an element the stress state in the element is changed. This is analogous to temperature and energy. Not the temperature is transported, but energy. After transporting energy the temperature is re-computed by dividing the energy by element mass and specific heat. In case of stress the “energy” is given by mass times stress. After transporting this “energy” the new stress follows by dividing it by mass. As shown in Chapter 6 of the Theory Manual this gives a correct updating procedure for stresses. There it also proven that stress times mass is conserved during transport.
3. In most simulations variations in density are small and the multiplication by mass can be replaced by a multiplication by volume. This method is activated by option VOLUME which is the default option. Using the MASS option may have some influence on simulations with large density variations. The option MASS will give the most accurate results.
4. The transport logic of the effective plastic strain is identical to that of stresses. When using option MASS the plastic strain is computed more accurately when material is compressed.
5. The (single material) Euler with strength solver makes use of the multiplication by mass. The multiplication by volume is not implemented for this solver.

## EUSUBCYC

Default = 1, SOL 700 only

Controls the maximum growth of the subcycling interval in Euler computations.

### Example:

```
PARAM,EUSUBCYC,2
```

### Remarks:

1. The subcycling algorithm automatically estimates the number of subcycles to be used. This is updated throughout the calculation. This parameter controls how much the number of subcycles can grow. For example, EUSUBCYC is set to 1, and the current number of time steps between updates of the Euler variables. If the solver estimates that the subcycling interval should be 7, the subcycling interval is increased by 1 until a value of 7 is reached.
2. There is no control on the amount by which the subcycling interval can decrease.

## EXCLUDE

Default = 0.

PARAM, EXCLUDE, Integer. Add PARAM, EXCLUDE, n in the buckling subcase(s) to activate linear buckling with local exclusion of differential stiffness. If n is positive, it selects the SET1 entry ID in the bulk data that defines the list of GRID points for which differential stiffness will be ignored. If n is negative, the absolute value selects the SET1 entry ID in the bulk data that defines the list of GRID points for which differential stiffness will be retained.

To select the GRID points care must be exercised by the user which follow natural mesh lines as much as possible, otherwise an element may be connected to some GRID points that have differential stiffness and some GRID points that do not. Sometimes this is impossible to ensure, and so the transition zone between retained-excluded differential stiffness should not be in, or close to, a region of interest. Selecting stiff (unlikely to buckle) zones for the transition zones is also advised.

While, EXCLUDE, can occur in either Case Control or Bulk Data, for multiple buckling subcases, it must occur in Case Control.

SOL105, is a linearization of a nonlinear behavior, therefore it is recommended that parts of the structure, for which buckling is important, are in the residual or SE=0. However, if the user puts the parts of the structure for which buckling is to be considered in a BEGIN BULK SUPER=n; then the sets must be in the Part superelement or Module.

Multiple buckling subcases with different exclude values are allowed. For example:

```
DISPLACEMENT (PLOT, SORT1, REAL) =ALL
SUBCASE 1
  SUBTITLE=Static Load
  SPC = 2
  LOAD = 2
  analysis=statics
subcase 2
  SUBTITLE = Buckling Subcase
```

```

      SPC=2
      statsub=1
      analysis=buck
      METHOD=105
      param,exclude,-1
subcase 3
      SUBTITLE = Buckling Subcase
      SPC=2
      analysis=buck
      statsub=1
      METHOD=105
      param,exclude,-2
BEGIN BULK

```

**EXTDR**

Deprecated. See the EXTDRIN Case Control command description.

**EXTDROUT**

Deprecated. See the EXTDROUT Case Control command description.

**EXTDRUNT**

Deprecated. See the EXTDROUT Case Control command description.

**EXTOUT**

Deprecated. See the EXTSEOUT Case Control command description.

**EXTRCV**

Deprecated. See the EXTDRIN Case Control command description.

**EXTUNIT**

Default = 30.

EXTUNIT specifies the Fortran unit number for an external superelement stored on an op2 or op4 file and is required if the default value of 30 is not desirable and a CSUPER Bulk Data entry is used to define the external superelement in an assembly run. EXTUNIT is also required if it references an op4 file in which case the value for the unit number must be negative.

**FACTOR**

Default = 10000

See OLDSEQ.

**FASTFR**

Default = AUTO

In MSC Nastran 2004, the FASTFR method was introduced for modal frequency response analysis. It can be selected via the Bulk Data entry, PARAM,FASTFR,YES and shows significant performance improvement for certain models in the mid-frequency range. PARAM,FASTFR,NO deselects the FASTFR method causing the program to use the standard method for modal frequency analysis.

By default, the program will decide automatically which solution method will be most efficient for the frequency response part in a SOL 111 analysis. Based on the size of the modal space and some other heuristic criteria, either the FASTFR solution method will be run, or the FRRD1 module with or without the iterative solver will be used.

Limitations for the FASTFR method

1. The FASTFR method works only for SOL 111 and for SOL 200 with ANALYSIS=MFREQ.
2. SESDAMP and FASTFR are not allowed in the same run.
3. To force the iterative solver in FRRD1, FASTFR=yes is required.

## FBATOLR

Default = 1.0E-05

This is the tolerance that is applied to grid point coordinates in order to determine connections between potential connection grid points of various FRF components in the FBA process.

The default tolerance should be satisfactory for most situations. A looser tolerance may be needed in certain situations. An example is the case where the potential connection points of an FRF component are associated with the shell elements of RSSCON solid-to-shell element connectors. In this case, a looser tolerance may need to be specified in order to achieve proper connections between FRF components in the FBA process.

## FBLEND

Default = 0.6667, SOL 700 only

Eulerian elements with uncovered fractions smaller than FBLEND are blended with adjacent elements to form a clump so that they do not control the time step.

### Format:

PARAM,FBLEND,VALUE

### Example:

PARAM,FBLEND,0.5

VALUE            The uncovered fraction below which blending occurs. ( $0.0 \leq \text{Real} < 1.0$ )

### Remarks:

1. The default value is satisfactory for virtually all calculations.
2. Elements are blended only if they would have controlled the time step otherwise.
3. Elements with uncovered fractions greater than FBLEND are not blended and are allowed to control the time step.
4. Large values of FBLEND produce a larger time step but many blends. Small values produce a smaller time step and fewer blends.
5. In a calculation with a coupling surface, STEPFACT is smaller or equal FBLEND to avoid instabilities (see PARAM,STEPFACT).

## FDRLDS

Default = YES

PARAM, FDRLDS, YES turns on the logic to generate additional residual vectors for SOL 111 based on the differences of structural and structural damping matrices. For free-free models, a SUPORT entry may improve the free-free modes and yield additional augmented eigenvalues (PARAM, BAILOUT, -1 may occasionally be needed even for a good static SUPORT set). PARAM, FDRLDS, NO can be used to turn off the generation of frequency dependent residual vectors.

## FIRSTKI

PARAM, FIRSTKI, Integer

This parameter is specified when external superelements are used in assembly models of aircraft. This lists the location of the first k-set point of the first CAEROi point related to each superelement, SEID.

For example, if superelement 10 (SEID10) contains CAERO1 point 1001, and the first DOF related to this CAERO1 point is at internal location 51 in the k-set, then this information can be obtained using "PARAM, USETPRT, 0". This information is then added in the input .dat file using "PARAM, FIRSTKI, 51" after "BEGIN SUPER=10" line.

## FIXEDB

Default = 0

FIXEDB is used to reduce the cost of superelement checkout.

-2	(SOL 101 only) is used on the initial runs when the user suspects that the superelement may contain errors and that only operations necessary for fixed-boundary solutions need be performed. In particular, the generation of the $[G_{oa}]$ matrix is branched over in the SEKR operation and $[P_a]$ is not generated in the SELR operation. These operations typically result in 50% of the reduction cost and are not needed in the fixed-boundary data recovery operations described in the next paragraph. After this operation has been completed, the keyword SELANG will appear in the database dictionary, indicating that the $[P_a]$ stored there is incomplete, and should not be summed into the downstream superelement, because System Fatal Message 4252 will be issued.
$\leq -1$	(SOLs 101 and 103 only) allows uncoupled solutions for any superelement with conventional output requests. This output may be obtained as soon as the superelement is successfully generated and reduced and does not require that the entire model be assembled. In superelement statics, the solution is the component due to the $\{u_o^o\}$ vector, i.e., a fixed-boundary solution. In superelement modes, the solution is the uncoupled eigenvectors of the component. If PARAM, FIXEDB, -1 is specified in the Bulk Data or in the residual structure subcase, the modes of the residual structure will not be computed. For a printout or plotting of the component mode eigenvectors it is recommended that PARAM, FIXEDB, -1 be specified in the Bulk Data Section or above the subcase level in Case Control. If the modes of the residual structure are desired, then PARAM, FIXEDB, 0 should be specified in the residual structure subcase. Exterior degrees-of-freedom listed on SECSETi and SESUP entries are free, and those on SEBSETi degrees-of-freedom are fixed. Data recovery for the residual structure should not be requested for this option.
+1	(SOL 101 only) is used after the superelement has been proven valid. In the SEKR and SELR operations, it provides a branch over all operations already completed in the SEKR and SELR phases and completes the generation of the $[G_{oa}]$ matrix and the boundary stiffness and load matrices. It is also a method to recover the factor of the $[K_{oo}]$ matrix if the run aborted while computing $[G_{oa}]$ .

## FKSYMFAC

Default = 0.024

Follower force stiffness is typically unsymmetric, but in some cases making it symmetric may improve convergence in nonlinear problems, whereas in other cases it may hinder it.

FKSYMFAC controls the symmetrization of the follower force stiffness in SOL 106 and SOL 400. If FKSYMFAC = 1.0 is specified, the follower force stiffness  $K_f$  is symmetrized as:

$$K_{fs} = \frac{1}{2}(K_f + K_f^T)$$

and the symmetric part  $K_{fs}$  is used for efficiency. If FKSYMFAC= 0. is specified, the original follower force stiffness  $K_f$  is used. If a value of  $0. < \text{FKSYMFAC} < 1.$  is specified, the non-symmetric part of the follower force stiffness is calculated as:

$$K_{fn} = K_f - K_{fs}$$

and the ratio of unsymmetry:

$$r = \frac{\|K_{fn}\|}{\|K_f\|}$$

is compared with the user specified value of FKSYMFAC. The norm  $\| \cdot \|$  is the absolute maximum number of the matrix.

If  $r < \text{FKSYMFAC}$ , the symmetric stiffness  $K_{fs}$  is used.

If  $r > \text{FKSYMFAC}$ , the original unsymmetric stiffness  $K_f$  is used.

The default value for FKSYMFAC was determined by a parametric study and for most cases this will make the follower force stiffness symmetric, which will give sufficiently accurate answers. The asymmetry ratio(r) increases as geometric nonlinearity intensifies so when it becomes greater than FKSYMFAC, the unsymmetric follower force stiffness is used.

It is considered important to retain the full unsymmetric follower force stiffness, set FKSYMFAC to zero.

The parameter FKSYMFAC is applicable to SOL 106 and SOL 400 only, all other solution sequences symmetrize the follower force stiffness. See parameter FOLLOWK for a list of solution sequences which calculate the follower force stiffness.

## FLEXINCR

Default = NO

In SOL 144, a value of YES will cause the TRIM subcases to be ignored. Instead, the TRIM Bulk Data will be used to obtain the set of Mach, Dynamic pressure and symmetry values for Unit Solutions (Flexible

Increments). These data can be archived in the aeroelastic database for subsequent reuse. (Flexible Increments are always computed. This param merely avoids the TRIM subcase if these increments are all that is required.)

## FLUIDMP

Replaced by options on the Case Control command [FLSPOUT \(Case\)](#).

## FLUIDNE

Default = 500

The Householder method of eigenvalue extraction is more reliable and is automatically selected for the fluid's system modes if the acoustic cavity is defined in a superelement and there exists fluid boundary points. The switch to Householder occurs if the number of estimated fluid modes is less than or equal to the value specified by PARAMeter FLUIDNE.

## FLUIDSE

Default = 0

PARAM,FLUIDSE,seidf specifies a special superelement reserved for fluid elements. Frequency dependent fluid elements must still be in the residual. Partitioned superelements are not supported.

## FMULTI

Default = .10, SOL 700 only

Defines the dimension of the multimaterial element array.

### Format:

PARAM,FMULTI,VALUE

### Example:

PARAM,FMULTI,,25

VALUE            The relative amount of multimaterial elements. ( $0.0 < \text{Real} < 1.0$ )

### Remark:

The multimaterial Eulerian elements use an overflow array in which to store material data. This array can hold FMULTI times the total number of Eulerian elements. In a problem where more than 10% of the elements have more than one material, the default value of FMULTI must be increased.

## FOLLOWK

Default = YES

In SOLs 101,103, 105, 106, 107, 108, 109, 110, 111, 112, 115, 116, and SOL 400, FOLLOWK=YES (Default) requests the inclusion of follower force stiffness in the differential stiffness. FOLLOWK=NO requests that the follower force stiffness not be included. For FOLLOWK=YES in SOLs 101,103, 105, 107, 108, 109, 110, 111, 112, 115, and 116, a separate static subcase is required and the STATSUB command is also required in the eigenvalue subcase. In nonlinear analysis (SOL 106 and 400), the follower force is

included if PARAM,LGDISP,1 is specified. FOLLOWK is ignored in SOL 106 and SOL 400 if LGDISP is not specified.

## FRQDEPO

Default = NO

By default, frequency-dependent elements cannot be connected to o-set degrees-of-freedom. PARAM,FRQDEPO,YES allows frequency-dependent elements to be connected to o-set degrees-of-freedom. However, results may not be reliable.

## FULLSEDR

Default = NO

In a run with superelements, PARAM,FULLSEDR,YES will merge results (DISPL, STRESS, etc.) from all of superelements into a single result as if the run contained no superelements. This is not supported for BEGIN BULK superelements (parts) unless the element and grid identification numbers are unique across all part superelements and the residual structure. Additionally, if there are part SE present, then FULLSEDR has to be specified in all Bulk Data sections (BEGIN BULK and BEGIN SUPER) or in the Case Control.

## FZERO

Default = 1.0

See AUTOSPRT.

## G, GFL

Default = 0.0

G and GFL specify the uniform structural and fluid-damping coefficient in the formulation of dynamics problems. In coupled fluid-structure analysis, G is applied to the structural portion of the model and GFL to the fluid portion of the model. To obtain the value for the parameter G or GFL, multiply the critical damping ratio,  $C/C_o$ , by 2.0. PARAM,G and GFL are not recommended for use in hydroelastic or heat-transfer problems. If PARAM,G (or GFL) is used in transient analysis, PARAM,W3 (or W3FL) must be greater than zero or PARAM,G (or GFL) will be ignored. See [Formulation of Dynamic Equations in SubDMAP GMA](#) in *the MSC Nastran Reference Guide*.

In frequency response and complex eigenvalue analyses, the use of G or GFL will cause the stiffness matrix corresponding to the structural or fluid portion of the model to become complex. The user should be aware that this will, in general, require more memory and resources for the calculations.

## GEOMU

Default = 40

See POST=0.

## GPECT

Default = -1

GPECT controls the printout of all elements connected to each grid point. GPECT=+1 requests the printout. In superelement analysis, the list is printed if PARAM,CHECKOUT,YES is specified or the SEMG or SEALL Case Control command selects the superelement. GPECT=-1 suppresses the printout.

## GRADMESH

Default = OFF, SOL 700 only

Glues fine meshes to coarse meshes. See the section on Graded meshes in the user manual for further information.

### Format:

PARAM,GRADMESH,OPTION

### Example:

PARAM,GRADMESH,MINVOL

OPTION	OFF	Graded mesh gluing is not used (Character)
	MINVOL	If an element of one mesh is covered by an element of another mesh the element with the largest volume will be inactivated. It will also be removed from the output request for Eulerian archives.
	ELNUM	If an element of one mesh is covered by an element of another mesh the element with the smallest element number will be inactivated. It will also be removed from the output request for Eulerian archives.

### Remarks:

1. This parameter can be used to build block-structured meshes.
2. All Euler elements have to be either orthogonal or axial symmetric.
3. To get meaningful physical results, the change in mesh size going from one element to the next should not be larger than 1.4 or smaller than 0.7.

## GRAVSET

Default = 0

A PARAM, GRAVSET, n where n is a Bulk Data SET1 entry, allows the user to apply gravity loading (GRAV) to just a portion of the structure. GRAVSET like GRAV loading is global and is computed once at the beginning of the analysis. The Bulk Data SET1 n defines the GRIDS to which the gravity loading is to be applied. GRAVSET can appear in either the **Bulk Data** or **ABOVE** or **IN the 1st Subcase**. A GRAVSET appearing in any other Subcase will be ignored and may cause incorrect results. A GRAVSET appearing in or above the first subcase takes precedence over a GRAVSET appearing in Bulk Data. See also the companion RFORSET entry. If there is no GRAV loading called out, then PARAM, GRAVSET, n needs to be removed from the run

## GRDPNT

Default = -1

GRDPNT > -1 will cause the grid point weight generator to be executed. The default value (GRDPNT = -1) suppresses the computation and output of this data. GRDPNT specifies the identification number of the grid point to be used as a reference point. If GRDPNT = 0 or is not a defined grid point, the reference point is taken as the origin of the basic coordinate system. All fluid-related masses and masses on scalar points are ignored. The following weight and balance information is automatically printed following the execution of the grid point weight generator.

- Reference point.
- Rigid body mass matrix [MO] relative to the reference point in the basic coordinate system.
- Transformation matrix [S] from the basic coordinate system to principal mass axes.
- Principal masses (mass) and associated centers of gravity (X-C.G., Y-C.G., Z-C.G.).
- Inertia matrix I(S) about the center of gravity relative to the principal mass axes. Note: Change the signs of the off-diagonal terms to produce the “inertia tensor.”
- Principal inertias I(Q) about the center of gravity.
- Transformation matrix [Q] between S-axes and Q-axes. The columns of [Q] are the unit direction vectors for the corresponding principal inertias.

In superelement static or geometric nonlinear analysis, GRDPNT > -1 also specifies the grid point to be used in computing resultants, in the basic coordinate system, of external loads and single point constraint forces applied to each superelement. If GRDPNT is not a grid point (including the default value of -1), then the resultants are computed about the origin of the basic coordinate system. In superelement analysis, weights and resultants are computed for each superelement without the effects of its upstream superelements.

For axisymmetric elements, the GRDPNT output may be misleading as the algorithm is designed for 3D elements. For the TRIAX6 element, the mass is for the entire model and the center of gravity and inertias are for the cross section in the x-z plane. For the hyperelastic TRIAX and QUADX elements, the mass is for one radian and the center of gravity and inertias are for the cross section in the x-y plane. For the harmonic TRIAX and QUADX elements, the mass is for the entire model and the center of gravity and inertias are for the cross section in the element coordinate system x-y plane.

## GUSTAERO

Default = 1

If gust loads are to be computed, for example on restart, set GUSTAERO to -1. The default is recommended if no gust loads are to be computed after the flutter analysis.

## GYROAVG

Default = 0

Used to specify one of two formulations for frequency response analysis using the rotor dynamic capability. The default is to determine any frequency-dependent terms for each frequency. This option activates the frequency-dependent looping option. Setting the value < 0 uses an ‘average’ frequency formulation. This option avoids using the frequency-dependent looping and results in a shorter execution time. For this option, PARAM,WR3 and PARAM,WR4 must be specified to include rotor damping.

## HEATCMD

Character\*16, Default=nastran

Name of a command to run SOL 600 thermal contact runs. Nastran first sets up an Marc run to determine the thermal contact conditions which are output in a file named `jid.nthcnt`. Next, Nastran converts these to standard Nastran thermal elements, and finally spawns a second Nastran job from the primary Nastran job. The command to run the second Nastran job is provided using this parameter. For example, if `nast2005t1` is desired, enter `CMD=nast2005t1`. If the command “Nastran” is desired, either leave the parameter out or enter “nastran”. The MSC Nastran run to be spawned will have the form:

```
CMD jid.nast.dat rcf=RCF
```

Where file RCF depends on PARAM,MARHEATM.

### Remarks:

1. See PARAM,MRSPAWN2 for structural analysis.
2. CMD will be converted to lower case regardless of the case entered.

## HEATSTAT

Default = NO

In SOL 101, if PARAM,HEATSTAT,YES is entered, then temperatures are computed in a linear steady state heat transfer and then applied as thermal loads in a subsequent thermal stress analysis. Two subcases are required. The first defines the temperature loads, boundary conditions, and output requests for the heat transfer analysis and the second subcase defines the thermal loads, boundary conditions, and output requests for the thermal stress analysis. Thermal loads in the second subcase are requested through the command

```
TEMP(LOAD) = Heat Transfer Subcase ID
```

If this default is not acceptable, then in heat transfer subcase add the Case Control word TSTRU=SID and in structures subcase here

```
TEMP(LOAD) = SID
```

See the Case Control command, [TSTRU \(Case\)](#). PARAM,NESET is no longer used.

## HFREQ, HFREQFL

Default = 1.+30

The parameters LFREQ, HFREQ, LFREQFL, and HFREQFL specify the frequency range in cycles per unit time of the modes to be used in the modal formulations. (LFREQ and LFREQFL are the lower limits and HFREQ and HFREQFL are the upper limits.) In coupled fluid-structure analysis, HFREQ and LFREQ are applied to the structural portion of the model and HFREQFL and LFREQFL are applied to fluid portion of the model. The default for HFREQ and HFREQFL will usually include all vectors computed. Related parameters are LMODES and LMODESFL.

**Note:** If the MODESELECT Case Control command is used, it takes precedence over the parameters LMODES, LFREQ and HFREQ (or LMODESFL, LFREQFL and HFREQFL if MODESELECT refers to fluid modes). For the hierarchy of usage when the MODESELECT Case Control command is used in conjunction with these parameters, refer to the Remarks in the description of the MODESELECT Case Control command. See also the FLSFSEL Case Control command for an alternative selection.

## HTOCITS

Default = 20 (SOL 106 only)

HTOCITS sets the maximum allowable iterations in a hot-to-cold analysis. (See the ANALYSIS=HOT2COLD Case Control command).

## HTOCPRT

Default = NO (SOL 106 only)

PARAM,HTOCPRT,YES requests the printout of the final cold shape's grid locations in a hot-to-cold analysis. (See the ANALYSIS=HOT2COLD Case Control command).

## HTOCTOL

Default = 1.E-2 (SOL 106 only)

HTOCTOL is used to determine convergence of cold shape in hot-to-cold analysis. (See the ANALYSIS=HOT2COLD Case Control command). The parameter is used to compare the geometries as the model deforms from its "hot" to "cold" shape.

## HTSYM

Default = 0

This parameter controls the decomposition method for SOL 400 thermal analysis.

- = 0     Use symmetric decomposition solver
- = 1     Use unsymmetric decomposition solver

## ICOPT

Default = 1, SOL 400 Only

Parameter ICOPT works together with the NLIC Case Control Command. The user input loads may or may not be in equilibrium with the initial condition. If ICOPT=0, MSC Nastran will compute the initial acceleration based on user's inputs. Otherwise, it will be assumed that the initial acceleration is null. In other words, when ICOPT=1 (the default), it is assumed the whole structure is in equilibrium automatically. Theoretically, ICOPT=0 gives better solution. However, due to that the matrix is highly singular, a large amount CPU time may be required and the accuracy of the result may be in doubt for the solution with ICOPT=0.

## IFP

Default = value of PARAM,DBALL.

See DBALL.

## INREL

Default = 0

INREL controls the calculation of inertia relief or enforced acceleration in linear static analysis and buckling. INREL = -1, -2, or -4 requests that inertia relief or enforced acceleration be performed.

For INREL = -1 and -2, enforced accelerations, if desired, are input on the DMIG,UACCEL Bulk Data entry. (See Section 7.2 of the *MSC Nastran Reference Guide* for the theoretical basis.)

Inertia Relief is not currently supported with external superelements and in the contact analysis.

- 1 SUPORT or SUPORT1 entries are required on one or more grid points in the Bulk Data Section which restrain rigid body motion. The total number of degrees-of-freedom specified on SUPORT and SUPORT1 entries must be less than or equal to six.

In SOL 105, SUPORT1, not SUPORT, Bulk Data entries must be used to define the supported degrees-of-freedom and the SUPORT1 Case Control command may only be specified in a separate static subcase.

Loads due to unit rigid body accelerations at the point referenced by PARAM,GRDPNT are computed and then appended to the external loads. If PARAM,GRDPNT is specified in superelement analysis, then the point must be interior to the residual structure and exterior to all superelements.

- 2 The value of PARAM,INREL,-2 will provide an inertia relief analysis without the use of SUPORT<sub>i</sub> entries. To use this capability the structure must contain six and only six rigid body degrees of freedom. SUPORT<sub>i</sub> entries must not be present when using this option. If the structure has either more or less than six rigid body degrees of freedom, the analysis will either fail or give incorrect results.

- 4 SUPORT or SUPORT1 entries are required on one or more grid points in the Bulk Data Section which restrain rigid body motion. Any number of degrees-of-freedom may be specified on SUPORT and SUPORT1 entries. With this method, the mass matrix is reduced which will increase CPU requirements over PARAM,INREL,-1 and -2. The INREL=-4 method is a general approach and is capable of handling mechanisms and unconstrained problems. It is also capable of handling problems that have possible rigid body motion in selected directions. The INREL=-1 and -2 methods are more efficient implementation but are limited to six or less supported degrees-of-freedom because those methods can only handle problems that are fully unconstrained (that is, those with no constraints preventing rigid body motion of any kind and whose model does not contain mechanisms).

## INRLM

Replaced by the INRLOD keyword on the RESVEC Case Control command.

## IRES

Default = -1

IRES=1 requests that the residual load vectors RULV and RUOV be output in all solution sequences. In superelement analysis, the parameters PRPA and PRPJ may also be used to request output of the partial load vectors  $\{P_a\}$  and  $\{P_j\}$ , respectively. In geometric nonlinear analysis, PARAM,IRES,1 will cause the printing of the residual vector

$$\{\Delta P_f\} = [K_{ff}] \left\{ u_f^{n+1} - u_f \right\} + \{F_f\} - \{P_f\}$$

## ITAPE

Default = -1

ITAPE specifies the output status of the DSCMR matrix in SOLs 101, 103, and 105; and the DSCMCOL table and the DSCM2 matrix in SOL 200. (See the OUTPUT2 and OUTPUT4 module descriptions in the [MSC Nastran DMAP Programmer's Guide](#).)

## IUNIT

Default = 11

IUNIT specifies the FORTRAN unit number on which the DSCMR matrix in Design Sensitivity SOLs 101, 103, and 105 and the DSCMCOL table and the DSCM2 matrix in SOL 200 will be written. (See the OUTPUT2 and OUTPUT4 module descriptions in the [MSC Nastran DMAP Programmer's Guide](#).)

## JWLDET

Default=NOLINK

With the default multiple denotations with EOSJWL are NOT LINKED: the detonation wave of one explosive cannot ignite another explosive. When the option is LINK, multiple denotations with EOSJWL are LINKED: the detonation wave of one explosive can ignite another explosive. For option NOLINK: TDET is set to -1 for elements that have no JWL material. The "NOLINK" option is only valid with true JWL materials - not valid for the "Static Detonation/Ideal Gas" model. Setting this parameter as "NOLINK" will prevent "sympathetic ignition". Each charge will ignite at the specified "TDET" in its own DETSPH card.

## KDAMP, KDAMPFL

Default = 1

If KDAMP or KDAMPFL is set to -1, viscous modal damping is entered into the complex stiffness matrix as structural damping. In coupled fluid-structure analysis, KDAMP is applied to the structural portion of the model and KDAMPFL to the fluid portion of the model. See [Superelement Analysis](#) in *the MSC Nastran Reference Guide*.

## KDIAG

Default = -1.0 (SOLs 106, 153, and SOL 400 with non-contact analysis), or 0.0 ( SOL 400 with contact analysis)

In SOLs 106 (nonlinear static analysis), 153 (steady state heat transfer), and SOL 400 (nonlinear static and transient analysis), KDIAG may be used to eliminate spurious mechanisms and singularities in the nonlinear stiffness matrix. The absolute value of KDIAG will be added to some or all of the diagonal terms in the nonlinear stiffness matrix as follows:

- < 0.0        Then add the absolute value of KDIAG to the null diagonal terms only (SOLs 106 and 153). For SOL 400, the absolute value of KDIAG is added to the diagonal term of null columns only.
- = 0.0        Then no action is taken.
- > 0.0        Then add the value of KDIAG to all diagonal terms.

## KDMFILT

Default = 0

- 0            Differential stiffness correction will NOT be added to rigid body behavior of pre-stressed models for modal analysis.
- 1            Differential stiffness correction will be added to rigid body behavior of pre-stressed models for modal analysis.
  1. Currently, PARAM, KDMFILT, 1 is active in SOL103 with a preload subcase (STATSUB) and a single modal (METHOD) subcase.
  2. Currently, PARAM, KDMFILT, 1 is active in SOL400 with a series of preload steps and a single ANALYSIS=MODES step. Also, in SOL400, the correction is not available when enhanced nonlinear elements are used via NLMOPTS or PSHLN1, etc., type entries.

In nonlinear mechanics, in theory a tangent matrix is computed, using a deformation gradient. By polar decomposition, a consistent rotation matrix can be obtained.

In practice, most finite elements such as beam, shell and solid elements, are developed in a heuristic fashion with polynomial type functions representing displacement and volume characteristics. The tangent stiffness is composed of several matrices. A linear K matrix, a  $K_D$  for differential stiffness or geometric stiffness, and often a  $K_F$  for follower load stiffness.

In general, the  $K_D$  matrix which represents a stiffening to the structure due to pre-load of the structure, does not meet rigid body requirements. When a structure is preloaded with a self-equilibrating set of loads and statically supported, for a free-free modal analysis of the pre-loaded structure the static support set is removed. Often because of the deficiency of the  $K_D$  matrix to correctly represent rigid body modes, the resulting free-free modes are poor or missing.

PARAM, KDMFLT, 1 turns on a method to orthogonalize and normalize the computed rigid-body modes.

It cannot be over emphasized the importance of the need to have a self-equilibrating set of loads using a static support system.

The above structure represents a plate structure to be tension pre-stressed in the x-direction. This is accomplished by applying FORCE1 entries on grids 111 thru 121 in the positive x-direction defined by grids 1 thru 11 to grids 111 to 121 and a set of FORCE1 entries along grids 1 thru 11 in the negative x-direction defined by grids 111 thru 121 to grids 1 thru 11.

A static support set is applied at grids 1, 11, and 111. This set is removed for the modal analysis.

If, instead of the FORCE1 entries along grids 1 thru 11, the user chose to apply SPC1 entries for these grids, constraining then in the x-direction, a self-equilibrating loading would not be obtained. This is so, because FORCE1 entries are follower loads while SPC1 entries are not. With the SPC1 entries, the structure would not be in true static equilibrium upon removal to the static support set.

If, instead, along grids 1 thru 11, the user chose to apply SPC1 entries for these grids, constraining then in the x-direction and non-follower FORCE entries along the grids 111 thru 121, an almost self-equilibrating loading is achieved and PARAM, KDMFLT, 1 will get six good free-free modes. In this case, however, the Lanczos Method has some stability issues and AHO should be used.

## K4RITZ

Default = 0

Setting PARAM,K4RITZ to a positive value activates logic to generate additional residual vectors for SOL 111 when using ACMS to compute the modal space. Structural damping degrees of freedom (K4) are used to augment the existing set of residual vectors in order to capture damping effects when GE inputs might contribute significantly to overall frequency response. The value of K4RITZ specifically controls the number of iterations performed to compute the basis vectors. Due to extra computation required, this parameter should be used with caution and should rarely be set greater than 1.

## K6ROT

Default = 100.

K6ROT specifies the scaling factor of the penalty stiffness to be added to the normal rotation for CQUAD4 and CTRIA3 elements. The contribution of the penalty term to the strain energy functional is

$$\Pi_p = 10^{-6} K6ROT \frac{1}{2} G \int_A (\Theta_z - \Omega_z)^2 t dA \quad \text{with} \quad \Omega_z = \frac{1}{2} \left( \frac{\partial u_y}{\partial x} - \frac{\partial u_x}{\partial y} \right)$$

where  $A$  is the area of the shell element,  $t$  is the shell thickness,  $G$  is the in plane shear modulus, see the MID1 material identification number on the **PSHELL** Bulk Data entry. The in plane displacements  $u_x$ ,  $u_y$  and the normal rotation  $\Theta_z$  are shown in **Figure 6-1**. The normal rotation has no physical meaning and should be ignored. The penalty stiffness removes the singularity in the normal rotation. A higher value than  $K6ROT=100$ . is not recommended because unwanted stiffening effects may occur. If you use only the MID1field, Nastran automatically sets  $K6ROT=0.0$

Figure 6-1 In plane displacements  $u_x$ ,  $u_y$  and normal rotation  $\Theta_z$

## LANGLE

Default = 1

LANGLE specifies the method for processing large rotations in nonlinear analysis. By default, large rotations are computed with the gimbal angle method in nonlinear analyses SOLs 106, 129, 153, and 159 with geometric nonlinearity (PARAM,LGDISP,1). If PARAM,LANGLE,2 is specified, then they are computed with the Rotation Vector method. The value of LANGLE cannot be changed in a subsequent restart. For SOL 400, users should not use LANGLE. SOL 400 will use the appropriate method depending on type of element or type of analysis.

## LDSUM

Default = 0

Dictates what trim information is to be stored on a CSV (comma separated values) file in a SOL 144 (static aeroelasticity) task. The unit the CSV file is stored to is specified by PARAM,XYUNIT, n. LDSUM has the following options:

0	(Default) – Do not create a CSV file for static aeroelasticity
1	Create a CSV file that contains for each static aeroelastic subcase: <ul style="list-style-type: none"> <li>■ Subcase ID</li> </ul>

	<ul style="list-style-type: none"> <li>■ Mach number</li> </ul>
	<ul style="list-style-type: none"> <li>■ Dynamic Pressure</li> </ul>
	<ul style="list-style-type: none"> <li>■ Trim Values</li> </ul>
	<ul style="list-style-type: none"> <li>■ Mass and CG information (mass, xcg,ycg,zcg, IXX,IYY,IZZ,IXY,IXZ and IYZ)</li> </ul>
2	Same as 1 plus net structural monitor point (MONPNT1, MONDSP1, MONPNT2, MONPNT3) results.
3	Same as 2 plus the output of RIGID AIR, ELASTIC RESTRAINED, and INERTIAL, RIGID APPLIED and ELASTIC APPLIED components for the structural MONPNT1 results.
4	Same as 3 plus the output of RIGID AIR and ELASTIC RESTRAINED components for aerodynamic MONPNT1 results.

## LFREQ, LFREQFL

Default = 0.0

See HFREQ, HFREQFL

If the MODESELECT Case Control command is used, it takes precedence over the parameters LMODES, LFREQ and HFREQ (or LMODESFL, LFREQFL and HFREQFL if MODESELECT refers to fluid modes). For the hierarchy of usage when the MODESELECT Case Control command is used in conjunction with these parameters, refer to the Remarks in the description of the MODESELECT Case Control command. See also the FLSFSEL Case Control command for an alternative selection.

## LGDISP

LGDISP is a global parameter. For the case with multiple LGDISP definitions, Nastran will use the first definition for all the subcases and steps. Default = -1

- ≥ 0 The differential stiffness for structural elements is computed for the linear elements and added to the differential stiffness of the nonlinear elements.
- 1 All the nonlinear structural element types that have a large displacement capability in SOLs 106, 129, 153, 159, 600 and SOL 400 (see [Table 3-1](#), under “Geometric Nonlinear” in the *MSC Nastran Reference Guide*) will be assumed to have large displacement effects (updated element coordinates and follower forces). For simultaneous multi-physics coupling analysis defined through the SUBSTEP Case Control option in SOL 400, nonlinear heat transfer element types will be treated the same as LGDISP = -1 (i.e., original geometry for thermal stiffness, element fluxes and external loads).
- 1 No large displacement effects will be considered.
- 2 Follower force for structural elements effects will be ignored but large displacement effects will be considered. For simultaneous multi-physics coupling analysis defined through the SUBSTEP Case Control option in SOL 400, nonlinear heat transfer element types will be treated the same as LGDISP = -1 (i.e., original geometry for thermal stiffness, element fluxes and external loads).

- 11 Nonlinear structural elements will be treated the same as LGDISP = 1 in all supporting solution sequences. For simultaneous multi-physics coupling analysis defined through the SUBSTEP Case Control option in SOL 400, nonlinear heat transfer element types will be based on the current updated geometry (updated element coordinates for the thermal stiffness, element fluxes and external loads).
- 12 Nonlinear structural elements will be treated the same as LGDISP = 2 in all supporting solution sequences. For simultaneous multi-physics coupling analysis defined through the SUBSTEP Case Control option in SOL 400, nonlinear heat transfer element types will be based on updated current geometry (updated element coordinates for the thermal stiffness and element fluxes, original geometry for external loads).

## LMFACT

LMFACT and PENFN are the scale factor and penalty function for the Lagrange rigid elements and the contact analysis. For Lagrange rigid elements, please see Case Control command, RIGID. The purpose of LMFACT and PENFN is to make the values of stiffness matrix of the Lagrange rigid elements and/or the contact components about the same relative magnitude as those of the other elements in the model. Too small a value will produce inaccurate results and too large a value will produce numerical difficulties. The same value is usually assigned to both LMFACT and PENFN. Under special requirement, user may assign different values for LMFACT and PENFN. For example, if PENFN=0.0 and LMFACT  $\neq$  0.0, then the solution method for the rigid elements becomes the pure Lagrange multiplier method instead of the augmented Lagrangian method. However, user must exercise caution if different values are assigned to LMFACT and PENFN. MSC Nastran will compute the appropriate default values for LMFACT and PENFN. The default value is 1.0e+5 for all solution sequences except SOL 400 and SOL 101 contact.

For SOL 400 and SOL 101 contact, MSC Nastran will compute the appropriate default values for LMFACT and PENFN. These defaults are currently calculated as 0.05% of the average stiffness of the diagonal terms of the stiffness matrix. This computed default is good in general. But when the material/element stiffnesses (e.g., Young's Modulus, Spring Stiffnesses) used in the model vary in a wide range, users may have to adjust the computed LMFACT and PENFN. Note that the computed LMFACT, PENFN are printed out in a .f06 file. It is generally recommended that for these cases, the LMFACT and PENFN should be reduced by several orders of magnitude to avoid numerical difficulty.

If in a coupled multi-physics analysis distinct values for LMFACT and PENFN are desired for each physics pass, the parameter definitions must be made inside the SUBSTEP Case Control command. If no values are entered each physics pass computes its own defaults.

## LMODES, LMODESFL

Default = 0

LMODES and LMODESFL are the number of lowest modes to use in a modal formulation. In coupled fluid-structure analysis, LMODES specifies the lowest modes of the structural portion of the model and LMODESFL the modes of the fluid portion of the model. If LMODES (or LMODESFL) = 0, the retained modes are determined by the parameters LFREQ and HFREQ (or LFREQFL and HFREQFL).

In SOL 103, LMODES may be used to reduce the number of eigenvectors to be processed in data recovery which may significantly reduce the CPU and storage costs.

**Note:** If the MODESELECT Case Control command is used, it takes precedence over the parameters LMODES, LFREQ and HFREQ (or LMODESFL, LFREQFL and HFREQFL if MODESELECT refers to fluid modes). For the hierarchy of usage when the MODESELECT Case Control command is used in conjunction with these parameters, refer to the Remarks in the description of the MODESELECT Case Control command. See also the FLSFSEL Case Control command for an alternative selection.

## LOADU

Default = -1

See POST=0.

## LOOPID

Default = 0

LOOPID defines the desired loop number for initial conditions in a restart of SOLs 106, 129, 153, and 159. By default in SOLs 106 and 153 the restart proceeds from the last loop ID of the subcase defined by SUBCASID or SUBID. In SOLs 106, and 153 PARAM,SUBID or SUBCASID may also be specified.

## LSTRN

Replaced by the STRAIN Case Control command.

## MACH

Default = 0.0

Mach number. If more than one Mach number was used to compute aerodynamic matrices, the one closest to MACH will be used in dynamic aeroelastic response analysis. The default causes the matrices computed at the lowest MACH number to be used.

## MARALPHA

Default = 10, SOL 600 only.

Determines what type of coefficient of thermal expansion (CTE) is entered in the Nastran input file when CTE varies with temperature. For most Nastran solution sequences, such as SOL 106 and SOL 400, if CTE's vary with temperature, secant values need to be entered. This parameter specifies whether secant or actual values are entered at each temperature on curves using the TABLEM1 entry. In addition, it offers methods to convert the secant CTE's instantaneous values required by Marc. Please read MAT1 Remark 10 and MATHE Remark 8 for further details.

- 1 CTE's (vs temperature) are entered in the Nastran input as instantaneous values – no conversion is required (Warning if this option is used, the CTE's should only be used in SOL 600 and will produce incorrect results if used in SOL 106 or SOL 400).
- 0 CTE's (vs temperature) are secant values (as required by SOL 106, 129 and 400). They will be converted to instantaneous values using the formula immediately below for use in the Marc portion of SOL 600.

$$\alpha_i = A_i + \left( \frac{A_i - A_{i-1}}{T_i - T_{i-1}} \right) (T_i - T_{ref})$$

- 1 CTE's (vs temperature) are secant values and are converted to instantaneous values using the formula immediately below for use in the Marc portion of SOL 600.

$$\alpha_i = \frac{A_i(T_i - T_{ref}) - A_{i-1}(T_{i-1} - T_{ref})}{T_i - T_{i-1}}$$

- 2 CTE's (vs temperature) are secant values and are converted to instantaneous values using the average of the values computed by options 0 and 1.
- N Same as option 1 except N intermediate points are placed between each original CTE vs temperature value to increase accuracy. N must be 3 or greater. Testing has shown that for CTE's that change appreciably over the temperature range, N should be 10 or larger. The total number of points must not exceed 8000.

### Remarks:

1.  $\alpha$  is the actual (instantaneous) CTE
2.  $T$  is temperature  $T_{ref}$  is specified on MAT1 and other MAT entries.
3. At  $T(1)\alpha_1 = A_1$
4. The above equations are applied at mid temperatures. The first temperature is retained. Starting with the second temperature  $T_{iN} = 0.5 \cdot (T_i + T_{i-1})$  original. Since the new final temperature will be smaller than the original the user should ensure that the final average temperature is large enough to cover the applied temperature range of the analysis.
5. If the CTE's entered in the Nastran input file are secant values, it is recommended that MARALPHA=N with N set to a value of 20 or larger but less than 8000 divided by the number of points in the largest CTE vs temperature TABLEM1 entry.
6. Only option -1 was available prior to MD Nastran 2010 and MSC Nastran 2008.

### MARAUTOC

Default = 0, SOL 600 only.

Determines whether NLAUTO entries for SOL 600,129 will override the default or not.

- 0 Do not override the default. (Default)
- 1 NLAUTO initial time step and final time will override the defaults.

**Remark:**

The default for the initial time step is to use the DT value from the entry or the first non-zero time value on the TABLED1 entry divided by 100.0 whichever is smaller. The default for the final time is NDT\*DT from the entry or the last time point from the TABLED1 entry whichever is smaller.

**MARBATCH**

Default = 0, SOL 600 only.

Specifies whether Marc will be spawned from Nastran in the “batch” mode or not.

- 0            Marc will be spawned using batch=no. (Default)
- 1            Marc will be spawned using batch=yes.

**Note:** PARAM,MARBATCH,0 requires PARAM,MARCTEMP,1 (which is the default). This combination of parameters will place the Marc log file in the Nastran log file.

**MARBK105**

Default = 1, SOL 600 only.

This parameter controls whether linear buckling or nonlinear buckling eigenvalues are calculated for SOL 600,105.

- 1            Nonlinear eigenvalues are found. In other words, all loads are placed after Marc’s END OPTION and default values are used for CONTROL and AUTOSTEP. This option simulates what happens with SOL 106 or SOL 400.
- 1            Linear eigenvalues are found. In other words, all loads are placed before Marc’s END OPTION, a linear analysis is used to obtain the differential stiffness and eigenvalues are then calculated. This option simulates what happens with SOL 105. (Default)

**MARBK106**

Default = 1, SOL 600 only.

Controls whether linear buckling or nonlinear buckling eigenvalues are calculated for SOL 600,106.

- 1            Nonlinear eigenvalues are found. In other words, all loads are placed after Marc’s END OPTION and default values are used for CONTROL and AUTO STEP. This option simulates what happens with SOL 106 or SOL 400.
- 1            Linear eigenvalues are found. In other words, all loads are placed before Marc’s END OPTION, a linear analysis is used to obtain the differential stiffness and eigenvalues are then calculated. This option simulates what happens with SOL 106.

## MARC4401

Default = 0, SOL 600 only.

Determines whether recycling due to body to body contact occurs.

- 0 Recycling due to body to body contact can occur
- 1 Recycling due to body to body contact is prevented - will add feature,4401 to the Marc input

## MARC7601

Default = 0, SOL 600 only.

Determines whether large deformation RBE3 element will be used.

- 0 Use small deformation RBE3
- 1 Use large deformation RBE3

### Remarks:

1. MARC7601=0 sets FEATURE,7601 in Marc.
2. MARC7601=1 will not set FEATURE,7601.

## MARCASUM

Default is -1 for nonlinear analysis and 1 for linear analysis. SOL 600 only.

Marc's assumed strain formulation is used for plane stress, plane strain and solid elements (Marc types 3, 11 and 7). The assumed strain formulation improves the bending behavior of these elements and uses an enriched set of interpolation functions. Assumed strain should be off for analyses with a significant amount of plasticity. In determining the type of analysis (linear or nonlinear) for defaults of this parameter, the SOL 600, ID Executive statement is used. If ID is 106 or 129, the analysis is considered to be nonlinear and the default is -1. If ID is any other value, the analysis is considered to be linear and the default is 1. For nonlinear analyses without plasticity, this parameter should be turned on for models with solid elements.

- 1 Assumed strain is not used.
- 1 Assumed strain is used.

## MARCAUTO

Default = leave out parameter, SOL 600 only.

Determines which Marc's increment option is used.

- 1 NLPARM entries will be translated to Marc's AUTO STEP option. If contact is present, the number of steps (NINC) is less than 100, it will be reset to 100. Marc will adaptively reduce the number of steps if possible, however, this option forces the first step to be 1% of the total time. If the first step is too large, experience has shown that convergence problems may result. To start with a different initial time step, see options 999 or -999.
- 1 NLPARM entries will be translated to Marc's AUTO INCREMENT option. If contact is present, the number of steps is automatically set to 100. It has been found that certain difficult contact problems which fail using the AUTO STEP option run successfully using AUTO INCREMENT. This option is not available if the only "loading" is rigid contact or velocity control.
- 2 NLPARM entries will be translated to Marc's AUTO LOAD option with no adjustment in the number of steps. Use of the option is not recommended. This option is not available if the only "loading" is rigid contact or velocity control.
- 999 Marc's AUTO STEP option will be used with no adjustment in the number of steps whether or not contact is present. This option is not available if the only "loading" is rigid contact or velocity control.
- 999 Marc's AUTO INCREMENT option will be used with no adjustment in the number of steps whether or not contact is present. This option is not available if the only "loading" is rigid contact or velocity control.

See PARAM,MARCITER for a similar option. Do not use both MARCAUTO and MARCITER parameters.

## MARCAXEL

Default = 0, SOL 600 only.

Allows a combination of axisymmetric and plane stress elements for 2D analyses. This analysis technique is sometimes used for approximate turbine disk/blade analysis.

- 0 The combination, if present in the input data will cause a Severe Warning and Marc will not be spawned.
- 1 Combination is allowed and all CQUAD4, CQUAD8, CQUADR, CTRIA3, CTRIA6, CTRIAR elements will be considered to be plane stress and mate with CTRIAX6 elements.

## MARCBEAM

Default = -1, SOL 600 only.

- 1 All CBEAM elements which reference PBEAML will be mapped to Marc element type 14 for all cross if any CBEAM elements in the model reference MATS1 or MATEP entries. Full plasticity is available for all such cross section shapes with this option. CBEAM cross sections specified using PBEAM (where only A, I, J are available) will be mapped to Marc element 98 and remain elastic even though they might reference MATS1 or MATEP.
- 0 CBEAM will be mapped to Marc element type 14 for all cross sections specified with PBEAML. Full plasticity is available for all such cross section shapes with this option. CBEAM cross sections specified using PBEAM will be mapped to Marc element 98 and remain elastic even though they might reference MATS1 or MATEP.
- 1 All CBEAM elements will be mapped to Marc element type 98 and remain elastic regardless of whether the cross section is specified using PBEAM or PBEAML or whether they reference MATS1 or MATEP.

**Remark:**

If PBMARB6 or PBMNUM6 beam properties are used, MACRBEAM must be set to zero which automatically activates the new forms of Marc element 98 that can include plasticity.

**MARCBODY**

Default=0, SOL 600 only.

Control the logic when the specified value of NBODIES entry on BCPARA bulk data card does not match the actual number of contact bodies in the model.

- 0 Analysis continuing with number of bodies actually in the model
- 1 Analysis continuing with number of bodies specified on NBODIES entry on BCPARA bulk data card. (This may produce exit 13 in Marc)

**MARCBUSH**

Default = -1.0 if parameter is not entered, no “small” stiffness will replace zero stiffness terms, SOL 600 only.

Determines whether “small” stiffness values will be used instead of zero for the stiffness values in various directions of CBUSHi elements.

- 1.0 No “small” stiffness terms will replace zero stiffness values in any direction.
- 0.0 Stiffness values of 0.01\*Kmax will be added for any direction that is zero Marc input (applies to both translational and rotational directions)
- Value The value entered will be used to calculate  $\text{stiffness} = \text{Value} * K_{\text{max}}$  to replace any zero stiffness values (applies to both translational and rotational directions)

**MARCCBAR**

Default = 0, SOL 600 only.

Specifies whether CBAR will be replaced by CBEAM for SOL 600.

- 0      CBAR is not replaced by CBEAM.
- 1      CBAR is replaced by CBEAM (PBAR is replaced by PBEAM, PBARL is replaced by PBEAML).

**Note:** Use of this parameter is not usually required but might be beneficial in combination with PARAM,MSPEEDSE,1 to speed up translation of models with a large number of CBAR elements particularly when there are a large number of PBAR entries or PBARL entries.

## MARCCENT

Default = 0, SOL 600 only.

Controls where the element output is generated.

- 0      Element output from Marc will be generated for each integration point.
- 1      Element output from Marc will be generated at the center of each element only. This option saves disk space and computer time, but may not catch the maximum stresses or strains. Because the residual load calculation is not accurate, this should not be used in a nonlinear analysis.

## MARCCON2

Default = Program determines value, SOL 600 only.

- Value      If entered, the integer value entered is the second value on Marc's CONTACT second entry representing the maximum number of entities to be created for any contact surface.

## MARCCON3

Default = Program determines value, SOL 600 only.

- Value      If entered, the integer value entered is the third value on Marc's CONTACT second entry representing the maximum number of nodes that lie on the periphery of any deformable contact surface.

## MARCCPY

If MARCCPY is specified, Marc files will be copied to Nastran output files and/or deleted according to the option (0, 1, or 2) shown below.

MARCCPY Option	Copy Marc Output Files to Nastran Output Files	Delete Marc Input & Output Files
0 (Default)	No	No
1	Yes	Yes
2	Yes	No
3	No	Yes

If MARCCPY is 1 or 2, the out and log files will be copied as produced by Marc. If MARCCPY is -1 or -2 the actions as shown above for +1 or +2 will occur, and Marc-type test will be converted to Nastran-type text using and ASCII file named marcfilt.txt which must be located in the same directory where the Nastran input resides or in the same directory where the Nastran executable resides.

The following Marc files are potentially affected by the MARCCPY option:

Marc Output File	Nastran Output Copied to	MARCCPY
name.marc.out	name.f06	1, 2, -1, -2
name.marc.log	name.log	1, 2, -1, -2
name.marc.t16	not copied, will remain if produced	
name.op2, fort.11, or ftn11	not copied, will remain if produced	

## MARCDEF

Default = 2, SOL 600 only.

- 0 SOL 600 default options for Marc will be set to values determined to be best for Nastran-type problems (for MARCDEF=0, Marc's SHELL SECT parameter will be set to 11 if the value of MARCDEF is zero.
- 1 Default values will be set to current Marc standard (Mentat) values.
- 2 Default values will be set to "improved" Marc default values agreed on by the Marc and Nastran development groups.

Default values affect the following Marc input data entries and fields:

MARCDEF Value	MARC Implicit Entry Type	Field	Value
0	control	2	10
0	Auto Step	5	0.01*max time
0	Auto Step	8	10
0	Auto Step	10	1

MARCDEF Value	MARC Implicit Entry Type	Field	Value
1	control	2	3
1	Auto Step	5	1.0E-5*max time
1	Auto Step	8	5
1	Auto Step	10	0
2	control	2	10
2	Auto Step	5	1.0E-3*max time
2	Auto Step	8	5
2	Auto Step	10	1

**Note:** For MARCDEF=0, the first three values were found to provide better convergence and the last (auto step 10) allows snap-through solution to converge correctly without having to use arc-length methods. This parameter can be set in the system-wide rc file as well as the user's rc file or the local rc file (same directory as the Nastran input data to provide the selected set of defaults for all runs if so desired. If the parameter is entered in the Nastran input data file, it will override any parameters set in any of the rc files.

## MARCDILT

Default = 0, SOL 600 only.

If omitted, SOL 600 determines the value.

- 0 Constant dilatation is not used.
- 1 Constant dilatation formulation is used for solids, axisymmetric, and plane strain elements (advance nonlinear element types 7, 10, 11, 19 and 20) if the model includes any of these element types. For elastic-plastic and creep analysis this formulation is usually too stiff when constant dilatation is not used. MARCDILT=1 and MARCASUM=1 should not both be used.

## MARCDIS2

Default = Program determines value, SOL 600 only.

- Value If entered, this integer value entered here is the second value on Marc's DIST LOADS ("parameter" Section 2 of Marc's Volume C Program Input) entry representing the maximum number of different lists of distributed loads.

## MARCDIS3

Default = Program determines value, SOL 600 only.

**Value**        If entered, the integer value entered here is the third value on Marc's DIST LOADS ("parameter" Section 2 of Marc's Volume C Program Input) entry representing the maximum number of elements in any particular distributed loads list.

## MARCDIS4

Default = Program determines value, SOL 600 only.

**Value**        If entered, the integer value entered here is the fourth value on Marc's DIST LOADS ("parameter" Section 2 of Marc's Volume C Program Input) entry representing the maximum number of nodes with point loads applied.

## MARCDMIG,N

Default = 0, SOL 600 only.

If matrices or loads are entered using K2GG, M2GG, B2GG, K2PP, M2PP, B2PP, P2G in the Nastran Case Control Section, they will be translated to Marc as follows depending on the value of N:

**N=0**        All DMIG's in the Nastran file (and include files) will be placed in the Marc input file whether used or not.

**N>0**        All DMIG's in the Nastran file (and include files) will be placed on a new file named dmigxxx.dmi where xxx is the value of N. This new file will be "included" in Marc using a Marc include statement. For example, if N=100 the file name will be dmig100.dmi if N=25765 the file is dmig25765.dmi. N must not exceed a value of 999999.

**Note:** This parameter is ignored for External Superelements (if the MESUPER Bulk Data entry is present).

## MARCDUPE

SOL 600 only.

Controls whether SOL 600 will check for duplicate entries for most every type of bulk data entry. SOL 600 does not allow duplicate entries, but the portion of IFP that runs prior to spawning Marc does not usually check for duplicate entries.

**1**        Duplicate entries will be checked and exact duplicates are found, the job will fatal out.

**2**        In addition to option 1, entries will be checked and if duplicate ID's (field 2 for most entries or field 3 for loads) are found, the job will fatal out.

**-1**       Duplicate entries and ID's will not be checked (this is desirable for certain models)

## MARCDYND

Integer, Default = 0

Determines whether dynamic loads with “advanced table input” will be used in SOL 600.

- 0 Do not use advanced table input for dynamic loads
- 1 Use advanced table input for dynamic loads

If MARCDYND=1, PARAM,MARCTOTD,1 and PARAM,MARCTOTT,1 must also be set.

## MARCEKND

Default = 0, SOL 600 only.

- ID Selects the type of strain results to be placed in a Nastran op2 file (if a request for an op2 file is made). ID can take the following values:

MARCEKND=0, Total strains will be processed

MARCEKND=1, Plastic strains will be processed

MARCEKND=2, Elastic strains will be processed

For creep analyses, creep strain is output if a request for strain output is made.

## MARCEXIT

Default = 0, SOL 600 only.

- 0 If one of the COPYR options on the SOL 600 statement is specified, Nastran will process these options and then a DMAP exit will occur.
- 1 The COPYR options will be processed and Nastran will not exit.

## MARCFEAT,N

SOL 600 only.

If entered will add FEATURE,N to the Marc input file in the Parameters Section.

- N Feature to be added, for example PARAM,MARCFEAT,5102 will generate a heat transfer thermal contact file jid.marc.nthcnt

Only one PARAM,MARCFEAT may be entered.

## MARCFILI

No Default, SOL 600 only.

Name Name a file name limited to 8 characters (16 characters if param\* is used) used in conjunction with one of the CONTINUE options on the SOL 600 statement. For example, if CONTINUE=1 on the SOL 600 statement and PARAM,MARCFIL1,DMIG44 is entered, friction stiffness and possibly damping) matrices are created in DMIG format by Marc and placed on file DMIG44. The various CONTINUE options use the following MARCFILi entries:

Continue Option	MARCFILi	SOL Executed	K2GG/K2PP
1.	MARCFIL1	107	K2GG
2.	MARCFIL2	107	K2GG
3.	MARCFIL3	111	K2PP
4.	MARCFIL1	112	K2PP
5.	MARCFIL1	*	*
6.	MARCFIL1	110	K2GG
7.	MARCFIL1	103	K2GG

**Remarks:**

- For most continue options other than brake squeal models, the Marc portion of SOL 600 will produce files with very long names such as jid.marc.conmpc\_0007. These file names are too long for a Nastran parameter field even if PARAM\* is used. The solution is to specify a short name such as PARAM,MARCFIL1,ABCD.TXT  
 Inside ABCD.TXT place an include line for the actual file desired, such as  
 INCLUDE 'myjob.marc.conmpc\_0007'  
 Where myjob would be replaced by the actual JID of the primary Nastran run without the bdf or dat extension.
- If INITCON=4 on the BCPARA entry is specified contact MPC's for each increment will be out on a file named jid.marc.conmpc\_incr (if the increment is 7 it would be jid.marc.conmpc\_0007).
- If the DMIGOUT Bulk Data entry is used, DMIG's will be produced in the form jid.marc\_cglsti\_incr. See the description of DMIGOUT for further details.
- For most cases, the difference between jid.marc.conmpc\_last and jid.marc.conmpc.0001 is not large enough to affect the subsequent analysis significantly. To be sure that the last jid.marc.conmpc\_XXXX is used specify the following  
 param,marcfil1,lastt  
 Nastran will search for all jid.marc.conmpc\_\* files and choose the one with the largest \_XXXX. If no jid.marc.conmpc\_\* files exist, the job will terminate with an fatal error message.

## MARCFRIC

Default = 0.0, SOL 600 only.

When the Case Control command, BCONTACT = ALL is specified, no other 3D contact data is required in the input file, except that the Coulomb coefficient of friction may be entered using the value of this parameter. Do not enter this entry if contact surfaces are specified in the Bulk Data.

## MARCGAPD, D

Default is U0 of the PGAP entry, SOL 600 only.

- D        Depending on the value of PARAM,MARCGAPP, enter the gap closure distance for fixed direction gaps or the minimum distance between end points for the true distance gap. If  $d > 0$ , the two end points are never closer than a distance  $|d|$  apart. If  $d < 0$ , the two end points are never farther apart than  $|d|$ .

## MARCGAPN, ID

No Default, SOL 600 only.

- ID        ID of gap element for which the immediately following PARAM,MARCGAPP and PARAM,MARCGAPD apply. Unlike most other parameters, several sequences of parameters MARCGAPN, MARCGAPP and MARCGAPD may be entered to specify values for all gap elements. If no MARCGAPN is entered, the values entered for MARCGAPP and MARCGAPD will be used for all gaps in the model.

## MARCGAPP

Default = 0, SOL 600 only.

- 0        Nastran gap elements will be translated to Marc fixed gap elements.  
1        Nastran gap elements will be translated to Marc True Distance gaps.

## MARCGAUS

Default if parameter is not entered = 1, SOL 600 only.

- 1        SOL 600 output stresses and strains will be at the Gauss points for solid elements and extrapolated to the corner points for plates/shells elements. Strains are handled the same way as stresses.

- 2 SOL 600 output stresses and strains will be at the center and at the grid points for solid elements (the maximum stress from any Gauss point is determined and compatible stresses for that Gauss point are placed at the center and at each of the grid points). Shell/plate stresses are at the center (top and bottom surfaces). The maximum Gauss point stress at each surface is found and a compatible set of stresses at that Gauss point are placed in the center of the surface. Strains are handled the same way as stresses.
- 3 Solid stresses/and strains are the same as option 1 and shell/plate stresses and strains are the same as option 2.

If this parameter is entered with values of zero or less or values greater than 3, it will be reset to 1.

## MARCGLUE

Default = 0 if parameter is not entered, SOL 600 only.

If MARCGLUE is set to 1, all contact surfaces will be glued whether or not IGLUE=1 is specified on the BCTABLE entry or not.

- 0 IGLUE on BCTABLE entries specifies whether or not glued contact is used
- 1 IGLUE on BCTABLE entries will be ignored and glued contact will be used for all contact surfaces.

### Remark:

For this parameter to function BCTABLE entries must be entered (do not set BCONTACT=ALL).

## MARCRAV

Integer, Default = 0

Determines whether PARAM,MNASTLDS,777 will automatically be set if multiple GRAV entries are present in any subcase. This is determined in a simplified fashion by comparing the number of GRAV entries to the number of subcases to save computer time.

- 0 Set PARAM,MNASTLDS,777 for multiple GRAV entries.
- 1 Do not set PARAM,MNASTLDS,777 regardless of the number of GRAV and SUBCASE entries.

## MARCHOST

No Default, SOL 600 only.

Determines the name of a hostfile to be used with SOL 600 parallel runs. If this parameter is missing, no host file is used and the parallel run will run on one machine. That machine may have several processors and as many processors as specified on the PARAMARC Bulk Data entry will be used. If

PARAM,MARCHOST,Name is specified, the hostfile must be generated by the user in a format acceptable to Marc (see the *Marc and Marc Mentat Installation and Operations Guide*). Each line of the hostfile normally

lists how many processors are used on each machine. If PARAM\*,MARHOST is entered, the name is limited to 16 characters (all lower case).

## MARCIAMN

Default = 1, SOL 600 only.

- 0 Nastran is directed to spawn Marc (as specified by the SOL 600 Executive Control statement or PARAM,MARCRUN), using a full version of Marc. Standard Marc licensing is required.
- 1 A special version of Marc is spawned by Nastran. This version of Marc may have certain features that are not available in the full version. Marc will be spawned from Nastran with the additional command line switch - iam nanl. The licensing for both Nastran and Marc reflect this situation. This option applies only to Marc version 2003 or later. If PARAM,MARCVERS points to a Marc version earlier than 2003, MARCIAMN will be set to zero and a full version of Marc is required.

The parameter may be set in the system-wide rc, the user rc file or as an environmental variable using NASM\_IAMN=0 or 1 (similar to the way values on the SOL 600 statement are set).

## MARCINTC

Default = 2.

Option to ignore or fatal SOL 600 if any CINTC Bulk Data entries are found This option will also ignore or issue a warning for GMBNDC entries.

- 0 Fatal job if any CINTC entries are found (also issue warning messages if any GMBNDC entries are found).
- 1 Ignore all CINTC and GMBNDC entries in SOL 600.
- 2 Generate the MPC's for CINTC/GMBNDC and combine them with standard MCP entries (if they exist), then use them in the SOL 600 analysis (SOL 600 only).

### Remark:

MARCINTC=2 spawns a secondary SOL 100 Nastran job to generate MPC's for the CINTC's. Licenses from the primary job are released, then reclaimed after the secondary job terminates. The secondary job stops prior to decomp and uses the standard SOL 101 licenses.

## MARCINTF

Default = 1.0D-6.

Threshold value below which MPC coefficients generated by CINTC/GMBNDC are not considered. This parameter is ignored unless PARAM,MARCINTC,2 has been entered.

## MARCITER

Default = 0, SOL 600 only.

Used to control fixed time stepping in SOL 600.

- 0 Fixed time steps or auto time steps will be controlled by PARAM,MARCAUTO.
- N Allows fixed time steps to be used without needing to set the maximum and minimum times to nearly the same value (using Marc's AUTO STEP option). This parameter triggers true fixed time stepping with the other advantages AUTO STEP has over methods such as AUTO LOAD. For example, it uses better numerical damping. If this parameter is entered with a positive integer (N), a value of 2 is placed in the AUTO STEP field 9 and N is placed in field 7.
- 1 This option is similar to PARAM,MARCITER,N (fixed time stepping will be used) except that the time comes from the NLPARAM or entry. This option is not available if the only "loading" is rigid contact or velocity control. See PARAM,MARCAUTO for a similar option. Do not use both MARCAUTO and MARCITER parameters.

### MARCL001

Default = -1, SOL 600 only.

Determines whether Marc's POINT LOAD (without tables) 2<sup>nd</sup> datablock, 3<sup>rd</sup> field will be honored or not. If this value is set to 1 multiple loads at the same dof in the same subcase will usually be summed (however, see item d.).

- 1 The 2<sup>nd</sup> datablock 3<sup>rd</sup> field will be set to 1 (see Remark)
- 1 The 2<sup>nd</sup> datablock 3<sup>rd</sup> field will not be set to 1. If it is necessary to sum the loads, this must be accomplished in one of several ways:
- a. Summed in the GUI or other method of data input
  - b. By setting PARAM,MNASTLDS,1
  - b. By setting PARAM,MARCTOTT,1
  - d. For certain simple multiple force/moment cases, SOL 600 can sum them and PARAM,MNASTLDS,1 must be specified to prevent loads from being specified multiple times. However, it may be difficult to determine whether the loads are complex or not, so the use of either option c or b is recommended.

#### Remarks:

1. For releases prior to MD Nastran 2010 and MSC Nastran 2009, this field was set to 1 to automatically sum any forces or moments that might have been entered more than once by the GUI (see PARAM,MNASTLDS for a discussion of ways this can happen). This field, when set to one, allows loads entered more than once at the same grid ID in the same subcase to be summed. However, experience shows that this field does not work in certain circumstances, particularly when "total loads" using PARAM,MARCTOTL are requested. PARAM,NASTLDS has been added beginning with MD Nastran 2010 and MSC Nastran 2009 to handle the cases where the 2<sup>nd</sup> datablock 3<sup>rd</sup> field does not work as expected.

2. To maintain backward compatibility with previous runs, set the following parameters:  
 PARAM,MARCL001,1  
 PARAM,MNASTLDS,0  
 PARAM,MARCTOTL,0  
 PARAM,MARCTOTT,0
3. If PARAM,MARCTOTL,1 is entered, PARAM,MARCL001,1 will be set unless PARAM,MARCL001,-1 is entered.
4. This parameter may be set in RC files.

## MARCLOWE

Default = 0, SOL 600 only.

Used in conjunction with superelement matrices created by Marc.

- |   |  |
|---|--|
| 0 | Standard modulus values for all materials will be used.  |
| 1 | All modulus of elasticity values will be changed to 1.0E-9 for the second Nastran run (when Nastran spawns another Nastran run using the SOL 600 continue option. This option is sometimes necessary for cases where Marc creates a superelement or substructure stiffness matrix but does not create a mass matrix. In this case, the second Nastran run will create the mass matrix using standard elements, density and other concentrated and distributed masses but the stiffness created by Nastran will be very low. Essentially the entire stiffness of the model will come from the stiffness matrices created by Marc. |

## MARCLUMP

Default = 0, SOL 600 only.

- |   |  |
|---|--|
| 0 | Consistent mass will be used for SOL 600 transient dynamics or eigenvalue problems with rotational masses (if applicable). (Default) |
| 1 | Lumped mass will be used for SOL 600 transient dynamics or eigenvalue problems with rotational masses (if applicable).               |
| 2 | Consistent mass will be used for SOL 600 transient dynamics or eigenvalue problems without rotational masses.                        |
| 3 | Lumped mass will be used for SOL 600 transient dynamics or eigenvalue problems without rotational masses.                            |

### Remark:

This parameter is only used with dynamic analysis.

## MARCMAT2

Default = -1.0, SOL 600 only.

Used if  $g_{33} = 0.0$  on MAT2 entries. Marc will diverge if  $g_{33} = 0.0$  for MAT2 entries. If the value entered is positive, the value is a multiplier of  $g_{11}$  and  $g_{22}$  to calculate  $g_{33}$  as follows:

$$g_{33} = \text{marcmat2} * (g_{11} + g_{22})$$

### MARCMAT3

Default = 1, SOL 600 only.

Used if Nastran has generated MAT2 from PCOMP and the MID of MAT2 is 30000001 is greater corresponding to MID3 for PSHELL.

If the value entered is 0, this entry is ignored regardless of the MAT2 MID value.

If the value entered is 1 the MAT2 entry will be mapped to Marc's ANISOTROPIC entry such that all  $C_{ij}$  are zero except the following:

$$C_{55} = g_{11}$$

$$C_{56} = g_{12}$$

$$C_{66} = g_{22}$$

If the value entered is 2 the MAT2 entry will be mapped to Marc's ANISOTROPIC entry such that all  $C_{ij}$  are zero except the following:

$$C_{44} = g_{11}$$

$$C_{45} = g_{12}$$

$$C_{55} = g_{22}$$

$$C_{66} = g_{22}$$

If the value entered is 11 the MAT2 entry will be mapped to Marc's ANISOTROPIC entry such that all  $C_{ij}$  are zero except the following:

$$C_{55} = g_{11}$$

$$C_{56} = g_{12}$$

$$C_{66} = g_{22}$$

If the value entered is 12 the MAT2 entry will be mapped to Marc's ANISOTROPIC entry such that all  $C_{ij}$  are zero except the following:

$$C_{44} = g_{11}$$

$$C_{45} = g_{12}$$

$$C_{55} = g_{22}$$

$$C_{66} = g_{22}$$

**Note:** This entry is ignored unless the MAT2 MID is greater than 30000000.

### MARCMATT

Default = -1 if parameter is not entered, SOL 600 only.

Determines if Marc input file will be created with materials using the table-driven formats or not.

- 1 Table-driven formats for materials will not be used. (Default)
- 1 Table-driven formats for materials will be used

**Remark:**

This parameter can be set in RC files.

**MARCMEM, Value**

Default = Program determines value, SOL 600 only.

**Value**        If entered, the integer value entered here is the second field on Marc's SIZING entry (MAXALL) and is the main memory specification for memory in Marc. This value is entered in MW (the program multiplies it by 1,000,000). For example, if a value of 350 is entered, the number of 350000000 will be placed in the second field of the SIZING entry.

**MARCMID3**

Default = 0, SOL 600 only.

Controls whether MID3 will be set to the same value as MID2 when the Marc PSHELL option is used (designated by PARAM,MRPSHELL,1 or when the SMEAR option is used on the SOL 600 Executive Control statement.)

- 0        MID3 will not be changed (if zero or blank, it will remain zero or blank). (Default)
- 1        MID3 will be set to MID2. This improves the singularity ratio in some problems without appreciably changing the results particularly when orthotropic material properties are used. It is not necessary if PARAM,MMAT2ANI,11 or a similar option is used to specify anisotropic material properties.

**MARCMNF**

Default = 0, SOL 600 only.

Controls creation of an Adams MNF file by Marc for eigenvalue analysis when Marc is spawned from SOL 600.

- 0        MNF file will not be created. (Default)
- 1        MNF file will be created (for Marc 2003, the MNF file is located in the .t19 file, so PARAM,MARCT19,1 must also be specified).

**Note:** It is not necessary to use this parameter if the MDMIOUT Bulk Data entry is used to request an MSC Adams MNF file.

**MARCMPC**

Default = 0, SOL 600 only.

Determines whether SOL 600 converts MPCs to stiff beams or not.

- 0 MPC's are not converted to stiff beams. (Default)
- 1 MPC's are converted to stiff beams.

**Note:** PARAM,MARCMPC,1 should not be used if RBE's are converted to MPC's using PARAM,MARCRBE2 or PARAM,MARCRBE3.

## MARCMPII

Integer, Default = 2 for DDM parallel executions, SOL 600 only.

Determines whether the MPI service on PC systems will remain running after the job finishes.

- 1 The MPI service will remain running after SOL 600 finishes
- 1 The Intel MPI service, ismpd.exe will be uninstalled before SOL 600 terminates.
- 2 The Intel MPI service, ismpd.exe will be started before each Marc execution and terminated at the end of each Marc execution from within the Nastran portion of SOL 600.
- 771 MSMPI rather than Intel MPI is requested (starting and/or stopping of the ismpd.exe Intel MPI service is ignored)

### Remarks:

1. If SOL 600 terminates abnormally the service may remain running regardless of the value of this parameter.
2. Leaving the MPI service running will speed up the execution of multiple jobs.
3. This parameter may be entered in RC files.
4. Although ismpd.exe is started by the Marc script, it sometimes fails to start properly unless started outside the script. The user can either do this in his own script or set MARCMPII=2 to have Nastran do it. Either of these options improves reliability of the Intel MPI starting.

## MARCN99

Default-see below. SOL 600 only.

Determines whether a set in the Marc input file to output all nodal quantities will be generated or not. If MARCN99=1, all Case Control nodal output requests must have the PLOT qualifier or the job may fail.

- 1 A set named ND999999 will be generated to output all nodes for at least one type of nodal output. This is the default of all Case Control nodal requests do not have (plot).
- 1 The set will not be generated. If all nodal Case Control requests have (plot) such as DISP(PLOT)=ALL, ACCEL(PLOT)=ALL, etc. the default is 1 even if the parameter is not entered.

## MARCNOER

Default = 0, SOL 600 only.

Determines action to take when unsupported features are encountered.

- 0 The internal Marc translator will stop and generate FATAL ERRORS if unsupported features in Marc or in the internal translator are encountered.
- 1 If unsupported features are encountered, they are ignored, no FATAL ERROR messages are issued and if requested, Marc will be executed.

## MARCOFFT

Default = -1, SOL 600 only.

Controls whether Nodal Temperatures are specified at the original or offset grid point or both grid points for beams and shells with offsets or connected by RBE2's (see note 2) when PARAM,MAROFSET is set to 0,2,3. For the default MAROFSET=1 where Marc handles the offsets and RBE2's are not added, this parameter is not applicable and will be reset to -1 internally. Applies only if MAROFSET=0.

- 0 Temperatures are applied both at the original grid point and at the offset grid point.
- 1 Temperatures are applied at the original grid point only.
- 2 Temperatures are applied at the offset grid point only.
- 1 Temperature loading is not altered in any way from the Nastran input.

**Note:**

1. Processing time can increase significantly if beam or shell offsets are present and param,marcofft is zero or greater unless PARAM,MOFFCORE,1 is used.
2. If nodes are connected by RBE2's and a temperature is applied at an independent node, the temperature will be applied at the independent node and the first dependent node of the rbe2 if MARCOFFT=0.
3. If MAROFSET is 0, 2 or 3 and a node has applied temperature and is also a part of a standard RBE2 with many grids, the job may abort or the results can be wrong.

## MARCONTF

No Default, SOL 600 only.

- Name Name of a file name limited to 8 characters (16 characters if param\* is used) used in conjunction with one of the CONTINUE options on the SOL 600 statement. If entered this file will be used as the input file for the second Nastran execution (after Marc has finished). If specified, this file will be used instead of automatically creating a file named jid.nast.dat from the original jid.dat input. This option allows more versatility in achieving exactly what is desired in the Nastran continuation run input at the expense of additional input data preparation.

## MARCOOCC

Default = 0, SOL 600 only.

- 0 Standard Marc memory management will be used. If the memory is sufficient the decomposition will be in core. If the memory requirements are too large, an out of core solution will take place.
- 1 An out of core solution will be forced if solvers 0, 2, 4 or 8 are used. This option triggers Marc parameter, OOC (without any other characters).
- 2 An out of core solution will be forced if solver 0, 2, 4 or 8 are used - available starting with Marc 2005 r2. This option generates Marc parameter OOC,0,1.
- 3 Same as option2 except Marc parameter version,4902 will be added. This option triggers Marc parameter OOC,0,1 plus version,4902.

## MARCOPT

Default = 9, SOL 600 only.

Determines which bandwidth optimizer is to be used.

- 0 Marc does not optimize the bandwidth.
- 2 Cuthill-McKee bandwidth optimization is used
- 5 External user-supplied bandwidth optimization is used
- 9 Sloan bandwidth optimization is used. (Default)
- 10 Minimum degree bandwidth optimization is used (only available with the sparse solver)
- 11 Metis nested dissection algorithm (only available with multifrontal direct sparse solver)
- 9999 Set MARCOPT to -9999 if the OPTIMIZE entry is not wanted in the Marc file for example with use by the iterative solver.

## MARCOSET

Default = 0, SOL 600 only.

Determines whether SOL 600 set names will be standard sets or “open sets” for nodes and elements. The standard Marc sets are:

DEFINE, ELEMENT, SET, PR00001  
DEFINE, NODE, SET, ND001

The Marc open sets (OSET) are:

DEFINE, ELEMENT, OSET, PR00001  
DEFINE, NODE, OSET, ND001

- 1 Standard sets are defined.

- 0 Standard sets are defined for small models and open sets are defined for large models.
- 1 Open sets are defined.

**Note:** For Parallel (DDM) analyses, it is sometimes necessary to set MARCOSET=1.

## MARCOTIM

Default = 0, (SOL 600 only and is mapped to Marc's POST 2nd line 9th field.

Determines if Marc is to be processed at selective or at all output times.

- 0 or 1 Marc output data will be processed by Nastran at all converged output times. This option is similar to INTOUT=YES on the NLPARM entry.
- 2 Marc output data will be processed by Marc only at times near 1.0, 2.0, 3.0, etc. For this option, no additional output times will be available in the Marc .t16 and/or .t19 output files. This option is similar to INTOUT=NO on the NLPARM entry.
- N Marc output data will be processed by Marc every Nth increment for the .t16 and/or .t19 output files. (N > 2)

## MARCOUTR

Default = 1 if Marc single file parallel input is used, Default = 0 if Marc multiple file inputs are used, see Note, SOL 600 only.

Determines how Marc t16 file results will be handled for SOL 600 parallel processing.

- 0 Multiple t16 files, one for each domain will be produced.
- 1 A single t16 file will be produced by Marc. This option requires Marc 2005 or later versions and the parallel run made using the "single file" input (PARAMARC KIND=0). (Default)

**Note:** Whether single file or multiple Marc inputs are used for parallel processing is determined by the PARAMARC Bulk Data entry.

## MARCPARR

Default = 0, SOL 600 only.

Controls options for splitting an Marc file into parts for DDM.

- 0 All Marc files will be created during this run. (Default)
- 1 Nastran will be stopped after the single-processor file has been created and before DDM files are created. If desired, all files may be copied to a backup directory for use with MARCPARR=2.

- 2 The parallel files will be created starting with the single processor file created using the MARCPARR=1 option.
- 3 Same as MARCPARR=2 except the debug option MARCBUG=1 is turned on.

## MARCPENT

Default = 0, SOL 600 only.

Option to specify if CPENTA is mapped to Marc brick element with degenerate nodes or actual penta elements (see Remarks).

- 0 Map CPENTA to Marc brick elements with degenerate nodes. (Default)
- 1 Marc CPENTA to actual Marc penta elements.

### Remarks:

1. Option zero is the default to maintain backwards compatibility.
2. The t16 to op2 version is not available for option 1. That means no op2, xdb, f06 or punch file is available for option 1. Postprocessing must occur using the t16 or t19 file if option 1 is used.
3. Speed options such as invoked using param,mspeedse are available using option 1 only.

## MARCPINN

Default = 0, SOL 600 only.

- 0 Pin flags will be included by created new nodes and appropriate MPC's by the translator in Nastran. (Default)
- 1 Pin flags will be ignored and the translator will continue.
- 2 A severe warning will be issued and Marc will not run.
- 3 The new Marc PIN CODE option will be used. feature,6901 will also be used so that extra nodes are not introduced.

### Remark:

This parameter can be set in RC files.

## MARCPLAS, n

Default = 3 if there is plasticity in the model. SOL 600 only.

This parameter effects the value of Marc's PLASTICITY parameter. The value of n can range from 0 to 6 (0 is the same as 3).

- 1 Additive decomposition using the mean normal method; small strain formulation
- 2 Additive decomposition using the radial return method; small strain formulation.

- 3 Additive decomposition using the mean normal method; large strain formulation using the updated Lagrange procedure.
- 4 Additive decomposition using the radial return method; large strain formulation during the updated Lagrange procedure.
- 5 Multiplicative decomposition (FeFp) using the radial return method and the three field variational principle; large strain formulation using the updated Lagrange procedure.
- 6 Advance nonlinear elements type 3 and 26 (plane stress), 18 and 30 (membrane) using multiplicative decomposition with the radial return method; large strain formulation using the updated Lagrange procedure.
- 1 Ensures that the Marc PLASTICITY parameter will not be used.

## MARCPOS

SOL 600 only.

Determines whether to terminate Marc if a non-positive definite matrix is attempted.

- 0 The run will terminate if a non-positive definite matrix decomposition is encountered.
- 1 Non-positive definite matrices will be solved.

## MARCPOST

Default, SOL 600 only.

Determines the format for the .t16 and .t19 files.

- 1 The .t16 and .t19 files will be created using the Marc default for the version of Marc that is executed.
- 0 Same as MARCPOST=9.
- 1 The .t16 and .t19 files will be created using Marc K2 formats.
- 3 The .t16 and .t19 files will be created using Marc K3 formats.
- 4 The .t16 and .t19 files will be created using Marc K4 formats.
- 5 The .t16 and .t19 files will be created using Marc K5 formats.
- 6 The .t16 and .t19 files will be created using Marc K6 formats.
- 7 The .t16 and .t19 files will be created using Marc K7 formats.
- 8 The .t16 and .t19 files will be created using Marc K8 formats.
- 9 The .t16 and .t19 files will be created using Marc 2000 formats.
- 10 The .t16 and .t19 files will be created using Marc 2001 formats.
- 11 The .t16 and .t19 files will be created using Marc 2003 formats.

- 12 The .t16 and .t19 files will be created using Marc 2005 formats.
- 13 The .t16 and .t19 files will be created using Marc 2005 r3 formats.

**Note:** It is suggested that a small test case be executed and tested with your postprocessor to determine what version is necessary for your postprocessor.

### MARCPR99

Default-see below. SOL 600 only.

Determines whether a set in the Marc input file to output all elemental quantities will be generated or not. If MARCPR99=1, all Case Control element output requests must have the PLOT qualifier or the job may fail.

- 1 A set named PR999999 will be generated to output all elements for at least one type of element output. This is the default if all elemental Case Control requests do not have (plot).
- 1 The set will not be generated. If all elemental Case Control requests have (plot) such as STRESS(PLOT)=ALL, STRAIN(PLOT)=ALL, etc. The default is 1 even if the parameter is not entered.

### MARCPRN

SOL 600 only.

Controls the amount of contact information printed.

- 0 Detailed contact information is not printed.
- 1 Detailed contact information is printed (this is equivalent to Marc parameter PRINT,2,8).
- 2 Somewhat less detailed contact information is printed (this is equivalent to Marc parameter PRINT,2). Print constraint matrices associated with MPC's, RBAR, RBE2, RBE3 and the formable to deformable contact.
- 5 Marc print option. PRINT,5 will be used. Prints messages when changes in contact status occur.
- 25 Marc print options. PRINT,2,5 will be used.
- 258 Marc print options. PRINT,2,5,8 will be used. In addition to 2 and 5, also prints the displacement and reaction forces in the local coordinate system associated with formable to rigid contact.

For other print options, use the MARCIN Bulk Data entry.

### MARCPRNG

Default = 0, SOL 600 only.

Determines whether geometry is printed in the Marc .out file.

- 0 Most geometry printing is suppressed.
- 1 All geometry is printed.

## MARCPNR

Default = 0, SOL 600 only.

Determines whether nodal stress and strain output is printed in the Marc .out file.

- 0 Nodal, stress and strain printing is suppressed.
- 1 Nodal, stress and strain printing will occur if Case Control options request it specifically or by default.

## MARCPROG

No Default, SOL 600 only.

- prg “prg” is the name of a program to be executed instead of Marc. The program may be any program desired and must already be fully compiled on the computer system being run. prg is limited to 8 characters, however 16 characters can be used if PARAM\* is entered. “prg” must be a compiled program, not a script or batch file. The name of the program must be in lower case (if not, it will be converted to lower case).

## MARCRACC

Default = 0, SOL 600 only.

SOL 600 does not normally support RACC on the RFORCE entry. The default is to fatal a job when RACC is zero or blank. This parameter may be used to set it to zero or to obtain approximate results.

- 0 If MARCRACC is zero and RACC is nonzero, the job will terminate with an appropriate message (Default).
- 1 If MARCRACC is one and RACC is nonzero, RACC will be set to zero internally and the job will continue.
- 2 If MARCRACC is two and RACC is nonzero, the following will occur:  
for brake squeal, coriolis loading and values (C1, C2, C3) will be placed in Marc ROTATION A 3rd datablock fields 4-6 as follows:  

$$RR = \sqrt{R1^2 + R2^2 + R3^2}$$

$$C1 = RACC * R1 / RR$$

$$C2 = RACC * R3 / RR$$

$$C3 = RACC * R3 / RR$$

Where RACC, R1, R2, R3 are described on the RFORCE entry.

For standard structural analysis if MARCRACC=2, the value of A in RFORCE field 5 will be altered using the following equation:

$$A_{new} = \sqrt{A^2 + RACC}$$

Marc's ROTATION A entry will be the same as if RACC=0.0 was entered unless A is zero, in which case the third line will have all zero entries. Results should be considered as an approximation.

### Remarks:

1. See PARAM,MARCRCID for related SOL 600 RFORCE uses.
2. MARCRACC=2 only applies for brake squeal and only if the BRKSQL entry is used for releases prior to MD Nastran R2.1 and MSC Nastran 2007.

### MARCRBAL

Default = 0, SOL 600 only.

This parameter is used only for eigenvalue analysis in the Nastran-Marc interface where natural frequencies or buckling modes need to be calculated using the deformed geometry from a nonlinear analysis. The parameter is only necessary if the last nonlinear increment created a non-positive definite matrix. When MARCRBAL=1 is set, the system will be rebalanced and a positive-definite matrix is assured. Do not use this parameter unless it is known that a non-positive definite system occurs just prior to eigenvalue analysis.

### MARCRBAR

Default = 0, SOL 600 only.

Determines how RBAR is treated.

- |   |  |
|---|--|
| 0 | RBARS will be simulated using Marc's Servo Link. This option is best only for small incremental deformation and rotations. (Default)                     |
| 1 | RBARS will be converted to RBE2 with GN=GA, CM=123456, GM1=GB. The MARCRBE2 option specified will then be used to translate the converted RBARS to Marc. |

### MARCRBE2

Default = 3, SOL 600 only.

- |    |  |
|----|--|
| ID | Determines the type of RBE2 used. The default should be used (parameter not entered) with models comprised of solid elements or a mixture of solid elements and other types of elements.   |
| 0  | RBE2s will be simulated using Marc's Servo Link. This option is best only for small incremental deformations and rotations.  |
| 1  | RBE2s will be simulated using Marc's TYING type 80 for translation and Servo Link for rotations. This option is capable of larger incremental deformations but requires small rotational increments. The MARCRBE2=1 option is only available if all 6 DOF's are specified in the CM field (4) of the RBE2 entry. |

- 2 RBE2s will be simulated using the new RBE2 element introduced into Marc Version 2003 for a 2D analysis.
- 3 RBE2s will be simulated using the new RBE2 element introduced into Marc Version 2003 for a 3D analysis.

**Note:** If RBAR, RROD or RTRPLT elements are found in the model and if MARCRBE2=2 or 3, these elements will be converted to equivalent RBE2's and used with the new Marc RBE2 element during the Marc execution (thus providing higher accuracy for large deformations and/or rotations).

The default should be used (parameter not entered) with models comprised of solid elements or a mixture of solid elements and other types of elements.

### MARCRBE3

Default = 3 SOL 600 only.

Determines the type of RBE3 used.

- 0 RBE3s will be simulated using Marc's Servo Link. This option is best only for small incremental deformations and rotations (see option 4 for a similar alternative).
- 2 RBE3s will be simulated using the new Marc RBE3 element introduced into Marc Version 2003 for a 2D analysis.
- 3 RBE3s will be simulated using the new Marc RBE3 element introduced into Marc Version 2003 for a 3D analysis. (Default)
- 4 Same as MARCRBE3=0 except that all MPC's due to RBE3 will be placed ahead of all other MPC's. This option might improve the Marc solution for versions where Marc has not implemented AUTOMSET logic (those versions prior to MSC Nastran 2005 r3).

### MARCREVR

Default = 0, SOL 600 only.

Specifies that all rigid surfaces need to be modified.

- 0 Rigid contact surfaces are correct as entered and no changes are made by the translator. (Default)
- 1 All rigid surfaces are entered backwards and will be reversed.

### MARCREVRX

SOL 600 only.

Determines whether coordinates for NURBS2D (BCBODY) will be reversed or not if CQUADX, CTRIAX, and/or CTRIAX6 elements exist.

- 0 Reverse the coordinates (Y becomes X, X becomes Y).
- 1 In addition to reversing the coordinates (option 0) all points are also reversed. For example, if there are 4 points (1,2,3,4) they are reversed to (4,3,2,1). (Default)
- 1 Do not reverse the coordinates.
- 2 Reverse the coordinates for CQUADX and CTRIAX abut not for CTRIAX6.

## MARCRIGD

Default = 0, SOL 600 only.

The parameter should only be entered if PARAM,MARMPCHK and/or PARAM,AUTOMSET options fail during a Marc execution.

- 0 All RBEi will not be converted to stiff beams or plates. (Default)
- 1 All RBEi will be converted to stiff beams or plates for the Marc input file using a stiffness scale factor from parameter MARCRSCL. This parameter allows such elements to have large rotations for versions of Marc which do not include large rotations of rigid elements.

### Remarks:

1. This option may not be used if RBAR, RROD or RTRPLT elements are in the model. See PARAM,MSTFBEAM for an alternative.
2. See PARAM,MARCSCLR to specify a scale factor for the “default” properties of these stiff beams.

## MARCSAME

Default = 0, SOL 600 only.

Determines whether SOL 600 runs with multiple subcase having the same LOAD ID or loads (see note below) in more than one subcase will be processed or not. SOL 600 will usually run under such circumstances but may get the wrong results.

**Important:** Do not use this parameter if the loading contains enforced displacements or the results may be incorrect.

- 0 The job will be aborted before Marc is spawned with a “Severe Warning” message. (Default)
- 1 The job will run to completion (if there are no other errors) and a standard Warning message will be issued.

It is recommended that if the same loads are to be used in multiple subcases that each subcase have a different LOAD ID. A typical file setup for SOL 600 should be setup in the following manner:

```
SOL 600,NLSTATIC PATH=1 STOP=1
CEND
DISP=ALL
STRESS=ALL
```

```

SPC=123
TEMP (INIT)=33
PARAM,MARCSAME,1
SUBCASE 1
LOAD=100
SUBCASE 2
LOAD=200
TEMP (LOAD)=300
BEGIN BULK
LOAD, 100, 1., 1.0, 1000, 1.0, 2000
LOAD, 200, 1., 1.0, 1000, 1.0, 2000
PLOAD4, 1000, 10, 20.0
PLOAD4, 2000, 20, 25.0
(Other Bulk Data entries)
ENDDATA

```

**Note:** In the above example if the Bulk Data LOAD entries are changed to:

```

LOAD, 100, 1., 1.0, 1000, 1.0, 2000
LOAD, 200, 0.9, 1.0, 1000, 1.0, 2000

```

The loads are the same before the overall scale factor (1.0 and 0.9, respectively) are applied and PARAM,MARCSAME,1 is needed. However if the entries were as follows, it is not needed because the loads before the overall scale factor is applied are different.

```

LOAD, 100, 1., 1.0, 1000, 1.0, 2000
LOAD, 200, 1.0, 0.9, 1000, 1.0, 2000

```

## MARCSCLR

SOL 600 only.

Sets property values for stiff beams when PARAM,MARCRIGD or PARAM,MSTFBEM are used in SOL 600.

The value of this parameter scales the “default” properties of stiff beams or plates if parameter MARCRIGD=1. The “default” (unscaled) values for the stiff beams are A = 10, I = 100 (both directions) J = 200, shear area = 5 and plate thickness of 1.5. Linear scaling is used for all areas and thickness, all inertia terms are multiplied by the square of the Value entered.

## MARCSETS

Integer, Default = 0, SOL 600 only.

Controls the type of sets used for the Marc input file element and node sets.

- |   |   |
|---|---|
| 0 | Sets will have the format DEFINE, ELEMENT, ... or DEFINE, NODE, ... |
| 1 | Sets will have the format DEFINE, ELSQ, ... or DEFINE, NDSQ, ...    |

### Remarks:

1. PARAM,MARCSETS,1 can speed up certain large Marc jobs by a considerable amount.
2. The parameter may be set in RC files.

## MARCSETT

Default = 0, SOL 600 only.

- |   |   |
|---|---|
| 0 | The current environment is not printed. (Default)   |
| 1 | The current environment is printed in the .f06 file. A user program named eodenv.f must be compiled, linked and placed in the input file directory. The contents of eodevn.f resembles the following: |

```
Program eodenv
call system("set")
stop
end
```

## MARCSINC

Default = 0, SOL 600 only.

This parameter controls how often a spline file is written if the spline option (analytical contact for deformable bodies) is requested. If this parameter is not entered or if it is 0 or -1, then a file is not written. If N is greater or equal to 1, then every nth time step is written. Spline files have the extension \*.mfd which may be processed by MSC Mentat.

## MARCSIZ3, Value

Default = Program determines value, SOL 600 only.

- |       |   |
|-------|---|
| Value | If entered, the integer value entered here is the third value on Marc's SIZING entry representing the maximum number of elements. |
|-------|---|

## MARCSIZ4, Value

Default = Program determines value, SOL 600 only.

- |       |   |
|-------|---|
| Value | If entered, the integer value entered here is the fourth value on Marc's SIZING entry representing the maximum number of grid points. |
|-------|---|

## MARCSIZ5, Value

Default = Program determines value, SOL 600 only.

- |       |   |
|-------|---|
| Value | If entered, the integer value entered here is the fifth value on Marc's SIZING entry representing the maximum number of constrained degrees-of-freedom. |
|-------|---|

## MARCSIZ6, Value

Default = Program determines value, SOL 600 only.

**Value**            If entered, the integer value entered here is the sixth value on Marc's SIZING entry representing the maximum number of elements in the largest list of distributed loads (the internal Marc to Nastran translator generates these one at a time, so this value is normally 1).

## MARCSLHT

Default = 5, SOL 600 only.

Number of layers through the shell thickness used to integrate shell and beam elements. For linear behavior, N=1 is sufficient. For most plasticity problems, N=5 is adequate. For extremely nonlinear plasticity problems N=11 should be used. SOL 600 requires that N be 5 or larger. If N is entered with a positive value less than 5, SOL 600 will set it to 5. To use values smaller than 5, enter N as a negative number. The absolute value will be used, however the job may fail or results may be incorrect if the model has plasticity.

**Note:** Use of PARAM,MARCDEF can effect the value of Marc's SHELL SECT parameter if PARAM,MARCSLHT is not entered. To eliminate SHELL SECT from the Marc file set N to -9999.

## MARCSOLV

Default = 8, SOL 600 only.

Determines the solver to use for Marc.

0	The profile solver will be used (solver 8 should normally be used instead)
2	The Sparse Iterative Solver will be used.
4	The Direct Sparse Solver will be used.
6	A hardware-provided solver will be used.
8	A sparse solver similar to the one used by Nastran will be used (Default)
9	The CASI element based iterative solver will be used.
10	The mixed direct/iterative solver will be used.
11	Pardiso direct solver (see param,mrthread)
12	MUMPS parallel direct solver (see param,mrthread)

**Note:** If any NLSTRAT entries are entered, the solver type must be specified using the IOLSVR option of NLSTRAT rather than this parameter.

## MARCSPCC

Default = 0 if no SPCD's are entered or 2 if there are SPCD's in the input.

Determines how SOL 600 will proceed if non-zero value enforced displacements are found in SPC entries for multiple subcase models.

- |   |   |
|---|---|
| 0 | A fatal error will be issued and the user will be requested to change all non-zero value enforced displacements to SPCD's.  |
| 1 | The job will continue without any changes (wrong results could be produced).  |
| 2 | All displacements on SPC entries will be set to blank and the job will continue (will usually produce the correct results if SPCD's with the correct values are specified). |

### Remark:

Non-zero enforced displacements should always be specified using SPCD (not SPC) for SOL 600. It is not necessary to specify SPC's for degrees of freedom where SPCD's are applied for SOL 600, but it will not do harm unless non-zero enforced displacements are specified on the SPC entries (either in addition to being specified on SPCD's or without having any SPCD's). If there is only one subcases, the non-zero enforced displacements may be specified on SPCD's and/or SPC's, however for multiple subcases wrong results can result even if the displacements specified on the SPC's and SPCD's are the same. The results will be even further off if the displacements are different. The remedy is to ensure that the SPCD's reflect the correct applied displacements, and then either remove the applied displacements from all SPC's or to set MARCSPCC=2.

## MARCSTIFF, Time

Default = 1.0, SOL 600 only.

- |      |  |
|------|--|
| Time | This parameter specifies what time matrices entered using PARAM,MARCFILi will be used in a Nastran solution. The file may contain matrices at several times, but only the matrices specified by the parameter will be used. This parameter is not usually used, MRMTXNAM,NAME is used instead. |
|------|--|

## MARCSTOP

SOL 600 only.

- |   |   |
|---|---|
| 0 | Normal Marc execution when spawned from Nastran.                                      |
| 1 | Marc will exit (with exit code 7) after phase 0 (corresponds to Marc parameter stop). |

## MARCSUMY

Default = 0, SOL 600 only.

Determines if the summary of maximum values is to be printed.

- 0 A summary of maximum displacements, stresses and strains will be printed in the Marc output file. (Default)
- 1 The summary of maximum values is not output.

## MARCT16

Default = 2, SOL 600 only.

Controls generation of a Marc t16 file. MARCT16=0, Marc does not generate a .t16 output file.

- 1 or 0 Does not generate a t16 file.  
Parameter omitted generates a t16 file. All entries are controlled by the MARCOUT Bulk Data entry, or if MARCOUT is not specified, by the default shown in option 2 below.
- 1 Generates a .t16 output file with the following post codes:  
11 11,1 11,N 12 12,1 12,N 13 13,1 13,N 14 14,1 14,N  
15, 15,1 15,N 16 16,1 16,N 17 17,1 17,N 18 18,1 18,N  
7 7,1 7,N 27 27,1 27,N 301 301,1 301,N 321 321,1 321,N  
341 341,1 341,N 401 401,1 401,N  
Nodal: 1, 2, 3, 4, 5, 6, 35, 36, 37, 38, 39, 40, 46, 48, 51, 52
- 2 Generates a .t16 output file with the following post codes. (Default)  
301, 301,1 301,N 341 341,1 341,N 47  
Nodal: 1, 2, 3, 4, 5, 6, 34, 35, 36, 37, 38, 39, 46, 48
- 3 Generates a .t16 output file with the following post codes (op2, xdb, f06, punch results cannot be made using this option):  
301, 341 47  
Nodal: 1, 2, 5, 6, 34, 35, 36, 37, 38, 39
- 4 Generates a .t16 output file with the following post codes (op2, xdb, f06, punch results cannot be made using this option):  
301 341 47  
Nodal: 1

### Remarks:

1. This entry is used as an easy way to control which results are placed on Marc's op2 file. All entries can be overridden using the MARCOUT Bulk Data entry. For MARCOUT values of 1 and larger, MARCOUT should be omitted for the input file. MARCOUT should not be used if PARAM,MARCT16 is entered.
2. The frequency of output is controlled by the NLPARM or Bulk Data entries (variables INTOUT and NO respectively).
3. Items such as 341,1 and 341,N designate stresses at the bottom and top surfaces (for applicable elements). Items such as 341 designate stress at mid-thickness.

4. When stress 341 is specified for models with composite elements, the value will be changed to 391 to obtain stresses in the fiber (layer) direction.
5. Consult Marc Volume C documentation for the meaning of the above blocks. Option 1 provides most of the structural output anyone might want, option 2 provides total strain, Cauchy stress, displacement and contact information at the top, center and bottom of surfaces. Option 3 provides the information of option 2 but only at the center (not at the top and bottom).
6. It is necessary to generate a t16 file in order to produce op2, xdb, f06 or punch results.
7. Op2, xdb, punch and f06 results can only be created using option 1 and 2 although option 0 can also be used if the selected outputs are the same as option 1 or 2.
8. If a Bulk Data VCCT entry is included in the model, nodal post codes 57-64 and 74 will be added to any of the previous defaults if MARCOUT is not entered in the model.

## MARCT19

Default = 0, SOL 600 only.

- |   |  |
|---|--|
| 0 | Marc does not generate a .t19 output file. (Default) |
| 1 | Generates a .t19 output file.                        |

## MARCTABL

Default = 0, SOL 600 only.

Determines if contact table is to be generated.

- |   |  |
|---|--|
| 0 | Contact tables will be generated for the main Marc input (phase 0) and for each subcase if specified by the user (Default). When MARCTABL=0, each subcase may have a BCONTACT Case Control command and a matching BCTABLE ID entry. In addition, Marc's "Phase 0" entry is supported by entering a BCTABLE with an ID of zero (or 1,000,000). Each separate BCTABLE will reference the BCBODY entries defined which, in turn, reference BSURF entries. (Default)                           |
| 1 | No contact tables will be generated and all contact bodies (if any) will be placed in the main input data section. Contact will thus be the same for all subcases. When MARCTABL=1, there must only be one BCTABLE entry in the file. There must only be one BCONTACT command in the Case Control and it must be above all subcases. The BCONTACT and BCTABLE entry must have the same ID. The BCTABLE entry can reference several BCBODY entries which, in turn, reference BSURF entries. |

## MARCTEDF

Character\*8, no Default, SOL 600 only.

Enter the Marc nthcnt file name without extension. Use this option only if PARAM,MARCTEDN,1 is entered (the file name without extension is limited to 8 characters). The characters ".nthcnt" will automatically be appended to the name specified.

## MARCTEDN

Default = 0, SOL 600 only.

Determines whether a thermal contact analysis will use the Marc `jid.nthcnt` file generated by this run or use one input by the user.

- 0 Analysis uses the Marc `jid.marc.nthcnt` file generated in this run. (Default)
- 1 Analysis uses a Marc `nthcnt` file generated by the user or in a previous run.

**Note:** If MARCTEDN=1, PARAM,MARCTEDF below must be entered to specify the file name.

## MARCTEMP

Default = 1, SOL 600 only.

- 0 The scratch files produced by Marc will be in the same directory as the Nastran input file.
- 1 The scratch files produced by Marc will be in the same directory as the Nastran scratch files. (Default)

**Note:** The Marc scratch files cannot be split.

## MARCTETT

Integer, Default = 0, SOL 600 only.

Determines how CTETRA elements will be mapped to marc.

- 0 4-node or 10-node Nastran CTETRA elements will be mapped to the Marc tet-4 or tet-10 elements.
- 11 4-node or 10-node Nastran CTETRA elements will be mapped to Marc solid element type 7. for tet-10 elements, the mid-side nodes are neglected. the 4 CTETRA nodes (N1,N2,N3,N4) are mapped to the 8 solid shell nodes as follows N1,N2,N3,N4,N4,N4,N4.
- 12 Same as MARCTETT=11 except debug is turned on (for the tetra conversion only)

### Remark:

MARCTETT should not be greater than zero for heat transfer or Herrmann elements.

## MARCTIEC

Default = 1, SOL 600 only.

- 1 Transient Time Integration Error Check for Marc's AUTO STEP method. A value of 1 turns the check on. (Default)
- 0 A value of 0 turns the check off. Turn the check off to match Marc results for version prior to Marc 2003 r1.

## MARCTOL

Default = 0, SOL 600 only.

Determines the method of convergence tolerance.

If parameter MARCTOL=0, convergence tolerances are based on residuals (loads). If parameters MARCTOL and MARCTVL are not entered, the tolerances are determined by and/or NLPARM Bulk Data entries. However, parameters MARCTOL and MARCTVL provide extra control over these convergence tolerances particularly in the case where or NLPARM specify more than one convergence type (such as load and energy).

- 1 Convergence tolerances are based on displacement.
- 2 Convergence tolerances are based on strain energy.
- 4 Convergence is achieved when either residual or displacement satisfies the criteria.
- 5 Convergence is achieved when both residual and displacement satisfies the criteria.

## MARCTOTD

Default = 0, SOL 600 only

Determines whether for SOL 600 dynamic analyses will use full table association.

- 0 Full table vs time association is not used. (Default)
- 1 Full table vs time association will be used

### Remarks:

1. param,marctott,1 must also be set if MARCTOTD=1
2. This parameter may be set in RC files.

## MARCTOTL

Default = 0, SOL 600 only

Determines whether total or incremental loads are used in a SOL 600 static nonlinear analysis.

- 0 Incremental loads are used. (Default)
- 1 Total loads are used

**Remarks:**

1. Warning - If MARCTOTL=1, MRFOLOW3=1 will be set if possible (see PARAM,MRFOLOW3)
2. This parameter may be set in RC files.

**MARCTOTT**

Default = 0, SOL 600 only

Determines whether total loads, including pressures, gravity, spcd, etc., with associated tables are used in a SOL 600 static or dynamic analysis (Remark 3.)

- |   |   |
|---|---|
| 0 | Total loads with tables are not used. (Default) |
| 1 | Total loads with tables are used                |

**Remarks:**

1. Warning - If MARCTOTT=1, MRFOLOW3=1 will be set if possible (see PARAM,MRFOLOW3)
2. This parameter may be set in RC files.
3. For full table association, dynamic analyses require PARAM,MARCTOTD,1 to also be set.

**MARCTUBE**

Default = 0, SOL 600 only.

Determines whether CTUBE maps to Marc element 31 or 98 (Default = 0 if this parameter is omitted).

- |   |   |
|---|---|
| 0 | CTUBE elements map to Marc tube element 31 (see Remark) (Default) |
| 1 | CTUBE elements map to Marc element 98 (elastic beam)              |

**Remarks:**

Marc element 31 does not support thermal loading or creep. If the model contains thermal Loading or creep (even if not applicable to the CTUBE elements, option 1 is always used).

**MARCTVL, Value**

SOL 600 only.

- |       |  |
|-------|--|
| Value | If parameter MARCTVL is entered, it must have a real value. The value entered is the convergence tolerance used by Marc (see PARAM, <a href="#">MARCTOL</a> ). If parameters MARCTOL and MARCTVL are not entered, the tolerances are determined by and/or NLPARM Bulk Data entries. However, parameters MARCTOL and MARCTVL provide extra control over these convergence tolerances particularly in the case where or NLPARM specify more than one convergence type (such as load and energy). |
|-------|--|

## MARCUSUB, chr

No Default, SOL 600 only.

chr            chr is the name of a “user subroutine” to be included in the Marc run. chr is limited to 8 characters without the .f extension. This file must be located in the same directory as the Nastran input data. The subroutine name must have all lowercase letters. chr should be in lower case to prevent confusion. (Nastran will convert the file name to uppercase, but it will be reconverted to lower case when Marc is spawned.) Any user subroutine available to Marc may be specified. Multiple user subroutines must be combined into one file.

Restriction: The computer must have a Fortran compiler and Linker and the Fortran compiler must be the same as used to create the original Marc executable (see the Marc installation manual). The Marc input file does not as yet call out user subroutines, so manual editing of the Marc input file may be necessary in some cases to invoke them. Existing regular Marc subroutines can be modified and handled in the same manner if available to you.

**Note:** If more than one user subroutine is required, all should be combined into one file before execution.

## MARCVERS

SOL 600 only.

This parameter has been replaced by the following parameters:

param,mrconver  
param,mrcontab  
param,mrsprver

## MARCWDIS

Default = 1, SOL 600 only.

Determines whether Marc parameter section DIST LOADS Is written or not. If any of the three values for DIST LOADS are entered (see PARAM,MARCDIS2 PARAM,MARCDIS3 PARAM,MARCDIS4) it will be written. If PARAM,MARCWDIS,1 is entered, it will be written. If PARAM,MARCWDIS,-1 is entered, it will not be written.

**Caution:** Nastran cannot estimate these values very well and produces overly conservative numbers that sometimes leads to failure of the Marc run due to lack of memory. We suggest that the user should use this parameter sparingly and enter the MARCDIS2, MARCDIS3 and MARCDIS4 values for best Marc memory usage.

## MARCWELD

Default = 0 if this parameter is omitted, SOL 600 only.

Determines how CWELD/PWELD elements will be translated to Marc.

- 0            Add extra nodes and elements to simulate the weld.
- 1            Use Marc CWELD/PWELD formulation (available starting with MD Nastran R2 and MSC Nastran 2007).

This parameter may be set in RC files.

## MARELSTO

Default = 0, SOL 600 only.

Determines whether Marc's parameter ELSTO will be created.

- 1          ELSTO will not be created.
- 0          ELSTO will be created only for large models as determined by Nastran. The value of ELSTO will be 40960 except for parallel runs (where a PARAMARC entry exists in the input file) in which case ELSTO will not be created. (Default)
- >0        ELSTO will be created with the value specified used as the Marc ELSTO parameter whether or not the run uses parallel processing.

## MARGPFEL

Default = 0, SOL 600 only.

Used to determine if Marc GRID FORCE output will occur by element, by node, or both ways.

- 1          Output is by element only.
- 0          Output is by node only. (Default)
- 1          Output is by both element and node.

### Notes:

1. This parameter effects the contents of the Marc jid.marc.grd file. Option 0 or 1 is required for GPFORCE output in op2, xdb, punch, and/or f06 files.
2. This parameter can be set in RC files.

## MARFACEA

Default = 1, SOL 600 only.

Face number for "A" side of weld if welds are made of solid elements. Not used if welds involve plates or shells.

## MARFACEB

Default = 1, SOL 600 only.

Face number for “B” side of weld if welds are made of solid elements. Not used if welds involve plates or shells.

## MARFATAL

Default = 1, SOL 600 only.

Determines whether non-existent grid id’s for BCBODY entries will cause fatal errors or not.

- 0 Non-existent grid ID in BCBODY entries will only cause warning messages. The grid ID will be reset to zero and the job will continue. The results should be checked carefully. In some cases this could result in an entire contact body being skipped.
- 1 Non-existent grid ID in BCBODY entries will cause FATAL ERRORS. (Default)

## MARGPFOR

Default = 0, SOL 600 only.

Used to determine whether GPFORCE is active for SOL 600. A Case Control request GPFORCE must be specified to obtain grid point forces (see note 4). The grid point forces are output from Marc on a file named `jid.marc.grd`. The `t16op2` program reads this file, puts the data on the `f11` file along with displacements, stresses, etc. After `t16op2` finishes, the `f11` file is brought into DBALL, from which DMAP generated on the fly can produce `op2`, `xdb`, `punch`, or `f06` output.

- 1 GPFORCE is ignored (Default).
- 0 GPFORCE is output for the last time in the last subcase only.
- 1 GPFORCE is output at all times given in the `.sts` file.
- N GPFORCE is output for times 1, 1+N, 1+2N, etc.

### Notes:

1. This parameter can be set in RC files.
2. Output is available only in the new Marc `jid.marc.gid` file.
3. The Case Control GPFORCE request must be above all subcases, or the same within all subcases.
4. The `jid.marc.grd` file can become very large if option 0 or N is not used.

## MARHEATM

Default = 0, SOL 600 only.

Determines whether a file named `heatm.rc` is necessary to run the second phase of SOL 600 heat transfer initial contact job.

- 0 heatm.rc is not required. Defaults will be used. The defaults are scr=yes batch=no mem=80mw
- 1 A heatm.rc file will be supplied by the user in the same directory as the original Nastran input file. The heatm.rc can contain any information used by other rc files except that batch=no. If the original Nastran input file is named jid.dat (or jid.bdf) and out=jid is specified, the final output will be in files such as jid.f06, jid.op2, jid.xdb. If out=jid is not specified the final output will be in files such as jid.nast.f06, jid.nast.op2, jid.nast.xdb.

## MARHTPRT

SOL 600 only.

Controls heat transfer output in the Marc .out file.

- 0 Do not print any output except for summary table.
- 1 Print the nodal temperatures.
- 2 Print all possible nodal heat transfer output.

## MARIBOOC

Default = 0, SOL 600 only.

- 0 Incremental backup data will be stored in memory. (Default)
- 1 For large problems, incremental backup data will be stored on disk. This option triggers Marc's parameter IBOOC.

## MARIPROJ

Default = 0, SOL 600 only.

Flag to determine if auxiliary nodes of a CWELD will be projected on the model or not. (If this parameter is not entered)

- 0 Nodes are not projected on to the model.
- 1 Nodes are projected on to the model.

## MARLDCMB

Default = -1, SOL 600 only.

Determines whether extraneous loads in the input file will be filtered out at an early stage to save computer time. This applies only to SOL 600, ID where ID=1, 3, 6, 101, 105, 106.

- 1 Extra loads will not be filtered out.
- 2 Extra Bulk Data LOAD entries will be filtered out early in SOL 600 to save computer time.

**Note:** If PARAM,MARLDRMV,-1 is not entered, extra FORCE, MOMENT and PLOAD4 entries not used in the present analysis will also be filtered out early in SOL 600. Computer time saving can be appreciable for certain models with many extra loads.

## MARLDRMV

Default = 1, SOL 600 only.

Determines whether extraneous FORCE, MOMENT, and/or PLOAD4 entries in the input file will be filtered out at an early stage to save computer time. This applies only to SOL 600, ID where ID=1, 3, 6, 101, 103, 105, 106.

- 1 Extra loads will not be filtered out.
- 1 Extra Bulk Data FORCE, MOMENT, and/or PLOAD4 entries will be filtered out early in SOL 600 to save computer time. (Default)

**Note:** This option will be ignored (same as PARAM,MARLDRMV,-1) if PARAM,MARLDCMB,-1 is entered.

## MARMPCHK

Default = -1, SOL 600 only.

Determines whether Marc parameter MPC-CHECK is written.

- 1 MPC-CHECK is not written. (Default)
- 1 Apply the MPCs in the default order:
  1. MPCs obtained from SERVO LINK option.
  2. MPCs obtained from INSET option.
  3. MPCs obtained from TYING, RBE2, or RBE3 options (the actual order follows from the order of these options in the model definition block of the data file.)
  4. MPCs obtained from CYCLIC SYMMETRY option.
  5. MPCs obtained from CONTACT option.
 Print a warning message if a tied degree of freedom is being used by a subsequent MPC.
- 2 Same as 1, but instead of warning, a fatal error message is printed and the analysis will stop with exit 2001.

- 3 Try to rearrange the MPCs in such a way that a tied degree of freedom will not be used in a subsequent MPC. If this reordering cannot successfully be completed, print a fatal error message and stop the analysis with exit 2011.
- 999 Skip MPC-CHECK entirely, prevent Marc's error message "Exceed the max trial to order RBE2/3". This option should be used in conjunction with PARAM,AUTOMSET,YES only. (Marc feature,3901 is set)

**Note:** This parameter can be set in RC files.

## MARMPCID

Integer, Default = 1, SOL 600 only

Determines the ID of the MPC Case Control command for SOL 600 jobs using a CONTINUE=101 to CONTINUE=159 (see SOL 600 Executive Control statement, CONTINUE option).

- 0 or 1 A line MPC=1 will be inserted in the Case Control (remark)
- N A line MPC=N will be inserted in the Case Control (N must be between 2 and 9999)

### Remark:

When models with contact and if BCPARA,INITCON,4 is specified, MPC's for each increment will be produced and placed in files named jid.marc.conmpc\_xxxx where xxxx ranges from 0001 to the number of increments in the solution. The ID of these MPC's is usually equal to one. If for some reason it is not one, the actual value may be specified by this parameter.

## MARMTLCK

Default = 0, SOL 600 only.

Determines whether a check of various property-material combinations for SOL 600 will be made or not.

- 0 The checks will not be made. (Default)
- 1 Check will be made. These take extra computer processing time and for most models are not required. The user should turn on these check if he is in doubt if any property-type of material combinations entered into the model may be in error. Current check made are for the following illegal combination.  
PSOLID/MATHE (model should be PLSOLID/MATHE)  
PSOLID/MATHP (model should be PLSOLID/MATHP)

## MARNOCID

Default = 0, SOL 600 only.

SOL 600 does not support MCID defined by cylindrical or spherical coordinate systems. This parameter determines whether MCID defined by cylindrical or spherical coordinate systems will be ignored or “fataled out” for shell and solid elements.

- 0 The run will be “fataled out” if MCID defined by cylindrical or spherical coordinate systems are found for shell or solid elements. (Default)
- 1 MCID defined by cylindrical or spherical coordinate systems for shell or solid elements will be ignored.

## MARNOSET, Name

No Default, SOL 600 only.

- Name Character. If entered, this parameter will not write out a set with the specified name. This is useful, when portion of the model specify sets that are not actually used in the present analysis. Up to 20 of these can be specified.

## MAROFSET

Default = 1, SOL 600 only.

Determines how beam and shell offsets are applied.

- 0 Extra grids and rigid elements will be created to model the offsets.
- 1 Marc will automatically handle offsets for beam and shell elements. No extra grids or elements will be created. The offsets will be found in Marc’s GEOMETRY data. (Default)
- 2 Marc will automatically handle offsets for beam elements only.
- 3 Marc will automatically handle offsets for shell elements only.

<b>Note:</b>	If MAROFSET is 1 or 2, the beam orientation can be specified using the CBAR/CBEAM “BIT” flag. It is suggested that only combinations, GGG or BGG be used.
--------------	---

## MARPLANE

Default = 0, SOL 600 only.

For composite structures described using PCOMP, together with CQUAD4, CQUADR, etc., it is not possible to tell whether a standard 3D shell or a plane strain shell has been modeled. If MARPLANE is set to 1, such composite models will be assumed to be plane strain (as if a PLPLANE property had been entered rather than PCOMP).

## MARPROCS

Determines the number of domains to be used in a DDM parallel execution.

1	Use 1 processor.
2	Use 2 processors.
N	Use N processors.

### Remarks:

1. This parameter is not intended to be used by parallel jobs using several different machines.
2. This parameter and PARAMARC may not both be entered in the same run.
3. This parameter and PARAM,MRTTHREAD may both be used in the same job.
4. The parameter may be used with most of the solver types except for the MUMPS solver (type 12).

## MARRBAR2

Default = 1, SOL 600 only.

If MARCRBAR is set to 1, all CMA fields will be changed to 123456.

0	CMA field will remain as coded by user, Marc run may fail.
1	CMA field will be set to 123456. (Default)

## MARROUT

Default = -1, SOL 600 only.

Determines whether an inconsistent set of outputs between the Marc t16 file (selected using MARCOUT) and standard Nastran output selected using Case Control requests (and param,post) is allowed or not.

-1	Inconsistent output is not allowed, if the outputs are inconsistent, the job will fatal early before spawning Marc. (Default)
1	Inconsistent output is allowed. However, if the output requests are inconsistent, the job may fail during the t16op2 conversion after Marc has finished.

### Remark:

Nastran outputs in the op2, xdb, punch or f06 files are obtained by converting the Marc output from the t16 file. If output is not available in the t16 file, or if it is in the wrong form, errors will occur during the t16op2 conversion. For most problems, if op2, xdb, f06 and/or punch output is required, it is best not to enter MARCOUT. In most cases MARCOUT should only be used if post-processing using the Marc t16 file is to be done.

## MARSHRII

Integer  $\geq 0$ , Default = 0, SOL 600 only.

Controls how the properties of bars added to the edges of CSHEAR elements when f1 or f2 of PSHEAR is nonzero.

- |     |   |
|-----|---|
| 0   | CBAR elements at the edges of CSHEAR elements (if any) will only have area (I1, I2, J are all 0.0). See PSHEAR Remark 2 as to how the area of these bars is calculated. |
| > 0 | The value specified will be used to calculate I1, I2 and J from the area as<br>$I1=I2=A/MARSHRII$ . $J = 2.0 * I1$  |

### Remark:

This parameter must be entered in the Case Control above any subcases.

## MARTET10

Integer, Default = 10, SOL 600 only

Controls how to treat badly shaped 10-node tetra elements in SOL 600 if renumbering the element does not correct problems.

- |    |  |
|----|--|
| -1 | Stop the analysis if all possible re-numbering options do not correct the bad element. See Remark 4.         |
| 0  | Continue the analysis with the best re-numbering option and let Marc possibly fail with inside out messages. |
| 1  | If all possible re-numbering options fail, change the bad tet 10 element to tet 4. See Remarks 1 and 5.      |
| 2  | If all possible renumbering options fail, deactivate the bad tet 10 element. (See Remarks 2, 3, and 5.)      |
| 3  | Change the coordinates of bad tet 10 midside nodes to line at the midpoints of the vertices. (See Remark 6.) |

### Remarks:

1. Changing bad tet 10 elements to tet 4 may ignore continuity on the edges of adjacent tet 10 elements unless they also get changed to tet 4 elements. If many tet 10 elements are changed to tet 4 elements, the accuracy of the stresses could be inaccurate. In addition, if the elements are used in contact, the same contact body can't have mixed elements with midside and without midside nodes.
2. Deactivating bad tet 10 elements creates holes in the model. If only a few bad elements are deactivated in a fine-grid model, the overall behavior will usually be nearly the same as if the elements were good and remained in the model, however the stresses near the deactivated elements may be too large. If many bad elements are deactivated, all analysis results will probably be inaccurate.
3. Setting PARAM,MARTET10,2 will deactivate all types of elements for which Marc gets inside out elements (not just tet 10 elements). This option maps to Marc's 10-DEACT parameter.

4. This parameter is available starting with MD Nastran 2010. Prior to this release, only option 0 was available.
5. Use options 1 or 2 with extreme care and only when all other alternatives including remeshing using the gui have been exhausted.
6. If martet10=3, any midside nodes whose coordinates are changed and lie on the boundary of the structure will redefine the exterior of the structure by a small amount. Also, if the element is used in contact and the stress-free option is invoked, the coordinates may be changed again and the elements may become badly shaped again.

## MARTETIN

Integer, Default = 0, SOL 600 only.

Controls whether additional information messages are output to the .f06 file or not when param,martet10 is set to a positive value.

- |   |   |
|---|---|
| 0 | Do not output additional tet10 information messages.  |
| 1 | Output additional tot10 information messages regarding checking of all tet10 elements. (The .f06 file could be very large using this option.) |

## MARUPDAT

Default = 1, SOL 600 only.

If this parameter is omitted, the Updated Lagrange method will be used if plasticity is involved. Ensure that all elements in the analysis are capable of using the Updated Lagrange method. If not, enter PARAM,MARUPDAT,-1. The Updated Lagrange Method is more accurate for many problems and also runs faster for some problems.

- |    |   |
|----|---|
| -1 | The Total Lagrange solution procedure will be used when Marc is executed from Nastran.  |
| 1  | The Updated Lagrange solution procedure will be used when Marc is executed from Nastran. This corresponds to Marc parameter update. (Default)                   |
| 2  | The updated Lagrange solution with large rotations for beam elements. This corresponds to Marc parameter (see Marc VOL C documentation for details): update,0,2 |
| 3  | The following Marc parameter will be set, in which LARGE DISP need not be specified elsewhere (see Marc VOL C documentation for details): update,0,2,1          |
| 4  | The following Marc VOL C parameter will be set, in which case LARGE DISP need not be specified elsewhere. (see Marc documentation for details): update,0,,1     |
| 5  | The following Marc parameter will be set (see Marc VOL C documentation for details): update,0,1   |

## MARVFCUT

Default = 0.0001, SOL 600 only.

Controls the fraction of the maximum view factor that is to be used as a cutoff. View factors calculated below this cutoff are ignored. (Used in SOL 600 radiation heat transfer only.)

## MAUTOSPC

Default = -1, SOL 600 only.

Determines whether Marc AUTOSPC will be added.

-1	Do not add AUTOSPC. (Default)
1	Add AUTOSPC to Marc's parameter's section. It will remain throughout the run.
2000	Turn on AUTOSPC by adding the integer 1 to Marc's model definition SOLVER option
2001	Turn on AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 1
2002	Turn on AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 2
...	
2999	Turn on AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 999
3000	Turn off AUTOSPC by adding the integer 1 to Marc's model definition SOLVER option.
3001	Turn off AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 1.
3002	Turn off AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 2.
...	
3999	Turn off AUTOSPC by adding the integer 1 to Marc's SOLVER option in subcase 999.

## MAXAPL

Default = 1000

MAXAPL specifies the maximum number of applied loads to be used as a basis for residual vector calculations. If the number of applied loads exceeds MAXAPL, User Warning Message 9166 is issued, and residual vector augmentation is disabled. Note that the computing requirements for a large number of residual vectors can be prohibitive. See also, the RESVEC Case Control command.

## MAXDAMP

Default = 1000

See [BEIGRED](#).

## MAXIREV

Default = 1, SOL 600 only.

Determines whether to reverse axisymmetric coordinates ( $x \rightarrow y \rightarrow x$ ) and reorder nodes in the elements or not.

- 1 Do not reverse coordinates and renumber elements
- 1 Reverse coordinates and renumber grid ID's for each element. (Default)

### Remark:

Experience has demonstrated that certain models require the -1 option and others require the +1 option. The majority require the +1 option. If one of the options produces inside out messages in the first increment or other error messages, switch to the other option.

## MAXLP

Default = 5

MAXLP specifies the maximum number of iterations for element relaxation and material point subincrement processes in SOLs 129 and 159. MAXLP is 10 in SOLs 106 and 153 and cannot be changed by the user.

## MAXRATIO

Default = 1.E7

The ratios of terms on the diagonal of the stiffness matrix to the corresponding terms on the diagonal of the triangular factor are computed. If, for any row, this ratio is greater than MAXRATIO, the matrix will be considered to be nearly singular (having mechanisms). If any diagonal terms of the factor are negative, the stiffness matrix is considered implausible (non-positive definite). The ratios greater than MAXRATIO and less than zero and their associated external grid identities will be printed out. The program will then take appropriate action as directed by the parameter BAILOUT.

By default, in the superelement solution sequences the program will terminate processing for that superelement. A negative value for BAILOUT directs the program to continue processing the superelement. Although forcing the program to continue with near-singularities is a useful modeling checkout technique, it may lead to solutions of poor quality or fatal messages later in the run. It is recommended that the default values be used for production runs. A related parameter is ERROR.

The value -1 of BAILOUT causes the program to continue processing with near singularities and a zero value will cause the program to exit if near singularities are detected.

In SOLs 101 through 200 when PARAM,CHECKOUT,YES is specified, PARAM,MAXRATIO sets the tolerance for detecting multipoint constraint equations with poor linear independence. (See [Superelement Analysis](#) in *the MSC Nastran Reference Guide*.)

BAILOUT and MAXRATIO may be specified in the Case Control Section in order to provide different values between superelements but not between different boundary conditions.

## MBENDCAP

Default = 1, SOL 600 only.

Determines how PBEND internal pressure will be treated.

- 1 Stress stiffening and axial loading due to pressure is ignored
- 0 Stress stiffening and axial loading occurs (this usually happens with end caps)
- 1 Only stress stiffening occurs. (Default)
- 2 Stress stiffening and axial loading occurs for CBEND elements with any nodes having SPC or SPC1 and stress stiffening occurs for all other CBEND elements regardless whether the SPC/SPC1 is referenced above the subcase level or within a subcase.

## MCNLPARM

Default = 1, SOL 600 only.

Determines whether to make all field 5 (KMETHOD) consistent if more than one NLPARM entry occurs in the input stream. If mixed KMETHOD fields are provided for different NLPARM entries, SOL 600 can sometimes encounter difficulties.

- 1 KMETHOD will not be changed to be consistent.
- 1 KMETHOD will be changed to be consistent with that used with the NLPARM entry with the lowest ID. (Default)

### Remark:

This parameter may be set in RC files.

## MCON2D3D

Integer, Default = -1, SOL 600 only.

Controls whether a mixture of 2D and 3D contact will be allowed in a SOL 600 model. For most models a mixture of 2D and 3D contact will fail but there are a few cases where it will run properly. The default will stop the run should a mixture of 2D and 3D contact as specified in field 3 of the first BCBODY line is found. PARAM,MCONF2D3D,1 will allow the job to continue but the job may fail later in the run.

- 0 Stop job with a FATAL ERRO if a mixture of 2D and 3D contact is found.
- 1 Allow job to continue if a mixture of 2D and 3D contact is found.

## MCORDUPD

Default = 0, SOL 600 only.

Determines if the coordinates will be updated if one of the CONTINUE options is specified on the SOL 600 Executive Control statement.

- 0 Original coordinates are used for the continue option. (Default)
- 1 Coordinates are revised to reflect the final position after the nonlinear analysis. These updated coordinates are used in the continue option.

**Remark:**

If `mcordupd=1`, `parampmarct19,1` is automatically set and `jid.marc.t19` will be generated (`jid.marc.t16` may also be generated if desired).

**MCSSHLCK**

Default = 1, SOL 600 only.

Case Control parameter that determines whether to check that the thickness direction of CSSHL elements is in the direction pointing from grids 1-2-3-4 to 5-6-7-8 or not.

- 1 Do not make the check.
- 1 Make the check. (Default)
- 2 Make the check only for 6-sided elements (looking like chexa) and ignore for 5-sided elements (looking like cpenta).

**Remark:**

This parameter must be set in the Case Control above the first subcase.

**MCSSHORR**

Default = 1, SOL 600 only.

Case Control parameter that sets the orientation of the thickness direction of CEHXA converted to solid shells.

- 1 The smallest CEHXA direction will be determined and the element will be renumbered such that the thickness of the renumbered elements points from grids 1-2-3-4 to 5-6-7-8
- 1 The thickness direction will be in the grid 1 to 5 direction (thickness points from grids 1-2-3-4 to 5-6-7-8). (Default)
- 2 The thickness direction will be in the grid 1 to 2 direction (grid numbering that originally was 1,2,3,4,5,6,7,8 will be changed to 1,5,6,2,4,8,7,3)
- 3 The thickness direction will be in the grid 1 to 4 direction (grid numbering that originally was 1,2,3,4,5,6,7,8 will be changed to 1,4,8,5,2,3,7,6)
- 11 The thickness direction will be along the side closest to the basic X-direction
- 12 The thickness direction will be along the side closest to the basic Y direction
- 13 The thickness direction will be along the side closest to the basic Z direction.

**Remarks:**

1. This parameter must be set in the Case Control above the first subcase.

2. This entry is only used in conjunction with the CSSHLM entry only.
3. This entry should only be used if all elements converted to solid shells are CHEXA, none should be CPENTA.
4. See the CSSHL entry for a description of grids 1 to 8.
5. For options other than mcsshorr=1 the material properties and material orientation direction must be orientated properly.

### MDAREAMD

Default = 1, SOL 600 only.

Option to modify or not modify all DAREA entries which are not associated with any other loads (DAREA entries that supply the actual load).

- 1 Do not modify any DAREA entries.
- 1 Modify all DAREA entries that are not associated with any other load entries and supply the actual loading. (Default)

### MDEFSEPP

Integer, Default = see below

This SOL 600 parameter allows an easy way to set the defaults for contact separation control. Since this parameter may be placed in RC files, the user can set default separation controls appropriate to the type of problems normally run and apply the same values to all models without having to enter them in the bulk data for each run. These values are normally entered on the BCPARA entry. The form of MDEFSEPP is as follows:

PARAM,MDEFSEPPAABBBBCD

where AABBBBCD is a packed integer field comprised of the following 4 controls:

	Variable	Standard Default	Values that can be Entered	Max Digits	Min Digits
AA	NODSEP	5	0 to 99	2	0
BBBB	MAXSEP	9999	0 to 9999	4	4
C	ICSEP	0	0 to 3	1	1
D	IBSEP	0	0 to 4	1	1

#### Remarks:

1. All values of AA, BBBB, C, D override the standard defaults.
2. NODSEP, MAXSEP, ICSEP, IBSEP entered on BCPARA override values on this parameter.
3. This parameter can be set in RC files.

4. Max digits is the maximum number of digits that can be entered.  
Min digits is the minimum number of digits that must be entered if this parameter is used.
5. A common setting for moderately difficult separation problems is MDEFSEPP=5001004  
AA=NODSEP=5  
BBBB=MAXSEP=10  
C=ICSEP=0  
D=IBSEP=4
6. A common setting for more difficult separation problems is MDEFSEPP=2999934  
AA=NODSEP=5  
BBBB=MAXSEP=9999  
C=ICSEP=3  
D=IBSEP=4

### MDK4OPT

Default = 1

Performance parameter used in MDACMS for the calculation of K4. If MDK4OPT>0 the most common value of GE for structure elements will be internally applied to PARAM,G to speed up the calculation of K4. Set MDK4OPT to 0 to disable this feature. The traditional K4 calculation will be used instead.

### MDOPT14

Default = NO

Option 14 of the MDENZO functional module modifies degree of freedom (DOF) based domain decomposition such that DOF belonging to any one grid point are retained in a single domain. This action (PARAM,MDOPT14,YES) lends stability to the resulting solution at the possible expense of some efficiency. Setting MDOPT14 to NO bypasses this operation so that DOF may be distributed to any domain without restriction. This parameter applies to Matrix Domain ACMS.

### MDOTM

Default = AUTO

The default selects the most efficient method for data recovery in DOMAINSOLVER ACMS (PARTOPT=DOF). There are two methods: (1) Output transformation matrix (OTM) method is selected if the number of modes multiplied by PARAM,MDOTMFAC (Default = 20) exceeds the number of degrees-of-freedom at which displacements are required in order to complete data recovery (DISP, STRESS, etc.) This method also requires PARAM,SPARSEPH,YES which is the default. This method may be forced with PARAM,MDOTM,YES. (2) If the number of modes multiplied by PARAM,MDOTMFAC (Default = 20) does not exceed the number of degrees-of-freedom at which displacements are required in order to complete data recovery condition is not satisfied then the non-OTM method is selected. This method may be forced with PARAM,MDOTM,NO.

### MDOTMFAC

Default = 20

See MDOTM.

## MDREDOPT

Default = -1

This parameter is used in ACMS for matrix reduction operations. It affects the way in which matrices are reduced to modal coordinates. Quantities affected are damping, loads, and acoustic coupling. By default, the ACMS-generated Q-size matrices are reduced to H-size (modal coordinates). This is the most efficient method. If MDREDOPT=1, a triple matrix multiplication is used.

## MDUMLoad

Default = 0, SOL 600 only.

- 0 For subcases with no applied loads and enforced displacement or velocity of rigid contact bodies, a small magnitude dummy load will be created. Without these dummy loads, Nastran becomes confused and does not produce the correct contact information. If there is only one subcase, the dummy loads are not necessary. (Default)
- 1 Dummy loads will not be produced for any subcase and rigid contact with enforced motion may be incorrectly described.

## MECHFIL

Default = 1.E-6

Criterion for discarding massless mechanism modes with small generalized mass. A smaller value will result in more marginal constraint modes being retained. This parameter is used for PARAM,MMMETH,OLD. See also [MECHFIX](#), [MMMETH](#), and [MMFIL](#).

## MECHFIX

Default = AUTO

Control for fixing the massless mechanism problem. This capability is provided automatically for the default of this parameter, listed above. This capability is executed only when the eigensolution does not provide answers because of symptoms consistent with the presence of massless mechanisms. If MECHFIX is set to YES, the constraint modes are removed before attempting an eigensolution. When set to NO, the capability is blocked, the eigensolution will fail, and User Fatal Message 9119 will be printed in the F06 file. See also [MMFIL](#) and [MMMETH](#).

## MECHPRT

Default = NO

For SOL 103 only, if massless mechanisms are found the constraint modes are printed with a format similar to eigenvectors when this parameter is set to YES. They are labeled CONSTRAINT MODES, and are numbered sequentially. Grid points with only zero values in a mode are not printed. This parameter should be used when performing initial checkout of a model and a goal is to remove all massless mechanisms before starting production analysis. The number of each "mode" matches the corresponding GID,C pair in the high ratio message. If there are many (thousands) of such modes the output file will be large. There is no method to plot these shapes at present.

## MESH

Default = NO

If MESH=YES is specified, then a summary of the shading status and the subelement mesh for each CHBDYi element referencing a VIEW Bulk Data entry is printed.

## METHCMRS

Default = 0

In dynamic analysis (SOLs 103, 107, 108, 109, 110, 111, 112, 145, 146, and 200), METHCMRS specifies the set identification number of an EIGR or EIGRL entry to be used in the calculation of the normal modes on the v-set of the residual structure.

By default, the residual structure v-set normal modes will be computed based on the METHOD Case Control command selection as long as q-set is present.

## MEXTRNOD

Default = 0, SOL 600 only.

Determines whether extra grids will be added to SOL 600 parallel analyses.

- 0 Extra grids will not be added. (Default)
- 1 Extra grids will be added so that all grids from 1 to the highest grid are defined this was necessary for certain version of Marc prior to the 2005 version. All extra grids that are added have coordinates of 0.0 in all three directions.

## MEXTSEE,N

Default = 0, SOL 600 only, Case Control Parameter

Determines whether SOL 600 external superelement residual runs contain loads in the main input file or not.

- 0 External Superelement residual runs will not contain any loads. (Default)
- 1 External Superelement residual runs will contain all loads.

## MFASTCMP

Default = 1, SOL 600 only.

Determines default composite shell integration method.

- 1 Standard integration method is used. Failure, plasticity, thermal loads, etc. are all allowed. (Default)
- 2 A “fast integration” through the thickness technique is used which ignores thermal strains, plasticity, and temperature-dependent material properties (which should not be entered in the model).
- 3 A “fast integration” through the thickness technique is used which only ignores plasticity. Thermal strains and temperature-dependent materials are allowed.

**Remarks:**

1. To override the default integration method, use Bulk Data entry PCOMP.
2. If option 2 is used and temperature loading is present in the model, the option will automatically be re-set to 3.

**MFEA5701**

Default = 1, SOL 600 only.

Determines whether feature 5701 is written to the Marc file. When this feature is set to 1, it disables default rotation checking set to 0.001, which was initially set for early versions of Marc when RBE2 and similar elements were added because the 0.001 value proved to be responsible for convergence problems. For models that need rotation checking, you can enter the value using the NLSTRAT variable RLROTT. We recommend always using MFEA5701,1 to turn off the default 0.001 checking value in Marc whether or not the value is entered using NLSTRAT RLROTT.

- |   |   |
|---|---|
| 0 | Rigid rotation checking of 0.001 is turned on.            |
| 1 | Rigid rotation checking of 0.001 is turned off. (Default) |

**MFORCOR1**

Default = 1, SOL 600 only.

Option to correct forces entered twice (at the same node) in multiple subcases. This is not commonly found in the input files.

- |   |                               |
|---|-------------------------------|
| 0 | Do not correct the forces.    |
| 1 | Correct the forces. (Default) |

**Remark:**

This parameter can be set in RC files.

**MFORDUPE**

Default = 0, SOL 600 only.

Controls how duplicate forces encountered for the same load case are handled in SOL 600.

- |   |   |
|---|---|
| 0 | Forces will be translated to Marc as encountered even if duplicates are present. In the case of duplicates (more than one set of forces for the same node in the same subcase), all forces found will be translated directly to the Marc input. (Default) |
| 1 | If duplicates exist, only the last set of forces will be translated.  |

**Note:** To prevent confusion, it is suggested that duplicate forces not be used.

## MFSKIPPP

Integer, Default = 0, SOL 600 only.

Controls memory near the end of SOL 600 translations will be freed or not.

- 0 Memory is freed.
- 1 Memory is not freed (can save computer time, and, in some cases may be necessary for some models.)

## MGAPINIT

Integer, Default = 0, SOL 600 only.

Controls whether CGAP elements are initially open or closed (during Marc increment zero).

- 0 Gaps are initially open.
- 1 Gaps are initially closed.

## MGLUETOL

Real, Default = 1.0E-6, SOL 600 only

Determines the tolerance for the PERMGLUP option of the SOL 600 Executive Control statement for situation where the primary method (same as SOL 101 with permanent glue) fails to find any glued contact possibilities (for example, for edge contact will usually find no glued contact using SOL 101). If not glued contact is found using the primary method a secondary method, which can sometimes take a significant amount of computer time for large models is used. The second method evaluates all grids that have the same coordinates as the grids within the tolerance specified by this parameter. They will be tied together unless they have SPC's, MPC's or are grids attached to rigid elements.

## MHEATSHL

Default = 0, SOL 600 only.

Determines whether a membrane or thick shell element formulation is used for heat transfer. This parameter can be overridden by individual PSHELL entries. In the current release, the membrane elements should not be used for thermal contact analysis.

- 1 All "quad" elements in the model will have membrane capability regardless of MIDi values on the PSHELL entries.
- 0 All "quad" elements in the model will have membrane capability. (Default)
- 1 All "quad" elements in the model will have thick shell capability (shell sect, 1).
- 2 Shells use 2 dof per node, linear variation of temperature through thickness (shell sect, 2).
- 3 Shells use 3 dof per node, quadratic variation of temperature through thickness (shell sect, 3).
- >3 Shells use  $2 \cdot n_i + 1$  dof per node (where  $n_i$  is the value of MHEATSHL specified). (shell sect,  $2 \cdot (n_i - 2) + 1$ )

**Notes:**

1. Membrane capability in heat transfer means that the temperature is constant throughout the thickness, The MHEATSHL=0 option can be overridden by entering a non-blank value for MID2, MID3 and/or MID4 on an applicable PSHELL entry in which case the MHEATSHL=1 option will be used if no MHEATSHL parameter is entered.
2. Post options will be added to be the same as the value for Marc's shell sect. For example, if shell sect, 3 is generated, post codes 9,1 9,2 and 9,3 will also be generated.

## MHEATUNT

Default = 2, SOL 600 only.

Specifies the units for heat transfer using SOL 600.

- |   |                          |
|---|--------------------------|
| 0 | SI mm units used         |
| 1 | SI m units used          |
| 2 | US units used. (Default) |

**Note:** This parameter is used by Marc's ISOTROPIC (heat transfer) third datablock, fourth field.

## MHEMPIX

Default = 500, SOL 600 only.

Controls the number of pixels used in radiation heat transfer for SOL 600 using the hemi-cube method.

## MHOUBOLT

Default = 0, SOL 600 only.

- |   |  |
|---|--|
| 0 | SOL 600 transient dynamics will use the single step Houbolt numerical integration method. (Default)            |
| 1 | SOL 600 transient dynamics will use the Newmark Beta numerical integration method.                             |
| 2 | SOL 600 transient dynamics will use the standard Houbolt numerical integration method.                         |
| 7 | SOL 600 transient dynamics will use the generalized alpha (Hilber-Hughes Taylor) numerical integration method. |

## MHRED

Default = YES

MHRED=YES, selects the c-set and r-set component mode reduction method suggested by Dr. Arya Majed and Ed Henkel. See the *MSC Nastran V2004 Release Guide* for details.

## MICRO

Default = 10, SOL 700 only

Defines the accuracy of the initial conditions in Eulerian elements, when using the geometrical shape definition.

### Format:

PARAM,MICRO,VALUE

### Example:

PARAM,MICRO,15

VALUE            Micro-zoning parameter. (Integer > 0)

### Remarks:

1. MICRO is the number of micro zones into which an element is subdivided during initial condition generation.
2. The default MICRO = 10 results in material fractions as accurate as 0.001. If a higher accuracy is required, a greater value for MICRO can be used, but the CPU time for the generation increases rapidly.
3. Micro zoning is only used when the initial conditions of the Eulerian material are specified on a TICEUL1 entry.

## MIDNODE

Default = 0, SOL 200 only

- = 0            High order element mid-side grid is updated by shape basis vectors.
- = 1            High order element mid-side grid is smoothed by algorithm 1.
- = 2            High order element mid-side grid is smoothed by algorithm 2 (most robust).

## MINCLDSB

Integer, Default = 0, SOL 600 only

Determines whether the SB value in field 4 of MATF will be included or not in the stiffness formulation of the model (Marc COMPOSITE datablock 3 field 4):

- 0            SB will not be included.
- 1            SB will be included.

### Remarks:

1. For releases prior to MD Nastran 2010, SB was not included.

2. If SB is included, Marc parameter TSHEAR will also be included.

## MINIGOA

Default = NO

Allows for the reduction in the amount of disk space used when using superelements. When this parameter is set to YES, the transformation matrix GOA will contain terms only for the degrees-of-freedom in the U5 (USET, USET1, SEUSET, SEUSET1) set. This can allow for a significant reduction in the amount of disk space used by the database. The limitation of using this approach is that data recovery will be available only for these degrees-of-freedom and elements connected to them.

## MINRECC, N

Default = 0, SOL 600 only.

N Integer. Minimum number of iterations per load step. This is the same as MINREC on the NLSTRAT entry. If no other NLSTRAT values are entered, it is easier to enter this parameter. The value can range from 0 to 9. For certain problems, the value should be 2 or greater or accuracy will be poor.

Minimum number of iterations per load step. This is the same as MINREC on the NLSTRAT entry. If no other NLSTRAT values are entered, it is easier to enter this parameter. The value can range from 0 to 9. For certain problems, the value should be 2 or greater or accuracy will be poor.

## MINSOUTT

Default = 0, SOL 600 only

Determines elements that deform so much that they go inside-out in an analysis will be deactivated.

0 Issue an error message and terminate the job if an element goes inside-out. (Default)  
1 Deactivate any element that goes inside-out and continue the analysis. This option is particularly useful for models which allow failure (for example those using MATF).

### Remark:

param,minsoutt,1 maps to Marc's parameter IO-DEACT.

## MINVASHF

Default = 1.0, SOL 600 only

Inverse Power "auto shift" value. A new shift point (in frequency squared) is determined as the highest frequency squared plus this entry times the difference between the highest and next highest distinct frequency squared.

## MINVCITR

Default = 40, SOL 600 only

Inverse Power method, number of iterations.

## MINVCSHF

Default = 0.0, SOL 600 only

Inverse Power shift frequency in Hz.)

## MINVCTOL

Default = 1.0E-5, SOL 600 only

Inverse Power convergence tolerance.

## MINVFMAX

no Default, use MINVNMATCH, SOL 600 only

Real. Inverse Power max frequency to extract in Hz.

## MINVNMATCH

Default = 5, SOL 600 only

Integer. Inverse Power max number of modes to extract.

## MLDALLOW

Integer, Default = 0

Determines whether forces (FORCE, MOMENT, PLOAD4, etc.) are allowed in SOL 600 if their ID is the same as the value N of any Case Control LOAD=N entry.

- |   |  |
|---|--|
| 0 | Forces with the same ID are not allowed. |
| 1 | Forces with the same ID are allowed.     |

### Remarks:

1. MLDALLOW=0 is the only option available for most other Nastran solution sequences.
2. MLDALLOW=1 was the only option available in SOL 600 prior to MD Nastran 2010.
3. MLDALLOW=1 cannot be used with PARAM,MNASTLDS if MNASTLDS>0.
4. This parameter can be set in RC files.

## MLSTRAIN

Default = -1, SOL 600 only.

Corresponds to Marc's "LARGE STRAIN" parameter and optionally allows large rotation of beams and shells.

- |    |  |
|----|--|
| -1 | Small strain, small rotation analysis is used. (Default)   |
| 1  | Large strain and large rotation analysis of beams and shells is implemented in a way to automatically select the best options for a large strain analysis based upon the element type (see the following table). |

- 2 Use large strain and large rotation analyses of beams and shells for hyperelasticity and multiplicative plasticity with radial return mapping
- 11 Same as option 1 except beams and shells are limited to small rotations (see Remark 1.)
- 12 Same as option 2 except beams and shells are limited to small rotations (see Remark 1.)

Element Type/ Material Model	1-Dimensional	Plane Stress or Membranes or Shell Elements	Plane Strain or Axisymmetric, or 3- Dimensional Displacement Form	Plane Strain or Axisymmetric, or 3- Dimensional Herrmann Form
Conventional elastic-plastic	Updated Lagrange additive plasticity; no finite strain	Updated Lagrange additive plasticity; includes finite strain	Updated Lagrange additive plasticity; includes finite strain utilized constant strain	Updated Lagrange multiplicative plasticity; includes finite strain
Mooney, Ogden, Gent, or Arruda- Boyce	Total Lagrange	Total Lagrange	Updated Lagrange	Updated Lagrange
Foam	Total Lagrange	Total Lagrange	Updated Lagrange	Updated Lagrange; incompressibility neglected

**Remarks:**

1. Starting with MD Nastran 2010, if MLSTRAIN=1 or 2, feature,2103 will also be added to provide the best large rotation solution of beam and shell models using updated Lagrange. To prevent feature,2103 from being used MLSTRAIN can be set to 11 or 12 instead of 1 or 2 respectively if large strain small rotation is desired.
2. Starting with MD Nastran 2010, if hyperelastic materials are found in the model, PARAM,MLSTRAIN,12 will be set automatically unless a different value of MLSTRAIN has been set by the user.

**MLSTRAN2**

Integer, Default = 0, SOL 600 only

Determines how the LARGE STRAIN option is written in the Marc input file for SOL 600.

- 0 LARGE STRAIN, (other options if applicable)
- 1 LARGE STRA, (other options if applicable)

**Remark:**

Since SOL 600 writes the Marc input file using large-field free-format input either option will work properly. If the input file is modified by hand and this entry is changed to fixed-format, the LARGE STRA option must be used.

## MMAT2ANI

Default = 2, SOL 600 only.

Determines how MAT2 will be mapped to Marc.

- 0 MAT2 will be mapped to Marc's ORTHOTROPIC option.
- 1 MAT2 will be mapped to Marc's ANISOTROPIC option.
- 2 MAT2 will be mapped as explained in the following note. (Default)

**Note:** The default, MMAT2ANI=2, maps MAT2 to Marc's ORTHOTROPIC option if G13 and G23 are both zero or blank and to Marc's ANISOTROPIC option if G13 and/or G23 are non-zero.

## MMBOLTUS

Integer, Default = -1, SOL 600 only

Controls how the top and bottom nodes are placed in the Marc "tying 69" input when MBOLTUS is used in a SOL 600 model.

- 1 Same as pre-MD Nastran 2010 versions tying 69 node order is top, bottom, control
- 1 Reversed - tying 69 node order is bottom, top control

### Remarks:

1. If it appears that a bolt preload may be backwards for bolts modeled using MBOLTUS, this parameter may be entered to reverse the mpc equations internally generated in Marc by tying 69 instead of reversing the loads.
2. For the MBOLTUS entry to be consistent with the SOL 400 BOLT entry PARAM,MMBOLTUS,1 is usually required.

## MMEMDETT

Default = -1, SOL 600 only.

Determines the Nastran portion of SOL 600 determines how much usable memory is available just before spawning Marc and informs Marc through the -ml flag. If Marc needs more memory than this value, it will go out of core.

- 1 Do not determine the amount of usable memory. (Default)
- 1 Determine the amount of usable memory and set the -ml Marc command line option to that value

**Remarks:**

1. Marc can determine this memory, however the computations determine the amount of installed memory and do not take into account memory used by the operating system or by other user processes.
2. This parameter may be entered in RC files.

**MMFIL**

Default = 1.E-10

Filter value used to distinguish between massless mechanism modes and rigid body modes. A smaller value may discard rigid body modes. The default value has been effective on all problems solved to date. This parameter is used for PARAM,MMMETHOD,NEW and PARAM,MMMETHOD,BETA. See also [MMMETHOD](#).

**MMMETHOD**

Default = NEW

Selects method for searching for massless mechanisms. The default value is generally the most reliable method. Use PARAM,MMMETHOD,BETA to invoke a new procedure that can sometimes find massless mechanisms when the default does not find any. Specify PARAM,MMMETHOD,OLD to use the original procedure. See also [MECHFIX](#).

**MNASTLDS**

Integer, Default = See Remark 1., SOL 600 only.

Option to determine complex forces using OLOADS datablock or the forces, moments, pressures, etc. in the Nastran input file. Positive values of MNASTLDS may also significantly speed up the SOL 600 translation and, in the case of RFORCE, the marc portion of the run will also usually be faster.

-1 or 0	Loads for Marc are translated or calculated directly from the forces, moments, pressures, etc. in the Nastran input file. (Remark 1.)
1	Complex loads and moments are obtained from the OLOADS datablock, pressures, rforce and other distributed loads are translated from the values found in the Nastran input. (Remark 3.)
4	Same as MNASTLDS=1 if the model has Bulk Data LOAD entries with more than one term (L2, L3, ... on the Bulk Data LOAD entry is defined), otherwise same as mnastlds=0.
99	Same as MNASTLDS=1 regardless of whether complex loads or Bulk Data LOAD entries with more than one term exist in the mode.
777	Same as MNASTLDS=99 except that all type of distributed loads (pressures, rforce, etc.) will be converted to force and obtain from the OLOADS datablock. (Remark 5.)

**Remarks:**

1. Default=99 if any GRID entry has field 7 defined. Default=777 if there are multiple subcases and RFORCE or PLOAD4 with continuation lines exist in the model or if any FORCE entry with nonzero (or blank) field 4 is defined, otherwise the default is 4.
2. MNASTLDS=-1 (or 0) was the only option prior to MD Nastran 2010.

- Complex loads are defined as those forces or moments whose grid appears more than once when the Case Control and Bulk Data LOAD entries are evaluated. For example consider the following situation:

```
....
SUBCASE 1
LOAD = 10
SUBCASE 2
LOAD = 20
BEGIN BULK
LOAD, 10, 1.0, 2.0, 1, 3.0,2
LOAD, 20, 1.0, 4.0, 1, 5.0,2
FORCE,1,51, ,1.0,0.0,0.0,100.0
FORCE,2,51, ,1.0,0.0,0.0,200.0
```

Although the force at grid 51 occurs for different load ID's when combined using the LOAD entries it actually occurs twice in each subcase. This is the simplest form of a complex load and can be handled by either MNA STLDS option. However, some models will have much more complex situation, even having different entries for the Fx, Fy and Fz directions. In such circumstances, particularly if multiple subcases are involved MNA STLDS > 0 is recommended.

- This parameter may be set in RC files.
- When MNA STLDS=777 pressures (and other forms of distributed loads) are converted to nodal forces and the follower force effects will be lost. However, for multiple subcases the follower force effects are not available in SOL 600 unless the loading is the same between subcases except for a scale factor.

## MODACC

Default = -1

- |     |  |
|-----|--|
| 0   | Selects the mode acceleration method for data recovery in dynamic analysis. See <a href="#">Formulation of Dynamic Equations in SubDMAP GMA</a> in the <i>MSC Nastran Reference Guide</i> for further discussion. If PARAM,SPARSEDR,NO is specified, then PARAM,DDRMM,-1 must also be specified. |
| 1   | Is the same as MODACC = 0 except if SUPORTi entries are present then the displacements are corrected for rigid body motion and the local flexibility at the SUPORTi degrees-of-freedom.  |
| ≥ 0 | Is not recommended for use in hydroelastic problems.   |

## MODEL

Default = 0

This parameter also allows several models to be stored in the same graphics database created by PARAM,POST,0.

## MOFFCORE

Default = 1, SOL 600 only.

Determines how memory for PARAM,MARCOFFT above is to be allocated (for increased speed).

- 1 Additional memory is not allocated.
- 1 Additional memory is allocated if available. (Default)

## MOP2TITL

Default = 1, SOL 600 only.

Determines how titles are placed on the 146 word record for op2 output records generated by SOL 600.

- 1 Standard titles will not be placed, however titles of the form “CQUAD4 STRESS FROM MARC”, and similar titles for other element types, strains, displacements, etc. will be written. This option is useful for certain postprocessors.
- 1 Standard Nastran title, subtitles will be placed on op2 files generated by SOL 600. This option is useful for postprocessors that require SOL 600 op2 data to be exactly in the same format as that generated by other Nastran solution sequences. (Default)

**Note:** The SOL 600 op2 file follows that of SOL 109 as closely as possible.

## MOUTRCOR

Integer, Default = 0, SOL 600 only

Determines whether SOL 600 OUTR options are disabled or not if any CORD2i references another coordinate system.

- 0 Disable OUTR options
- 1 Do not disable OUTR options

### Remarks:

1. In some cases, OUTR results are inaccurate if a CORD2i references another CORD.
2. CORD2i entries are not checked to see if they are actually used in the model.

## MP1SET

Character “F” or “G” (default, see below)

Controls the integration set used in the calculation of MONPNT1 results. For the value of “F”, the integrated values will reflect any redistribution of loads caused by rigid elements and MPCs. This is particularly useful in the static aeroelastic solution sequences (SOL 144) when RBE3s are used to distribute mass, applied loads and splining. For the value of “G”, no redistribution occurs. The default is a function of the solution sequence.

SOL 144 - Default = "F", option "G" is not available.

All other sequences - Default = "G", option "F" can be specified by the user.

### **MPCX**

Default = 0

See OLDSEQ.

### **MPERMPRT**

SOL 600 only.

Determines whether to print permanent glue MPC's in the f06 file.

- |   |                                   |
|---|-----------------------------------|
| 0 | Do not print permanent glue MPC's |
| 1 | Print permanent glue MPC's        |

### **MPTUNIT**

Default=0

MPTUNIT is used in conjunction with an FMS ASSIGN statement to specify the unit number for the storage of monitor points results in OUTPUT2 format in SOL 146. Default=0 indicates that no monitor point data are to be stored

### **MQUATERN**

Integer, Default = 2, SOL 600 only

Controls whether quaternions will be used for SOL 600 models with large rotation.

- |    |   |
|----|---|
| -1 | Do not use quaternion "feature" for large rotation  |
| 1  | Use quaternion feature,2103 which allows large rotations for total Lagrange or updated Lagrange |
| 2  | Use quaternion feature,2105 which allows large rotations only if updated Lagrange is used       |

### **Remarks:**

1. The use of MQUATERN = -1 allows backwards compatibility such that most models will obtain the same results using MD Nastran R3 as were obtained using MD Nastran R3.
2. The use of MQUATERN = 1 is believed to yield the most accurate large rotation results for most models.
3. With PARAM,MQUATERN,1 large rotation may be used both with updated Lagrange and total Lagrange.
4. mquatern = -1 does not set Marc feature 2103 (feature 2105 is not set).
5. mquatern = 1 sets Marc feature 2103

## MRADUNIT

SOL 600 only.

Controls the units used in radiation heat transfer for SOL 600.

- |   |   |
|---|---|
| 1 | Degrees Celsius                                   |
| 2 | Degrees Kelvin (default if parameter not entered) |
| 3 | Degrees Fahrenheit                                |

**Note:** Degrees Rankin are not available.

## MRAFFLOR, N

Default = N0, SOL 600 only.

- |   |   |
|---|---|
| N | Integer. If N=0, a new AF_flowmat file containing temperature-dependent stress-strain curves will be generated during the current Nastran execution and also used in the spawned Marc run. If N=1, an existing AF_flowmat file will be used. The name of the file is always determined by the value of PARAM,MRAFFLOW, but PARAM,MRAFFLOT determines if other characters are added. |
|---|---|

## MRAFFLOT, N

Default = N0, SOL 600 only.

- |   |   |
|---|---|
| N | Integer. If N=0, the file name as specified using PARAM,MRAFFLOW,Name will be used with no changes except that all characters will be in lower case and the extension “.mat” will be added. If N=1, the characters “asm_” will be added at the beginning of Name, the first character of Name will be upper case (the other characters of Name will be lower case) and the extension “.mat” will be added. This will make the AF_flowmat file name compatible with many names in Marc’s AF_flowmat directory. |
|---|---|

## MRAFFLOW, Name

No Default, SOL 600 only.

- |      |  |
|------|--|
| Name | Character. Name of a file containing temperature dependent stress versus plastic strain curves in Marc’s AF_flowmat format. This file can be generated from the current Nastran run using TABLEST and TABLES1 entries or a pre-existing file can be used depending on the value of PARAM,MRAFFLOR. The extension “.mat” will be added to Name. If this is a new file, it will be saved in the directory from which the Nastran execution is submitted. If a pre-existing file is to be used, it can either be located in the directory where the Nastran execution is submitted or in the Marc AF_flowmat directory. |
|------|--|

## MRALIAS ID (MALIAS02, MALIAS03, etc.)

No Default, SOL 600 only. This parameter is not usually used.

The purpose of the parameter is to map the advance nonlinear element type selected by the internal Marc translator in Nastran to a different type. For example, if the element type 75 for CQUAD4 is normally used, a mapping to advance nonlinear element type 139 could be made. ID is a 6 digit number. The left 3 digits are the element type normally selected by the translator and the right 3 digits are the element type to be mapped. In the above example, element type 75 is to be mapped to 139. The user would enter ID=075139. If element type 165 is to be mapped to element type 1 (which is not a real case), ID=165001. Consult Marc Volume B for a list of elements and their meaning. The user is responsible for ensuring that the mapping selected is proper. There is a limit of 18 aliases that may be entered in any model. Since Nastran can only accept one parameter with a given name, the second alias should be named PARAM,MALIAS02 and the third PARAM,MALIAS03, etc. All original element types mapped must actually exist in the model.

### Remark:

These entries should only be used if the Marc GEOMETRY entries are identical for the original and new element types.

**Note:** If you use one of the MRALIAS parameters, certain “parameters” in the Marc file may no longer be correct. For example, an element originally capable of using the updated Lagrange method may be aliased to one that must use the total Lagrange method. Such conditions are not checked by the translator when you use alias and you will need to make modifications to the Marc input file yourself to reflect them. To resolve this use PARAM,MLSTRAIN.

The Bulk Data entry, ALIASM, is available and subsequent version are more powerful.

## MRALLOGC

No Default, SOL 600 only.

Integer. The value entered here is the amount of memory (MB) allocated for general Marc memory when Marc is spawned from Nastran. It specifies the initial allocation of “general memory”. This is used for storing element stiffness matrices and part or all of the matrix solver workspace among other things. Please note that element data like stresses and strains are not part of the general memory. Solvers 6, 8, and 9 use the main part of the workspace in separate memory. Initial allocation of the general memory can be used for avoiding reallocation (increase of the workspace). For parallel processing the amount specified is the total for the job. It is divided by the number of domains used.

## MRALLOCS

No Default, SOL 600 only.

Integer. The value entered here is the amount of memory (MB) allocated for Marc solver memory when Marc is spawned from Nastran. It specifies the initial allocation of memory for solver 8. By giving a value that is more than the maximum used during the run, one avoids that the solver workspace is increased (reallocated). This can be particularly useful for large contact jobs, where additional memory may be allocated due to

contact. If the given workspace is less than what is needed, it is automatically increased. This option is only for use with solver type 8. No check is done to see if solver type 8 is used in the job. For parallel processing the amount specified is the total for the job. It is divided by the number of domains used.

## MRBE3SNG

SOL 600 only.

Option to check the singularity of RBE3's in SOL 600. The real value entered is the singularity threshold allowed. If MRBE3SNG is entered as a positive value, all RBE3's with poor singularity values above the value entered will be output in the `jid.marc.out` file as warning messages. If MRBE3SNG is entered as a negative value, all RBE3's with poor singularity values above the absolute value entered will be output in the `jid.marc.out` file as error messages and the job will abort if they are found in increment zero, but if they are found after increment zero the messages are warning messages and the job will continue.

**Note:** A "good" RBE3 element using the original geometry in increment zero could become singular as the structure deforms in subsequent increments.

## MRBEAMB

Default = 0, SOL 600 only.

- |    |  |
|----|--|
| 0  | Write equivalent radius for all beams (see PARAM, BEAMBEA) whether beam-beam contact is anticipated or not. The equivalent radius is the 7th field of Marc's GEOMETRY values for beam type elements. (Default) |
| -1 | Do not write equivalent radius (7th field is blank). This might be necessary for versions of Marc earlier than 2003.   |

## MRBEPARM, IJK

Default = 0, SOL 600 only.

IJK provides settings for Marc's RBE parameter. If PARAM, MRBEPARM parameter is entered, Marc's RBE parameter will be set using this IJK. If PARAM < MRBEAMPM is not entered, PARAM, MARCRBE2 or PARAM, MARCRBE3 can be used to set Marc's RBE parameter.

IJK is a combination of three variables. For example 311. Descriptions for individual entries are as follows:

- |   |   |
|---|---|
| I | Enter 3 or 6 to control the number of degrees-of-freedom. For the dependent grid (reference grid) of each rbe2 or rbe3. The independent grids can have 3 or 6 dof and can be different than what is specified by I. |
| J | Enter 1 to use large displacement formulation of rbe2. Enter 3 to deactivate automatic convergence test for rbe2.   |
| K | Enter 1 to use large displacement formulation of rbe3. Enter 2 to activate non-normalized rotation constraint coefficient for rbe3.   |

**Note:** If IJK values other than specified above are entered, IJK will be set to zero and the parameter will not be used. This parameter should not be entered unless there are rbe2's or rbe3's in the model and they are to be used as such in Marc (rather than mpc or stiff beams).

## MRBDYCVT

Default = 0, SOL 600 only.

Determines if CHBDYG is converted to CHBDYE for SOL 600 heat transfer.

- |   |   |
|---|---|
| 0 | Do not convert. (Default)   |
| 1 | Attempt to convert CHBDYG to CHBDYE. All grids specified by all CHBDYG entries must reference actual conduction elements (CQUAD4, CHEXE, CTETRA, etc.) If even one CHBDYG does not reference an existing conduction element, this parameter will be re-set to zero. |

**Note:** If MRBDYCVT=0, CHBDYG will normally result in point heat transfer loads rather than distributed heat transfer loads.

## MRBIGMEM

Integer, Default = 0, SOL 600 only.

- |   |   |
|---|---|
| N | If N=0, memory allocations during loads translation phases are sized for computers with limited memory and swap space (paging space). Some large problems and/or unusual problems may not run. If this happens, use a newer modern computer with lots of memory and disk space (and lots of swap space) and set N=1. Larger memory allocations will then be available. This parameter is not usually required unless the available memory is extremely small. |
|---|---|

## MRBUKMTM

Default = 2, SOL 600 only

- |   |   |
|---|---|
| 1 | Buckling modes will be computed using the Inverse Power method.   |
| 2 | Buckling modes will be computed using the Lanczos method. Matrices must be positive-definite for this option. (Default) |
| 3 | Use Lanczos if EIGRL is specified, Inverse Power if EIGB is specified.  |

**Note:** MRBUKMTH should be specified if EIGR or EIGRL is used for buckling unless SOL 600,105 is the solution sequence. An alternative is to use ANALYSIS=BUCK. In SOL 600, it is not possible to compute natural frequencies and buckling modes in the same run. If ANALYSIS=BUCK is specified anywhere in the Case Control and if PARAM,MRBUKMTH is omitted, param,mrbukmth=3 will be set automatically.

## MRC2DADD

Default = 0, SOL 600 only.

Allows an offset to be added to all coordinates for 2D analyses so that X and Y will always be positive.

- 0 Offsets will not be added. (Default)
- 1 Offsets will be determined so that all Marc X and Y coordinates are positive (will exceed 0.1).

## MRCKBODY

Integer, Default = 1, SOL 600 only.

Determines whether each BCBODY will be checked to see if the 2nd line is present when more than 2 lines exist. If the 2nd line is missing for BCBODY entries with more than 2 lines, errors can occur.

- 1 BCBODY entries are not checked.
- 1 BCBODY entries are checked. If the 2nd line is not present for BCBODY entries having more than 2 lines, a 2nd line will be added internally.

### Remark:

This parameter can be set in RC files.

## MRCKLOAD

Integer, Default = 0, SOL 600 only.

Controls whether each subcase has LOAD or DLOAD specified. SOL 600 will usually not run correctly unless each subcase has some type of load (dummy or real). If a subcase only has a change in SPC, MPC, or contact to obtain the correct results a dummy load is usually required.

- 0 No check is made to see if each subcase has a Case Control LOAD or DLOAD entry.
- 1 A check is made to see if each subcase has a Case Control LOAD or DLOAD entry and if any subcase does not have such entry, a fatal error will be issued.

### Remarks:

1. This parameter must be entered in the Case Control above any subcases.
2. This parameter may be set in RC files.

## MRCONADD

Integer, Default = 1, SOL 600 only.

Controls whether PARAM,MRCONVER,11 will be added automatically if any BCTABLE with FBSH, BKGL and/or SEGS sub-headers is found. Also controls whether a BCTABLE with ID=0 will be added if one is not present in the input file.

- 1 Do not change value of PARAM,MRCONVER and do not add a BCTABLE with ID=0 if it is missing.
- 1 Change PARAM,MRCONVER to 11 if any sub-headers FBSH, BKGL and/or SEGS are found. Also add BCTABLE=0 if there are other BCTABLEs and non with ID=0 exists.
- 2 Change PARAM,MRCONVER to 11 if any sub-headers FBSH, BKGL and/or SEGS are found but do not add BCTABLE=0 if there are other BCTABLEs and none with ID=0 exists.
- 3 Do not change PARAM,MRCONVER to 11 if any sub-headers FBSH, BKGL and/or SEGS are found. Add BCTABLE=0 if there are other BCTABLEs and none with ID=0 exists.

### Remarks:

1. PARAM,MRCONVER,11 is necessary if BCTABLE sub-headers FBSH, BKGL and/or SEGS exist in the model.
2. BCTABLE with ID=0 is sometimes necessary for certain contact problems. It never hurts to have one as it will be ignored for those contact problems where it is not needed.
3. This parameter may be used in MD Nastran 2010 and subsequent versions. The behavior of previous versions was the same as PARAM,MRCONADD,-1.
4. This parameter may be set in RC files.
5. This parameter, if used, must be placed in the Case Control above any subcases.

## MRCONRES

Default = 0, SOL 600 only.

For restart runs, Marc will produce “continuous” results files (t16/t19) which contain the results of the original run(s) as well as the results of the restart run. If Nastran postprocessing is requested to generate op2, xdb, etc. files, they will also contain the results from prior runs as well as the restart run.

MRCONRES=1, output results files will contain the results of the restart run only.

## MRCONTAB

Default = 0, SOL 600 only.

Determines whether CONTACT and CONTACT TABLE for SOL 600 use table-driven form or not.

- 0 Do not use table-driven form. (Default)
- 11 Use table-driven form of CONTACT and CONTACT TABLE

**Remarks:**

1. If MRCONTAB=11 then MRCONVER must also be set to 11
2. This parameter should is not necessary for SOL 600 heat transfer analysis and should not be set

**MRCONUSE**

Integer, Default = 0, SOL 600 only

Determines which increment for which contact MPC's will be used for SOL 600 jobs using a CONTINUE=101 to CONTINUE=159 (see the SOL 600 Executive Control statement, CONTINUE option).

- |   |   |
|---|---|
| 0 | The last increment will be used (remark). |
| N | Increment N will be used.                 |

**Remark:**

When models with contact and if BCPARA<INITCON,4 is specified, MPC's for each increment will be produced and placed in files named jid.marc.conmpc\_xxxx where xxxx ranges from 0001 to the number of increments in the solution. This parameter allows the user to specify which increment will be used in the continuation run spawned by the primary Nastran run after Marc finished. N must be less than or equal to the number of actual increments.

**MRCONVER**

Default = 0, SOL 600 only.

Determines version of Marc to use for CONTACT and CONTACT TABLE for structural analysis.

- |    |   |
|----|---|
| 0  | Uses enhanced Marc version 9 (Marc 2001 with added fields). |
| 11 | Users Marc version 11 (Marc 2005).                          |

**Remarks:**

1. This parameter only affects contact and only options 0 and 11 are available. It is not needed unless BCTABLE with FBSH and/or BKGL is entered.
2. This parameter may be set in RC files.
3. If PARAM,MRCONVER,11 is entered it is usually also necessary to enter PARAM,MRSRVER,11.

**MRCOORDS**

Default = 0, SOL 600 only.

Determines whether Marc COORD SYSTEM will be added if any CORD1i or CORD2i entries are in the model and if CBUSH elements, orientation vectors or other items requiring coordinate system transformation are present in the model or if PARAM,MRPLOAD4,2 is entered which signifies that PLOAD4 with continuation entries with CID, N1, N2, N3 are to be taken into account in the model.

- 0 Add Marc COORD SYSTEM. (Default)
- 1 Do not add MARC COORD SYSTEM

### MRCQUAD4

Default = 75, SOL 600 only.

Controls the “Default” advance nonlinear element type for CQUAD4 elements in SOL 600.

- 75 Advance nonlinear element type 75 is used. (Default)
- 139 Advance nonlinear element type 139 is used.

**Note:** Element 75 is capable of thick shell behavior and element type 139 is applicable to thin shells.

### MRCTRIA3

Default = 75, SOL 600 only.

Controls the “Default” advance nonlinear element type for CTRIA3 elements in SOL 600.

- 75 Advance nonlinear element type 75 with a duplicate node is used. (Default)
- 138 Advance nonlinear element type 138 with 3 nodes is used.

**Note:** Element 75 is capable of thick shell behavior and compatible with the default element 75 used for CQUAD4, but since one node is degenerate (repeated) stresses may not be accurate. Element 138 is accurate for thin shell behavior but may not be accurate for thick shell behavior. Currently there is no triangle thick shell in Marc.

### MRCWANGL

Default = 0.0, SOL 600 only.

Angle in degrees over which to rotate the cross-section about the beam axis to obtain its final orientation.

### MRDELTTT

Default = 3, SOL 600 only.

Determines how delta time is set for each “step” of a SOL 600 transient nonlinear analysis.

- 0 DTI=Ti/N
- 1 DTI=Ttot/N
- 2 DTi=min(Ttot/N, Ti/2.0)

- 3 DTi=min(Ttot/N, Ti/10.0) (Default)
- 4 DTi=min(Ttot/N, Ti/100.0)
- 5 DTi=min(Ti/N, Ti/2.0)
- 6 DTi=min(Ti/N, Ti/10.0)
- 7 DTi=min(Ti/N, Ti/100.0)

- SOL 600 transient dynamics is run by taking each pair of points on the applicable TABLED1 entry for the applied forcing function as a step. For example, if the following TABLED1 is given, the time steps will be as shown below:

```
TABLED1, 1
+, 0.0, 0.0, 1.0E-3, .2 4.0E-3, .3, 6.0e-3, -.3
+, 1.0E-2, 0.0
```

Step	Final Time	Delta Step Time (Ti)
1	1.0E-3	1.0E-3
2	4.0E-3	3.0E-3
3	6.0E-3	2.0E-3
4	1.0E-2	4.0E-3

If the entry for this model is (N=100, Ttot=1.0E-2)

DTi is the initial delta time (AUTO STEP (2,1) for the particular step, the six selections of MRDELTTT would give for the DTi values shown in the table below. Note that option 3 gives at least 10 points per step and the old option 0 is probably too conservative.

Step	Final Time	Time Step (Ti)	DTi for MRDELTTT							
			0	1	2	3	4	5	6	7
1	1.0E-3	1.0E-3	1.0E-5	1.0E-4	1.0E-4	1.0E-4	1.0E-5	1.0E-5	1.0E-5	1.0E-5
2	4.0E-3	3.0E-3	3.0E-5	1.0E-4	1.0E-4	1.0E-4	3.0E-5	3.0E-5	3.0E-5	3.0E-5
3	6.0E-3	2.0E-3	2.0E-5	1.0E-4	1.0E-4	1.0E-4	2.0E-5	2.0E-5	2.0E-5	2.0E-5
4	1.0E-2	4.0E-3	4.0E-5	1.0E-4	1.0E-4	1.0E-4	4.0E-5	4.0E-5	4.0E-5	4.0E-5

- If DTi is set using NLAUTO variable TINIT, this parameter will be ignored.

### MRDISCMB

Default = 0 without gravity, =1 with gravity, SOL 600 only.

Determines whether distributed loads, such as pressure, are combined in the Marc input file into one list if the magnitude of the distributed loads are the same. This parameter applies to MSC Nastran 2005 only. For previous MSC Nastran versions, MRDISCMB was 1. Option 0 save Marc memory and processing time.

- 0 Distributed loads with the same magnitude are combined.
- 1 All distributed loads are input individually. Must be used if multiple subcases with the same loadings are present in the model.

**Caution:** This parameter should be used with caution. For multiple load cases, MRDISCMB=0 may produce the wrong results particularly if gravity loading is present. MRDISCMB=1 must be used if multiple subcases with the same loadings are present in the model.

## MRDUPMAT

Default = 1 without gravity loading and -1 with gravity loading, SOL 600 only.

Controls whether to create duplicate materials for elements used by both the Marc pshell (PARAM,MRPSHELL,1 or the smear option on the SOL 600, ID statement) or not. If the user knows in advance that no materials are used by shells and any other types of elements, this step can be skipped to save considerable computer time.

- 1 Check for materials used by shells and other types of elements and create duplicate materials if any are used by both.
- 1 Do not check or create duplicate materials.

## MRDYNOLD

Default = 1, SOL 600 only.

Determines whether dynamic loads created by SOL 600 are the same as in MD Nastran R3 (and MSC Nastran 2008) and prior releases or uses a new calculation method.

- 1 Dynamic loads are the same as in MD Nastran R3 (and MSC Nastran 2008) and prior releases.
- 1 Dynamic loads are “total loads” and may be more accurate for multiple subcases. (Default)

## MREIGMTH

Default = 1, SOL 600 only.

- 1 Eigenvalue analysis will be done in Marc using the Lanczos method. (Default)
- 0 Eigenvalue analysis will be done in Marc using the inverse power sweep with double eigenvalue extraction.
- 3 Eigenvalue analysis will be done in Marc using the inverse power sweep with single eigenvalue extraction.

## MREL1103

Default = 0, SOL 600 only.

- 0 Maps CQUAD4 to Marc's element type 11 for plane strain problems. (Default)
- 3 Maps CQUAD4 to Marc's element type 3 for plane stress problems.

## MRELRB

Default = 0, SOL 600 only.

- 0 If BCMOVE with the release option is specified, IDRBODY (see the BCMOVE entry) will refer to the actual IDs of BCBODY entries. (Default)
- 1 The release option of BCMOVE is used, IDRBODY (see the BCMOVE entry) will be in the order of occurrence of the BCBODY entries in the sorted Nastran Bulk Data file. For example, if there are two BCBODY entries with ID 12 and 22, the MRELRB=1 option means that you should specify IDRBODY on the BCMOVE entry using values of 1 and 2. If MRELRB=0, the IDRBODY values should be 12 and 22.

## MRELSPCD

Integer, Default = 0, SOL 600.

Controls whether SPCD for the second or subsequent subcase represents total (absolute) displacements or incremental displacements (relative to the displacement at the end of the previous subcase). SPCD for the first subcase is always total (absolute).

- 0 SPCD represents relative displacements (same as SPCR) for subcases 2 and above unless PARAM,MARCTOTT,1 has been set, in which case the SPCD's represent absolute displacements.
- 1 SPCD represents absolute displacements for subcases 2 and above (relative displacements for subcases 2 and above must be entered using SPCR).

### Remarks:

1. This parameter may be set in RC files.
2. PARAM,MRELSPCD,1 will automatically set PARAM,MARCTOTT,1 which means total loads using table-driven input will be used in the analysis. This is the only way total (absolute) displacements for subcases 2 and above can be used in Marc.
3. The behavior of SPCD prior to the MD Nastran 2010 release was to consider SPCD as relative displacements for subcases 2 and above.

## MRENUCLE

Default = -1 if parameter is not entered and MRENUCLE is not entered on the SOL 600 statement, SOL 600 only.

It is best if MRENUCLE is specified in the SOL statement. Some models will not have memory allocated properly if this parameter is placed in the bulk data.

- 1 No renumbering will occur (suggested for models with largest element number less than approximately 20000). (Default)
- 1 All elements will be renumbered and the new numbers will be used in the Marc analysis (see Remark 4.)
- 2 All elements will be renumbered, the new numbers are used internally during translation however the original element numbers will be used in the Marc input file and Marc analysis.

### Remarks:

1. This parameter can be set in RC files or on the SOL 600 statement.
2. To use models where the maximum element number is greater than 9,999,999 this parameter must be set on the SOL 600 statement (see MRENUCLE on the SOL 600 statement).
3. MRENUCLE should not be set both on the SOL 600 statement and as a parameter.
4. For MRENUCLE=1 an equivalence list of original and re-numbered element numbers is output on file elenum.txt.

## MRENUGRD

Default = -1 if parameter is not entered and MRENUGRD is not entered on the SOL 600 statement, SOL 600 only.

It is best if MRENUGRD is specified in the SOL statement. Some models will not have memory allocated properly if this parameter is placed in the bulk data.

- 1 No renumbering will occur (suggested for models with grid IDs less than approximately 20000). (Default)
- 1 All grid IDs will be renumbered and the new numbers will be used in the Marc analysis (see Remark 4.)
- 2 All grid IDs will be renumbered, the new numbers are used internally during translation however the original element numbers will be used in the Marc input file and Marc analysis.

### Remarks:

1. This parameter can be set in RC files or on the SOL 600 statement.
2. To use models where the grid ID is greater than 9,999,999 this parameter must be set on the SOL 600 statement (see MRENUGRD on the SOL 600 entry).
3. MRENUGRD should not be set both on the SOL 600 statement and as a parameter.

4. For MRENUGRD=1 an equivalence list of original and re-numbered grid IDs is output on file gridnum.txt.

## MRENUMBR

Default = 0, SOL 600 only.

Determines if both grid and element IDs for SOL 600 will be renumbered or not.

- |   |  |
|---|--|
| 0 | No renumbering will occur (suggested for models with largest grid ID less than approximately 20000). (Default)   |
| 1 | All grid and element IDs will be renumbered and the new numbers will be used in the Marc analysis. An equivalence list will be output on file grdid.txt                |
| 2 | All grid and element IDs will be renumbered internally during translation, however the original element numbers will be used in the Marc input file and Marc analysis. |

### Remarks:

1. This parameter can be set in RC files or on the SOL 600 statement.
2. To use models where the grid ID is greater than 9,999,999 this parameter must be set on the SOL 600 entry (see MRENUMBR on the SOL 600 statement).
3. MRENUMBR should not be set both on the SOL 600 statement and as a parameter.
4. For MRENUMBR=1 an equivalence list of original and re-numbered grid IDs is output on file gridnum.txt.

## MRESTALL

Default = 1, SOL 600 only.

Controls rotational restraints for solid element-only models.

- |   |  |
|---|--|
| 0 | SPCs for DOFs 4-6 will be ignored if entered in the Nastran file             |
| 1 | SPCs for DOFs 4-6 will be included if entered in the Nastran file. (Default) |

**Note:** This option might produce an input-data error in the Marc run but is sometimes required if RBEs or other special items are included in the model.

## MRESULTS

Default = 0, SOL 600 only.

If MRESULTS is set to 3, postprocessing of a previously-generated Marc t16 file to a results-only op2 file (normally called an f11 file) will be accomplished. OUTR=f11 and STOP=3 should also be set on the SOL 600 command line. This capability is available starting with MSC Nastran 2004.1.0. If MRESULTS=0 the t16 file from the current job will be processed if requested by OUTR options on the SOL 600 statement.

## MREVPLST

Default = -1, SOL 600 only.

Determines whether 2D plain stress triangular element node numbers will be reversed or not.

-1 or 0	Do not reverse the node numbers
1	Reverse the node numbers

## MRFINITE

No Default, SOL 600 only.

Controls Marc's FINITE parameter. If entered, with an integer value of 1, Marc's FINITE option will be employed. If this option is entered, parameters MRFOLOW1, MRFOLOW3 and MARUPDAT should also be entered. Other parameters to be considered are MARCDILT, MARCASUM and LGDISP.

## MRFOLLOW

Default = 0, SOL 600 only.

- 0 FORCE1, FORCE2, MOMENT1, MOMENT2 will act as non-follower forces. (Default)
- 1 Follower forces entered using FORCE1, FORCE2, MOMENT1, MOMENT2 will be mapped to Marc's new follower force option.
- 1 Follower forces will be turned off even if requested to be on using other options. This is sometimes necessary for multiple load cases where pressures are applied to different elements in the different load cases.

## MRFOLLOW2

Default = 0, SOL 600 only.

Controls whether Marc's follow for, 2 is used when multiple subcases are present.

- 0 Marc's follow for, 2 will not be used when multiple subcases are present. (Default)
- 1 Marc's follow for, 2 will be used when multiple subcases are present

## MRFOLOW1

No Default, SOL 600 only.

Controls the second field of Marc's follow for, N, M, L parameter (in this case, value N). If entered, options 1, 2, 3 and -1 are currently available. Enter:

- 0 If follower force due to distributed loads (pressure) is not to be considered.
- 1 If follower force stiffness due to distributed loads is not required.
- 2 If follower force stiffness due to distributed loads is to be included.

- 3 If the follower force for distributed loads is based upon the displacement at the beginning of the increment, as opposed to the last iteration.
- 1 If the undeformed geometry is required but total values of distributed loads are to be used (not presently available)

### MRFOLOW3

Default = 0 for statics and 1 for dynamics.

Controls the 3rd field of Marc's follow for N, M, L parameter (in this case, value M). This parameter is normally set internally by SOL 600 and should not normally be set by users, please see the following remarks.

#### Remarks:

1. Starting with MD Nastran 2010 and MSC Nastran 2009, MRFOLOW3 must be 1 for SOL 600 dynamics and if entered as zero for dynamics will be reset to 1. If the user enters dynamic loads using MARCIN they should be in the form of total loads rather than incremental loads.
2. Starting with MD Nastran 2010 and MSC Nastran 2009, MRFOLOW3 must be 1 for SOL 600 statics if PARAM,MARCTOTL,1 is entered. IF PARAM,MRFOLOW3 is entered as zero when PARAM,MARCTOTL,1 is entered, it will be reset to 1 if possible.
3. Starting with MD Nastran 2010 and MSC Nastran 2009, MRFOLOW3 must be 1 for SOL 600 if PARAM,MARCTOTT,1 is entered. If PARAM,MRFOLOW3 is entered as zero when PARAM,MARCTOTT,1 is entered, it will be reset to 1 if possible.

### MRFOLOW4

SOL 600 only.

Controls the 4th field of Marc's follow for N, M, L parameter (in this case, value L). This parameter is normally set internally by SOL 600 and should not normally be set by users, please see the following remark.

- 0 If follower force for point loads is not required. (Default)
- 1 If follower force for point loads is to be considered.

#### Remark:

To activate follower forces (concentrated loads) PARAM,MRFOLOW,1 must be entered as well as the forces using FORCE1, FORCE2, MOMENT1 and/or MOMENT2. PARAM,MRFOLOW4 should also be set to one.

### MRGAPUSE

Default = 0, SOL 600 only.

Determines whether Nastran CGAP elements will be approximated as Marc gap elements. The default is to fatal SOL 600 analyses if CGAP elements are found in the model.

- 0 Do not translate Nastran models using Nastran CGAP elements.
- 1 Translate Nastran models using CGAP elements. Marc gap elements are quite different than Nastran elements and usually can't be translated. In a few limited cases the Nastran and Marc gap elements are equivalent. It is up to the user to determine whether the gap Nastran elements can be used with SOL 600 or not. It is suggested that the user read Marc Volume A and C and run small test models to access each particular use of gaps. If gaps can be used, set PARAM,MRGAPUSE,1 and re-run the analysis. See also [MARCAPP](#), [MARCAPN](#), and [MARCAPD](#).

## MRHERRMN

Default = 1, SOL 600 only.

This entry controls whether extra grid created for such items as hyperelastic Herrmann elements, CWELD, et.c are output or not in the op2, f06, punch and/or xdb files. When Herrmann grids are output, the displacement value is actually pressure which might be confusing when looking at an f06 file.

- 1 Nodal output for extra grids is not provided.
- 1 Nodal output for extra grids is provided when the above files are requested. (Default)

## MRHYPMID

Default = 0, SOL 600 only.

- 0 Hyperelastic models with mid-side nodes will be translated to Marc including the mid-side nodes. Such models might run quite slowly. (Default)
- 1 Hyperelastic models with mid-side nodes will be translated to Marc leaving out the mid-side nodes. These models will normally run faster, but the displacements of the mid-side nodes will be zero and thus plots might look strange unless the model without mid-side nodes is read into the postprocessor using the .marc.dat or .t16 files.

## MRITYPE,

Default = 0, SOL 600 only.

Type of "constraint" used to connect the auxiliary nodes in all CWELDs.

- 0 RBE3 constraints will be used. (Default)
- 44 Kirchhoff constraints will be used
- 80 Combined RBE2 and RBE3 constraints will be used.

### MRMAT8A3, Value

Default = 1.0, SOL 600 only.

Value            If solid composites are modeled using MAT8, the third coefficient of thermal expansion, ALPHA3 is not defined. ALPHA3 is calculated as  $ALPHA3=value * ALPHA1$ .

### MRMAT8E3, Value

Default = 0.1, SOL 600 only.

Value            If solid composites are modeled using MAT8, the third modulus, E3 is not defined. E3 is calculated as  $E3=value * E1$ .

### MRMAT8N1, Value

Default = 0.5, SOL 600 only.

Value            If solid composites are modeled using MAT8, NU31 is not defined. NU31 will be calculated as  $NU31=value * NU12$ .

### MRMAT8N3, Value

Default = 1.0, SOL 600 only.

Value            If solid composites are modeled using MAT8, the NU23 is not defined. NU23 is calculated as  $NU23=value * NU12$ .

### MRMAXISZ

Default = Value in Marc include file in tools directory. SOL 600 only.

If this value is entered, the integer value will be used on the command line to run Marc as `-maxsize N` where N is the integer entered.

### MRMAXNUM

Default = Value in Marc include file in tools directory. SOL 600 only.

If this value is entered, the integer value will be used on the command line to run Marc as `-maxnum N` where N is the integer entered.

### MRMEMSUM

Default = 0, SOL 600 only.

If `MRMEMSUM=1`, a summary of memory used by the internal Nastran-to-Marc translator will be printed in the `f06` file. Each line will contain four numbers (all are in 4-byte words). The first number is the current memory request, the second the current memory (in addition to standard MD Nastran open core), the third is the memory limit with zero meaning no memory limit, and the fourth is the high water memory used so far by the Nastran-to-Marc translator and/or the `t160p2` results conversion.

This parameter must be entered in the Case Control.

### MRMTXKGG, Name

No Default, SOL 600 only.

**Name** Character. The NAME will be used for K2GG entries if entered. This parameter is similar to MRMTXNAM. Either MRMTXKGG or MRMTXNAM can usually be entered. The proper Case Control K2GG=NAME or K2PP=NAME will be selected automatically by SOL 600 as follows: If the continue option involves dynamic response analysis, K2PP will be used. If the continue option involves eigenvalue extraction or static analysis, K2GG will be used.

### MRMTXNAM, Name

No Default, SOL 600 only.

**Name** Character. The NAME (field 2 of the DMIG entry) that will be used for DMIG values in a spawned Nastran execution. For example, a common name used frequently is K2XX. The Case Control command K2PP=Name will be added (in this example K2PP=K2XX will be added) at the end of the Case Control of the spawned job. DMIG entries with other names may exist on the file, but only those with NAME will be used in the spawned execution. Either MRMTXKGG or MRMTXNAM can usually be entered. The proper Case Control K2GG=NAME or K2PP=NAME will be selected automatically by SOL 600 as follows: If the continue option involves dynamic response analysis, K2PP will be used. If the continue option involves eigenvalue extraction or static analysis, K2GG will be used.

### MRNOCOMP

Default = 1, SOL 600 only.

Determines whether n-layer composite will be created if CORDM is defined on the PSOLID entry. This allows output in material coordinate systems.

- 1 Composite are not created (automatically activated for brake squeal). (Default)
- 1 1-layer composites are created.
- N N-layer composites are created.

## MRNOCOR

Default = 0, SOL 600 only.

0	Marc parameters ELASTICITY, PLASTICITY, UPDATE, LARGE DISP, CONSTANT DILATATION will be automatically adjusted as recommended by the Marc developers.
1	the above parameters will be adjusted as determined to be the most consistent in correlation between Nastran and Marc results for similar problems. This parameter should be entered for buckling problems without plasticity. PARAM,LGDISP,1 should also be entered.

## MRNOECHO

Default = 0, SOL 600 only.

Determines whether various outputs are placed in the Marc file.

0	Output is not suppressed (unless other entries are made to suppress it). (Default)
1	Suppress echo of nodes and element lists
2	Suppress echo of boundary conditions
3	Suppress echo of nurbs data

**Note:** Enter any combination to suppress whatever is desired. To suppress all items, enter 123.

## MRORINTS

Default = 99, SOL 600 only.

Controls orientation type for all solid elements in model (see Marc Volume C documentation, ORIENTATION option).

1	Edge 1-2
2	Edge 2-3
3	Edge 3-4
4	Edge 3-1
5	Edge 4-1
6	XY Plane
7	YZ Plane
8	ZX Plane
9	XU Plane
10	YU Plane

- 11 ZU Plane
- 12 UU Plane
- 13 UORIENT Define transformation matrix with orient.f user subroutine
- 14 3D ANIO
- 91 Composite orientations will be Edge 1-2 for shells and 3D ANSO for solids and all non-composites will use option 99. This option provides compatibility with earlier versions and requires that all referenced coordinate systems by composite elements be rectangular.
- 99 All orientations are specified by coordinate systems (CORD2R, CORD2C, etc.). (Default)
- 101-112 Shell elements will have options 1-12, solid element will have option 14. (See Note 2)

**Notes:**

1. For solid composites, it is necessary to use the PSOLID entry as well as the PCOMP entry. The PSOLID entry should normally have an entry in field 4 which specifies a CORDi entry to use for the material alignment direction.
2. If option 101 is picked, shells will have edge 1-2 and solids will have 3D ANISO. If option 102 is picked, shells will have edge 2-3 and solids will have 3D ANISO, etc.

**MROUTLAY**

Default = -9999, SOL 600 only.

Indicates which shell or composite layers are to be output using the MARCOUT Bulk Data entry or by default. Options are as follows:

- 9999 All layers will be output. (Default)
- N Layers 1 and abs(N) will be output. (N must not be -1.)
- 1 If the number of layers is less than 21, same as -N option. If the number of layers is greater than 21, layers 1, 11, 21, 31, ..., N will be output.
- 0 Top and Bottom layers only will be output.
- N Layers 1 through N will be output.
- 9999 Stresses at the element center only will be output (top and bottom are not output). This option produces output with the assumption that the element has constant stress and strain throughout the element.

**Remarks:**

1. Options -9999, -N, -1 and N also produce output at the element center.
2. MROUTLAY = 0 is the same as MROUTLAY = -1.
3. Do not enter this parameter if Bulk Data entry MAYOUT is used.

## MRPARALL

Default = 0, SOL 600 only.

Determines whether parallel processing for SOL 600 will be forced even if Nastran detects that it might fail prior to spawning Marc.

- 0           Spawn Marc in single-processor mode if Nastran detects Marc may fail in DDM mode. (Default)
- 1           Spawn Marc in DDM mode even if Nastran detects Marc may fail. Leave any COORD SYS entries in the Marc input file. If COORD SYS occur in the input file a DDM Marc job may fail depending on the version of Marc being used. Please read the following remark carefully before using this option.
- 2           Spawn Marc in DDM mode even if Nastran detects Marc may fail. Remove all COORD SYS entries from the Marc input file. Please read the following remark carefully before using this option.

### Remark:

Known situations where Marc does not presently work in parallel are as follows:

When local coordinate systems are specified for the following:

Field 7 of any GRID entry.

Material coordinate systems (for example field 8 of CQUAD4).

If CBUSH uses coordinate systems.

For the following cases, this situation can be avoided and PARAM,MRPARALL does not need to be entered:

If coordinate systems are used only for input (field 3 of the GRID entry) or just entered in the Nastran input but not actually used, enter PARAM,MRCOORDS,1 to allow parallel processing to proceed.

If coordinate systems are only used for shell orientation (such as field 8 of CQUAD4) and if all such coordinate systems are rectangular the following two parameters may be used to allow parallel processing.

PARAM,MRCOORDS,1

PARAM,MRORINTS,1

## MRPBUSHT

Default = 0, SOL 600 only.

Determines whether the requirement that when PBUSHT and contact occur in the same model, BCTABLE must be specified for each subcase.

- 0           This requirement is enforced and the job will abort if BCTABLE's are not entered
- 1           This requirement will be ignored and the job will proceed. Wrong results may occur and/or the job may terminate later in the run.

## MRPIDCHK

Integer, Default = 1, SOL 600 only.

Controls whether a check for duplicate PIDs (property IDs) will be made in SOL 600.

- 1 Do not make a check for duplicate PIDs.
- 1 Check for duplicate PIDs for structural elements - if any are found fatal the job.

### Remarks:

1. This parameter may be set in RC files.
2. This parameter may be used in the MD Nastran 2010 and subsequent versions.
3. Duplicate PIDs will usually cause SOL 600 to fail or obtain the wrong results if the duplicates occur for structural elements. It is usually acceptable to have a duplicate PID for a spring or damper and for a structural element.
4. For versions prior to MD Nastran 2010, SOL 600 behaved as if PARAM,MRPIDCHK,-1 was set.

## MRPELAST

Default = -1, SOL 600 only.

Determines whether PELAST will be skipped or cause the job to abort for SOL 600. SOL 600 does not support PELAST. PBUSHT along with CBUSH and PBUSH should be used instead.

- 1 SOL 600 jobs with PELAST that are referenced by any CELAS will abort.
- 1 PELAST entries will be skipped (ignored).

## MRPLOAD4

Default = 2, SOL 600 only.

Determines whether continuation entry for PLOAD4 will cause the run to stop or if the continuation line(s) are to be ignored.

- 0 The job will stop and a “Severe Warning” message will be issued.
- 1 The job will continue and the continuation lines will be ignored. A warning message will be issued for the first few such entries.
- 2 CID, N1, N2, N3 and SOLR will be used. If SOLR=LINE, the direction must be specified using the CID, N1, N2, N3 fields for SOL 600. LDIR is ignored. (Default)
- 3 If any CSSHL elements are used, the pressures at the corners will be averaged and applied to the entire element for all element types in the model.

**Remarks:**

1. MRPLOAD4 should not be set to 2 for axisymmetric or plain strain analyses or if parallel processing is used unless the “single file Marc input file” option is used. In some cases, but not all, if MRPLOAD4=2 is set it will automatically be changed to zero one of these conditions exist.
2. See parameter MRPLOD4R for a companion control.
3. If any CSSHL elements are used, the pressures at the corners will be averaged and applied to the entire element for all element types in the model.

**MRPLOD4R**

Integer, Default = 0, SOL 600 only.

Determines how PLOAD4 pressures are treated in Marc when PARAM,MRPLOAD4,2 is set.

- |   |  |
|---|--|
| 0 | Pressures are treated as constant over the element if the pressure over the element varies, the average is applied.      |
| 1 | The Marc PLOAD4 style of loads is used which allows the pressures at the four corners of a quad surface to be different. |

**Remark:**

Versions of Marc including MDR3 and Marc 2008R1 and versions previous to these versions produce incorrect results for some models using MRPLOD4R=1 if total loads (specified by PARAM,MARCTOTL,1 or MARCTOTT,1) are used even if the pressure is the same at the four corners of each quad element.

**MRPLSUPD**

Default = 1, SOL 600 only.

Determines whether Marc’s PLASTICITY,3 will be used or not for fast integrated composites or smeared composites. Wrong results may be obtained if PLASTICITY,3 is used for these types of analyses even if the plasticity is in non-composite portions of the model (Default = 1 if this parameter is omitted).

- |    |   |
|----|---|
| -1 | Use PLASTICITY,3 if it is necessary for non-composite regions of the model                |
| 1  | Replace PLASTICITY,3 with UPDATE (FINITE and CONSTATN DIALITATION are not used. (Default) |

**Remark:**

SOL 600 determines if smeared composites are used by the presence or lack of the SMEAR word on the SOL 600,ID entry. Fast composites are determine if PARAM,MFASTCMP is set to 2 or 3 or if any PCOMPF Bulk Data entries are present in the model.

**MRPOISCK**

Integer, Default = 2, SOL 600 only

Controls whether to check if a “bad” Poisson ratio has been entered in SOL 600 for MAT1 entries.

- 0 Do not check or correct “bad” Poisson ratios.
- 1 Check if Poisson ratio is negative or > 0.5, if so change it to 0.333.
- 2 Check if Poisson ratio is negative or > 0.5, if so change MAT1 to MATORT with all three E values, the same as E for MAT1, all three G values the same as G for MAT1 and  $v12=v223=v31=0.333$

**Remarks:**

1. Current Marc versions do not allow isotropic materials with Poisson ratios having negative values or values greater than 0.5. Previous Marc versions may have allowed this.
2. “Bad” Poisson ratios may occur if the user specifies E and G and leaves the Poisson field on MAT1 blank.
3. If mrposick=1, the value of G will change. The value of E remains as originally specified.
4. If mrposick=0, the job will error out in the Marc phase of SOL 600.
5. This parameter is available starting the MD Nastran 2010.

**MRPREFER**

Default = 1, SOL 600 only.

Determines to output SOL 600 stresses on the t16 file in the standard Marc coordinate system for the element or the “preferred” (layer) coordinate system when the model contains composite elements.

- 0 Stresses are output in the standard coordinate for the element
- 1 Stresses are output in the “preferred” (layer) coordinate system. (Default)

**Remarks:**

1. The standard coordinate system for solids is usually the basic coordinate system. The standard coordinate system for shells and beams is usually the element coordinate. See Marc documentation volumes A and B for further details.
2. Some versions of Patran cannot plot stresses for MRPREFER=1.

**MRPRSAC**

Default = 0.0, SOL 600 only.

This parameter is primarily used by Versions of SOL 600 prior to MD Nastran R2 and MSC Nastran 2007 which could not support different pressures at the different corners, pressures applied in directions that are not normal to a surface or edge loads. This parameter is not necessary starting with the MD Nastran R2 and MSC Nastran 2007 Version 5 if PARAM,MRPLOAD4,2 is set.

Factor by which pressure loads are scaled for SOL 600. Prior to MD Nastran 2006 R1 and MSC Nastran 2006, Marc was not capable of handling different pressure applied to different corners of a surface. In other words, different values of p1, p2, p3, p4 on the PLOAD4 entry could not be handled. Approximations can be made by assuming the pressure is uniform over the surface if the surface is small enough. For SOL 600, the pressure (P) used by Marc is calculated using the following:

If p1 is not blank (or zero) regardless of the value of mrprsfac  
 $P = p1$

If mrprsfac is positive and p1 is blank or zero and one or more of p2, p3, or p4 are not zero or blank,  
 $P = mrprsfac * (p1 + p2 + p3 + p4)$  (This default if p2 or p3 or p4 are not zero or blank)

If mrprsfac is zero or negative,

If none of p1, p2, p3, p4 are blank or zero  $P = 0.25 * (p1 + p2 + p3 + p4)$

Otherwise,

$p = (+/-)pp$  where pp is the value largest absolute value of p1, p2, p3, p4 and P will have the proper associated sign.

### Remarks:

1. If MRPLOAD4=2, MRPRSFAC is ignored and p1,p2,p3,p4 are used as entered.
2. If MRPLOAD4 is not 2, the default for mrprsfac varies from element to element. For each element it is 1.0 divided by the number of Pi defined. For example, if only one of p1,p2,p3,p4 is defined, the default mrprsfac is 1.0. If two of p1,p2,p3,p4 are defined, the default for mrprsfac is 0.5. If three are defined the default is 0.33333 and if all four are defined the default is 0.25. When PARAM,MRPRSFAC is entered, the value is the same for all elements with pressure specified by PLOAD4.

**Note:** The default for mrpsfac varies from element to element. For each element it is 1.0 divided by the number of Pi defined. For example, if only one of p1,p2,p3,p4 is defined, the default mrprsfac is 1.0. If two of p1,p2,p3,p4 are defined, the default for mrpsfac is 0.5. If three are defined the default is 0.33333 and if all four are defined the default is 0.25. When PARAM,MRPRSFAC is entered, the value is the same for all elements with pressure specified by pload4.

## MRPSHCMP

Integer, Default = 0, SOL 600 only

If MRPSHELL=1 and there is a Marc PSHELL and composite for the same elements, this option controls which will be used.

- 0 Use Marc composite and ignore Marc pshell. (Default)
- 1 Use Marc pshell and ignore Marc composite.
- 2 Do not make any corrections (this works for some models and fails for others)

## MRPSHELL

Default = 0, SOL 600 only.

Used to control shell property specifications for Marc in SOL 600.

- 0 Classical GEOMETRY options will be used for all shell elements. (Default)
- 1 The Marc PSHELL option will be used, (can only be used with CQUAD4, CQUAD8, CTRIA3, and CTRIA6).

**Important:** If MRPSHELL=1, shell elements will use Marc's new PSHELL option. No materials used by PSHELL may be referenced by other types of elements that this option has used. For commonly used elements, duplicate materials will automatically be created by SOL 600 to satisfy this criteria, however this can take considerable computer time. If the user knows that no materials are used by both PSHELL and other properties, he can set PARAM,MRDUPMAT,-1 to bypass the checking and creation for duplicate materials. To speed up this process, set PARAM,MSPEEDPS,1. The Marc PSHELL formulation is more stable if MID3=MID2. To set MID3=MID2, set PARAM,MARCMID3,1.

### MRRBE3TR

Default = 0, SOL 600 only.

Controls whether all translations or all translation and rotations will be used for the reference degrees of freedom or whether fewer than 3 are allowed.

- 0 Fewer than 3 reference degrees-of-freedom may be used. (Default)
- 3 All RBE3's with REF C (field 5 of the RBE3 entry) not having 123 will have all translations for the Marc REFC (field 5 of the Marc RBE3 entry) set to 123.
- 6 All RBE3's with REF C (field 5 of the Nastran RBE3 entry) not having 123456 will have all translations and rotation for the Marc REFC (field 5 of the Marc RBE3 entry) set to 123456.

#### Remarks:

1. Marc frequently gives a singular tying message if there are not at least degrees of freedom 123 for REFC. This sometimes results in poor singularity ratios and incorrect results for nonlinear analyses. It also can prevent eigenvalues from being calculated.
2. It is recommended that option 3 or 6 be used for all SOL 600 analyses unless the user is certain that REFC can have fewer than three dof's for the particular analysis.

### MRRCF, RCF

No Default, SOL 600 only.

- RCF Character. Name of RCF file name (limited to 8 characters) used in conjunction with another MSC Nastran run spawned from an original MSC Nastran run as specified by the CONTINUE option on the SOL 600 command. The RCF file may contain any information required (such as scratch=yes, exe=, etc.) as discussed in [Executing MSC Nastran, 2](#) of this guide. This rcf file does not have to use the same options as the primary rcf file and should normally set batch=no as one of the options.

## MRRELNOD

Default = -1, SOL 600 only.

Controls enforced displacements using SPCD.

- |    |  |
|----|--|
| 0  | For multiple subcases with SPCDs, the SPCDs from the previous subcase will be released at the start of the current subcase.  |
| 1  | SPC's and SPCD's from the previous subcase, not specified again in the current subcase, will be released gradually during the current subcase.   |
| -1 | SPC's and SPCD's from the previous subcase, not specified again in the current subcase, will be subtracted out. For example, if the previous subcase applied a SPCD of 0.1 to a particular dof, the current subcase will apply -1.0. This will bring the displacement of that dof to zero for the current subcase. |

## MRRSTOP2

Default = 0, SOL 600 only

Integer, Normally op2, xdb, punch and f06 output is not available for SOL 600 restart analyses. Setting this parameter to 1 will allow the program to attempt to create one or more of these files. Only in limited cases will the job be successful.

- |   |   |
|---|---|
| 0 | Do not attempt to create .op2, xdb, punch, f06 output for restart runs (default if parameter is not entered). (Default) |
| 1 | Attempt to create .op2, xdb, punch, f06 output as specified by other options.   |

## MRSCMOD

Default = 0.0, SOL 600 only.

Solution scaling factor for linear buckling analysis (SOLs 600, 105) using the Lanczos method. If the applied load in the first subcase is too large, the Lanczos procedure may fail. This number may be used to scale the solution for numerical reasons. The collapse load will be output based upon the total load applied.

### Remark:

This parameter applies to rigid surfaces described using 4-node patches only.

## MRSETNA1, N

Default = Program calculated, SOL 600 only.

- N        If this parameter is entered with  $N > 0$ , the integer value entered will be used in Marc's SETNAME parameter section as the first value of SETNAME,N,M which is an undocumented Marc option. N is the number of sets and M is the largest number of items in any set. This entry is sometimes necessary if large lists of elements or nodes are used to describe materials, properties or contact. Both MRSETNA1 and MRSETNA2 must be included for either to take effect. This option is no longer required for MSC Nastran 2005 r2 and subsequent releases.

## MRSETNA2, M

Default = Program calculated, SOL 600 only.

- M        If this parameter is entered with  $M > 0$ , the integer value entered will be used in Marc's SETNAME parameter section as the second value of SETNAME,N,M which is an undocumented Marc option. N is the number of sets and M is the largest number of items in any set. This entry is sometimes necessary if large lists of elements or nodes are used to describe materials, properties or contact. Both MRSETNA1 and MRSETNA2 must be included for either to take effect. This option is no longer required for MSC Nastran 2005 r2 and subsequent releases.

## MRSETNAM, N

Integer, Default = Program calculated, SOL 600 only.

- N        If this parameter is entered with  $N > 0$ , the value entered will be used in Marc's SETNAME parameter section. This entry is sometimes necessary if large lists of elements or nodes are used to describe materials, properties or contact. To get around a Marc bug, if a computed setname value is large, Nastran will normally use the undocumented form (see MRSETNA1). To prevent this, set N to -1.

## MRSPAWN2, CMD

Default = Nastran, SOL 600 only.

**CMD** Character. Name a command to run D Nastran (limited to 8 characters single field or 16 for large field) used in conjunction with the CONTINUE options on the SOL 600 command. The Nastran run to be spawned will have the form:

```
CMD jid.nast.dat rcf=RCF
```

where file RCF is provided by PARAM,MRRCFILE,RCF. As an example, if CMD is nastran, jid is myjob (original file myjob.dat) and RCF=nast.rc, the spawned run will execute using:

```
nastran myjob.nast.dat rcf=nast.rc
```

### Notes:

1. See PARAM\*,HEATCMD for SOL 600 thermal contact heat transfer analysis.
2. CMD will be converted to lower case regardless of the case entered.

## MRSPLINE

Default = 2, SOL 600 only.

Determines whether RSPLINE will be converted to CBAR or to MPC's.

- 1 RSPLINE will ignored (this option should only be used for model checkout)
- 1 RSPLINE will be converted to stiff CBAR elements
- 2 RSPLINE will be converted to MPC's (Marc's servo link) using the same equations used by other Nastran solutions, except that the MPC's are capable of large rotation. This option requires somewhat longer translation times than the others but can save computer time during the Marc execution phase. (Default)

## MRSRING

Default = 0.0, SOL 600 only.

Specifies a stiffness value to be added to the main diagonal of each translational term of the stiffness matrix. This option is useful in nonlinear static analysis with 3D contact of two or more separate structures. Some of the pieces may not be grounded until contact occurs. By adding a small spring to ground, such as K=1.0, these pieces are stabilized until contact occurs. This option applies to SOL 600 only and generates SPRINGS in the Marc input file for all nodes in the model and all three translational degrees-of-freedom. IF K is entered as a negative number, the absolute value of K will be added to all 6 degrees of freedom of each grid in the model.

If the run is for heat transfer and K is positive, the spring will only be added to DOF 1.

## MRSRVER

Integer, Default = -1, SOL 600 only

Controls how CELAS and all other items map to the Marc input data.

- 0 Non-table form is used which generally means the Marc input file version is less than 11.
- 11 The table form for SPRINGS is used which requires two lines, the first with spring rates and the second with table ID's. PARAM,MRSRVER,11 is usually required if PARAM,MRCONVER,11 is entered.

## MRSTEADY

Default = 1, SOL 600 only.

Controls the solution method for SOL 600 steady state heat transfer.

- 1 Marc STEADY STATE is used with TIME STEP of 1.0. (Default)
- 2 AUTO STEP is used.

## MRT16STP, N

Default = 0, SOL 600 only.

Enter in Case Control at the subcase level.

- N Number of load increments to put on the t16/t19 files for each subcase when the AUTO STEP method is used. The default of 0 puts all adaptive increments on the t16/t19 file. If a value of N is entered, load steps for times=tmax/N will always be introduced into the auto stepping process and the t16/t19 files will have outputs only at zero and those times. This corresponds to field 1 of Marc's AUTO STEP 2nd option and can also be set using the NLAUTO option. If this is the only non-default NLAUTO variable to set, it is more easily accomplished using this parameter. It is suggested that this parameter always be used for large models and that N be 10 or greater, otherwise the size of the t16/t19 files may become very large. This is especially important for Windows systems, which presently has a 4GB limit in converting t16 to op2 files due to compiler limitations.

## MRTABLIM

Integer, Default = 0, SOL 600 only

Determines the maximum number of points in any TABLES1 used when tables are specified or MATHE input.

- 1 Unlimited, not recommended - If used could lead to numerical errors or program aborts
- 0 The limit is 500 points.
- N The limit is set to N points. It is recommended that N does not exceed 500.

**Remark:**

If more than about 500 points are used for the tables, the curve filling processes used to determine the material constants may encounter numerical errors and the program could abort. If a table with more than the number points specified by this parameter is entered, the number of points will be reduced to the specified limit so that numerical errors are unlikely to occur.

**MRTABLS1**

Default = 0, SOL 600 only.

TABLES1 stress-strain curves are converted to Marc WORK HARD stress-plastic strain curves according to the following formulas for the value entered for MRTABLS1. In the formulas *s* is the stress entered for TABLES1, *e* is the strain entered in TABLES1, *S* is the Marc WORK HARD stress and *E* is the Marc WORK HARD Plastic strain. *e<sub>y</sub>* is the yield strain (*s<sub>y</sub>*/*E*) where *EE* is Young's modulus, *s<sub>y</sub>* is the yield stress. The first point of the Nastran curve will be skipped unless MRTABLS2 is set to 1.

0 (Default)	$S=s$ $E=e - e_y$
1	$S=s(1+e)$ $E=\ln(e+1)$
2	$S=s$ $E=e - s/E$
3	$S=s(1+e)$ $E=\ln(1+e) - s/EE$
4	$S=s$ $E=e$
5	$S=s$ $E=\ln(1+e)$
6	$S=s$ $E=\ln(1+e-s/E)$
7	$S=s(1+e)$ $E=\ln(1+e)-S/EE$
8	$S=s(1+E)$ $E=\ln(1+e)$
9	$S=s(1+E)$ $E=\ln(1+e)-\ln(1+e_y)$

**Note:** This parameter (like any other parameter) can only be entered once in an input file.

## MRTABLS2

Default = 0, SOL 600 only.

- |   |   |
|---|---|
| 0 | TABLES1 stress-strain curves are converted to Marc WORK HARD stress-plastic strain curves starting with the yield point. The first point will be skipped. (Default) |
| 1 | All points in TABLES1 will be connected to WORK HARD, however, the first plastic strain will be set to zero if entered as non-zero.                                 |

**Note:** This parameter (like any other parameter) can only be entered once in an input file.

## MRTABPRC

Integer, Default = 0, SOL 600 only

Determines the precision of stress-strain curves when translated from Nastran to Marc using SOL 600.

- |   |   |
|---|---|
| 0 | Standard precision (8 significant figures) is used. |
| 1 | Maximum precision (14 significant figures) is used. |

### Remarks:

1. This parameter is available starting with the 2010 entry. For MD Nastran 2010 it only applies to stress-strain curves entered in conjunction with MATEP.
2. Prior to MD Nastran 2010, only option zero was available.
3. In most cases, the stress-strain values are not known to even 8 significant figures. However, if the stress-strain is calculated from other data the extra precision might be useful.

## MRTFINAL

SOL 600 only.

Real. In some dynamic problems, due to numerical roundoff an extra time step with very small initial and final times is generated. If these times are too small, Marc sometimes will diverge even though the “final time” actually desired by the user has been reached within reasonable accuracy. MRTFINAL is a value below which this extra step will be eliminated to prevent excess computations and/or possible divergence. If this parameter is not entered, the default value is 1.0E-8. This parameter is only used with the AUTO STEP procedure. The ‘extra’ step will also be eliminated if the initial time step is less than MRTFINAL/100.0.

## MRTHREAD

Integer > 0, Default = 1, SOL 600 only.

Determines the number of threads to be used by the run. For multi-core processors speed can frequently be gained by specifying a number of threads equal to the number of cores assuming the job has exclusive use of the machine.

- 1            Use 1 thread.
- 2            Use 2 threads.
- N            Use N threads.

**Remarks:**

1. This parameter may only be used by solver types 8 (multifrontal direct sparse) and 11 (Pardiso).
2. This parameter may be combined with PARAM,MARPROCS to use several processors each using several threads.

**MRTIMING**

Default = 0, SOL 600 only.

If MRTIMING is 1, timing summaries for various portions of the internal Marc translator will be provided in the f06 and log files.

**MRTSHEAR**

Default = 0, SOL 600 only.

By default, parabolic shear deformation is not included in the formulation of beam and shell elements if there are no composite elements. If composite shell elements are present, parabolic shear deformation is included by default. This parameter can be used to override these defaults.

- 1            Parabolic shear deformation is included in the formulation of beam and shell elements.
- 1 or 0      Parabolic shear deformation is not included even if composite elements are present.  
(Default)

**Remark:**

This parameter maps to Marc TSHEAR parameter.

**MRUSDATA**

Default = 0, SOL 600 only.

Determines whether user subroutine USDATA will be activated and if so the size of data.

- 0            User subroutine USDATA is not active in the current run. (Default)
- N            User subroutine USDATA will be active the in the current run and N is the number or real\*4 words needed for the data stored in common block /usdam/

**Remark:**

In addition to adding this parameter, the user must enter USDATA on Bulk Data entry USRSUB6.

## MRVFIMPL

Default = 0.01, SOL 600 only.

Controls the fraction of the maximum view factor that is to be treated implicitly (contribute to operator matrix). View factor values smaller than this cutoff are treated explicitly.

## MRV09V11

Default = 1, SOL 600 only.

Determines whether certain Marc “features” which are default in Marc “version 11” are added for SOL 600-generated models that use “version 9”.

- 1 Do not add the features.
- 1 Add the following features:
  - feature,4703 to speed up DDM jobs for one-processor jobs, it has no effect)
  - feature,5701 to disable old rigid rotation checking which was too stringent
  - feature,601 to improve contact
  - feature,5301 to improve deformable-deformable contact
  - feature,3201 to improve contact friction types 6 and 7
  - feature,5601 to improve thickness updating when the updated Lagrange method is used
  - feature5801 to improve in-plane bending of advance nonlinear element type 140
  - feature,6001 to improve concrete cracking analysis

<b>Note:</b>	The above features are only used for certain problems, even though all are included with the default option, they have no effect on models that do not use advance nonlinear element type 140, feature 601 has no effect on models that do not have contact, etc.
--------------	---

## MSG10625

Default=0

- 0 USER FATAL MESSAGE 10625 will stop any frequency response run **with frequency dependent elements**, with the DMAP path **PARAM, BUSHNM, YES** (default) if multiple subcases with different Case Control **FREQ=n** are detected.
- 1 The run will be allowed to proceed.

The frequency dependent path BUSHNM, NO path is only viable when the frequency dependences are specified on the PBUSHT, PELAST, PDAMPT, PAABSF.

When the frequency dependences include MATiF entries, only the path PARAM, BUSHNM, YES path is viable. This path is also viable only for new features such as extended GEij on MAT2 or MAT9 entries, or the use of PDISTB/PDISTBM entries. The frequency dependences provided by PBUSHT, PELAST, PDAMPT, PAABSF also work for this path. Also, since the required element level  $\Delta K$ ,  $\Delta K4$ ,  $\Delta B$  matrices required for frequency dependency are computed in a completely different manner between PARAM, BUSHNM, YES/NO paths, the GPFORCE calculation is only available in the new PARAM, BUSHNM, YES path.

When the path PARAM, BUSHNM, YES has any type of frequency dependency, several new solution techniques are turned on. These include, by default, the use of master frequencies and extended residual vector calculations. Also, via PARAM, NMNLFREQ, value, in modal frequency the eigenvalue analysis may be performed using material stiffness values other than the base values defined on the basic MATi entries.

Automatic Master frequencies, controlled via the Case Control MFREQ, are based on the presence of MAT1F, MAT2F, MAT8F, MAT9F, PBUSHT, PELAST, PDAMPT entries and their associated TABLEDi entries.

For each forcing frequency corresponding to a determined master frequency, MSC Nastran forms complete element stiffness, structural damping and viscous damping matrices based on material and property table lookup at that frequency.

For forcing frequencies between master frequencies, the fully assembled g or modal sized stiffness, structural damping, and viscous damping matrices are computed by interpolation.

When multiple subcases are present, and these subcases have different FREQ=n selection, MASTER frequencies, computed based on the first subcase, may not have good correlation with forcing frequencies in subsequent subcases. Thus, USER FATAL MESSAGE 10625 will be issued by default.

## MSIZOVRD

Default = -1, for small models and +1 for large models, SOL 600 only.

Determines whether Marc SIZING values for large models will be updated or not. Nastran includes Marc directories with a file named “include” in the tools directory which includes a line MAXNUM=N, where N is some value like 1000000. If the maximum number of nodes or elements in the model exceeds N, memory overwrites or job aborts are possible unless either N is set larger than the actual max node or element number in the model or the values are specified on the SIZING entry (field 3 for max element and field 4 for max node).

- 1 The sizing entry will not be updated (either the model is not large, MAXNUM in the include file has been updated or parameters such as MARCSIZ3 and/or MARCSIZ4 have been entered into the run to provide values that are large enough. (Default)
- 1 If the number of nodes or elements in the model exceeds 1,000,000 the sizing entry will be updated to the max number of nodes and elements actually in the model. Extra nodes and or elements to account for welds, pinned members, Herrmann elements, etc. will be included.

**Note:** For PARAM,MSIZOVRD large models are considered to be those with more than 1,000,000 nodes and/or elements.

## MSOLMEM, MBYTE

Default = Program determined value, SOL 600 only.

**MBYTE** If entered, the integer value entered here is the 8th field of Marc's SOLVER option, and is the maximum memory in Mega Bytes that can be used by Marc's solver types 6 (hardware provided direct) and 8 (multi-frontal direct, which is the default solver for SOL 600) before going out of core. This parameter is the same as the MBYTE field on the NLSTRAT entry may be easier to enter as a parameter if no other NLSTRAT values are needed.

**Note:** This parameter should only be entered if NLSTRAT entries are not required. If any NLSTRAT entries are made, use the MBYTE field instead of this parameter.

## MSPCCCHK

Integer, Default = 0, SOL 600 only

Effects multiple subcases where SPCD's are applied and SPC's potentially change between the subcases.

- 0 A comprehensive check is made to ensure that all SPC changes are accounted for all subcases.
- 1 The check is not made. The check can take significant computer time and in most cases it is not actually needed. If the user knows it is not needed, computer time can be saved by turning it off.

### Remarks:

1. This parameter is available starting with MD Nastran 2010.
2. This parameter may be set in rc files.

## MSPCKEEP

Default = 0, SOL 600 only.

Determines which SPC's entered in the bdf file are retained in the Marc input file for 2D models.

- 0 Only retain those dof's that are normally associated with the type of 2D analysis (normally 2 translations) (Default)
- 1 Retain all dof entered in the bdf file in the Marc input file.

### Remark:

Some types of Marc 2D analyses support one rotation in addition to two translations and it is important to restrain this rotation.

## MSPEEDCB

Default = -1, SOL 600 only.

Determines whether CBEAM increased speed options are to be applied. This option may be necessary for models with a large number of beams whose element IDs are large.

- 1 No increased speed options are used for CBEAM. (Default)
- 1 cbeam.prp file will be standard unformatted rather than direct access. A small table to provide the location of each entry is saved in memory.
- 2 The entire cbeam.prp file is saved in memory

**Note:** See param,marccbar,1 to change CBAR to CBEAM.

### MSPEEDCW

Default = 0, SOL 600 only.

Determines whether CWELD elements will be translated to Marc in core (for increased speed) or out of core. This parameter is needed if many CWELD elements are present in the model to avoid large translation times.

- 0 Processed out of core. (Default)
- 1 Process in core.

### MSPEEDOU

Default = 1, SOL 600 only.

Determines whether speed enhancements are activated for the t16op2 conversion.

- 0 Speed enhancements are not activated.
- 1 Speed enhancements are activated which will place certain scratch data in memory. For large models make sure enough memory is available (if PARAM,MSPEEDSE and/or PARAM,MSPEEDP4 are used, there is probably sufficient memory unless there is a large number of output “time” points. (Default)

### MSPEEDP4

Default = -1, SOL 600 only.

Determines whether PLOAD4 entries will be translated to Marc in core (for increased speed) or out of core.

- 1 PLOAD4 will be processed in core.
- 1 PLOAD4 will be processed out of core. (Default)

**Note:** The MSPEEDP4=1 option may require more memory than is available on certain computers for large models. Do not use if CWELD elements are present.

## MSPEEDPS

Default = -1, SOL 600 only.

Determines whether additional memory will be used if the Marc PSHELL option is invoked (PARAM,MRPSHELL,1) or smear option on SOL 600,ID in order to speed up processing. This will be beneficial if there are many materials and properties in the model and not very beneficial if all elements use just a few properties and materials.

- 1 No additional memory will be used. (Default)
- 1 Additional memory will be used if available.

## MSPEEDSE

Default = -1, SOL 600 only.

Determines whether speed enhancements are activated using extra memory and/or special low level I/O routines.

- 1 No speed enhancements will be activated. (Default)
- 1 Solid elements 2D elements data will be processed in core.
- 2 All elements will be processed in core.
- 3 2D and 3D elements will be processed in core, 1D elements will be processed using bioxxx (low level direct access routines used by gino).

**Note:** The MSPEEDSE=1 option may require more memory than is available on certain computers for large models. MSPEEDSE > 0 should not be used for 64-bit integer versions of Nastran or DEC Alpha computer systems.

## MSPEEDS2

Default = -1, SOL 600 only.

Determines whether additional memory will be used when PARAM,MSPEEDSE with options 1, 2, 3 is entered to obtain additional speed.

- 1 Additional memory will not be used. (Default)
- 1 Additional memory will be used and additional speed will usually be obtained.

## MSPEEDSH

Default = -1, SOL 600 only.

Determines whether additional speed enhancements will be used to process shell/plate elements (CQUAD4, CTRIA3, etc.) using incore memory.

- 1 No additional speed enhancements are used. (Default)
- 1 Additional speed in-core enhancements will be used. Sufficient memory must be available. If not, the job will abort with an appropriate message.

**Note:** This parameter should only be used if shell speed enhancements are selected with one of the PARAM,MSPEEDSE options.

## MSPLINC0

Integer, Default = 0, SOL 600. For SOL 400, MSPLINC0 =1 is always used.

This parameter controls whether to enforce C0 continuity for all spline options if any are requested by setting IDSPL=1 on any BCBODY entry.

- 0 C0 continuity is not enforced.
- 1 C0 continuity is enforced.

## MSTFBEAM

Default = 0, SOL 600 only.

Determines if all rigid elements (RBE2, RBE3, RBAR, RTRPLT) will be converted to stiff beams. This parameter should only be used if PARAM,MARMPCHK and/or PARAM,AUTOMSET options fail during a Marc execution.

- 1 All rigid elements will be converted to stiff beams or plates after they have initially been formed in the Marc file as RBE2 or RBE3 elements. All 6 dof's at each end of the rigid beam will be used.
- 2 All rigid elements will be converted to stiff beams or plates after they have initially been formed in the Marc file as RBE2 or RBE3 elements. Pin codes specified by the original Nastran rigid elements will be used when possible.

### Remark:

See PARAM,MARCSCCLR to specify a scale factor for the "Default" properties of these stiff beams.

## PARFREE

Integer, Default = 0

Determines whether the nodal coordinates in the GEOM1 datablock of SOL 600 OOP2 files will have the original coordinates or revised stress-free coordinates.

- 0 GEOM1 will have the original coordinates (same as defined on GRID entries)
- 1 GEOM1 will have modified coordinates to enforce stress-free conditions if applicable

**Remarks:**

1. ICCOORD on the BCTABLE with ID=0 entry must be set to 1 or 3 for at least one secondary-primary combination.
2. The parameter only addresses op2 files (t16 and t19 files automatically use PARFREE=1)
3. This capability is available starting with MD Nastran 2010. Prior version always used PARFREE=0.

**MSTTDYNE**

Integer, Default = 0, SOL 600 only

Controls whether SOL 600 may have static and dynamic load cases in the same analysis.

- 0 All subcases must either be static or dynamic
- 1 Mixed static and dynamic load cases are allowed.

**Remarks:**

1. Use of this entry requires SOL 600,106 or SOL 600,NLSTATIC (not SOL 600,NLTRAN).
2. Do not enter , DLOAD, LOADSET, LSEQ, TLOADi in the Case Control or Bulk Data.
3. Each subcase must have NLAUTO entries. Whether the subcase is static or dynamic is controlled by IFLAG on each NLAUTO entry. For static subcases IFLAG=3 and for dynamic subcases IFLAG=0.
4. All loads in each subcase build up from an initial value at the end of the previous subcase to the full value entered on the various load-type entries (such as FORCE, PLOAD4, SPCD, etc.) at the end of the subcase. Time histories for individual load cases are not allowed with this parameter. If all loads for a particular subcase use the same time history, this subcase may be divided into N-1 smaller subcases where N is the number of points on the time history curve. For this situation, the loads for each smaller subcase should be scaled by the amplitude of each point on the time history curve. This technique may also be used to simulate force vs. time for an analysis with all static subcases.
5. When MSTTDYNE=1, the following will automatically be added to the Bulk Data:

```
marcin,-1,0,dynamic,6
param,marcauov,0
```

These two entries may be added by the user in place of PARAM,MSTTDYNE,1 however both should not be done.

**MTABIGNR**

Default = 0, SOL 600 only.

Determines whether tables for VCCT analyses will be ignored or used.

- 1 VCCT tables are not used
- 0 VCCT tables are used. (Default)

**Remark:**

Use of tables for VCCT SOL 600 2D analyses with contact is not supported. If the table variation is not important, this parameter may be used to obtain an approximate solution.

**MTABLD1M**

Default = 1, SOL 600 only.

Option to modify or not modify all TABLED1 entries which do not start with the first point of (0.0, 0.0).

- 1 Do not modify any TABLED1 entries
- 1 Modify all TABLD1 entries that do not start with (0.0, 0.0). (Default)

**Remark:**

See PARAM,MTABLD1T.

**MTABLD1T**

Default = 0.01, SOL 600 only.

Specifies the second time value of all TABLED1 entries that do not start with the first point being (0.0, 0.0) if PARAM,MTABLD1M=1. Modified tables will start with the first point of (0.0, 0.0), the second point will be at the time specified by this parameter with an amplitude of the original first amplitude. The 3<sup>rd</sup> point will be at time 2\*MTABLD1T and amplitude of the original first amplitude.

**Remark:**

The proper value of MTABLD1T to enter to analyze a step input depends on the fundamental natural frequency of the model. If MTABLD1T is too small, the response will not fully build up and if it is too large, it will act like a ramp input rather than a step. The best value to use is approximately 0.1/fn, where fn is the first linear natural frequency in Hz.

**MTEMPCHK**

Integer, Default = 0, SOL 600 only

Controls how temperature-dependent properties are checked in the Marc portion of SOL 600.

- 0 Check at zero degrees only. (Marc feature 9601)
- 1 Check at all temperatures, stop checking and fatal the job when the first problem is found. (Marc feature 9600)
- 2 Check at all temperatures and report all problems, then fatal the job if any problems were found. (Marc feature 9602)

**Remarks:**

1. This parameter is available starting with MD Nastran 2010.
2. The default in Marc previously was feature 9601.

3. The default in SOL 600 is different than in Marc. The default in Marc is 9600.
4. Checking in Marc will occur from the lowest temperature of any curve to the highest of any curve. Thus, to ensure that all curves pass, define all curves from the lowest temperature of any curve to the highest temperature of any curve (even though one particular curve can never reach the lowest or highest temperature specified on another curve).
5. features,960i will be entered if any TABLEMi or TABL3Di are found.

## MTEMPDWN

Default = -1, SOL 600 only.

Option to automatically choose the FeFp multiplicative decomposition plasticity model (PARAM,MARCPLAS,5) for plasticity problems with thermal loading when the temperature decreases (see PARAM,MARCPLAS).

- |    |   |
|----|---|
| -1 | Use the standard mean normal with large strain method unless PARAM,MARCPLAS is entered. (Default)   |
| 1  | Attempt to determine whether the temperature at the start of the run is lower than the initial temperature, and if so choose the FeFp method. |

### Remarks:

1. For some problems with very soft materials, the FeFp method is required to achieve convergence for plasticity cases where the temperature decreases during the early stages of the run. Since most users would not know this, PARAM,MTEMPDWN is offered to automatically let Nastran decide to invoke this method or not.
2. The FeFp method takes substantially more computer time than the default mean normal method.
3. This parameter can be entered in RC files if it is desired to be used for a large number of runs.

## MTET4HYP

Integer, Default = 0, SOL 600 only

Controls settings for TET4 elements with hyperelasticity.

- |   |   |
|---|---|
| 0 | Use Marc element 157 which uses the Herrmann formulation.   |
| 1 | Use Marc element 134 and automatically set PARAM,MARUPDAT,1 |

### Remarks:

1. MTET4HYP=1 should normally only be set if any tet4 elements use MATHE or MATHP and if one or more of the grids in such tet4 have field 7 set to a cylindrical or spherical coordinate system.
2. If Remark 1 does not apply, MTET4HYP=0 is more accurate, although it is highly recommended that tet10 elements be used for all SOL 600 models which will be even more accurate.

## MTLD1SID

Integer, Default = -1 for SOL 600

Determines whether the SID of TLOAD1s entered in the input will be changed or not. (SOL 600 only)

-1	Do not change the SID of any TLOAD1 entry
0	Change the SID of all TLOAD1s to match the lowest SID of any TLOAD1 found in the original input.
N	Change the SID of all TLOAD1s to the value N.

**Remark:**

This parameter may only be set in the input file.

**MUALLUDS**

Integer, Default = 0, SOL 600 only

Controls how material, contact and element-related user subroutines are specified in SOL 600.

- 0 User subroutines are entered using the MATUSR entry (material), contact-related (BCBODY, BCTABLE, etc.) or element entries as well as the USRSUB6 entry.
- 1 User subroutines are entered using the MATUDS, BCONDUDS and/or ELEMUDS. They should not be specified on MATUSR. BCxxx, element entries or by using the USRSUB6 entry.

**Remark:**

For version prior to MD Nastran 2010 only option 0 was available.

**MULRFORC**

Default = -1, SOL 600 only.

Option to activate multiple RFORCE entries for different portions of The model in the same subcase.

- 1 Do not allow this capability (only one RFORCE entry for subcase can be entered). (Default)
- 1 Allow multiple RFORCE entries for each subcase

**MUMPSOLV**

Integer > 0, Default = 1, SOL 600 only.

This can also be set by the Bulk Data entry PARAMARC.

- 1 Use 1 processor.
- 2 Use 2 processor.
- N Use N processor.

**Remarks:**

1. This parameter may only be used by solver the MUMPS solver (solver type 12).

2. The PARAMARC Bulk Data entry cannot specify this type of parallel processing.

## MUSBKEEP

Default = 0, SOL 600 only.

- |   |  |
|---|--|
| 0 | If user subroutines are included, they are compiled and linked to form a new version of Marc if MUSBKEEP=0, the new version of Marc will be deleted at the end of the run. (Default) |
| 1 | The new Marc executable will be saved on disk in the same directory as the Nastran input file. Its name will be the name used in PARAM,MARCUSUB with the extension marc.             |

## MVERMOON

Integer, Default = 0, SOL 600 only

Controls whether 5-term Mooney series or 5-constant Mooney will be used in the Marc portion of SOL 600.

- |   |  |
|---|--|
| 0 | 5-constant Mooney formulation will be used.    |
| 1 | 5-term series Mooney formulation will be used. |

### Remark:

Prior to MD Nastran 2010, the Marc only allowed a 5-constant Mooney formulation with no volumetric terms. Now Marc allows a full 5-term series for both distortional and volumetric behavior for both MATHP and MATHE entries. If a version of Marc prior to this is to be used, set param,mvermoon,0 or use the default.

## MWINQUOT

Integer, Default = 0, SOL 600 only

Determines whether SOL 600 run on Windows will attempt to place quote strings in the command to execute Marc when PATH is not specified on the SOL 600 Executive Control statement.

- |   |   |
|---|---|
| 0 | Attempt to place quote strings around various fields. |
| 1 | Do not place any quote strings.                       |

### Remarks:

1. Quotes are normally only required if spaces are needed in the file names or directory names.
2. This parameter may be placed in rc files.
3. Depending on the complexity of the command to execute Marc, quote strings may sometimes be incorrect. If the command is complex, it is suggested that PATH=1 be placed on the SOL 600 Executive statement and the statement to execute Marc be placed in the marcrun.pth file.

## MWLDGSGA

Integer, Default = 1, SOL 600.

Controls CWELD type ELEMID GS, GA, GB usage in SOL 600.

- 0 When GS, GA and GB are all greater than zero for CWELD type ELEMID, Marc ignores GS and uses GA and GB to determine if a connection is possible. MWLDGSA=0 retains this default behavior, however experience shows that some models will fail with a message that the weld connection could not be achieved.
- 1 This option will re-set GA and GB to zero so that GS will be used to achieve the connection. Experience shows that this option may be more reliable for many models with CWELD type ELEMID.

## MXICODE0

Default = 5

In nonlinear harmonic response analysis, if the solution fails to converge more than MXICODE0 times in succession, a new trial displacement vector is calculated.

## MXLAGM1

Default = 0.0

MXLAGM1 is to override the maximum Lagrange Multiplier that is used by the merit function in Trust Region.

## NASPRT

Default = 0

NASPRT specifies how often data recovery is performed and printed in SOL 200. By default, SOL 200, in addition to performing an analysis and optimization, will perform full data recovery operations at the first design cycle and upon completion of the last design cycle.

If NASPRT > 0, then data recovery operations are performed at the first design cycle; at every design cycle that is a multiple of NASPRT; and the last design cycle. For example, if PARAM,NASPRT,2 and the maximum number of design iterations requested is 5, then data recovery is obtained at design iterations 1, 2, 4, and 5.

If NASPRT < 0, then no data recovery operations are performed.

## NDAMP, NDAMPM

NDAMP:

Default = 0.01 for SOLs 129 and 159, -0.05 for SOL 400 heat transfer and mechanical non-contact analysis, 0.0 for SOL 400 contact.

NDAMPM:

Default = 0.0 for SOL 400 non-contact, 1.0 for SOL 400 contact. Not used for SOL 400 heat transfer.

NDAMP/NDAMPM:

In SOLs 129 and 159, numerical damping may be specified for the METHODS = "ADAPT" on the entry through the NDAMP entry in order to achieve numerical stability. A value of zero for NDAMP requests no numerical damping. The recommended range of NDAMP values is from 0.0 to 0.1.

SOL 400 Mechanical: In SOL 400, numerical damping may be specified for all METHODS (ADAPT, FNT, etc. on the entry. NDAMP and NDAMPM are two parameters that control the damping scheme and the associated dynamic operator. The equilibrium equation for the most general operator (the Generalized- $\alpha$  operator) is given by

$$M\ddot{u}_{n+1+\alpha_m} + C\dot{u}_{n+1+\alpha_f} + F_{n+1+\alpha_f}^{int} = F_{n+1+\alpha_f}^{ext}$$

where  $\alpha_m$  is NDAMPM and  $\alpha_f$  is NDAMP. In the previous equation, a typical quantity  $F_{n+1+\alpha}$  is given by the expanded form

$$F_{n+1+\alpha} = (1 + \alpha)F_{n+1} - \alpha F_n$$

Depending on the values of NDAMP and NDAMPM, the equilibrium equations can reduce to the HHT- $\alpha$  scheme (NDAMPM = 0) or the WBZ- $\alpha$  scheme (NDAMP = 0) or the Generalized- $\alpha$  scheme (NDAMPM  $\neq$  0, NDAMP  $\neq$  0). For the HHT- $\alpha$  scheme, NDAMP can vary in the range of  $-0.33 \leq \text{NDAMP} \leq 0.0$ . For the WBZ- $\alpha$  scheme, NDAMPM can vary in the range of  $0.0 \leq \text{NDAMPM} \leq 1.0$ . For the Generalized- $\alpha$  scheme, NDAMP can vary in the range of  $-0.5 \leq \text{NDAMP} \leq 0.0$  and NDAMPM in the range of  $-0.5 \leq \text{NDAMPM} \leq 1.0$ .

For problems involving no contact, the HHT- $\alpha$  is used in SOL 400 with default NDAMP = -0.05 and NDAMPM = 0.0 except that the model is linear, or no mass and no damping matrix. In this case, the defaults are NDAMP = 0.0 and NDAMPM = 0.0. For problems involving contact, the WBZ- $\alpha$  scheme is used in SOL 400 with default NDAMPM = 1.0 and NDAMP = 0.0

SOL 400 Heat Transfer: Numerical damping may be specified through the value of NDAMP only. NDAMPM is not used. NDAMP can be varied in the range of (-2.414,0.414). At these outer limits, the transient scheme reduces to the Backward-Euler method. Any value that is outside this range is automatically reset to the closest outer limit. For NDAMP = 0.0, the transient scheme reduces to the Crank-Nicholson scheme. The default value of NDAMP is -0.05.

SOL 400 Thermo-Mechanical Coupled Analysis: If NDAMP and NDAMPM are unspecified, then the default that is appropriate for the particular sub-step is used. For e.g., for a coupled transient contact problem, NDAMP = -0.05 during the heat transfer sub-step and NDAMP = 0.0, NDAMPM = 1.0 during the mechanical sub-step. If the values of NDAMP and NDAMPM are specified by the user in the Bulk Data Section, then these values would be applicable for both the thermal and mechanical sub-steps. To make the values of the NDAMP/NDAMPM physics-dependent, the user can define the values under each sub-step of the Case Control Section. E.g.,

```
SUBSTEP 1
  ANALYSIS=HTRAN
  PARAM,NDAMP,-2.414
```

```
SUBSTEP 2
  ANALYSIS=NLTRAN
  PARAM,NDAMP,-0.05
  PARAM,NDAMPM,0.0
```

## NEWMARK

Default = NO

See CQC under [SCRSPEC](#).

## NFDOPTS

Default = 2

PARAM, NFDOPTS, 2 computes frequency dependent matrices at master frequencies. In general, master frequencies via MFREQ in case control section of input deck is less than the number of forcing frequencies. Hence, PARAM, NFDOPTS, 2 can improve performance as well as reduce disk space requirement for large frequency response jobs. With PARAM, NFDOPTS, 1, frequency dependent matrices are computed at forcing frequencies.

## NHPLUS

Default = 20

In nonlinear harmonic response analysis, in order to avoid aliasing in the calculation of the Fourier coefficients, a certain number of extra evaluation points are used. NHPLUS allows the number of extra points to be defined.

## NINTPTS

Default = 10

N1NTPPTS requests interpolation over the NINTPTS elements closest to each grid point. NINTPTS=0 requests interpolation over all elements, which can be computationally intensive. Related parameters include BIGER, CURV, NUMOUT, OG, OUTOPT, SIG, S1M, S1AG and S1AM.

## NLAYERS

Default = 5 for CQUAD4 and CTRIAR, 7 for CQUADR and CTRIAR, 3 for CAXISYM (minimum=1, maximum=12) (SOLs 106, 129, 153, 159, and 400)

NLAYERS is used in material nonlinear analysis only and is the number of layers used to integrate through the thickness of CQUAD4, CTRIA3 CQUADR, CTRIAR and CAXISYM elements with isotropic material properties. Set NLAYERS=1 for efficiency if no bending is selected (MID2=0 or -1 on all PSHELL entries). Do not specify NLAYERS=1 if MID2 is greater than zero. A larger value of NLAYERS will give greater accuracy at the cost of computing time and storage requirements. For CQUADR and CTRIAR, the maximum is 11.

## NLHTLS

Default = 0

See Remarks under Case Control command, [TSTRU \(Case\)](#).

## NLHTOL

Default = 1.0E-5

During the iteration procedure of nonlinear harmonic response, the norm of the residual load vector for the current step is divided by the norm of the residual load vector for the previously converged step; this value is

then compared with NLHTOL. If the value is smaller than NLHTOL, the system is assumed to have converged.

## NLHTWK

Default = 1.0E-5

In nonlinear harmonic response analysis, if convergence is not obtained, a line search procedure is initiated to calculate a scaling factor for the displacement vector from which updated nonlinear loads are subsequently calculated. If the solution fails to converge more than 5 times in succession a new trial displacement vector is calculated using a push off factor the size of which is defined by NLHTWK. See also parameter [MXICODEO](#).

## NLMAX

Default = 60

The number of suspected massless mechanisms is determined from the number of high ratio messages. If this number exceeds NLMAX, the number of trial massless mechanisms is reduced to NLMAX. This avoids an expensive debug run when there may be thousands of massless mechanisms due to systematic modeling error, such as having CONM2 elements on many grid points for which structural elements have been left out through oversight. The value of this parameter may be increased on initial debug runs where many high ratio DOFs may be present, and the user prefers to see them all at once, rather than on successive runs where only a part are removed at one time. See also [MECHFIX](#).

## NLMIN

Default = 10

In the case of only one or a few high ratio DOFs, more MMs may be present resulting in more trial MM vectors being used, and those trial vectors that do not indicate true problems are discarded by the code. A smaller value could be considered on a stable model undergoing small modeling changes. See also [MECHFIX](#).

## NLPACK

Default=100

NLPACK is used in the nonlinear solution sequence SOL 400 with ANALYSIS=NLTRAN for transient analysis only.

In transient analysis SOL 400 will pack output data and restart data for NLPACK output time steps together at the last time step as a single data package. For example, if NLPACK=100 (the default), then one data package have output data for 100 output time steps and restart data for the last time step. Later usage such as restart or initial condition for later step can be performed only at data package boundaries. If NLPACK=-1, all output data for a STEP and restart data for end of the STEP are grouped into a single package. In this case, the restart can be performed only at STEP boundaries. NLPACK=0 is illegal. If NLPACK=1, each package of data on the database includes output data for one output time step and restart data. In this case, restart can be performed at every output time step. Please note that the output time step is controlled by the NO field on the Bulk Data entry, or NO filed of FIXED time step control as well INTOUT field of ADAPT

time step control in NLSTEP Bulk Data entry. NLPACK also influences the intermediate output selected by NLOPRM.

Please note that NLPACK is based on the number of the output load steps (concerning INTOUT in NLSTEP, and so on), but not the number of the calculated load steps. For example, one NLTRAN analysis has NLSTEP as:

```
NLSTEP, 900, 0.2
, fixed, 2000, 20
, mech, u
```

It has total 2000 increments, and asks output every 20 increments. Therefore, total output is 100 time step. In NASTRAN, default value of NLPACK for NLTRAN is 100, in this model, therefore, NASTRAN will write the results to OP2 after collecting 100 output, i.e., this model will write results to OP2 only one time. With intermediate output request, only one OP2 file will be created.

If NLPACK=1, NASTRAN will write results to OP2 for every output request. In this model, NASTRAN will write results to OP2 for every output request, i.e., writing 100 times in this model. With “intermediate output request, 100 OP2 files will be created.

If NLPACK=2, NASTRAN will write results to OP2 for every two output requests. In this model, NASTRAN will write results to OP2 for every two output request, i.e., writing 50 times in this model. With "intermediate output request, 50 OP2 files will be created.

## NLTOL

Default =  $\begin{cases} 2 & \text{(SOL 106 and MD Nastran SOL 400)} \\ 0 & \text{(SOL 153, nonlinear heat transfer)} \end{cases}$

NLTOL establishes defaults for the CONV, EPSU, EPSP and EPSW fields of NLPARM Bulk Data entry for nonlinear static and heat transfer analysis according to the following table:

NLTOL	Level of Accuracy
0	Very high
1	High
2	Engineering Design
3	Preliminary Design

See Remark 16. of the NLPARM entry for further details and corresponding default NLPARM field values.

## NMLOOP

Default = 0

In SOL 106 nonlinear static analysis, normal modes will be computed with the updated nonlinear stiffness if PARAM,NMLOOP is requested in the subcase section, it must be for all subcases. The nonlinear normal modes will be computed at the last iteration loop of each subcase in which a METHOD command appears.

## NMNLFRQ

Default = 0.0

PARAM, NMNLFRQ, Real\_Value allows users to select material or property values for frequency dependent materials or properties at a desired frequency other than the “nominal” values specified on the MATi or PBUSH, PCOMP, PCOMPG, PDAMP, or PELAS entries.

If there is only CBUSH frequency dependency and NO other type of material dependency, then Nastran will not use/update the CBUSH properties at the specified NMNLFRQ.

## NOCOMPS

Default = +1

NOCOMPS controls the computation and printout of composite element ply stresses, strains and failure indices. If NOCOMPS = 1, composite element ply stresses, strains and failure indices are printed. If NOCOMPS = 0, the same quantities plus element stresses and strains for the equivalent homogeneous element are printed. If NOCOMPS=-1, only element stresses and strains are printed. MAT1, MAT2, or MAT8 entries with MIDs>99999999 run the risk of conflicting with internally generated MAT2 entries when composites are present and should be avoided. Even if no composites are present, MIDs>99999999 signal to shell element stress computations that no STRESS is to be computed. In the case of MIDs>99999999 if the user desires stress calculations for shell elements, even if no composites are present, then PARAM, NOCOMPS, -1 is required.

Homogenous stresses are based upon a smeared representation of the laminate’s properties and in general will be incorrect. Element strains are correct however.

NOCOMPS only supports conventional elements, not advanced elements. For advanced nonlinear element, only ply stress/strain will be output.

## NODCMP

Default = 0

For some type of nonlinear transient problems, including heat transfer, the decomposition of the solution matrix is not required. In order to increase efficiency, NODCMP is created to determine whether the solution matrix will be decomposed. If NODCMP=0, the solution matrix will be decomposed. If NODCMP=1, the solution matrix will NOT be decomposed. In this case, MAXBIS and DJUST on the Bulk Data entry, NLPARM, must be set zero on the Bulk Data entry. NODCMP is available for SOL 129 and 159 only.

## NOELOF

Default = -1

If NOELOF > 0, then the grid point forces (GPFORCE Case Control command) are computed along the edges of the two-dimensional elements. The default value will suppress this output.

## NOELOP

Default = -1

If  $NOELOP > 0$ , then the sum of the grid point forces (GPFORCE Case Control command) are computed parallel to the edges of adjacent elements. The effect of CBAR element offsets is not considered in the calculation of the forces. The default value will suppress this output.

## NOGPF

Default = 1

NOGPF controls the printout of grid point forces (GPFORCE Case Control command).  $NOGPF > 0$  specifies that the grid point forces are to be printed.  $NOGPF < 0$  suppresses the printing of the grid point forces.

## NONCUP

Default = -1

In SOLs 111 and 112, NONCUP selects either a coupled or uncoupled solution algorithm in the modal dynamic response analysis. This parameter has the following meanings in both solution sequences:

NONCUP = -1 (Default)      Use the uncoupled solution algorithm if there are no off-diagonal terms in any of the modal matrices (MHH, BHH and KHH); otherwise use the coupled solution algorithm. However, in order to ensure correct results, the coupled solution algorithm is used when large mass enforced displacement, large mass enforced velocity or SPC/SPCD enforced motion is employed in SOL 112, regardless of the existence of off-diagonal terms in the modal matrices.

If **enforced motion** is requested in **modal transient analysis**, NONCUP = 0 is the default.

NONCUP > -1      Use the coupled solution algorithm unconditionally

NONCUP = -2      Use the uncoupled solution algorithm unconditionally

User Information Message 5222 indicates which solution algorithm is used in the analysis.

## NQSET

Default = 0

If  $NQSET > 0$ , and the PARAM entry is in Case Control, all part superelements that do not contain QSET entries, or are not referenced by SENQSET entries in the main Bulk Data Section, have NQSET generalized coordinates assigned to them. These QSET variables are functionally equivalent to those generated by SENQSET entries.

## NUMOUT, NUMOUT1, NUMOUT2, NUMOUT3

See S1, S1G, S1M.

## OELMOPT

Integer; Default=3.

PARAM,OELMOPT selects the class of elements to include in the search for grid points:

- 0 All regular elements but not PLOTEL and rigid elements.
- 1 All regular elements and PLOTEL.
- 2 All regular elements and rigid elements.
- 3 Both 1 and 2 (default).

## OELMSET

Integer; Default = 0

Identification number of a Case Control command SET definition. The members of the specified SET represent the identification numbers of the finite elements that are to be retained in the “reduced” op2 file element connection data block.

## OG

Default=0

See CURV.

## OGEOM

Default = YES

See POST < 0.

## OGRDOPT

Integer; Default = 1

Selects the method used to create the set of grid points retained in the reduced grid point geometry data block. The default simply uses the set of grid point IDs listed in the OGRDSET Case Control SET. Set consistency is checked. OGRDOPT=2 uses the list of grid point IDs that are connected to elements in the OELMSET Case Control SET. OGRDOPT=3 merges the contents of the OGRDSET Case Control SET with the contents of the grid point list connected to the elements in the OELMSET Case Control SET. There is no consistency check for OGRDOPT=2 or OGRDOPT=3. OGRDOPT=0 turns the SET consistency check off altogether. For this case, the grid points retained are those specified in the OGRDSET SET and the elements retained are those specified in the OELMSET SET. See also PARAM,OELMOPT description.

## OGRDSET

Integer; Default = 0

Identification number of a case control command SET definition. The members of the specified SET represent the identification numbers of the grid points that are to be retained in the “reduced” op2 file grid geometry data block.

## OLDSEQ

$$\text{Default} = \begin{cases} -1 & \text{for non-iterative-distributed-parallel solutions} \\ 5 & \text{for iterative solutions using distributed parallel methods} \\ & \text{(NASTRAN ITER=1 and system(231)>0)} \\ 6 & \text{if SUPER=2} \end{cases}$$

OLDSEQ selects from the following options for resequencing:

- 1 No resequencing is performed.
- 1 Use the active/passive option.
- 2 Use the band option.
- 3 For the active/passive and the band option select the option giving the lowest RMS value of the active columns for each group of grid points.
- 4 Use the wavefront (Levy) option.
- 5 Use the Gibbs-King option even if the CPU estimate is higher than for nonsequencing.
- 6 Use the automatic nested dissection option even if the CPU estimate is higher than for no resequencing. See the following SUPER=2 description.
- 8 Semiautomatic selection. The program will compute estimates for two options that are suitable for the decomposition method selected by the PARALLEL and SPARSE keywords on the NASTRAN statement and select the option with the lowest estimate. The following table shows the suitable options for each decomposition method.

Decomposition Method	Suitable Options
regular	1 and 4
parallel	2 and 5
sparse	6 and 7

- 9 The extreme partitioning method is used to partition the model into domains.
- 10 The METIS partitioning method is used to partition the model into domains.
- 11 The MSCMLV partitioning method is used to partition the model into domains.

**Notes:**

1. The model partitioning options make sense only when running with the DOMAINSOLVER command in the Executive Control Section. For DOMAINSOLVER (PARTOPT=GRID), param,oldseq,9 is the default. For all other DOMAINSOLVER options, the default is param,oldseq,11.
2. The wavefront option does not support superelement resequencing or starting nodes. Also note that the automatic nested dissection option uses starting nodes only to establish the root of the initial connectivity tree.

If the value of OLDSEQ is changed in superelement analysis, an SEALL=ALL restart is required.

PARAM,FACTOR is used to generate the sequenced identification number (SEQID) on the SEQGP entry as follows:

$$\text{SEQID}=\text{FACTOR}*\text{GRP}+\text{SEQ}$$

where:

SEQ = generated sequence number

GRP = group sequence number

If GRP=0, use GRP(MAX)+1 where GRP(MAX) is the largest group sequence number in the database.

PARAM,MPCX controls whether the grid point connectivity created by the MPC, MPCADD, and MPCAX entries and/or the rigid element entries (e.g., RBAR) is considered during resequencing:

- |    |  |
|----|--|
| -1 | Do not consider the connectivity of the MPC, MPCADD, MPCAX, or rigid element entries.  |
| 0  | Consider the connectivity of the rigid element entries only. (Default).  |
| >0 | Consider the connectivity of the rigid element entries and the MPC, MPCADD, and MPCAX entries with the set identification number set to the value of this parameter. |

PARAM,SEQOUT controls the output options as follows:

- |   |   |
|---|---|
| 0 | Do not generate any printed or punched output for the new sequence (Default). |
| 1 | Print a table of the internal/external sequence in internal order.            |
| 2 | Write the SEQGP entries to the PUNCH file.                                    |
| 3 | Perform SEQOUT=1 and 2.   |

PARAM,START specifies the number of the grid points at the beginning of the input sequence. The input sequence will be the sorted order of the grid point numbers including the effect of any SEQGP entries input by the user. A single SEQGP entry can be input to select the starting point for the new sequence. Otherwise, the first point of lowest connectivity will be used as the starting point.

If PARAM,SUPER<0, all grid points from the connection table that are not part of the group currently being processed are deleted. This option provides for sequencing only the interior points of a superelement. If any

superelements are present, the residual structure is not resequenced. If all of the grid points are in the residual structure, they are resequenced.

If PARAM,SUPER=0 or 1, all grid points in the connection table are considered. This option provides for the recognition of passive columns.

If PARAM,SUPER=2, then all points that are connected to multipoint constraints (via MPC entries) or rigid elements (e.g., the RBAR entry) are placed in a special group at the end of the sequence. This option also forces OLDSEQ=6 and may not be selected with other values of OLDSEQ. This option is intended primarily for models that have many active columns due to MPCs or rigid elements; e.g., a model with disjoint structures connected only by MPCs or rigid elements.

## OLDWELD

Default = NO

By default, the program uses new formulations for connector elements (CFAST, CSEAM and CWELD). To acquire identical connector results as those from previous versions before v2017.1, specify OLDWELD=YES.

## OMACHPR

Default = NO

See POST < 0.

## OMAXR

Default = 2 · BUFFSIZE

OMAXR specifies the maximum record length of data written by the OUTPUT2 module under PARAM,POST,<0 and PARAM,OPTEXIT,-4. BUFFSIZE is a machine-dependent value defined in the *MSC Nastran Configuration and Operations Guide*. For further information, see the OMAXR parameter description under the OUTPUT2 module description in [MSC Nastran DMAP Programmer's Guide](#).

## OMID

Default = NO

To print or punch the results in the material coordinate system, set the parameter OMID to yes. Applicable to forces, strains, and stresses for TRIA3, QUAD4, TRIAR6, and QUAD8. This is available for linear analysis only. Other elements and outputs are not supported. This capability is not supported by post-processors (xdb and op2 output are not changed), by grid point stress output that assumes output is in element coordinate system, random response analysis, heat transfer analysis, stress sorting, MAXMIN Case Control, composite elements, MONPNT3 Bulk Data and external superelement data recovery in the assembly run.

## OMSGLVL

Integer; Default = 0

Set consistency check error message severity flag. The default causes FATAL messages to be generated if the grid set is not consistent with the element-related grid point set and the job is terminated. If OMSGLVL=1, the FATAL messages are reduced to WARNINGS and the job is allowed to continue.

## OP2GM34

Default = TRUE

By default, the GEOM3 and GEOM4 are written in OP2 file. To avoid GEOM3 and GEOM4 output, set PARAM, OP2GM34, FALSE.

## OPCHSET

Integer; Default = 0

SET punch request flag. If OPCHSET=1, then the list of grid points used to reduce the grid point geometry data block will be punched in case control SET definition format.

## OPGEOM

Default = -1

OPGEOM > -1 prints the aerodynamic set definitions for all degrees-of-freedom. To print structural degree-of-freedom sets, please see [USETPRT](#).

Sequence	Print	USETPRT
None	None (Default)	-1
	Row sort only	0
Internal	Column sort only	1
	Row and Column sort	2
	Row sort only	10
External	Column sort only	11
	Row and Column sort	12

The [USETPRT](#) parameter description contains further explanation that is relevant to OPGEOM as well.

## OPGTKG

Default = -1

OPGTKG > -1 prints the matrix for the interpolation between the structural and aerodynamic degrees-of-freedom.

## OPPHIB

Default = -1

In the flutter (SOLs 145 and 200) and dynamic aeroelastic (SOLs 146 and 200) solution sequences, OPPHIB > -1 and a DISPLACEMENT request in the Case Control Section will output the real vibration modes with the structural displacement components transformed to the basic coordinate system.

## OPPHIPA

Default = -1

In the flutter (SOLs 145 and 200) and the dynamic aeroelastic (SOL 146) solution sequences, OPPHIPA > -1 and a DISPLACEMENT command in the Case Control Section will output the real

structural vibration modes at all degrees-of-freedom, including the aerodynamic degrees-of-freedom in the global coordinate system. Use PARAM,OPPHIPB to output in the basic system.

## OPTEXIT

Default = 0

In SOL 200, especially during the checkout of the analysis model and the design optimization input data (design model), it may be desirable to exit the solution sequence at certain points before proceeding with full optimization. OPTEXIT may be set to values of 1 through 7 and -4. The DSAPRT Case Control command overrides the specification of PARAM,OPTEXIT,4, -4, or 7. The description of OPTEXIT values follow.

OPTEXIT Value	Description
0	Do not exit. Proceed with optimization.
1	Exit after the initialization of the analysis and design model but before finite element analysis begins.
2	Exit after finite element analysis and initial design response and shape basis vector processing.
3	Exit after design constraint evaluation and screening.
4	Exit after design sensitivity analysis and print the matrix of design sensitivity coefficients (DSCM2). This is equivalent to the DSAPRT (UNIFORM,END=SENS) Case Control command.
-4	Exit after design sensitivity analysis and write the data blocks related to sensitivity coefficients (DSCM2 and DSCMCOL) to an external file using the OUTPUT2 and OUTPUT4 modules. This is equivalent to the DSAPRT (NOPRINT,EXPORT END=SENS) Case Control command. See related parameters ITAPE, IUNIT, and OMAXR.
5	Exit after the first approximate optimization of the design model.
6	Exit after the first update of the analysis model based on the first approximate optimization of the design model.
7	Compute and output design sensitivity coefficients at the end of normal program termination: hard convergence, soft convergence, or maximum design cycles. This is equivalent to the DSAPRT (UNIFORM,START=LAST) Case Control command. If the final design is a discrete design optimization, no sensitivity is performed and the OPTEXIT=7 request is not honored.

## OPTION

Default = ABS

See SCRSPEC.

## OSETELE

Default = 2

See [AUTOGOUT](#).

## **OSSETGRD**

Default = 1

See [AUTOGOUT](#).

## **OSWELM**

Default = -1

Offset for identification numbers of internally generated RBE3 rigid body elements (generated by all formats of CFAST and CSEAM as well as CWELD with formats ELEMID, GRIDID, ELPAT and PARTPAT). By default, OSWELM=-1, the numbering starts with SYSTEM(182) + 1. The default of system cell 182 is SYSTEM(182)=100,001,001. If the user defines OSWELM > 0, then the numbering starts with OSWELM + 1.

Active ONLY for "PARAM,OLDWELD,YES", for each CWELD element, a pair of RWELD constraint elements is generated if MSET=ON is specified, see the entry PWELD, 3329 for an explanation.

Active ONLY for "PARAM,OLDWELD,YES", in an SOL 400 nonlinear analysis this defines the offset for identification numbers of internally generated RBE3 rigid body elements (generated by CWELD and CFAST, all formats) and CONM2 mass elements (generated by CFAST when it has nonzero mass). The default behavior in SOL 400 is the same as in the linear solution sequences.

## **OSWPPT**

Integer, Default = -1

Offset for internally generated grid identification numbers for connector elements (GA and GB for CWELD and CFAST if these are not specified and all auxiliary grids for CWELD, CFAST and CSEAM). By default, OSWPPT=-1, the numbering starts with SYSTEM(178) + 1. The default of system cell 178 is SYSTEM(178)=101,000,000. If the user provides OSWPPT > 0, then the numbering starts with OSWPPT + 1.

Active ONLY for "PARAM,OLDWELD,YES", for each CWELD or CFAST element, a pair of grid points GA and GB is generated internally if the formats ELEMID, GRIDID, ELPAT or PARTPAT are used and if no identification numbers for GA and GB are specified, see the entry CWELD, 1696 and CFAST, 1505 for a definition of the formats.

Active ONLY for "PARAM,OLDWELD,YES", in an SOL 400 nonlinear analysis this defines the offset for identification numbers of internally generated grids of connector elements CWELD and CFAST (GA and GB if these are not specified in the bulk data input and all auxiliary grids). The default behavior in SOL 400 is the same as in the linear solution sequences.

## **OUGCORD**

See [POST](#).

## **OUGSPLIT**

Default=YES

By default, displacements, velocities, and accelerations are written to separate tables. PARAM, OUGSPLIT, NO will combine these tables into a single table and is intended for third-party post-processors which are not able to read the separate tables. The value of OUGSPLIT does not affect the results in the f06 file.

## OUNIT1

Default = Value of OUNIT2

For PARAM, POST, -1 and -2 defines the unit that geometry data blocks are output to. See PARAM, POST. This parameter should not be specified after BEGIN SUPER.

## OUNIT2

Default = 12

For PARAM, POST, -1 and -2 defines the unit that results data blocks are output to. See PARAM, POST. This parameter should not be specified after BEGIN SUPER.

## OUTOPT

Default = 0

See CURV.

## PACINFID

Integer, no default.

This parameter is used only in data recovery operations for elements in acoustic field point mesh bulk data. PACINFID is the ID of the PACINF entry that contains the location of the pole used to determine element orientation. Data recovery operations require that the element surface normal vector point away from the pole location. This parameter is required only if the acoustic model references multiple PACINF bulk data entries and the pole locations on the PACINF entries are not coincidental.

## PANELMP

Replaced by a keyword on the FLSPOUT Case Control command.

## PATPLUS

Default = NO

PARAM, PATPLUS, YES may be used with PARAM, POST, 0 to allow the user to also write data related to geometry, connectivity, and properties and results from GPFORCE, WETSENS, ELSENS, and PACCE to a Fortran unit as is done under PARAM, POST, -1.

## PATVER

Default = 3.0

See POST = -1.

## PCOMPRM

Default = 0

PCOMPRM controls the computation and printout of composite element extreme ply stresses, strains, failure Indices and strength ratios. Note that extreme ply output encompasses ply stresses, ply strains, ply failure indices and ply strength ratios together. Punch output is not available for extreme ply results.

PCOMPRM = 0 (default) , STANDARD composite ply responses are output.

PCOMPRM = 1 STANDARD & EXTREME composite ply responses are output

PCOMPRM = 2 ONLY EXTREME composite ply responses are output

## PDRMSG

Default = 1

PDRMSG controls the printout of messages associated with deformed plots, including error messages. PDRMSG = 0 suppresses the printout. Contour values will not be displayed unless the default value is used.

## PEMDMP

Default = 'NO'

Setting the value of character parameter PEMDMP to 'YES' (PARAM,PEMDMP,YES in bulk data) will invoke the distributed Nastran-PEM solution logic. PEMDMP is intended for large Nastran models with multiple PEM trim components.

The PEMDMP solution strategy is to distribute Trim Master Frequencies evenly among distributed Nastran DMP processes. The PEMDMP solution is possible when all the following are true:

- Nastran SOL 111 solution specification
- DOMAINSOLVER ACMS is used
- Command line option "dmp=N" where N>1
- Multiple hosts; or use of RUNOPT=MULTIPAR on the DOMAINSOLVER entry (Multiple-Parent DMP processing)
- Number of forcing frequencies greater than NDMP (number of DMP processes)
- Number of trim master frequencies greater than NDMP+1
- PARAM,PEMDMP,YES in bulk data

If one of the above items is not true, or if RUNOPT=PARCHILD is specified on the DOMAINSOLVER entry, the PEMDMP solution is not deployed. If the PEMDMP solution is active, User Information Messages 10544 and 10545 are printed in the F06 file. Otherwise, no messages are printed.

## PEMFRIM

PARAM,PEMFRIM,1 is used to request full Reduced Impedance Matrix (RIM) from Actran, instead of lower-triangular RIM. By default (PARAM,PEMFRIM,0), Actran returns lower-triangular RIM. Note that PEMFRIM will increase disk space demand of PEM job. In addition, OOC field of ACPEMCP will cause Actran to generate full RIM when set to an integer greater than 1.

## PEMMAPC

PEMMAPC is used to generate lists of GRD IDs of the coupling surfaces. 'PARAM,PEMMAPC,1' (default is 0) will produce following files in 'mapping\_control' subdirectory of job submit directory.

For	SET ID	Generic File name
Structure GID coupled with all TRMCs	100000	<deckname>.<job seq>.x_nas.structure_component1.set
Fluid GID coupled with all TRMCs	200000	<deckname>.<job seq>.x_nas.fluid_component2.set
Structure GID coupled with TRIMID=xxxx only	y00018xxxx for GLUED or z00018xxxx for SLIDING	<deckname>.<job seq>.>.x_nas.structure_component1.trim_coupling.<xxxx>.<y or z>.set
Fluid GID coupled with TRIMID=xxxx only	Y00028xxxx for OPEN or Z00028xxxx for IMPER	<deckname>.<job seq>.>.x_nas.fluid_component2.trim_coupling.<xxxx>.<Y or Z>.set
TRIMID=xxxx GID coupled with structure	xxxx90001	<deckname>.<job seq>.>.x_nas.interface<xxxx>.surface.1.set
TRIMID=xxxx GID coupled with fluid	xxxx90002	<deckname>.<job seq>.>.x_nas.interface<xxxx>.surface.2.set

Guidelines for PARAM,PEMMPAC,1

1. PARAM,PEMMPAC,1' must be placed in the main bulk data section or under 'BEGIN BULK' to be effective.
2. Without 'PARAM,PEMNPART,n', PEMMPAC logic has a TRIM ID limit of less than 10000.
3. With 'PARAM,PEMNPART,n', PEMMPAC logic has a TRIM ID limit of less than 100.

## PEMNCOP4

PARAM,PEMNCOP4,1 (default) is used to request each Reduced Impedance Matrix (RIM) from Actran to be written into individual file. With PARAM,PEMNCOP4,0, Actran writes all RIMs into a single file. Note that PARAM,PEMNCOP4,1 can reduce footprint on disk space of large PEM jobs.

## PEMNPART

PEMNPART can be utilized to partition a large trim component. The default value for PEMNPART is 1. 'PARAM,PEMNPART,n' will partition a large trim component into 'n' parts. The guidelines are:

1. PARAM,PEMNPART,n' must be placed under 'BEGIN TRMC=xx' to be effective for trim component 'xx'.
2. Each trim component can have its own 'PARAM,PEMNPART,n'
3. When value of 'n' for PEMNPART is greater than 1, new trim components are generated with ID equal to 'xx'\*100+<seq no> where <seq no> goes from 0 to n-1.
4. For no loss of accuracy, setting 'n' to a value equal to the number of disconnected parts of a large trim component.
5. For accepting loss of accuracy to run on a machine with limited memory, setting 'n' to a value larger than the number of disconnected parts of a large trim component.

6. 'PARAM,PEMNPART,n' with  $n > 1$  should be utilized only as an alternative for running PEM jobs with large trim component and insufficient memory on the computer. Other alternatives for running PEM job with large trim component and insufficient memory are:
  - a. Split large trim component into smaller trim components and/or
  - b. Acquire more memory for the computer
7. For a trim component with 'PARAM,PEMNPART,n' where  $n > 1$  and 'PARAM,TRMBIM,physical', data recovery will be skipped for all partitioned trim components.

## PEMSKIN

'PARAM,PEMSKIN,1' is used for Actran to couple the trim bodies only to the surface of the cavity and will not search any node inside the cavities. The default value for PEMSIN is 0 which allows Actran to target both surface and interior nodes of the cavities for trim bodies coupling.

## PENFN

Default =  $1.0e+5$  (See LMFACT)

## PERCENT

Default = 40

See CQC under [SCRSPEC](#).

## PH2OUT

Default = 0, SOL 400 only

For nonlinear solution sequence, SOL 400, in addition to the regular phase III output, the user can also request the phase II output. This is useful when the run is terminated abnormally before the phase III outputs are formatted and printed. The phase II output consists of all outputs requested by the Case Control commands in the input file and prints in sort1 format. If there's no PH2OUT, MSC Nastran outputs phase III outputs only. This is the regular output. If PH2OUT=1, MSC Nastran outputs phase II outputs only. In this case, there will be no output for the upstream superelements. If PH2OUT=3, MSC Nastran outputs both phase II and phase III outputs. In this case, some of the outputs for the residual structure may be redundant.

Case Control command, NLOPRM OUTCTRL, takes precedence over PH2OUT. In other words, when NLOPRM OUTCTRL is present, PH2OUT is no longer functional. NLOPRM OUTCTRL=SOLUTION is equivalent to PH2OUT=1 and NLOPRM OUTCTRL=(STD,SOLUTION) to PH2OUT=3.

## PKRSP

Default = -1

If PKRSP=0, the magnitude of the output quantities at the time of peak acceleration of the modal variables is output. This option is available only for modal transient analysis.

## PLTMSG

Default = 1

PARAM,PLTMSG,0 suppresses messages associated with undeformed plot requests, including error messages.

## POST

Default = 9999999

If PARAM,POST,0, then the following parameters and discussion apply (not support in SOL 400):

The data blocks often used for pre- and postprocessing will be stored in the database and also converted, by the DBC module (see [MSC Nastran DMAP Programmer's Guide](#)), to a format suitable for processing by MSC Patran. These data blocks include input data related to geometry, connectivity, element and material properties, and static loads; they also include output data requested through the Case Control commands OLOAD, SPCF, DISP, VELO, ACCE, THERMAL, ELSTRESS, ELFORCE, FLUX, GPSTRESS, GPFORCE, ESE, GPSDCON, and ELSDCON.

The converted data is written to logical FORTRAN units, which may be assigned to physical files in the File Management Section. The FORTRAN unit numbers are specified by the parameters GEOMU, POSTU, and LOADU. By default, all data is written to the logical FORTRAN unit indicated by GEOMU. If LOADU > 0, static load data may be diverted to another unit indicated by LOADU. If POSTU > 0, then output data requested with the Case Control commands listed above will be diverted to the logical unit indicated by POSTU. See [Database Concepts in the MSC Nastran Reference Guide](#) for the procedure for assigning physical files.

By default, if converted data already exists on the files indicated by GEOMU, POSTU, and LOADU, then the DBC module will overwrite the old data. If this is not desirable, then PARAM,DBCOVWRT,NO must be entered. The parameters MODEL and SOLID may be used to store more than one model and solution in the graphics database. These parameters are not supported by MSC Patran.

PARAM,DBCDIAG > 0 requests the printing of various diagnostic messages from the DBC module (see [MSC Nastran DMAP Programmer's Guide](#)) during the data conversion. By default, no messages are printed.

If PARAM,PATPLUS,YES is specified along with PARAM,POST,0 then the PARAM,POST,-1, operation will also be performed.

If PARAM,POST,< 0 or 1, then the following parameters and discussion apply:

- PARAM,POST,1 outputs the appropriate files for the SimXpert and Patran programs and should be used to obtain results from the latest result data blocks from SOL 400 and other recent MSC Nastran developments such as NEF.
- PARAM,POST,-1 outputs the appropriate files for the Patran program (PARAM,POST,1 should be used for more recent versions of MSC Nastran > 2012).
- PARAM,POST,-2 outputs the appropriate files for the Siemens I-deas<sup>®</sup> program.
- PARAM,POST,-4 outputs the files indicated below along with OPHIG for the MSC\_NF interface by LMS International.
- PARAM,POST,-5 outputs the files indicated in the table below along with LAMA and OPHG1 for the FEMtools interface by Dynamic Design Solutions.
- POST=-4 and -5 are intended for SOL 103 only.
- PARAM,POST,-6 outputs the files indicated below for Siemens Unigraphics<sup>®</sup>.

- PARAM,POST,-7 outputs the files for Free Field Technologies.

An OUTPUT2 file for FORTRAN unit 12 in binary format is automatically created in the same directory and with the same name as the input file and with the extension “.op2”. For example, if the input file is fender.dat then the OUTPUT2 file will be called fender.op2.

An ASSIGN statement is required in the FMS Section only if neutral file format is desired as follows:

ASSIGN OP2='filename of FORTRAN file' FORM

Geometry data blocks are output with PARAM,OGEOM,YES (Default) and are written to a FORTRAN unit specified by PARAM,OUNIT1 (Default = OUNIT2) for POST = -1, -2, -4, and -6. PARAM,OUNIT2K (Default = 91) specifies the unit number for KELM and KDICT with PARAM,POST,-5. PARAM,OUNIT2M (Default = 92) specifies the unit number for MELM and MDICT with PARAM,POST,-5. Note that PARAM,POST,-5 is not supported with DMP. See the following table for the specific geometry data blocks written for different values for POST.

See also the PARAM,POSTEXT description for additional data blocks written to the .op2 file.

POST					Geometry Data Block	Description
-1,1 or -7	-2	-4	-5	-6		
YES	NO	NO	NO	NO	GEOM1S	Grid Point Definitions (Superelement)
NO	YES	YES	NO	YES	CSTM	Coordinate System Transformations
NO	YES	YES	NO	YES	GPL	Grid Point List
NO	YES	YES	NO	YES	GPDT	Grid Point Definitions
NO	YES	YES	NO	NO	EPT	Element Properties
NO	YES	YES	NO	NO	MPT	Material Properties
YES	YES	YES	NO	NO	GEOM2	Element Definitions
YES*	YES	NO	NO	NO	GEOM3	Load Definitions
YES*	YES	NO	NO	NO	GEOM4	Constraint Definitions
YES	NO	NO	NO	NO	DIT	Dynamic Table Input
YES	NO	NO	NO	NO	DYNAMICS	Dynamic Loads Definition
NO	NO	YES	YES	NO	KDICT	Element Stiffness Dictionary
NO	NO	YES	YES	NO	KELM	Element Stiffness Matrices
NO	NO	YES	YES	NO	MDICT	Element Mass Dictionary
NO	NO	YES	YES	NO	MELM	Element Mass Matrices
NO	NO	NO	NO	YES	ECTS	Element Connections
YES	NO	NO	NO	NO	VIEWTB	View Element Table
YES	NO	NO	NO	NO	EDOM	Design Model Input
YES	NO	NO	NO	NO	GEOM2S	Same as GEOM2 for superelements

POST					Geometry Data Block	Description
-1,1 or -7	-2	-4	-5	-6		
YES	NO	NO	NO	NO	CSTMS	Same as CSTM for superelements
YES	NO	NO	NO	NO	EPTS	Same as EPT for superelements
YES	NO	NO	NO	NO	MPTS	Same as MPT for superelements

\* To avoid having GEOM3 and GEOM4 written if POST=-1, set PARAM,OP2GM34,FALSE.

PARAM,OMACHPR,NO selects the single precision format for GPDT, CSTM, and GEOM1.

PARAM,OMACHPR,YES selects the machine precision format. With PARAM,POST,< 0,

PARAM,OMACHPR,NO is the default. With PARAM,POST,1, PARAM,OMACHPR,YES is the default.

For PARAM,POST = -1 and -2, results data blocks are output to a FORTRAN unit specified by

PARAM,OUNIT2 (Default = 12). This parameter is allowed to vary between superelements. In buckling solution sequence (SOL 105), a unique value of OUNIT2 should be specified for the buckling subcase. For all other solution sequences or within a given analysis type, changes to PARAM,OUNIT2 between subcases is not supported. See the POST Case Control command to change the unit number between subcases. See also the related parameter OMAXR.

By default the displacements are output in the global coordinate system. To output in the basic coordinate system, specify PARAM,OUGCORD,BASIC.

PARAM,POST,-1 or 1: Results Data Blocks for Patran and SimXpert

By default, the following data blocks are output under PARAM,POST,-1. The following parameters may be used to disable the output of data blocks to the OUTPUT2 file. For example, if PARAM,OQG,NO is specified, then the SPCFORCE output is not written to the OUTPUT2 file. It is recommended when processing large post files in Patran and SimXpert that the following environment variable setting is used when starting the session: DRANAS\_NAST\_MEM=2048MB.

PARAM,PATVER		Parameter Name	Case Control	Data Block Name	Description
< 3.0	≥ 3.0				
YES	YES	OQG	SPCFORCE	OQG1	Forces of single-point constraint

PARAM,POST,-2: Results Data Blocks for Siemens I-deas®

By default, the following data blocks are output under PARAM,POST,-2. By default, the displacements are output in the basic coordinate system. To output in the global coordinate system, specify PARAM,OUGCORD,GLOBAL. The following parameters may be used to disable the output of data blocks to the OUTPUT2 file. For example, if PARAM,OQG,NO is specified, then the SPCFORCE output is not written to the OUTPUT2 file.

PARAMeter Name	Case Control	Results Data Block Name	Description
OQG	SPCFORCE	OQG1	Forces of single-point constraint
OUG	DISPLACE	BOUGV1	Displacements in the basic coordinate system
		BOPHIG	Eigenvectors in the basic coordinate system
		OUGV1	Displacements in the global coordinate system
		TOUGV1	Grid point temperatures
OES	STRESS	OES1	Element stresses (linear elements only)

PARAMeter Name	Case Control	Results Data Block Name	Description
OEF	FORCE	OEF1	Element forces (linear elements only)
	FLUX	HOEF1	Element heat flux
OEE	STRAIN	OSTR1	Element strains
OESE	ESE	ONRGY1	Element strain energy
OCMP	STRESS	OEFIT	Failure indices
	STRESS	OES1C	Ply stresses
	STRAIN	OSTR1C	Ply strains
OUMU	ESE	LAMA	Eigenvalue summary
		ONRGY2	Element strain energy
OEFX	FORCE	OEF1X	Element forces (nonlinear elements only)
OESX	STRESS	OES1X	Element stresses (nonlinear elements only)
none	none	ODELBGPD	Shape optimization geometry changes

PARAM, POST, -4: Results Data blocks for LMS International/MSC NF

By default, the following data blocks are output under PARAM,POST,-4. The following parameters may be used to disable the output of data blocks to the OUTPUT2 file. For example, PARAM,OUG,NO requests that eigenvectors not be written to the OUTPUT2 file.

PARAMeter Name	Case Control	Data Block Name	Description
OUG	DISPLAC	OPHIG	Eigenvectors in the global coordinate system.

PARAM, POST, -5: Results Data blocks for Dynamic Design Solutions/FEMtools

By default, the following data blocks are output under PARAM,POST,-5. The following parameters may be used to disable the output of data blocks to the OUTPUT2 file. For example, PARAM,OUG,NO requests that eigenvectors not be written to the OUTPUT2 file. PARAM,OUNIT2O (Default51) specifies the unit number of the OUTPUT2 file.

PARAMeter name	Case Control	Data Block Name	Descriptions
OUG	DISPLAC	OUGV1	Eigenvectors in the global coordinate system.
		LAMA	Eigenvalue summary.

PARAM, POST, -6: Results Data Blocks for Siemens Unigraphics®

By default, the following data blocks are output under PARAM,POST,-6. The following parameters may be used to disable the output of data blocks to the OUTPUT2 file. For example, PARAM,OUG,NO requests that displacements not be written to the OUTPUT2 file.

PARAMeter Name	Case Control	Data Block Name	Description
OQG	SPCFORCE	OQG1	Forces of single-point constraints
OUG	DISPLAC	OUGV1	Displacements
OES	STRESS	OES1	Element stresses
OEF	STRESS	OEF1	Element forces
OEE	STRAIN	OSTR1	Element strains
OESX	STRESS	OES1X	Element stresses with intermediate station stresses and stresses on nonlinear elements
OEFX	STRESS	OEF1X	Element forces with intermediate station forces and forces on nonlinear elements
OPG	OLOAD	OPG1	Applied static loads
none	none	DVPTAB	Designed property table
none	none	OPTPRMG	Optimization parameters
none	none	PROPO	Final element properties
none	none	DBCLOPT	Optimization summary data

#### PARAM.POST,-7 Results Data Blocks for Free Field Technologies

Except eigenvectors, all other output data blocks are the same as PARAM,POST,-1. For eigenvectors, the matrix form is written to the OUTPUT2 file.

### POSTEXT

Default = NO

Under PARAM,POST,-1 and -2, and if PARAM,POSTEXT,YES is specified, then the following data blocks are also written to the .op2 file specified by PARAM,OUNIT2.

Data Block Name	PARAM POST	Description
FRL	-1, -2	Frequency response list (modal frequency response only).
BHH	-1, -2	Modal damping matrix (modal frequency response only).
KHH	-1, -2	Modal stiffness matrix (modal frequency response only).
BGPDT	-1	Basic grid point definition table.
PVT0	-1, -2	User parameter value table
CASECC	-1	Case Control table
EQEXIN(S)	-1	Equivalence external to internal grid ID table

Data Block Name	PARAM POST	Description
CLAMA	-1, -2	Complex eigenvalue table
OEDE1	-1, -2	Element energy loss output table
OEKE1	-1, -2	Element kinetic energy output table
OUGV2	-1, -2	Displacement output table in SORT2
PSDF	-1, -2	Power spectral density table
OGPWG	-1, -2	Grid point weight generator output table
TOL	-1, -2	Time output list
OPHSA	-1, -2	Solution set eigenvectors (modal frequency response only)
LAMA	-1	Eigenvalue summary table
ONRGY2	-1	Element kinetic energy (obsolete)
PSDFH	-1, -2	Power spectral density table for modal coordinates
DSCM2	-1, -2	Design sensitivity coefficient matrix
DSCMCOL	-1, -2	Design sensitivity parameters table
MPOUT	-1,-2	Monitor point outputs

## POSTADF

Default = NO

This parameter is used to export the results of frequency analysis responses and participation factors by PFMODE, PFPANEL, and PFGRID in ADF format file. This exportation is requested by setting this parameter to YES. The unit information of the exported functions should be defined by DTI, UNITS statement for this function (see ADAMSMNF statement). If not defined, SI unit will be assumed with the warning message. The ADF file is defined as input data name with the extension “afu” automatically. Alternatively the name can be defined with ASSIGN ADFFILE= statement in FMS section. For the participation factor output, FILTER=0. option should be applied in PFMODE and PFPANEL.

## POSTU

Default = -1

See POST=0.

## PREFDB

Default = 1.0

See ACOUT.

## PRGPST

Default = NO

PRGPST is replaced by the PRINT keyword on the AUTOSPC Case Control command. The specification of the AUTOSPC command overrides the specification of PARAM,PRGPST.

## PRINT

Default = YES

PARAM,PRINT,NO suppresses the automatic printing of the flutter summary in flutter analysis.

## PROUT

Default = -1

PARAM,PROUT,-1 suppresses execution and printout from the ELTPRT module. PARAM,PROUT,-1 prints a list of all elements sorted on EID and summary tables giving the range of element identification numbers for each element type.

ELTPRT will provide an information message when it detects any duplicate element ID. For the case of CONV and CHYBDi elements, duplicate element IDs are by design. The information message provided by ELTPRT can be safely ignored for these elements.

## PRPA

Default = 1.0E37

## PRPJ

PRPA and PRPJ control the printout of intermediate load matrices for diagnostic purposes during superelement assembly. If the value of PRPA (or PRPJ) is positive, all terms larger in magnitude than the value are printed. If the value of PRPA (or PRPJ) is negative, all terms smaller in magnitude than the value are printed. The default value requests no printout. PARAM,IRES,1 must be present for these parameters to be effective. The PA matrix contains the internal loads transmitted to the downstream superelement. The PJ matrix contains external loads applied on the superelement; that is, it has the same content as the data produced by the Case Control command OLOAD. All of this data may be obtained on restart using the SELR Case Control command option. A related parameter is IRES.

## PRPHIVZ

Default = 1.0E37

PRPHIVZ controls the printout of the PHIVZ matrix that contains the component mode eigenvectors of the model. It includes all degrees-of-freedom with motion except the m-set, eliminated for multipoint constraints. The FAPPROX matrix contains the square root of the diagonal terms of the generalized stiffness matrix divided by  $2\pi$ . For fixed-boundary solutions, it is a good approximation for the natural frequencies of the component. For free- or mixed-boundary solutions, it is of a lower value than the natural frequencies. All terms larger than PRPHIVZ in both matrices will be printed (i.e., PARAM,PRPHIVZ,0.0 causes all terms to be printed).

## PRTMAXIM

Default = NO

PRTMAXIM controls the printout of the maximums of applied loads, single-point forces of constraint, multipoint forces of constraint, and displacements. The printouts are titled “MAXIMUM APPLIED LOADS”, “MAXIMUM SPCFORCES”, “MAXIMUM MPCFORCES”, and “MAXIMUM DISPLACEMENTS”.

## PRTRESLT

Default = YES

PRTRESLT controls the printout of the resultants of applied loads, single-point forces of constraint, and multipoint forces of constraint. The printouts are titled “OLOAD RESULTANTS”, “SPCFORCE RESULTANTS”, and “MPCFORCE RESULTANTS”.

## PSENPCH

Default = NO, for SOL 200 job with PART SEs only.

Setting PSENPCH to YES causes updated Bulk Data entries of a PART SE for a design cycle punched to a separate file named as follows

JOBNAME\_psexx\_yy.pch – where xx is the PART SE ID and yy is the design cycle.

## PTHRES

Default = -1

PARAM, PTHRES, TABLED1\_ID requests the PEAKOUT result at which the desired response exceeds a prescribed threshold value. The threshold value for the response is defined on the TABLED1 Bulk Data entry as frequency vs. the threshold of a response value.

## Q

Default = 0.0

Q specifies the dynamic pressure. Q must be specified in aeroelastic response analysis (SOLs 146), and the default value will cause a User Fatal Message.

## RADMOD

Default = YES

This parameter only applies to heat transfer solution sequences for SOLs 153, 159 and 400. The parameter, RADMOD, only affects radiation heat transfer problems. The radiation matrix is modified to avoid the temperature overshoot with a coarse mesh. If the user wants the program to skip this operation (modify the radiation matrix) then insert PARAM,RADMOD,NO.

## RBSETPRT

Default=0

This parameter controls the printout of rigid element IDs that are included in the analysis. Setting PARAM,RBSETPRT to a value not equal to zero activates the printing of rigid element IDs. Note that this function works in conjunction with the rigid element selection via MPC=n in case control and SET3,n,RBxx in bulk data.

## RESLTOPT

Default = 8

RESLTOPT's default value provides component-level force summary output for model checkout (PARAM, CHECKOUT, YES), loads generation (OLOAD output), and SPC and MPC forces. Setting RESLTOPT to a value of 1 produces abbreviated output formats only.

## RESVEC

This parameter and the related parameters RESVINER, RESVSO, RESVSE, and RESVSLI are obsolete or replaced by options on the RESVEC Case Control command.

## RFORSET

Default = 0

A PARAM, RFORSET, n where n is a Bulk Data SET1 entry, allows the user to apply rotational force loading (RFORCE) to just a portion of the structure. RFORSET like RFORCE loading is global and is computed once at the beginning of the analysis. The Bulk Data SET1 n defines the GRIDS to which the rotational force loading is to be applied. RFORSET can appear in either the **Bulk Data** or **ABOVE** or **IN the 1st Subcase**. A RFORSET appearing in any other Subcase will be ignored and may cause incorrect results. A RFORSET appearing in or above the first subcase takes precedence over a RFORSET appearing in Bulk Data. See also the companion GRAVSET entry. If there is no RFORCE loading called out, then PARAM, RFORSET, n needs to be removed from the run.

## RHOCP

Default = 1.0

This parameter represents a scale factor used in the computation of ERP in units of dB. See the ERPREFDB parameter. This parameter may alternatively be set using the ERP Case Control command.

## RIMINTP

RIMINTP can be used to select the interpolation method for Reduced Impedance Matrix(RIM) for PEM and ACTRIM. The input options for RIMINTP are LINEAR and LOG10. The default is LINEAR.

## RKSCHEME

Default = Remark 1., SOL 700 only

Defines the type of time-integration scheme used in the Riemann solution-based Euler solvers.

### Format:

PARAM,RKSCHEME,NUMBER

### Example:

PARAM,RKSCHEME,3

NUMBER      Number of Runge-Kutta stages. (Integer > 0)

**Remarks:**

1. This parameter can be used in combination with the original Roe solver and the improved full 2<sup>nd</sup> order fluid- and gas Euler solver. The default number of stages depends on the spatial accuracy of the solution scheme. One stage is used for first order spatial accuracy, and three stages for second order spatial accuracy.
2. It is recommended that the user leave the setting to the default values as defined depending on the selected spatial accuracy of the solution.
3. It has been found that in some cases with fluid flows, it may be necessary to manually limit the time step to a fixed and lower value than the scheme determines. These occasions are noticeable when you view a contour plot of the pressure. The user may find that the pressure field looks like a checkerboard. This is then caused by a numerical instability due to a time step that is too large for the fluid flow. The face fluxes are always correct but the element values get decoupled due to the time integration instability. Lowering the time step to about half the maximum value the scheme determines solves this problem. Please note that this significantly slows down the computation! Since this problem rarely occurs we have chosen not to automatically limit the time step to a lower value for performance reasons. However, the user needs to be aware that the analysis may exhibit the aforementioned behavior.

**RMSINT**

Default = LINEAR for the trapezoidal approximation.

RMSINT specifies the interpolation method for numerical integration when computing both RMS (Root Mean Square) and N0 (Number of Zero Crossings or Mean Frequency) from PSDF (Power Spectral Density Function). RMSINT = LINEAR requests the trapezoidal approximation, which is the existing Nastran approach. RMSINT = LOGLOG requests the Log-Log interpolation.

**ROHYDRO**

Default = Remark 3., SOL 700 only

Defines the minimum density for hydrodynamic, single-material Eulerian elements.

**Format:**

PARAM,ROHYDRO,VALUE

**Example:**

PARAM,ROHYDRO,1.E-6

VALUE            Density cutoff. (Real > 0.0)

**Remarks:**

1. Hydrodynamic, single-material Eulerian elements with a density less than ROHYDRO are considered to be empty. All of the variables are set to zero, and the equation of state is bypassed.

2. In the Eulerian transport calculation, if the material is flowing from element A to element B, and
  - a. If the density of element B after transport is less than ROHYDRO, then no transport is done.
  - b. If the density of element A after transport is less than ROHYDRO, then all of the mass is transported to element B.
3. By default, the cutoff density for hydrodynamic Eulerian elements is set to 1.E-5 times the material reference density. For the Riemann solution-based solvers, the default is set to 1.E-6 times the reference density.
4. Please note that this parameter has a different effect in the Riemann-solution based Euler solvers. The elements are never viewed as empty, but a small amount of mass (equal to the element's volume times the cut-off density value) remains in the element. All other state variables (velocity, energy and pressure are reset to zero for these types of elements). For fluid flows where you wish to model cavitation, use Tait's equation of state with a critical density at which the pressure remains constant and the fluid cavitates.

## ROMULTI

Default = Remark 3., SOL 700 only

Defines the minimum density for multimaterial Eulerian elements.

### Format:

PARAM,ROMULTI,VALUE

### Example:

PARAM,ROMULTI,1.E-6

VALUE            Density cutoff. (Real > 0.0)

### Remarks:

1. Multimaterial Eulerian elements with a density less than ROMULTI are considered to be empty. All of the variables are set to zero, and the equation of state is bypassed.
2. In the Eulerian transport calculation, if the material is flowing from element A to element B, and
  - a. If the density of a specific material in element B after transport is less than ROMULTI, no transport is done.
  - b. If the density of a specific material in element A after transport is less than ROMULTI, all of the mass of that material is transported to element B.
3. By default, the cut-off density is set for each material separately as 1.E-5 times the material reference density.

## ROSTR

Default = Remark 3., SOL 700 only

Defines the minimum density for single-material Eulerian elements with shear strength.

**Format:**

PARAM,ROSTR,VALUE

**Example:**

PARAM,ROSTR,1.E-6

VALUE            Density cutoff. (Real &gt; 0.0)

**Remarks:**

1. Single-material Eulerian elements with shear strength with a density less than ROSTR are considered to be empty. All of the variables are set to zero, and the equation of state is bypassed.
2. In the Eulerian transport calculation, if the material is flowing from element A to element B, and
  - a. If the density of element B after transport is less than ROSTR, then no transport is done.
  - b. If the density of element A after transport is less than ROSTR, then all of the mass is transported to element B.
3. By default the cut-off density for Eulerian elements with shear strength is set to 1.E-5 times the material reference density.

**RSPECTRA**

Default = -1

RSPECTRA = 0 requests that response spectra be calculated for transient analysis. See [Response Spectrum Analysis](#) (Ch. 9) in *Dynamic Analysis User's Guide* for a discussion of this capability. Response spectra will be calculated for any superelements or the residual structure for which other output requests are present in the same run. The requirements for the other output requests are also in [Response Spectrum Analysis](#) (Ch. 9) in *Dynamic Analysis User's Guide*. Any punch data produced is sent to the standard Nastran PUNCH file. Related parameters are TABID and RSPRINT.

**RSPRINT**

Default = 0

RSPRINT controls the printout of tabulated values of response spectra. RSPRINT = -1 suppresses the printout. The related parameter is RSPECTRA.

**RSTTEMP**

Default = NO

In SOL 106, PARAM,RSTTEMP,YES will cause the automatic restart to ignore changes to or additions of TEMPij Bulk Data entries. This is applicable to SOL 106 restart runs in which the temperature changes are only intended to affect the loading and not the material properties. The restart run also requires the use of the DBLOCATE FMS statement instead of the RESTART statement to reference the data base; e.g.,

```
assign run1=plate-run1.MASTER
dbloc logical=run1
```

**RVLDFILT**

Default = NO

This parameter controls a filtering process for residual vector loads. Set `PARAM,RVLDFILT,YES` to check the linear independence of load vectors to be used as a basis for residual vector augmentation. This option is useful if you have many thousands of applied loads, many of which occupy the same vector space (for example, same direction). For this case, linearly dependent load vectors will be discarded and not used for residual vector computation, leading to a more efficient solution. The linear dependence check itself may be very time consuming, hence the default value is NO. If the number of load vectors is more than about 20,000, the linear dependence check may require long running time. When the number of load vectors is large, User Information Messages 10590, 10591, and 10592 may be printed in the F06 file. See also related parameter [MAXAPL](#).

## S1, S1G, S1M

Default = -1

The MAXMIN Case Control command offers more features with much greater efficiency. `PARAM,S1i,+1` requests the sorting and/or filtering of the element stresses selected on the DTI,INDTA entry. Stresses in the element coordinate systems (S1), at grid points (S1G), and/or in material coordinate systems (S1M) based on the parameters BIGER, NUMOUT, SRTOPT, and SRTELTYP may be requested. The S1G and S1M options also require the presence of `PARAM,CURV,1`.

Parameter	Quantity	Coordinate System	Location	Elements
$S1 \geq 0$	Stresses	Element	Element centers	CQUAD4, CQUAD8, CTRIA3, CTRIA6
$S1M \geq 0$	Stresses	Material	Element centers	CQUAD4, CTRIA3
$S1G \geq 0$	Stresses	Material	Grid points to which elements connect	CQUAD4, CTRIA3

NUMOUT, in conjunction with BIGER, controls the amount of stress output.

NUMOUT2 and BIGER2 serve the same function as NUMOUT and BIGER except that they apply only to composite element failure indices and do not require `PARAM,S1i,+1`. Similarly, NUMOUT3 and BIGER3 are used for composite strength ratio.

1. NUMOUT = +N requests that N element stresses be printed (or punched) for each element type.
2. NUMOUT=0 outputs all elements in a group when one or more exceeds BIGER. Some of the elements will have stresses small than BIGER. This is conceptually the same as describing an element set in case control, and limiting output in this manner. Stress files obtained with element group filtering may be used for xy plotting and other postprocessor options with DMAP alters. By contrast, the stress file when NUMOUT = -2 is more discontinuous, and may not be used for xy plotting.

3. NUMOUT = 0 does not sort but filters according to BIGER by element group. In static analysis an element group is defined as all case control selected elements for a given load case for SORT1 output. For SORT2 output an element group is defined as the data for a given element type for all load cases. In transient analysis an element group is defined as all case control selected elements at a given time for SORT1 output. For SORT2 output an element group is defined as the data for a given element at all time steps. The element group option applies only to output types described above for PARAM,S1. This option is not available with output types selected by PARAMs S1G and S1M.
4. NUMOUT = -1 requests that stresses be sorted and only those stresses with an absolute value that is greater than BIGER will be output.
5. NUMOUT = -2 (the Default) does not sort but filters according to BIGER. Related parameters include BIGER, NOELOF, NOELOP, and NOGPF.
6. NUMOUT2 = -3 outputs the maximum value of Failure Index for each element.

BIGER controls the elements for which stresses will be printed. Elements with stresses that are smaller in absolute value than BIGER will not be output. The quantity tested is element type dependent. Related parameters include CURV, NUMOUT, S1, S1G, and S1M. SRTOPT controls the scanning option to be performed.

SRTOPT Value	Description
0	Filter/sort on maximum magnitude.
1	Filter/sort on minimum magnitude.
2	Filter/sort on maximum algebraic value.
3	Filter/sort on minimum algebraic value.

SRTELTYP controls the element type to be processed, as described in the following table.

SRTELTYP Value	Description
0	All element types will be processed.
> 0	Only element type SRTELTYP will be processed.

NUMOUT1 and BIGER1 serve the same function as NUMOUT and BIGER except that they apply only to composite element stresses and do not require PARAM,S1i,+1.

NUMOUT2 and BIGER2 serve the same function as NUMOUT and BIGER except that they apply only to composite element failure indices and do not require PARAM,S1i,+1.

### S1AG,S1AM

Default = -1

See CURV.

## SBSPFORM

No Default

This parameter can be used to specify the Subspace Iteration method formulation for the structure-fluid coupled modes computation.

Subspace iteration method selects the formulation automatically based on the ratio of structure and fluid size and the existence of rigid body or constant pressure modes. But using this parameter, user can force one or other of the methods.

MF:     Mobility-Flexibility formulation

SM:     Stiffness-Mass formulation

## SCRSPEC

Default = -1 (SOLs 103 and 115 only)

SCRSPEC=0 requests that structural response be calculated for response spectra input in normal modes analysis. See [Response Spectrum Analysis](#) (Ch. 9) in the *MSC Nastran Dynamic Analysis User's Guide* for a discussion of this capability. The scaled response calculations are made for elements and grid points of the residual structure only. There exist two basic methods which are controlled by PARAM,CQC. The default (CQC=0) selects the traditional method. CQC > 0 selects a more recent method called the complete quadratic method of peak response combination—also called the CQC method. In both methods, the responses are summed with the ABS, SRSS, NRL, or NRLO convention, depending on the value of PARAM,OPTION. If the SRSS, NRL, or NRLO options are used, close natural frequencies will be summed by the ABS convention, where close natural frequencies meet the inequality  $f_{i+1} < \text{CLOSE} \cdot f_i$ . Both PARAM,OPTION and PARAM,CLOSE may be set in any subcase, allowing summation by several conventions in a single run.

In Version 70, the NRL option has been modified slightly to correspond to the NAVSEA-0908-LP-000-3010 specification. NRLO provides the V69 NRL.

PARAM,CQC,1 or 2 selects the complete quadratic method of peak response combination; also called the CQC method. PARAM,CQC,1 selects CQC method of response combination for sum across modes. PARAM,CQC,2 is same PARAM,CQC,1, but outputs the CQC coefficients for each mode ij pair and frequency and damping for each mode. The default is to consider all modes in the calculation but if only a subset of modes are of interest then a DTI,CQC,1,... Bulk Data entry may be used to specify a list of modes (by mode number) to retain for the CQC solution. When multiple excitation directions are specified, PARAM,CQC,1 or 2 specifies the summation across the modes and PARAM,OPTION specifies the summation across excitation directions. As with PARAM,OPTION and PARAM,CLOSE, when PARAM,CQC is used at the subcase level, each subcase can have a different value specified for OPTION, CLOSE and CQC. This allows comparisons to be made in the same run among summation across directions using ABS and SRSS methods while using the CQC method to sum across modes.

For the CQC method, PARAM,DIROUT,YES (Default = NO) outputs the responses combined across the modes for each separate excitation direction as well as the responses combined across modes and directions. This allows results to be assessed per excitation direction and for the total combined response.

PARAM,POST,-1 will write the additional directional responses to the op2 file for post processing with Patran. In this case, the directional responses will be labeled in the Patran Results menu with a TIME value corresponding to the excitation sequence number. For example, if the SUPORT entry specifies the following degrees of freedom to be excited: SUPORT,1,123 then direction 1 will be labeled with TIME value 1, direction 2 with TIME value 2, etc. PARAM,POST,-1 will also write the additional maximum response to the op2 file for post processing. In this case, the maximum response will be labeled in the Patran Results menu with a TIME value 4.

For the CQC method, PARAM,NEWMARK,YES (Default = NO) may be used in the case where 3 simultaneous excitation directions are defined and calculate the Newmark combinations across the excitations directions using the 40% rule. PARAM,PERCENT (Default = 40) may be used to specify a different percentage for Newmark combinations.

## SDCSV

Default = 0

Dictates what stability derivative information is to be stored on a CSV (comma separated values) file in a SOL 144 (static aeroelasticity) task. The unit the CSV file is stored to is specified by PARAM, SDUNIT, n. SDCSV has the following options which can be summed to select multiple options:

0	No output
1	Rigid aero
2	Rigid Splined
4	Elastic restrained
8	Elastic unrestrained
16	Inertial restrained
32	Inertial unrestrained

## SDUNIT,n

n SDUNIT is used in conjunction with an FMS ASSIGN statement to specify the unit number for the storage of stability derivative results in SOL 144.

## SEKD

Default = RSONLY

Controls the calculation of the upstream superelement differential stiffness matrix in SOL 106.

RSONLY	Calculate the differential stiffness for the residual structure only.
ALL	Calculate and reduce the differential stiffness for all superelements and the residual structure.

## SEMAP, SEMAPOPT, SEMAPPRT

SEMAP Default = SEMAP  
 SEMAPOPT Default = 42  
 SEMAPPRT Default = 3

The superelement map (SEMAP table) contains several lists useful for determining how the program has partitioned superelement models. It is printed automatically each time this table is generated. It consists of three major parts:

- GPM        The Grid Point Map contains a list of each grid point, its interior superelement placement, and the SEID of all grid points connected directly to it by elements. Three tables follow that summarize the connectivity between superelements, sorted on grid point sequence, SEID, and the number of connections.
- ISM        The Individual Superelement Map lists the interior grid points, exterior grid and scalar points, elements, and time and storage space estimates for each superelement.
- SDT        The Superelement Definition Table contains the SEID of every superelement in the model, the processing order, and a pictorial representation of the superelement tree.

SEMAP, SEMAPOPT, and SEMAPPRT are used to control the amount of output that is printed and other special features. The possible values for SEMAP are shown in the following table.

SEMAP Value	Output and Application
SEMAP (Default)	ISM, SDT. The lengthy GPM is suppressed. This is the appropriate value for use after the model is stable and only minor changes are to be made.
SEMAPALL	GPM, ISM, SDT. All tables are printed. This value is useful on the initial debug run of a model and when making extensive modeling changes.
SEMAPCON	Only the summary tables of the GPM and the estimation data is output. This is a useful value when iterating to an economic partitioning scheme for large, complex models.
SEMAPEST	Only the estimation data is printed. This is useful when evaluating several alternative partitioning schemes.
SEMAPPUN	No output is printed. The exterior grid points of the superelement with a SEID that is input on SEMAPOPT are placed on a CSUPER entry image on the PUNCH file, allowing the superelement to be used as an external superelement. If SEMAPOPT > 0, the superelement entry is given an SSID of SEMAPOPT. If SEMAPOPT < 0, the exterior points listed are those of the residual structure, but the CSUPER entry is given an SSID of  SEMAPOPT .

Other special features are available with parameters SEMAPOPT and SEMAPPRT. They are fully described under parameters OPT1 and OPT2 in the description of the TABPRT module in the [MSC Nastran DMAP Programmer's Guide](#).

If the default value of SEMAP is used, the other two parameters may be used to further refine this output, as described in [MSC Nastran DMAP Programmer's Guide](#) under the TABPRT module description. The printing of the SEMAP table can be avoided by the use of PARAM,SEMAPPRT,-1.

PARAM,SEMAPPRT,99 requests the printout of the SLIST (superelement processing list) and the DRLIST (superelement data recovery list).

## SENSU00

Default = NO

By default, in dynamic sensitivity analysis in SOL 200, displacements at the o-set due to pseudo-loads do not include any effect due to inertia and damping. If PARAM,SENSU00,YES is specified then these effects will be computed in a quasi-static manner and included in the sensitivity analysis.

## SEP1XOVR

Default = 0

The old and new location of moved shell grid points are printed if SEP1XOVR = 16. When the RSSCON shell-to-solid element connector is used. By default, the moved shell grid points are not printed, SEP1XOVR = 0. See the description of PARAM,TOLRSC for more details.

## SEQOUT

Default = 0

See OLDSEQ.

## SERST

Default = AUTO

By default, all restarts are considered automatic (see [Restart Procedures in the MSC Nastran Reference Guide](#)). If none of the following Case Control commands are entered, then SEALL=ALL is the default action: SEMG, SELG, SEKR, SELR, SELA, SEMA, SEMR, and SEALL.

These commands may be used to partition the analysis into several runs. By default, the restart will proceed in automatic fashion for each command, regenerating only that data that is affected by modifications in the Bulk Data and Case Control or changes in upstream superelements. If the user wishes to overwrite the data, even if it is not affected by modifications to the data, then PARAM,SERST,MANUAL must be entered.

With PARAM,SERST,AUTO or MANUAL, all superelements will be processed through Phase 0 (see [Superelement Analysis in the MSC Nastran Reference Guide](#)). This phase includes execution of the sequencer module (SEQP), initial superelement processing (SEP1), and initial geometry processing (GP1 and GP2) modules, which can result in significant CPU overhead. If this overhead is not desired, then PARAM,SERST,SEMI will limit Phase 0 and Phase 1 to only those superelements specified on the SEMG, SELG, SEKR, SELR, SELA, SEMA, SEMR, and SEALL Case Control commands. If none of these commands is entered, then execution will skip Phase 0 and 1.

In the modal solution sequences (SOLs 110, 111, 112, 145, 146, and 200), the modes of the residual structure are automatically computed in Phase 2 if any SE-type command (e.g., SEMG=n) is requested for the residual structure. If PARAM,SERST,SEMI and no SE-type command is specified for the residual structure, then, by default, its modes will not be recomputed. This logic is intended for restarts from SOL

103 into one of the modal solutions. If, however, the modes have not already been computed or need to be recomputed, then PARAM,SERST,RSMDS must be specified to force the calculation of the residual structure modes.

If PARAM,SERST,SEDR is specified, then Phases 0, 1, and 2 will be skipped. This option is intended for data recovery (Phase 3) runs only.

The options of SEMI, RSMDS, and SEDR are intended for models that are defined on more than one database; i.e., superelements are defined on separate databases (multiple MASTER DBsets) and processed in separate runs. Also, with this technique, databases are attached with the DBLOCATE File Management statement rather than the RESTART File Management statement. In general, these options are not recommended because they disable the automatic restart capability, which compromises the database integrity.

## SESDAMP

Default = NO

PARAM,SESDAMP,YES

Modal damping is calculated for superelements if PARAM,SESDAMP,YES is specified. An SDAMPING Case Control command that selects a TABDMP1 Bulk Data entry must also be specified in the desired superelement's subcase. By default, modal damping is added to viscous damping (B). If you insert PARAM,KDAMP,-1 (or PARAM,KDAMPFL,-1 for fluid superelements) then modal damping will be added to structural damping (K4). The SESDAMP parameter needs to be specified as NO for an assembly run.

PARAM,SESDAMP,AUG

By its nature, classical modal damping in superelements is computed only for the component modes. If fixed boundary or mixed boundary (some fixed, some free) methods are used to compute the component modes, no damping is computed for the constraint modes, which can lead to answer differences when comparing the same model with and without superelements. An enhanced modal damping method has been developed to account for damping on the constraint modes. To use the enhanced damping method instead of the classical method, define "PARAM,SESDAMP,AUG". When this enhanced damping method is defined, the user may choose how the damping factor for the constraint modes is determined via the parameter TDAMP.

## SESEF

Default = -1 (SOLs 103 and 115 only)

If SESEF = 0 in superelement normal modes analysis, the fraction of total strain energy for a superelement in each of the system's modes is output in the vector SESEFA for tip superelements and in SESEFG for nontip superelements. If SESEF = 1, strain energy fractions are output, and expansion of the eigenvectors from a-set size to g-set is branched over for tip superelements. If SESEF = -1 (the default value), no strain energy fractions are computed.

Output requests must be present in order for strain energy fractions to be calculated. If SESEF = 1, no other output results for tip superelements.

## SHIFT1

Default = -1.234

The negative shift used when computing massless mechanism constraint modes with PARAM,MMMETH,OLD. For very stiff model (1000. hz for the first flexible mode), consider using a larger value. See also [MECHFIX](#) and [MMMETH](#).

## SHLDAMP

Default = SAME

If SAME, then structural damping is obtained from MID1 material of PSHELL. If DIFF or any value not equal to SAME, each MIDi field of the PSHELL will have its own structural damping. See Remark 5. of the PSHELL.

## SIGMA

Default = 0.0

The radiant heat flux is proportional to

$$\text{SIGMA} \cdot (T_{grid} + T_{ABS})^4$$

where SIGMA is the Stefan-Boltzmann constant,  $T_{grid}$  is the temperature at a grid point, and  $T_{ABS}$  is the scale factor for absolute temperature and may be specified by PARAM,TABS. These parameters must be given in units consistent with the rest of the data in the model. The value for SIGMA in SI units is

$$5.67 \times 10^{-8} \text{ watts/m}^2\text{K}^4$$

The default value causes radiant heat effects to be discarded.

## SKINOUT

Default = NONE

Request that sets of grid and element lists be output for both the fluid and structure at the fluid-structure interface.

NONE	Requests no output of sets.
PUNCH	Requests set output to .pch only.
PRINT	Requests set output to .f06 only.
ALL	Requests set output to both .pch and .f06.

See the Case Control command FLSPOUT as an alternative selection.

## SKPAMP

Default = 0

For SOLs 145, 146, and 200, SKPAMP = -1 suppresses all unsteady aerodynamic calculations. The automatic restart performs a similar function without this parameter. Specifying it ensures suppression of the calculations, regardless of the determination of the automatic restart.

## SLOOPID

Default = 0 (SOL 129 and 159 only)

In a nonlinear transient analysis (SOLs 129 and 159) restart, SLOOPID identifies the initial conditioning previous nonlinear analysis run (SOLs 106 and 153 respectively). Setting SLOOPID greater than 0 will cause SOLs 129 and 159 to start from the static deformed position.

## SMALLQ

Default = 0.0

By default Nastran removes unused superelement q-set degrees-of-freedom from the residual structure solution set. Set this parameter to a small value (e.g., 1.0E-10) if you do not want unused superelement q-set degrees-of-freedom removed.

## SNORM

Default = 20.0

SNORM > 0.0 requests the generation of unique grid point normals for adjacent shell elements (see [Figure 6-2](#)). Unique grid point normals are generated for the CQUAD4, CTRIA3, CQUADR, and CTRIAR elements. The grid point normal is the average of the local normals from all adjacent shell elements including CQUAD8 and CTRIA6 elements. If grid point normals are present, they are used in all element calculations of the CQUAD4, CTRIA3, CQUADR, and CTRIAR elements.

SNORM	Tolerance in Degrees
> 0.0	Unique grid point normals are generated if each angle between the grid point normal and each local normal of the adjacent shell elements is smaller than SNORM. SNORM Bulk Data entries overwrite a generated normal.
= 0.0	The generation of grid point normals is turned off. The user can define normals with the SNORM Bulk Data entry.
< 0.0	Grid point normals are not generated. SNORM Bulk Data entries are ignored.

**Caution:** If the grid shown in [Figure 6-2](#) is located on a symmetric half model boundary and, hence, Shell 2 is not present, you may attain the same result as a full model by specifying the normal direction with the SNORM Bulk Data entry.

Figure 6-2 Unique Grid Point Normal for Adjacent Shell Elements

## SNORMPRT

Default = -1

PARAM,SNORMPRT,>0 writes the grid point normals of the model in the basic coordinate system to the .f06 and/or .pch files.

SNORMPRT	Switch to Print Out Normals
$\leq 0$	No output
1	Print out to the punch file (.pch)
2	Print out to the print file (.f06)
3	Print out to the punch (.pch) and print file (.f06)

## SOFTEXIT

Default = NO

In SOL 200, if soft convergence is achieved during optimization, before completing the maximum number of design iterations, the user may request an exit with PARAM,SOFTEXIT,YES.

## SOLADJC

Default = 0

PARAM SOLADJC indicates if adjoit solution vectors are to be calculated during the analysis:

- 1 Do not calculate adjoint solution vectors during the analysis. Any required adjoint solution vectors will be computed during sensitivity analysis.
- ≥0 For ANALYSIS=DFREQ, the adjoint vectors will be computed during the solution if:
1. All frequency response DRESP1 entries are grid responses.
  2. Each subcase has the same set of excitation frequencies.
  3. The number of degrees-of-freedom referenced on DRESP1 entries < (number of independent design variables + number of type-2 properties + number of spawned nonlinear beam library properties) x (number of subcases.)
  4. PARAM AUTOADJ=YES (Default)
- 999999 For ANALYSIS=MFREQ, the adjoint vectors will be computed during the solution if the four items above are satisfied and SOLADJC=999999. SOLADJC=999999 cannot be used in conjunction with FREQ3, FREQ4 or FREQ5 entries to specify excitation frequencies.

## SOLID

Default = 0

SOLID also allows several models to be stored in the same graphics database created by PARAM,POST,0.

## SPARSEDM

Default = YES

See SPARSEDR.

## SPARSEDR

Default = YES

SPARSEDR=YES limits the data recovery matrix calculations to recover only those grid points specified on SET commands referenced by grid point output requests (DISP, SPCF, etc.) or those points connected to elements specified on element output requests (STRESS, FORCE, etc.). In SOL 200, the design model and design responses are also taken into consideration for determining which grid points are needed for data recovery.

SPARSEDM=YES is for SOL 200 and takes further advantage of small design models/responses during the adjoint or pseudo-load sensitivity calculations.

These methods take advantage of very small output requests, and/or small design models in SOL 200, for large models resulting in significant CPU and disk space savings.

If, however, the output requests and/or the size of the design model in SOL 200 require the calculation of the solution over a large enough percentage of degrees-of-freedom, then it is more efficient to compute the solution at all grid points. The user PARAMeter SPDRRAT (Default75) and SPDMRAT (Default60) specifies this percentage.

The sparse data recovery method is not supported in Aeroelastic (SOL 146), Flutter (SOLs 145 and 200), Complex Eigenvalue (SOLs 107, 110, 145, and 200), Nonlinear (SOLs 106, 129, 153, 159, and 400) and Cyclic Symmetry Analysis (SOLs 114, 115, and 118).

The sparse data recovery method is deactivated when the following Case Control commands are specified: EKE, ESE, EDE, and CMSENRGY.

PARAM,DDRMM is ignored under PARAM,SPARSEDR,YES. To restore the data recovery solution process to pre-V2004 methods insert PARAM,SPARSEDR,NO.

### **SPARSEPH**

Default = YES

The default selects the very efficient sparse data recovery method during eigenvector data recovery in DOMAINSOLVER ACMS (PARTOPT=DOF). This method uses the same process for eigenvector data recovery as is requested by PARAM,SPARSEDR,YES in other dynamic solution sequences like SOLs 107 through 112.

SPARSEPH will be automatically changed to NO if ACPOWER or INTENSITY calculations are requested. These calculations require all eigenvector DOF to be computed.

PARAM,SPARSEPH,NO forces full data recovery on all degrees-of-freedom and can be significantly less efficient if data recovery is required at only a few degrees-of-freedom. See related user parameters [MDOTM](#) and [SPARSEDR](#).

### **SPDRRAT**

Default = 75

See SPARSEDR.

### **SPCGEN**

Default = NO

SPCGEN is analogous to and described by the PUNCH keyword on the AUTOSPC Case Control command. The specification of the AUTOSPC command overrides the specification of PARAM,SPCGEN.

### **SPDMRAT**

Default = 60

See SPARSEDR.

### **SQSETID**

Default = 99000001

See [AUTOQSET](#).

### **SRCOMPS**

Default = NO

SRCOMPS controls the computation and printout of ply strength ratios. If SRCOMPS=YES, ply strength ratios are output for composite elements that have failure indices requested.

## SRTLTYP

Default = 0

See S1, S1G, S1M.

## SRTOPT

Default = 0

See S1, S1G, S1M.

## START

Default = 0

See OLDSEQ.

## STEPFCT

Real, Default = 0.666, SOL 700 only. The scale factor has an effect on the time step computation of Lagrangian and Euler elements.

## STEPFCTL

Real > 0, Default = 0.9, SOL 700 only.

Defines a scale factor to be used on the internally calculated time step. When both of STEPFCT and STEPFCTL are defined, STEPFCTL will be used for Lagrangian elements and STEPFCT will be used for Euler elements.

## STIME

Default = 0.0 (SOLs 109, 112, 129 and 159 only)

In restarts from previous transient analysis runs, the user provides  $STIME = t_N$  where  $t_N$  is the last time step of the subcase to be continued with a new or changed subcase in the new run. Thus, the loading and printout will start from  $t_N$  as though the original run contained the new subcase data.

In SOLs 109 and 112 restarts from previous SOLs 109 and 112 runs,  $STIME$  is used to specify the proper starting time of the restart run. If  $STIME$  exceeds the last output time of the previous run, the starting time is assumed to be the last output time. Otherwise, the starting time is assumed to be the output time of the previous run (not necessarily the last output time) that is closest to  $STIME$ . In other words, the starting time of the restart run need not be the last output time of the previous run, but may be any time earlier than that. The program informs the user that it is a restart run and indicates the starting time (determined as above) that is used for the restart run.

In SOLs 109 and 112 restarts, the user must ensure that the model and the constraints as well as the subcase setup in the restart run are the same as those in the previous run. The user may, however, specify different  $TSTEP$  and  $DLOAD$  requests in Case Control and also different  $TSTEP$  and dynamic loading entries in the Bulk Data compared to the previous run. The loading and the results output from the restart run will start from the new starting time.

**Notes:**

1. The responsibility for ensuring that the model and the constraints as well as the subcase setup in the restart run are the same as those in the previous run is left to the user; the program does not check for this condition. If this condition is not met, the program may terminate the execution with a fatal error or give erroneous results.
2. Restarts in SOLs 109 and 112 using  $STIME > 0.0$  are supported **only** for applied loads, **not** for SPC/SPCD enforced motion. If this usage is violated, the program terminates the execution with an appropriate fatal message.

**STRUCTMP**

Replaced by a keyword on the FLSPOUT Case Control command.

**SUBCASID**

Default = 0

PARAM,SUBCASID,n where n is greater than zero, specifies that the restart proceeds from SUBCASE n in nonlinear static analysis, SOL 106. SUBCASID is an alternative to SUBID and is recommended over SUBID which indicates the subcase sequence number.

**SUBID**

Default = 1

In SOL 106 by default, the restart proceeds from the last LOOPID in the last subcase. SUBID may be used to specify an earlier subcase by specifying the sequential number (for SEID = 0) of the subcase. In SOLs 106 and 153, PARAM,LOOPID may also be specified for an earlier LOOPID. SUBCASID is an alternative to SUBID and is recommended over SUBID. See [Restarts for Nonlinear Static Analysis](#) in Appendix C: Nonlinear Analysis in *MSC Nastran Reference Guide* for further discussion.

**SUPAERO**

Default = ZONA

If SUPAERO=ZONA, then the ZONA51 code is used for supersonic aerodynamic calculations. If SUPAERO=CPM, then the CPM method is used. If ZONA51 is not available at a particular installation, PARAM,SUPAERO,CPM must be specified to avoid a fatal error when performing supersonic aerodynamic analyses. Only one supersonic aerodynamics method can be selected in a given run.

**Note:**

CPM is only supported for planar configurations.

**SUPDOF**

Default = 0

Digits 1 through 6 indicate which of the six rigid body degrees of freedom are supported for a Solution 144 run. For example, SUPDOF=35 indicates that the plunge (3) and pitch (5) degrees of freedom are supported. This parameter is optional. If omitted, Nastran will compute these data using a numerical method.

## SUPER

$$\text{Default} = \begin{cases} 0 & \text{(nonsuperelement sequences)} \\ -1 & \text{(superelement sequences)} \end{cases}$$

See OLDSEQ.

## TABID

Default = 2

TABID controls the punch output for response spectra. See [Appendix C](#) in *MSC Nastran Reference Guide*. A related parameter is RSPECTRA.

## TABS

Default = 0.0

TABS is used to convert units of the temperature input (°F or °C) to the absolute temperature (°R or °K). Specify:

PARAM,TABS,273.16      When Celsius is used.

PARAM,TABS,459.69      When Fahrenheit is used.

Refer to the Bulk Data entry, [CREEP](#) for a creep analysis with SOLs 106 or 153. Refer to PARAM,SIGMA for heat transfer analysis.

## TDAMP

PARAM,TDAMP,Real

When using enhanced modal damping for superelements (see PARAM,SESDAMP,AUG ), the user may choose how the damping factor for the constraint modes is determined.

If TDAMP=0.0 (the default), the damping factor is averaged over all the damping coefficients defined on TABDMP1.

If TDAMP is less than 0.0, the damping factor from TABDMP1 associated with the lowest natural frequency is used.

If TDAMP is positive, the damping factor defined by TDAMP is used directly.

## TESTNEG

$$\text{Default} = \begin{cases} -2 & \text{for Newtons method} \\ -1 & \text{for Arc-length method and SOLs 101-112,115,118,187, and} \\ & 200 \end{cases}$$

In nonlinear static analysis (SOLs 106 and 153), and differential stiffness generation with preload (SOLs 101-112, 115, 118, 187, and 200 with STATSUB) this parameter specifies the action to take when negative terms are encountered on the factor diagonal of matrix decomposition. Negative terms indicate that the differential

stiffness has introduced a structural instability. The instability may be real (structural buckling) or mathematical (the current iteration appears unstable, but a stable solution exists).

TESTNEG	Results
-1	Stop if negative terms occur.
1 or 0	Continue if negative terms occur.
-2	If negative terms exist, do not use differential stiffness.
2	Do not use differential stiffness.
3	Use differential stiffness with preload even if negative terms exist (SOLs 101-112, 115, 118, 187, and 200 with STATSUB only)

### TFSYMFAC

Default = 1.D-08

TFSYMFAC specifies the tolerance at which matrices generated via the TFL Case Control command are treated as anti-symmetric in the solution process. The default will not symmetrize the matrix even if the tolerance is not exceeded. Whereas, if TFSYMFAC is negative then the absolute values is used as the tolerance and the matrix will be symmetrized if the tolerance is exceeded. If TFSYMFAC is 0.D0 then the symmetry is not checked.

### TINY

Default = 1.E-3

Any elements with strain energy that is less than a TINY percentage of the total strain energy for any superelement will not be printed or made available for postprocessing by MSC Patran or other programs. TINY may also be used to suppress the printing of small numbers in the constraint check matrix  $[E_{mh}]$  described in [Geometry Processing in SubDMAP PHASE0](#) in the *MSC Nastran Reference Guide*.

### TOLRSC

Default = 0.05

When the RSSCON shell-to-solid element connector is used, the connecting grid points of the shell element are moved on to the solid face if the grid points are close enough. The tolerable distance of the shell grid point to the solid edge or face is  $\varepsilon \cdot h$  where  $h$  is the height of the solid edge; see the sample figure below. The relative tolerance is user modifiable using the parameter.

PARAM,TOLRSC, $\varepsilon$

The default for the relative tolerance is  $\varepsilon = 0.05$ . Rigid body invariance is satisfied with double-precision accuracy if the shell grid points are adjusted.

## TOPOCONV

Default = 80

Parameter TOPOCONV is applicable only to ESLNRO topology optimization tasks. It sets a lower bound for the percentage of the design variables whose maximum relative changes are within the tolerance specified by CONVDV on the DOPTPRM entry.

By default, when more than 80% of the design variables show their maximum relative changes are within CONVDV, the job will be terminated.

## TRMBIM

Default = PHYSICAL

TRMBIM is used to define the formulation used for reduced impedance matrix, RIM, for all trim components requested under TRIMGRP case control commands. It is default to 'PHYSICAL', which will generate RIM in physical coordinates. The other valid option for TRMBIM is 'MODAL', which will produce RIM in modal coordinates.

It is important to note that data recovery for trim components are supported only under 'PARAM, TRMBIM, PHYSICAL' and 'PARAM, PEMNPART, 1 (default)' for all trim components. In addition, SOL 200 supports for trim components is limited to following conditions:

1. Design model on structure and/or fluid model only (not the trim/PEM material).
2. Design responses/constraints on responses of structure and/or fluid only (not the trim/PEM material).

## TSTATIC

Default = -1 (SOLs 129, 159, 400 and 600 only)

If TSTATIC = 1, a static solution may be obtained while ignoring inertial and damping forces. For SOLs 129 and 159, this option is available only with the adaptive time-stepping method (see METHOD = "ADAPT" on the Bulk Data entry, TSTEPNL). For SOL 600, TSTATIC=1 may only be used for the default auto step iteration procedure.

## UGASC

SOL 700 only,

Real. Defines a value for the universal gas constant.

1. Must be used if the molar weight is used on a GAS option of the AIRBAG entry, or if molar gas fractions are given on an INFLFRAC entry.
2. Specify only one universal gas constant per problem.
3. In SI units, R equals  $8.3145 \text{ J mol}^{-1} \text{ K}^{-1}$ .

Using the tonne, mm, system of units R has a value of  $8314.5 \text{ tonne mm}^2 \text{ s}^{-2} \text{ mol}^{-1} \text{ K}^{-1}$ .

In imperial units, R equals  $1.9859 \text{ Btu lbmol}^{-1} \text{ }^{\circ}\text{R}^{-1}$  or  $1545.3 \text{ ft lbf lbmol}^{-1} \text{ }^{\circ}\text{R}^{-1}$

## UNSYMF

Default = NO

In SOL 106, nonlinear statics, PARAM,UNSYME,YES is required to include damping effects in the calculation of complex eigenvalues. See PARAM,NMLOOP.

## UNSYMKB

Character, default = 'NO'

In modal solutions or real eigenvalue solutions, if the stiffness or damping matrix is not symmetric, the run will normally terminate with a FATAL error message. Setting UNSYMKB to 'YES' will allow the run to continue.

## UPDTBSH

Default = NO

UPDTBSH controls the update of boundary shapes generated by auxiliary boundary model analysis in SOL 200. By default, the auxiliary boundary models and shapes are generated only once at the initial design cycle and will not be updated in subsequent cycles even if the shape of the primary model is changing.

PARAM,UPDTBSH,YES requests that the auxiliary models and shapes are updated and reanalyzed at every cycle.

## USETPRT

Default = -1

USETPRT controls the tabular printout of the structural degree-of-freedom sets. See [Degree-of-Freedom Sets](#). To print aerodynamic degree-of-freedom sets, please see [OPGEOM](#).

Sequence	Print	USETPRT
None	None (Default)	-1
	Row sort only	0
Internal	Column sort only	1
	Row and Column sort	2
	Row sort only	10
External	Column sort only	11
	Row and Column sort	12

The degrees-of-freedom can be listed in ascending order according to their internal or external sequence number, but not both. The external sequence number is the grid, scalar, or extra point identification number. The internal sequence number is the number assigned after resequencing (see PARAM,OLDSEQ).

For a given sequence there are two types of tables that may be printed: row sort and column sort. For row sort, a table is printed for each set selected by USETSEL. Here is an example of row sort (USETPRT = 0 or 10):

USET	DEFINITION	TABLE	(INTERNAL SEQUENCE, ROW SORT)								
	-1-	-2-	-3-	-4-	A	-5-	-6-	-7-	-8-	-9-	-10-
	DISPLACEMENT SET										
1=	2-1	2-2									

For column sort, a single table is printed for the following sets: SB, SG, L, A, F, N, G, R, O, S, M, E. Here is an example of column sort (USETPRT=1 or 11):

USET	DEFINITION	TABLE	(INTERNAL SEQUENCE, COLUMN SORT)													
	EXT GP.	DOF	INT DOF	INT GP.	SB	SG	L	A	F	N	G	R	O	S	M	E
---																
	1	- 1	1-	1 G	1					1	1			1		
	- 2		2-		2					2	2			2		
	- 3		3-			1				3	3			3		
	- 4		4-			2				4	4			4		
	- 5		5-			3				5	5			5		
	- 6		6-			4				6	6			6		

### USETSEL

Default = 0

USETSEL specifies the sets which will be printed in the row sort (USETPRT = 0 or 10). In order to select specific sets to be printed, you must sum their corresponding decimal equivalent numbers. For example, sets A, L, and R are selected with USETSEL=128+256+8=392. To print the aerodynamic degree-of-freedom sets: J, JS, K, KS, and SA, please see [OPGEOM](#).

USETSEL	Sets Printed
0	Sets SB, SG, L, A, F, N, G, R, O, S, M, and E
-1	All sets as defined in <a href="#">Degree-of-Freedom Sets</a> .
-2	Mutually exclusive sets only; i.e., sets MP, MR, SB, SG, SZ, O, Q, R, C, B, LM, and E.

### USETSTR1

Input-character-Default ' '

USETSTR1 through USETSTR4 specifies the sets that will be printed by the specification of parameters USETPRT and USETSEL. Any set in [Degree-of-Freedom Sets](#) may be specified. A ":" is used as a separator. In the following example, the m-set (degrees-of-freedom eliminated by multipoint constraints) and s-set (degrees-of-freedom eliminated by single point constraints) are specified.

#### Example:

PARAM,USETSTR1,M:S

## VARPHI

Default =  $\pi/4$  (0.78539816)

Feature angle for detection of singular geometric features (sharp edges or corners) in the mesh during adaptive mesh refinement.

When adaptive meshing is requested (see Case Control command, [HADAPT \(Case\)](#) and Bulk Data entry, [HADAPTL](#)), singular geometric features such as sharp edges or sharp corners must be detected. To this end the face outward normals  $N_1, N_2$  of each pair of adjacent mesh faces and the edge oriented tangents  $T_1, T_2$  of each pair of adjacent mesh edges are computed (see [Figure 6-3](#)). If the angle between  $N_1$  and  $N_2$  for mesh faces, or between  $T_1$  and  $T_2$  for mesh edges is bigger than the feature angle  $\varphi$ , then the common edge or vertex will be considered a splitting edge or vertex where surfaces or lines are broken and a singular geometric feature is defined.

Figure 6-3

Mesh faces and elements are preprocessed to ensure consistent orientation and that the appropriate sign of face normals and edge tangents will be accounted for during the computation of their mutual angle.

## VELCUT

Default = 1.E-6, SOL 700 only

Defines the minimum velocity in Eulerian meshes.

### Format:

PARAM,VELCUT,VALUE

### Example:

PARAM,VELCUT,1.0E-6

VALUE            Minimum velocity. (Real > 0.0)

**Remark:**

Any velocity less than VELCUT is set to zero. It is mainly used to eliminate harmless but annoying small values of velocity caused by round-off error and numerical dispersion.

**VMOPT**

Default = 0

By default (VMOPT=0), virtual mass is included after the component modes are computed. Virtual mass is not taken into consideration when using GRAV, RFORCE, or ACCEL loading.

If VMOPT=1, then the virtual mass will be included in the mass matrix at the same time as all other mass elements. In other words, the component modes will reflect the virtual mass. Virtual mass is taken into consideration when using GRAV, RFORCE, or ACCEL loading.

If VMOPT=2, the modes of the structure or component without the fluid are computed first (“dry” modes). The fluid effects are added to the modal basis during the residual flexibility computation to produce the “wet” modes for the component. Both eigenvalue tables are printed, allowing comparison of the dry and wet modes. The wet modes are used in modal dynamic analysis. Cost savings result from the dense Virtual Mass (VM) matrix being kept out when computing dry modes in the physical basis. Its presence can increase memory and computation times by an order of magnitude. The VM is added only to the smaller generalized basis used in Residual Flexibility Computations. The approximations introduced by this approach are generally small due to the homogeneous nature of the fluid. It is the preferred method when the number of wetted elements exceeds several hundred, for reasons of efficiency. It is to be noted that MAX normalization for eigenvectors with PARAM,VMOPT,2 may produce incorrect results. Therefore, MAX normalization is not recommended when using PARAM,VMOPT,2.

If VMOPT is not equal to 0, 1 or 2, then no virtual mass is computed.

**VREF**

Default = 1.0

In modal flutter analysis, the velocities are divided by VREF to convert units or to compute flutter indices.

**WHIRLOPT**

Default = FWD

Control forward whirl or backward whirl analysis for SYNC option in SOL 107/110 and SOL 108/111 for analysis in rotating reference frame using the ROTOR entry.

Usage:

PARAM, WHIRLOPT, FWD: For forward whirl analysis

PARAM, WHIRLOPT, BWD: For backward analysis

**WMODAL**

Default = NO

In Modal Transient analysis (SOL 112), PARAM, WMODAL, YES will automatically produce accurate conversion at all frequencies using the modal frequencies based on the eigenvalues as shown below. This

relieves the user of trying to determine the “best” value for (PARAM, W3 and W4). Note, use of WMODAL does not suppress user specified values of W3 and W4.

$$\begin{bmatrix} 1/\sqrt{\omega_1} & 0 & \dots & 0 \\ 0 & 1/\sqrt{\omega_2} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 1/\sqrt{\omega_q} \end{bmatrix} [\Phi_{dq}^T] (G[K_{dd}^1] + [K_{dd}^4]) [\Phi_{dq}] \begin{bmatrix} 1/\sqrt{\omega_1} & 0 & \dots & 0 \\ 0 & 1/\sqrt{\omega_2} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 1/\sqrt{\omega_q} \end{bmatrix}$$

Note the CBUSH, CELAS1, CELAS2, CELAS3, and CFAST elements when computing the element forces for data recovery do not currently take into account the WMODAL conversion in SOL112.

### WRBEAMB

Integer, Default = 0

- 0 Write equivalent radius for all beams (see PARAM, BEAMB) whether beam-beam contact is anticipated or not. The equivalent radius is the 7th field of Marc’s GEOMETRY values for beam type elements.
- 1 Do not write equivalent radius (7th field is blank). This might be necessary for versions of Marc earlier than 2003.

### WTMAS600

Integer, Default = 1

Determines whether GRAV entries will be scaled by WTMAS or not for SOL 600 only.

- 0 The value of A (4th field) on the GRAV entry will not be scaled by WTMAS.
- 1 The value of A (4th field) on the GRAV entry will be scaled by WTMAS.

### Remarks:

1. This parameter is available starting with the MD Nastran 2010.
2. Prior to MD Nastran 2010, WTMAS600=1 for all analyses.

### WTMASS

Default = 1.0

The terms of the structural mass matrix are multiplied by the value of WTMASS when they are generated. In coupled fluid-structure analysis WTMASS is applied to the structural portion of the model only. WTMASS applies to MFLUID entries but it is not recommended for use in hydroelastic problems.

### W3, W4, W3FL, W4FL

Default = 0.0

The damping matrix for transient analysis is assembled from the equation:

$$[B_{dd}] = [B_{dd}^1] + [B_{dd}^2] + \frac{G}{W3}[K_{dd}^1] + \frac{1}{W4}[K_{dd}^4]$$

In coupled fluid-structure analysis, W3 and W4 are applied to structural portion of the model and W3FL and W4FL to the fluid portion of the model. The default values of 0.0 for W3, W4, W3FL, and W4FL cause the  $[K_{dd}^1]$  and  $[K_{dd}^4]$  items to be ignored in the damping matrix, regardless of the presence of the PARAM, G or GFL or  $[K_{dd}^4]$ .  $[K_{dd}^1]$  is the stiffness.

$[K_{dd}^4]$  is the structural damping and is created when GE is specified on the MATi entries.

$[K_{dd}^1]$  is the stiffness. The units of W3, W4, W3FL, and W4FL are radians per unit time. (See [Real Eigenvalue Analysis in SubDMAPs SEMR3 and MODERS](#) in the *MSC Nastran Reference Guide* for further discussion.)

In SOLs 129 and 159, W4 may vary between subcases. *However, the linear portion of the model uses only the W4 value from the first subcase and the values in the subsequent subcases are applied to the nonlinear portion of the model.*

Parameters G, W3, W4 are case control selectable by either the PARAM entries in Case Control, or RSDAMP or SEDAMP appearing in Case Control pointing to a bulk data DAMPING entry. If both DAMPING type entries and PARAM entries occur in a subcase, the DAMPING entries take precedence.

When there is no Parameters G, W3, W4 or DMAPING reference in the first Case Control, the Bulk Data specification (if any) will be used. Subsequent Case Control specification will override the Bulk Data specification and Case Control rules apply to subsequent specifications.

The CBUSH, CELAS1, CELAS2, CELAS3, and CFAST elements when computing the element forces for data recovery take into account W3 and W4 in SOL109 and SOL112.

Linear CBUSH, CELAS1, CELAS2, CELAS3, and CFAST elements when computing the element forces for data recovery take into account W3 and W4 in SOL400 with ANALYSIS=NLTRAN. These elements behave in SOL400 with ANALYSIS=NLTRAN in a linear fashion when PARAM, LGDISP, -1 (Default) and there are no PBUSHT referring to the CBUSH or PELAST entries referring to the CELAS1, CELAS2, CELAS3.

For linear CBUSH, CELAS1, CELAS2, CELAS3, and CFAST elements in SOL400 with ANALYSIS=NLTRAN, SOL400 considers Case Control specification of G, W3, or W4 as a data recovery boundary condition change and each STEPi for the linear elements will pick up the appropriate G, W3, and W4 values.

Any of these elements in SOL400 with ANALYSIS=NLTRAN that are nonlinear only use the standard force output data recovery  $F=Ku(t)$  since nonlinear elements compute only the unbalanced stiffness force.

In SOL129 or SOL159 linear CBUSH, CELAS1, CELAS2, CELAS3, and CFAST elements (determined as in SOL400 above) should never have G, W3, or W4 selected in the Case Control as the linear force recovery will be incorrect as only the G, W3, and W4 of the first subcase is used.

In SOL129, the FUSE option of the CBUSH should never be used if GE or B is specified for the fusing CBUSH. This is because, unlike SOL400, SOL129 does not update the B or K4 matrix after the CBUSH fuses. Thus remnant CBUSH forces due to damping will be present.

### WR3, WR4, WRH

Default = 0.0, no rotor damping or circulation terms.

Specifies “average” excitation frequency for calculation of rotor damping and circulation terms. See “Equations Used in Analyses” in the *MSC Nastran 2004 Release Guide* for equations.

### XFACT

Default=0.5 for both STRUCT and FLUID.

Additional factor to determine upper bound for Q-set reorthogonalization subspace, for ACMS VERSION=NEW (module ACMS1). Values should range between 0.1 and 1.0. Note that PARAM,XFACT only affects XFACT for STRUCT. For the FLUID model, see DOMAINSOLVER.

### XFACTX

Default=1.0 for both STRUCT and FLUID.

Multiplier applied to user’s maximum frequency to determine maximum frequency for reorthogonalization for ACMS VERSION=NEW (module ACMS1). Values should range between 0.1 and 1.0. Note that PARAM,XFACTX only affects XFACT for STRUCT. For the FLUID model, see DOMAINSOLVER.

### XFLAG

Default = 0

By default (XFLAG = 0), when temperature loads and element deformations are present, the element strain energy for the linear elements is calculated using the following equation:

$$E = \frac{1}{2}u^T K_e u - u^T P_{et}$$

where  $u$  is the deformation,  $K_e$  is the element stiffness and  $P_{et}$  is the element load vector for temperature differences and element deformations. If XFLAG is set to 2, the element strain energy for linear elements is calculated using the following equation:

$$E = \frac{1}{2}u^T K_e u - \frac{1}{2}u^T P_{et}$$

The latter formula is the same strain energy calculation used for nonlinear elements.

When requesting Case Control commands ESE or EDE and executing SOL 108 or SOL 111, if Nastran detects frequency dependent elements (CBUSH if referred to by PBUSH/PBUSHT; CELAS1, CELAS3 if referred to by PELAS/PELAST; CDAMP1, CDAMP3 if referred to by PDAMP/PDAMPPT), Nastran will automatically remove the entire class of CBUSH, or CELAS1, or CELAS3, or CDAMP1, or CDAMP3 elements, whether or not all of a class are frequency dependent, from the residual (SE0) energy calculations because frequency dependent elements are not fully implemented in the ESE/EDE calculations and may result in wrong answers. USER INFORMATION MESSAGE 5245 will be issued for each class removed. If the user wishes to override this removal, set XFLAG to 32. If the user wants XFLAG=2 and XFLAG=33, then set XFLAG=34.

## XYMPCH

Default = NO

The XYPLOT/XPUNCH commands do not support SOL103 type mode shapes. XYMPCH when set to a value PARAM, XYMPCH, YES allows the XPUNCH command XPUNCH, DISP, RESPONSE / ... to punch without selective selection SOL103 mode shapes as SOL101 type displacements. For example:

```
$
METHOD = 10
SET 100 = 6, 7, 13
PARAM, XYMPCH, YES
DISP=100
MODES=20 $

...
OUTPUT (XYPLOT)
XPUNCH DISP RESPONSE / 6 (T3)    $
XPUNCH DISP RESPONSE / 7 (T3)    $
XPUNCH DISP RESPONSE / 13 (T2)   $
```

A more modern solution is to include in a standard SOL103 run the Nastran entry

```
NASTRAN HDF5=0
```

With for example DISP(PLOT)=ALL

And extract the resulting mode shapes from the resulting HDF5 Data Base.

Then the PARAM, XYMPCH, and MODES=n is not needed nor is any of the OUTPUT(XYPLOT) commands.

## XYUNIT, n

- n XYUNIT is used in conjunction with an FMS ASSIGN statement to specify the unit number for the storage of design optimization results and design sensitivity data in comma separated value format for use in a spreadsheet in SOL 200 or the storage of trim results in SOL 144.

## ZROCMAS

Default = NO

When performing component modal synthesis with free or mixed boundary conditions, the c-set mass is normally included during the calculation of the component modes. If the component has large masses on the c-set degrees-of-freedom, or if the user requests too many modes for the component, the c-set residual

flexibility will become singular. This causes a failure of the component reduction. The singularity may be avoided by setting ZROCMAS to YES, which will exclude the c-set mass when calculating the component modes.

## ZROVEC

Default=1.E-06

ZROVEC specifies the tolerance at which a residual vector is not linearly independent and subsequently removed from the residual vector computation process.

## Parameter Applicability Tables

[Table 6-1](#), [Table 6-2](#), [Table 6-3](#), [Table 6-4](#), and [Table 6-5](#) list parameter applicability to the solution sequences (SOLs 101 through 114).

[Table 6-6](#), [Table 6-7](#), [Table 6-8](#), [Table 6-9](#), [Table 6-10](#), [Table 6-11](#), [Table 6-12](#), [Table 6-13](#), [Table 6-14](#), [Table 6-15](#), and [Table 6-16](#) list parameter applicability to the solution sequences (SOLs 115 through 700).

- B Must be specified in the Bulk Data Section only.
- E May be specified in either the Bulk Data and/or Case Control Section.
- C Must be specified in the Case Control Section only.

## Item Codes

- Item Code Description
- Element Stress (or Strain) Item Codes
- Element Force Item Codes
- Fluid Virtual Mass Pressure Item Codes
- 2D Slideline and 3D Surface Contact Item Codes
- Element Strain Energy Item Codes
- Fatigue Item Codes for LOC=ELEM on FTGPARM
- Fatigue Item Codes for LOC=NODE or NODA on FTGPARM
- Item Codes for Fatigue Analysis of Spot Welds
- Item Codes for Fatigue Analysis of Seam Welds
- Equivalent Radiated Power (ERP) Item Codes

## Item Code Description

Item codes are integer numbers assigned to specific output quantities; such as, the third translational component of displacement, the major principal stress at Z1 in a CQUAD4 element, or the torque in a CBAR element. Item codes are specified on the following input statements:

- DRESP1 entry for Design Sensitivity and Optimization (SOL 200).
- X-Y Plotting commands. See [Plotting](#) in the *MSC Nastran Reference Guide*.
- DTI,INDTA entry for stress sorting.

The following tables provide item codes for:

- [Table 7-1](#). Element Stress or Strain.
- [Table 7-5](#). Element Force.
- [Table 7-7](#). Fluid Virtual Mass Pressure.
- [Table 7-8](#). Heat Transfer Flux.
- [Table 7-9](#). Slideline Contact Output.
- [Table 7-12](#). Element Strain Energy Item Codes.
- [Table 7-13](#). Fatigue Item Codes (LOC=ELEM)
- [Table 7-14](#) Fatigue Item Codes (LOC=NODE or NODA)
- [Table 7-15](#). Item Codes for Fatigue Analysis of Spot Welds
- [Table 7-16](#). Item Codes for Fatigue Analysis of Seam Welds
- [Table 7-17](#) Equivalent Radiated Power (ERP) Item Codes

The following superscripts appear in the tables and indicate:

1. Data for components marked with the symbol (1) are included in the data block MES and MEF outputs from modules DRMH1/DRMH3 and DRMS1. DRMH1/DRMH3 are used in EXTSEOUT Case Control processing. (See [MSC Nastran DMAP Programmer's Guide](#).)
2. Composite Element Stresses and Failure Indices.

## Element Stress (or Strain) Item Codes

All item codes refer to stresses (or strains) unless otherwise denoted.

If output is magnitude/phase, the magnitude replaces the real part, and the phase replaces the imaginary part. Strain item codes are equivalent to stress item codes. However, strain is computed for only some elements. See [Table 3-1](#) in the *MSC Nastran Reference Guide*.

Table 7-1 Element Stress-Strain Item Codes

Element Name (Code)	Real Stresses or Strains		Complex Stresses or Strains		
	Item Code	Item	Item Code	Item	Real/Mag. or Imag./Phase

## 2D Slideline and 3D Surface Contact Item Codes

Table 7-9 Contact Item Codes

Element Name (Code)	Real Element Data		
	Item Code	Slideline Item	3D Surface Item (SOL 600)
CSLIFID (116)	1	SECNDRY grid point	GRID ID
	2	Contact region identification number	(39) Contact Touched Body
	3	Primary grid 1	
	4	Primary grid 2	
	5	Surface coordinate	(38) Contact Status
	6	Normal force	(35) Normal Force
	7	Shear force	(37) Friction Force
	8	Normal stress	(34) Normal Stress
	9	Shear stress	(36) Friction Stress
	10	Normal gap	
	11	Slip	
	12	Slip ratio (Shear force/u*normal force)	
13-14	Slip code (Character)		

1. Numbers in parenthesis refer to MARCOUT nodal post codes.
2. 3D Surface contact is available in SOL 600 only.

Table 7-10 Contact Item Code for Nodal Data (SOL 400 only)

Element Code	Item	Real Nodal Data 3D Surface Item (SOL 400 only)
203	1	Grid point ID
	2	First touched body
	3	Second touched body
	4	Third touched body
	5	Contact status (Remark 7)
	6	Normal contact force magnitude
	7	Friction contact force magnitude
	8	Normal stress
	9	Friction stress 1
	10	Friction stress 2
	11	Contact normal force component $F_{nx}$
	12	Contact normal force component $F_{ny}$
	13	Contact normal force component $F_{nz}$
	14	Contact friction force component $F_{fx}$
	15	Contact friction force component $F_{fy}$
	16	Contact friction force component $F_{fz}$

Table 7-11 Contact Item Code for Body Data (SOL 400 only)

Element Code	Item	Rigid Body Data 3D Surface Item (SOL 400 Only)
203	1	BCBODY ID
	2-17	$[XMAT]_{4 \times 4}$
	18	Contact force component $RF_x$
	19	Contact force component $RF_y$
	20	Contact force component $RF_z$
	21	Contact moment component $RM_x$
	22	Contact moment component $RM_y$
	23	Contact moment component $RM_z$

**Remarks:**

1.  $F_{nx}$ ,  $F_{ny}$ ,  $F_{nz}$  are normal force components in the global coordinate system.
2.  $F_{fx}$ ,  $F_{fy}$ ,  $F_{fz}$  are friction force components in the global coordinate system.
3. Normal force magnitude is square root of sum of squares of  $F_{nx}$ ,  $F_{ny}$ ,  $F_{nz}$ .
4. Friction force magnitude is square root of sum of squares of  $F_{fx}$ ,  $F_{fy}$ ,  $F_{fz}$  with sign of largest absolute of these values.
5. Contact touched body applies to SECNDRY grids (touching node) only.
6. A secondary grid may not contact more than 3 bodies.
7. Only secondary grids have non-zero contact status or touched bodies.
8.  $RF_x$ ,  $RF_y$ ,  $RF_z$ ,  $RM_x$ ,  $RM_y$ ,  $RM_z$  are the contact force and moment in the global coordinate system that applied on the centroid of the corresponding rigid body.
9. [XMAT] is the translation matrix to compute the new location of the rigid body.
10. These contact outputs, both [Table 7-10](#) and [Table 7-11](#) are saved in datablock OFCON3D.

## Element Strain Energy Item Codes

Table 7-12 Element Strain Energy Item Codes

Element Name	Real Element Data	
	Item Code	Item
Element groups A and B	2	Element strain energy
Element groups A and B	3	Percent of total energy
Element group A	4	Element strain energy density

**Remark:**

1. Element group A includes elements of CBAR, CBEAM, CBEND, CONROD, CHEXA, CPENTA, CPYRAM, CQUAD4, CQUADR, CROD, CSHEAR, CTETRA, CTRIA3, CTRIA6, CTRIAR, and CTUBE. Element group B includes elements of CELAS1, CELAS2, CELAS3, AND CGAP.

## Fatigue Item Codes

Note that the codes of the [Table 7-13](#) through [Table 7-16](#) are limited to those that can be referenced on a DRESP1 entry with RTYPE= FATGUE.

Table 7-13 Fatigue Item Codes for LOC=ELEM on FTGPARAM

Element Name	Item Code	Real Element Data Item
Element Group A and Element Group B (for Z1 layer - bottom)	4 (-4)	Fatigue life in <i>Repeats</i> of the loading sequence See remark 4.
	5 (-5)	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6 (-6)	Fatigue life in user defined fatigue equivalent units
	7 (-7)	Log of fatigue life in user defined fatigue equivalent units
	8 (-8)	Fatigue damage
	9 (-9)	Log of fatigue damage
	12 (-12)	Scale factor from Factor of Safety analysis
Element Group B (for Z2 layer - top)	18	Fatigue life in <i>Repeats</i> of the loading sequence
	19	Log of fatigue life in <i>Repeats</i> of the loading sequence
	20	Fatigue life in user defined fatigue equivalent units
	21	Log of fatigue life in user defined fatigue equivalent units
	22	Fatigue damage
	23	Log of fatigue damage
	26	Scale factor from Factor of Safety analysis

### Remark:

1. Element Group A consists of elements: CHEXA, CPENTA, CPYRAM, CTETRA, CTRIA3, CSHEAR
2. Element Group B consists of elements: CQUAD4, CQUAD8, CQUADR, CTRIA6, CTRIAR
3. For CTRIA3 and CSHEAR elements, LOC=ELEM and LOC=NODE or NODA options on FTGPARAM use the same item codes in [Table 7-13](#).
4. For Element Group B (shell elements), if the item code is negative (e.g., -4) for layer Z1, this flags Nastran to automatically (and internally) create a DRESP1 with the corresponding item code for layer Z2. This is a convenient method to include responses from both top and bottom by defining only a single DRESP1 entry for any particular set of elements or property sets.

Note: SOL 200 only supports NODE and not NODA on the FTGPARM entry

Table 7-14 Fatigue Item Codes for LOC=NODE or NODA on FTGPARM

Element Name	Item Codes	Real Element Data Item
CTETRA	4,16,28,40	Life in <i>Repeats</i> of the loading sequence
	5,17,29,41	Log of life in <i>Repeats</i> of the loading sequence
	6,18,30,42	Life in user defined fatigue equivalent units
	7,19,31,43	Log of life in user defined equivalent units
	8,20,32,44	Fatigue damage
	9,21,33,45	Log of fatigue damage
	12,24,36,48	Scale factor from Factor of Safety analysis
CQUAD4 CQUAD8 CQUADR (for Z1 layer - bottom)	4,33,62,91 (-4,-33,-62,-91)	Life in <i>Repeats</i> of the loading sequence See remark 8.
	5,34,63,92 (-5,-34,-63,-92)	Log of life in <i>Repeats</i> of the loading sequence
	6,35,64,93 (-6,-35,-64,-93)	Life in user defined fatigue equivalent units
	7, 36, 65, 94 (-7,-36,-65, -94)	Log of life in user defined equivalent units
	8, 37, 66, 95 (-8,-37,-66,-95)	Fatigue damage
	9, 38, 67, 96 (-9,-38,-67-96)	Log of fatigue damage
	12, 41, 70, 99 (-12,-41,-70,-99)	Scale factor from Factor of Safety analysis
	(for Z2 layer - top)	
	18, 47, 76, 105	Life in <i>Repeats</i> of the loading sequence
	19, 48, 77, 106	Log of life in <i>Repeats</i> of the loading sequence
	20, 49, 78, 107	Life in user defined fatigue equivalent units
	21, 50, 79, 108	Log of life in user defined equivalent units
	22, 51, 80, 109	Fatigue damage
	23, 52, 81, 110	Log of fatigue damage
	26, 55, 84, 113	Scale factor from Factor of Safety analysis

Table 7-14 Fatigue Item Codes for LOC=NODE or NODA on FTGPARM (continued)

Element Name	Item Codes	Real Element Data Item
CTRIA6 CTRIAR (for Z1 layer - bottom)	4, 33, 62 (-4, -33, -62)	Life in <i>Repeats</i> of the loading sequence See remark 8.
	5, 34, 63 (-5, -34, -63)	Log of life in <i>Repeats</i> of the loading sequence
	6, 35, 64 (-6, -35, -64)	Life in user defined fatigue equivalent units
	7, 36, 6 (-7, -36, -6)	Log of life in user defined equivalent units
	8, 37, 66 (-8, -37, -66)	Fatigue damage
	9, 38, 67 (-9, -38, -67)	Log of fatigue damage
	12, 41, 70 (-12, -41, -70)	Scale factor from Factor of Safety analysis
	(for Z2 layer - top)	18, 47, 76

23, 52, 81		Fatigue damage
26, 55, 84		Log of fatigue damage
		Scale factor from Factor of Safety analysis
CPENTA	4,16,28,40,52,64	Life in <i>Repeats</i> of the loading sequence
	5,17,29,41,53,65	Log of life in <i>Repeats</i> of the loading sequence
	6,18,30,42,54,66	Life in user defined fatigue equivalent units
	7,19,31,43,55,67	Log of life in user defined equivalent units
	8,20,32,44,56,68	Fatigue damage
	9,21,33,45,57,69	Log of fatigue damage
	12,24,36,48,60,72	Scale factor from Factor of Safety analysis

Table 7-14 Fatigue Item Codes for LOC=NODE or NODA on FTGPARM (continued)

Element Name	Item Codes	Real Element Data Item
CPYRAM	4,16,28,40,52	Life in <i>Repeats</i> of the loading sequence
	5,17,29,41,53	Log of life in <i>Repeats</i> of the loading sequence
	6,18,30,42,54	Life in user defined fatigue equivalent units
	7,19,31,43,55	Log of life in user defined equivalent units
	8,20,32,44,56	Fatigue damage
	9,21,33,45,57	Log of fatigue damage
	12,24,36,48,60	Scale factor from Factor of Safety analysis
CHEXA	4,16,28,40,52,64,76,88	Life in <i>Repeats</i> of the loading sequence
	5,17,29,41,53,65,77,89	Log of life in <i>Repeats</i> of the loading sequence
	6,18,30,42,54,66,78,90	Life in user defined fatigue equivalent units
	7,19,31,43,55,67,79,91	Log of life in user defined equivalent units
	8,20,32,44,56,68,80,92	Fatigue damage
	9,21,33,45,57,69,81,93	Log of fatigue damage
	12,24,36,48,60,72,84,96	Scale factor from Factor of Safety analysis

**Remarks:**

1. CTRIA6 and CTRIAR item codes are listed for Grids 1-3, respectively.
2. CQUAD4, CQUAD8, CQUADR, CTETRA item codes are listed for Grids 1-4, respectively.
3. CPYRAM item codes are listed for Grids 1-5, respectively.
4. CPENTA item codes are listed for Grids 1-6, respectively.
5. CHEXA item codes are listed for Grids 1-8, respectively.
6. For CTRIA3 and CSHEAR elements, LOC=ELEM and LOC=NODE or NODA options on FTGPARM use the same item codes in [Table 7-13](#).
7. If it is desired to use a life response (or other item) for all nodes (using LOC=NODE or NODA on FTGPARM), all item codes for the particular item are required, e.g., 4, 16, 27, and 38 for CTETRA (one DRESP1 entry for each item code).
8. For shell elements with bottom (Z1) and top (Z2) layers, if the item code is negative (e.g., -4) for layer Z1, this flags Nastran to automatically (and internally) create a DRESP1 with the corresponding item code for layer Z2. This is a convenient method to include responses from both top and bottom by defining only a single DRESP1 entry for any particular response for a set of elements or property sets. So as an example, to specify the bottom and top response (Life in *Repeats*) for all the grids of the specified element or property set for a CQUAD4 element, use items codes: -4,-27,-50,-73
9. These item codes are used for LOC=NODE or NODA and all other element nodal values of RECOVER on the FTGPARM entry, namely, "SGAGE", "CORNER", "BILIN", and "CUBIC" also.

Table 7-15 Item Codes for Fatigue Analysis of Spot Welds

Element Name	Item Code	Real Element Data Item
CBAR CBEAM CWELD CHEXA (For Top Sheet at Angle = 0.0 degrees)	4 (-4) (-1004)	Fatigue life in <i>Repeats</i> of the loading sequence See remarks 2. and 3.
	5 (-5)(-1005)	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6 (-6)(-1006)	Fatigue life in user defined fatigue equivalent units
	7 (-7)(-1007)	Log of fatigue life in user defined fatigue equivalent units
	8 (-8)(-1008)	Fatigue damage
	9 (-9)(-1009)	Log of fatigue damage
	13 (-13)(-1013)	Scale factor from Factor of Safety analysis
CBAR CBEAM CWELD CHEXA (For Weld Nugget at Angle = 0.0 degrees)	4+12*NANGLE	Fatigue life in <i>Repeats</i> of the loading sequence
	5+12*NANGLE	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6+12*NANGLE	Fatigue life in user defined fatigue equivalent units
	7+12*NANGLE	Log of fatigue life in user defined fatigue equivalent units
	8+12*NANGLE	Fatigue damage
	9+12*NANGLE	Log of fatigue damage
	13+12*NANGLE	Scale factor from Factor of Safety analysis
CBAR CBEAM CWELD CHEXA (For Bottom Sheet at Angle = 0.0 degrees)	4+24*NANGLE	Fatigue life in <i>Repeats</i> of the loading sequence
	5+24*NANGLE	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6+24*NANGLE	Fatigue life in user defined fatigue equivalent units
	7+24*NANGLE	Log of fatigue life in user defined fatigue equivalent units
	8+24*NANGLE	Fatigue damage
	9+24*NANGLE	Log of fatigue damage
	13+24*NANGLE	Scale factor from Factor of Safety analysis

**Remarks:**

- Spot weld fatigue item code is related to NANGLE, the number of calculation angles around the weld circumference as defined on the FTGPARM entry. Item codes listed above are for the first angle at zero (0) degrees. For each subsequent angle, the item code should be increased by 12. For example, item code =16 is for “Fatigue life in *Repeats* of the loading sequence” at the Top Sheet for the second angle.

2. If item codes 4-9 or 13 are negative (e.g., -4), this flags Nastran to automatically (and internally) create a DRESP1 with the corresponding item code for the nugget and bottom sheet as well and for all specified angles. This is a convenient method to include responses from all locations and angles by defining only a single DRESP1 entry for any particular response for a set of spot weld elements or property sets. So as an example, to specify the response (Life in *Repeats*) for all the locations and angles, use a single DRESP1 entry with item code: -4.
3. In conjunction with the above remark, if the item code is negative and multiplied by 1000 (e.g., -1004), then the nugget responses are not generated. Only the top and bottom sheet responses are internally generated.

Table 7-16 Item Codes for Fatigue Analysis of Seam Welds

Element Name	Item Code	Real Element Data Item
CQUAD4 CQUAD8 CQUADR	4, 19, 34, 45	Fatigue life in <i>Repeats</i> of the loading sequence
	5, 20, 35, 46	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6, 21, 36, 47	Fatigue life in user defined fatigue equivalent units
	7, 22, 37, 48	Log of fatigue life in user defined fatigue equivalent units
	8, 23, 38, 49	Fatigue damage
	9, 24, 39, 50	Log of fatigue damage
	12, 27, 42, 53	Scale factor from Factor of Safety analysis
CTRIA6 CTRIAR	4, 19, 34	Fatigue life in <i>Repeats</i> of the loading sequence
	5, 20, 35	Log of fatigue life in <i>Repeats</i> of the loading sequence
	6, 21, 36	Fatigue life in user defined fatigue equivalent units
	7, 22, 37	Log of fatigue life in user defined fatigue equivalent units
	8, 23, 38	Fatigue damage
	9, 24, 39	Log of fatigue damage
	12, 27, 42	Scale factor from Factor of Safety analysis

**Remarks:**

1. CQUAD4, CQUAD8, CQUADR item codes are listed for Grids 1-4, respectively.
2. CTRIA6 and CTRIA6 item codes are listed for Grids 1-3, respectively.
3. Note that FTGDEF has a keyword “SEAMW” that may have the field NDSIDi, which lists seam line grids. If this is used, it means that some grids of the elements will not have fatigue life associated with them and are excluded from the analysis.

## Equivalent Radiated Power (ERP) Item Codes

Table 7-17 Equivalent Radiated Power (ERP) Item Codes

Element Name	Item Code	Item
QUAD4, CQUADR, CTRIA3,CTRIAR	2	ERP value

# 8

## Degree-of-Freedom Sets

- Degree-of-Freedom Set Definitions
- Degree-of-Freedom Set Bulk Data Entries

## Degree-of-Freedom Set Definitions

Each degree-of-freedom is a member of one mutually exclusive set. Set names have the following definitions:

Set Name	Definition
mp	Degrees-of-freedom eliminated by <u>m</u> ultipoint constraints.
mr	Degrees-of-freedom eliminated by <u>m</u> ultipoint constraints created by the <u>r</u> igid elements using the LGELIM method on the Case Control command RIGID.
sb*	Degrees-of-freedom eliminated by <u>s</u> ingle-point constraints that are included in <u>b</u> oundary condition changes and by the AUTOSPC feature. (See the sz set)
sg*	Degrees-of-freedom eliminated by <u>s</u> ingle-point constraints that are specified on the PS field on <u>G</u> RID Bulk Data entries.
sz	Degrees-of-freedom eliminated by the AUTOSPC feature.
o	Degrees-of-freedom <u>o</u> mitted by structural matrix partitioning.
q	Generalized degrees-of-freedom assigned to component modes and residual vectors.
r	<u>r</u> eference degrees-of-freedom used to determine free body motion.
c	Degrees-of-freedom that are free during component mode synthesis or dynamic reduction.
b	Degrees-of-freedom fixed during component mode analysis or dynamic reduction.
lm	<u>L</u> agrange <u>m</u> ultiplier degrees-of-freedom created by the rigid elements using the LAGR method on the Case Control command, RIGID.
e	<u>e</u> xtra degrees-of-freedom introduced in dynamic analysis.
sa	Permanently constrained aerodynamic degrees-of-freedom.
k	Aerodynamic mesh point set for forces and displacements on the aero mesh.
j	Aerodynamic mesh collocation point set (exact physical interpretation is dependent on the aerodynamic theory).

\*Strictly speaking, sb and sg are not exclusive with respect to one another. Degrees-of-freedom may exist in both sets simultaneously. Since these sets are not used explicitly in the solution sequences, this need not concern the user. However, those who use these sets in their own DMAPs should avoid redundant specifications when using these sets for partitioning or merging operations. That is, a degree-of-freedom should not be specified on both a PS field of a GRID entry (sg set) and on a selected SPC entry (sb set). Redundant specifications will cause UFM 2120 in the VEC module and behavior listed in [MSC Nastran DMAP Programmer's Guide](#) for the UPARTN module. These sets are exclusive, however, from the other mutually exclusive sets.

Each degree-of-freedom is also a member of one or more combined sets called “supersets.” Supersets have the following definitions:

Set Name	Meaning (+ indicates union of two sets)
$s = sb + sg$	all degrees-of-freedom eliminated by single point constraints
$l = b + c + lm$	the degrees-of-freedom remaining after the reference degrees-of-freedom are removed (degrees-of-freedom left over)
$t = l + r$	the total set of physical boundary degrees-of-freedom for superelements
$a = t + q$	the analysis set used in eigensolution
$d = a + e$	the set used in dynamic analysis by the direct method
$f = a + o$	unconstrained (free) structural degrees-of-freedom
$fe = f + e$	free degrees-of-freedom plus extra degrees-of-freedom
$n = f + s$	all degrees-of-freedom not constrained by multipoint constraints
$ne = n + e$	all degrees-of-freedom not constrained by multipoint constraints plus extra degrees-of-freedom
$m = mp + mr$	all degrees-of-freedom eliminated by multipoint constraints
$g = n + m$	all degrees-of-freedom including scalar degrees-of-freedom
$p = g + e$	all physical degrees-of-freedom including extra point degree-of-freedom
$ks = k + sa$	the union of k and the re-used s-set (6 dof per grid)
$js = j + sa$	the union of j and the re-used s-set (6 dof per grid)

table continued on the next page

Set Name	Meaning (+ indicates union of two sets)
$fr = o + l$	statically independent set minus the statically determinate supports ( $fr = \underline{f} - q - \underline{r}$ )
$v = o + c + r$	the set free to vibrate in dynamic reduction and component mode synthesis
$al = a - lm$	a-set without Lagrange multiplier degree-of-freedoms.
$dl = d - lm$	d-set without Lagrange multiplier degree-of-freedoms.
$gl = g - lm$	g-set without Lagrange multiplier degree-of-freedoms.
$ll = l - lm$	l-set without Lagrange multiplier degree-of-freedoms.
$nf = ne - lm$	ne-set without Lagrange multiplier degree-of-freedoms.
$pl = p - lm$	p-set without Lagrange multiplier degree-of-freedoms.
$tl = t - lm$	t-set without Lagrange multiplier degree-of-freedoms.
$nl = n - lm$	n-set without Lagrange multiplier degree-of-freedoms.
$fl = f - lm$	f-set without Lagrange multiplier degree-of-freedoms.
$ff = fe - lm$	fe-set without Lagrange multiplier degree-of-freedoms.

The a-set and o-set are created in the following ways:

1. If only OMIT<sub>i</sub> entries are present, then the o-set consists of degrees-of-freedom listed explicitly on OMIT<sub>i</sub> entries. The remaining f-set degrees-of-freedom are placed in the b-set, which is a subset of the a-set.
2. If ASET<sub>i</sub> or QSET<sub>i</sub> entries are present, then the a-set consists of all degrees-of-freedom listed on ASET<sub>i</sub> entries and any entries listing its subsets, such as QSET<sub>i</sub>, SUPORT<sub>i</sub>, CSET<sub>i</sub>, and BSET<sub>i</sub> entries. Any OMIT<sub>i</sub> entries are redundant. The remaining f-set degrees-of-freedom are placed in the o-set.
3. If there are no ASET<sub>i</sub>, QSET<sub>i</sub>, or OMIT<sub>i</sub> entries present but there are SUPORT<sub>i</sub> entries present, then the entire f-set is placed in the a-set and the o-set is not created.
4. There must be at least one explicitly ASET<sub>i</sub>, QSET<sub>i</sub>, or OMIT<sub>i</sub> entry for the o-set to exist, even if the ASET<sub>i</sub>, QSET<sub>i</sub>, or OMIT<sub>i</sub> entry is redundant.

In dynamic analysis, additional vector sets are obtained by a modal transformation derived from real eigenvalue analysis of the a-set. These sets are as follows:

$\xi_o$  = rigid body (zero frequency) modal degrees-of-freedom

$\xi_f$  = finite frequency modal degrees-of-freedom

$\xi_i = \xi_o + \xi_f$ , the set of all modal degrees-of-freedom

One vector set is defined that combines physical and modal degrees-of-freedom:

$u_h = \xi_i + u_e$ , the set of all modal degrees-of-freedom

The membership of each degree-of-freedom can be printed by use of the Bulk Data entries  
PARAM,USETPRT and PARAM,USETSEL.

## Degree-of-Freedom Set Bulk Data Entries

Degrees-of-freedom are placed in sets as specified by the user on the following Bulk Data entries:

Name	Bulk Data Entry Name
m	MPC, MPCADD, MPCAX, POINTAX, RBAR, RBAR1, RBE1, RBE2, RBE3, RJOINT, RROD, RSPLINE, RSSCON, RTRPLT, RTRPLT1
sb	SPC, SPC1, SPCADD, SPCAX, FLSYM, GMSPC*, BNDGRID, PARAM,AUTOSPC,YES
sz	PARAM,AUTOSPC,YES
sg	GRID, GRIDB, GRDSET (PS field)
o	OMIT, OMIT1, OMITAX, GRID (SEID field), SESET
q	QSET, QSET1
r	SUPPORT, SUPPORT1, SUPAX
c	CSET, CSET1, BNDFREE, BNDFRE1
b	BSET, BSET1, BNDFIX, BNDFIX1
e	EPOINT
sa	CAEROi
k	CAEROi
a	ASET, ASET1, Superelement exterior degrees-of-freedom, CSUPEXT
ap	ACCSPT
rv	RVDOF and RVDOF1
u1 - u6	USET, USET1, SEUSET, and SEUSET1

In superelement analysis, the appropriate entry names are preceded by the letters SE, and have a field reserved for the superelement identification number. This identification is used because a boundary (exterior) grid point may be in one mutually exclusive set in one superelement and in a different set in the adjoining superelement. The SE-type entries are internally translated to the following types of entry for the referenced superelement:

Entry Type	Equivalent Type
SEQSETi	QSETi
SESUP	SUPPORT
SECSETi	CSETi, BNDFREE, DNBDRE1
SEBSETi	BSETi, BNDFIXi

# 9

## Bulk Data Entries

- Key to Descriptions
- Bulk Data Entry Descriptions

## Key to Descriptions

The name of the entry. Must be entered as shown.

The field names in fields 2 through 9 are for reference only. Names enclosed in quotation marks represent character constants; e.g., "THRU" on ASET1 entry.

A brief sentence about the function of the entry is

**ACMODL** Fluid-Structure Interface Modeling

Defines modeling parameters for the interface between the fluid and the

**Format:**

1	2	3	4	5	6	7	8	9	10
ACMODL	INTER	INFOR	FSET	SSET	FSTO				

**Example:**

ACMODL					0.002				
--------	--	--	--	--	-------	--	--	--	--

If a box in fields 2 through 9 is shaded, then the field must be left blank.

If the box in field 10 is shaded, then no continuation entries may follow.

**FieldContents**

INTERType of interface between the fluid and the structure. See Remark 1. (Character = "IDENT" or "DIFF". Default = "DIFF").

INFORIndicates whether FSET and SSET are to be checked at only those grid points referenced by FSET and SSET that contains a list of fluid grid points on the interface. See Remark 3.

FSETIdentification number of a SET1 entry that contains a list of fluid grid points on the interface. See Remark 2. (Integer > 0 or blank).

SSETIdentification number of a SET1 entry that contains a list of fluid grid points on the interface. See Remark 2. (Integer > 0 or blank).

FSTOLTolerance, in units of length, used in determining the fluid-structure interface. (Integer > 0 or blank). (Default = 0.001).

Each of the fields is briefly described. Further details may be discussed under Remarks.

Character constants are enclosed in quotation marks to distinguish them from field names. Do not input these quotation marks.

Under contents, "blank" usually means that this feature can be optionally selected by the user. It may also mean the default action or value is described under Remarks. When content item is listed as, for example, (Integer>0 or blank) a value of 0 entered in the field is equivalent to "blank".

The field's type (Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. If no default value is given, then a value must be specified by the user.

**Remarks:**

- Only one ACMODL entry is allowed to assume INTER = "DIFF" and FSTO = 0.
- If INFOR = "ALL", then both FSET and SSET are checked at only those grid points referenced by FSET and SSET that contains a list of fluid grid points on the interface. See Remark 3.
- See the *MSC Nastran Reference Guide*, 15 for a description of the methods used in determining the fluid-structure interface.
- The points referenced by FSET and SSET must lie exactly on the fluid-structure interface. The remarks are generally arranged in order of importance and indicate such things as the entry's relationship to other entries or commands, restrictions, and recommendations on usage, or further details regarding the fields.

The remarks are generally arranged in order of importance and indicate such things as the entry's relationship to other entries or commands, restrictions, and recommendations on usage, or further details regarding the fields.

The field's type (Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. If no default value is given, then a value must be specified by the user.

Under contents, "blank" usually means that this feature can be optionally selected by the user. It may also mean the default action or value is described under Remarks. When content item is listed as, for example, (Integer>0 or blank) a value of 0 entered in the field is equivalent to "blank".

Each of the fields is briefly described. Further details may be discussed under Remarks.

Character constants are enclosed in quotation marks to distinguish them from field names. Do not input these quotation marks.

Under contents, "blank" usually means that this feature can be optionally selected by the user. It may also mean the default action or value is described under Remarks. When content item is listed as, for example, (Integer>0 or blank) a value of 0 entered in the field is equivalent to "blank".

The field's type (Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. If no default value is given, then a value must be specified by the user.

## The Bulk Data Section

The Bulk Data Section contains entries that specify model geometry, element connectivity, element and material properties, constraints (boundary conditions), and loads. Some entries, such as loads and constraints, are selected by an appropriate Case Control command.

Entries are prepared in either fixed or free field format. The descriptions in this section show only the fixed format. For a description of the various format options, see the [Use of Parameters](#) in the *MSC Nastran Reference Guide*.

New Bulk Data Entries added after the MSC Nastran 2011 version are only valid with the default option IFPSTAR=YES.

## Bulk Data Entry Descriptions

Each Bulk Data entry is described as follows:

### Description

A brief sentence about the function of the entry is given.

### Format

The name of the entry is given in the first field. The subsequent fields are described under the Field and Contents Section. Shaded fields must be left blank. If field 10 is shaded, then no continuation entries are permitted. Character strings enclosed in quotation marks must be specified without the quotation marks as shown in the example.

### Example

A typical example is given.

### Field and Contents

Each of the fields 2 through 9 that are named in the Format section is briefly described under Contents. The field's type (e.g., Integer, Real, or Character), allowable range, and default value are enclosed in parentheses. The field must be specified by the user if no default value is given.

### Remarks

The remarks in the Remarks Section are generally arranged in order of importance and indicate such things as how the Bulk Data entry is selected in the Case Control Section, its relationship to other entries, restrictions and recommendations on its use, and further descriptions of the fields.

## Format of Bulk Data Entries

### Real, Integer, and Character Input Data

Nastran is quite particular about the input requirements for data entry. The three possible types of data entries are Integer, Real, and Character (sometimes called literal, or BCD-binary coded decimal). The three types of data are described as follows:

Integer	Cannot contain a decimal point.
Real	Must contain a decimal point. If however, system cell 444 is set to 9 and the only possible value format is real, then an integer representation (less decimal point) will be converted to real. A single decimal point is not be considered a real zero value. Either 0 or 0. (a digit) must be supplied.
Character	Can be alphanumeric, and with exceptions (listed on specific bulk data entries) should always start with an alpha character. Legal alpha characters are the English: A-Z and a-z. Legal numeric characters are 0-9, and in special circumstances in fields that allow user naming the dash (-) and the underscore (_). In user naming fields use of \$, &, *, =, +, period (.), comma (,) should be avoided as they often have special meaning to the nastran bulk data interpreter. Misspelled required words such as the name of an entry will result in a fatal message. Substitution of non English alphabetic characters will cause a fatal message to be issued.

Real numbers may be entered in a variety of ways. For example, the following are all acceptable versions of the real number seven:

```
7.0          .7E1          0.7+1
.70+1       7.E+0         70.-1
```

### Free, Small, and Large Field Formats

Nastran has three different field formats for input data:

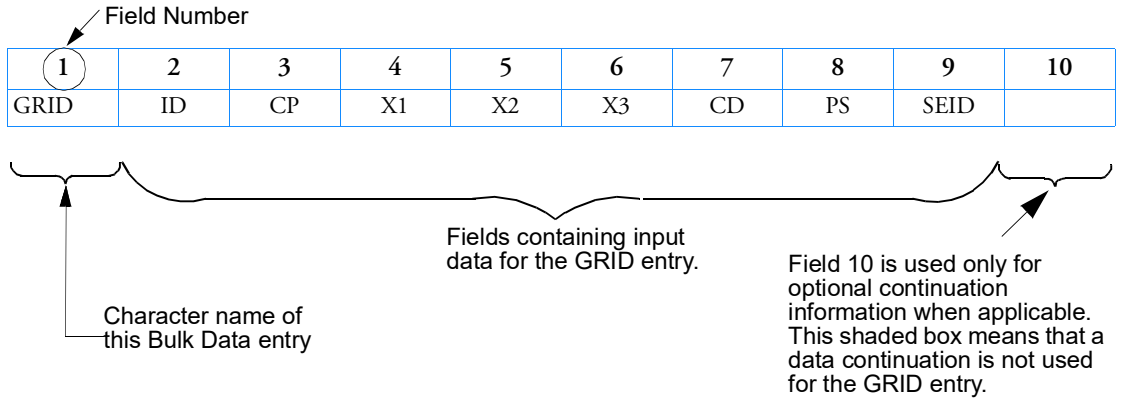

Free Field Format	Input data fields are separated by commas.
Small Field Format	Ten fields of eight characters each.
Large Field Format	Ten fields-eight fields containing actual data are sixteen characters each (fields 2-5 and 6-9). Large fields are used when greater numerical accuracy is required. See the <a href="#">Large Field Format, 1118</a> for additional information.

The NASTRAN statement, File Management Section, Executive Control Section, and Case Control Section use free field format. The Bulk Data Section allows the use of any of the three formats.

Nastran Bulk Data contains ten fields per input data entry. The first field contains the character name of the Bulk Data item (e.g., GRID, CBAR, MAT1, etc.). Fields two through nine contain data input information

for the Bulk Data entry. The tenth field never contains data—it is reserved for entry continuation information, if applicable.

Consider the format of a typical MSC Nastran Bulk Data entry, the GRID entry, which is used in Nastran to describe the geometry of the structural model.

Example:

1	2	3	4	5	6	7	8	9	10
GRID	2		1.0	-2.0	3.0		136		

We will now represent this example in free field, small field, and large field formats.

### Free Field Format

In free field format, data fields are separated by commas or blanks (commas are strongly recommended). The following shows the GRID Bulk Data entry example in free field format:

GRID, 2,, 1.0, -2.0, 3.0,, 136

Two consecutive commas indicate an empty field

The rules for free field format are as follows:

- Free field data entries must start in column 1.
- To skip one field, use two commas in succession. To skip two fields, use three commas in succession (and so on).
- Integer or character fields with more than eight characters cause a fatal error.
- Real numbers with more than eight characters are rounded off and lose some precision. For example, an entry of 1.2345678+2 becomes 123.4568. If more significant digits are needed, use the large field format. If however, NASTRAN IFPSTAR=YES is used, then the entry will automatically be converted to large field format.

- Free field data cannot contain embedded blanks to skip fields. An example of a free field embedded blank is shown:

GRID,2,,1 0,-2.0,3.0,,136

Embedded blank  
not allowed

In a continuation line, if a comma is the first character and in the first 12 columns, this line is free format.

- A dollar sign \$ can be used within a line. All data following the \$ on the line will be for comments. An example of a comment is shown:

DISP(PUNCH)=ALL \$ request punched displacement output for all grids

The free field data entry capability in Nastran have been enhanced to support easy to use data input formats. The following examples illustrate the possible forms of the free field data input and the resulting translation to the fixed-field format.

Entry with or without user continuation mnemonics.

MATT9,1101,2 , 3 , 4 , , , , 8 , +P101  
+P101, 9 , , , , 13

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9	1101	2	3	4				8	+P101
+P101	9				13				

GRID,100,,1.0,0.0,0.0,,456

Translates to:

GRID	100		1.0	0.0	0.0		456		
------	-----	--	-----	-----	-----	--	-----	--	--

The continuation mnemonics are not included because they are not required. This is illustrated by the entry with automatic continuation:

SPC1,100,12456,1,2,3,4,5,6,7,8,9,10

Translates to:

1	2	3	4	5	6	7	8	9	10
SPC1	100	12456	1	2	3	4	5	6	
	7	8	9	10					

If more than 80 characters of data are required, the free field may be continued in the next line provided that the next entry starts with a comma in the first column. The next entry will be a logical continuation of the first. For example, the free-field entry:

MATT9,1151,2,3,4,,,,8  
,9,,,,13

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9	1151	2	3	4				8	
	9				13				

Which is equivalent to:

MATT9,1151,2,3,4,,,,8,+  
,9,,,,13

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9	1151	2	3	4				8	+
+	9				13				

The free field data entry can be used to input mixed Small Field, Large Field continuations. Note that the plus (+) and asterisk (\*) characters are used to indicate Small Field and Large Field input form respectively when free field data entry is used. For example, the entries:

MATT9\*,1302,2,,4,+  
,,,,,13

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9*	1302		2					4	+
+					13				

MATT9,1303,2,3,4,,,,8,+  
\*,9,,,,+  
\*,13

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9	1303	2	3	4				8	+
*	9								
*	13								

MATT9,1355,2,3,,5,,,,8,+  
\*,10,,,,+  
,17

Translates to:

1	2	3	4	5	6	7	8	9	10
MATT9	1355	2	3		5			8	+
*			10						+
+	17								

System cell 363 must be set to 1 (i.e., system(363)=1, or STRICTUAI=1) if more than 80 characters of data are required, then the free-field entry is continued by terminating the parent with a comma. The next entry will be a logical continuation of the first. It is not required to end the first entry at any specific point. This is illustrated by the entry:

CHEXA,200, 200, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16,  
17, 18, 19, 20

Translates to:

1	2	3	4	5	6	7	8	9	10
CHEXA	200	200	1	2	3	4	5	6	
	7	8	9	10	11	12	13	14	
	15	16	17	18	19	20			

Because of the feature allowing more than 10 fields of data to be entered on one free field entry, IT IS NOT ALLOWED to terminate a single free field entry with a comma. For example:

CHEXA,200, 200, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16,

### Small Field Format

Small field format separates a Bulk Data entry into ten equal fields of eight characters each:

←→ 8 character field

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20

← 80 characters →

The following is an example of the GRID entry in small field format:

1	2	3	4	5	6	7	8	9	10
GRID	2		1.0	-2.0	3.0		136		

The rules for small field format are as follows:

- Fields 1 and 10 must be left justified.
- Fields 2 through 9 do not need to be either right or left justified, although aligning the data fields is good practice.

- Small field input data cannot contain any embedded blanks. An example of a small field embedded blank is shown:

### Large Field Format

A high degree of numerical accuracy is required in some Nastran applications. Large field format is used when small field format does not provide enough significant digits (recall that a minus sign, decimal point, and the “E” in scientific notation count as characters).

Large field format requires (at least) two lines for each entry: the first and last field of each line contains eight columns, and the fields in between contain 16 columns. Short field becomes two lines. Large field entries are denoted by an asterisk (\*) immediately following the character string in field 1A of the first line and immediately preceding the character string in field 1B of the second line.

The following is an example of the GRID Bulk Data entry example in large field format:

First Line: (Left half of single field)

Second Line: (Right half of single field)

### Continuations

Some Bulk Data entries require more than eight fields (72 columns) of data. Continuations are required in such cases. To do this, a parent entry (the first line) is followed by one or more continuation entries on subsequent lines. For example, consider the following PBAR simple beam property entry (do not worry about what each field represents-this will be explained later):

Format:

1	2	3	4	5	6	7	8	9	10
PBAR	PID	MID	A	I1	I2	J	NSM		
	C1	C2	D1	D2	E1	E2	F1	F2	
	K1	K2	I12						

Continuation Example:

PBAR	39	6	2.9	1.86	2.92	.48			+PB1
+PB1	0.	0.	0.	1.	1.	1.	1.	0.	+PB2
+PB2	.86	.86							

+PB1 in field 10 of the parent entry is an arbitrary (and unique) user-defined pointer to field 1 of the second line. +PB2 in the second line points the third line, and so on.

Continuation fields can also be generated automatically by Nastran (this approach is the recommended practice). To automatically generate a continuation, the continuation line (or lines) must immediately follow the parent Bulk Data entry. In addition, fields 1 and 10 of the continuation line (or lines) must be left blank. In the case of double-width generated continuations are not blank in field 1, but have an "\*" in column 1. Nastran will then generate unique continuations for you. This process is illustrated in the following example:

Input (.DAT) file:

```
CHEXA,      1,      10,      3,      5,      7,      1,      15,      17,
           ,      19,      13,      4,      6,      8,      2,      10,      11,
           ,      12,      9,      16,      18,      20,      14
```

Output (.F06) file:

```
GEAR TOOTH EXAMPLESEPTEMBER 29, 1993 MSC.Nastran 9/ 4/91 PAGE 3

S O R T E D B U L K D A T A E C H O
CARD
COUNT. 1 .. 2 .. 3 .. 4 .. 5 .. 6 .. 7 .. 8 .. 9 .. 10 .
1- CHEXA 1 10 3 5 7 1 15 17 +000001
2-++000001 19 13 4 6 8 2 10 11 +000002
3-++000002 12 9 16 18 20 14 +000003
```

Blank lines are allowed if they are in between entries but not allowed if they are in an entry and further continuations are followed if ifpstar is yes, for example, the blank line in below entry is not allowed. To ignore those blank lines, set system(767) to 1.

```
CHEXA, 1, 10, 3, 5, 7, 1, 15, 17,
, 19, 13, 4, 6, 8, 2, 10, 11,
, 12, 9, 16, 18, 20, 14
```

Nastran Continuation fields (fields one and ten) are replicated using the following conventions:

1. Only letters of the alphabet and integers may be used. They are coded into a base 36 number. That is, the sequence of numbers is 0,1, 2, ..., 8, 9, A, B, ...
2. The first character in field one or ten is not incremented.
3. The continuation fields are incremented by +1 regardless of the value specified by the user.

4. The number of characters in an incremented field will not be increased. For example, if the first field is "0", the thirty-seventh field will also be "0", resulting in an illegal entry. A method to solve this problem would be to start with a first field of "00". This will provide thirty-six squared unique fields.
5. At least one field in fields 2 through 8 of continuation entries must be non-blank.

### Replication

Replication is a limited data generation capability which may be used in a fixed or free-field format and is not currently fully supported with NASTRAN SYSTEM(444)=1 and its use, therefore, is not recommended. Also replication is not at all currently supported with SimX reading a user-generated input file and strange models may be displayed.

1. Duplication of fields from the preceding entry is accomplished by coding the symbol =.
2. Duplication of all trailing fields from the preceding entry is accomplished by coding the symbol ==.
3. Incrementing a value from the previous entry is indicated by coding \*x or \*(x), where x is the value of the increment. "x" should be a real number for real fields or an integer for integer fields.
4. Repeated replication is indicated by coding =n or =(n), where n is the number of images to be generated using the values of the increments on the preceding entry.
5. Data items may be enclosed with parentheses or the parentheses may be deleted.
6. Replication capabilities are described here by example:
  - Continuation entry fields may be incremented or decremented.
  - Repeated replication is indicated by coding =(n) in field 1, where n is number of entry images to be generated using the values of increments from the current or preceding replication entry.

Entered entries:

```
GRID, 101, 17, 1.0, 10.5,,17,3456
= , *1, =, *0.2, ==
=3
```

Generated entries:

GRID	101	17	1.0	10.5		17	3456		
GRID	102	17	1.2	10.5		17	3456		
GRID	103	17	1.4	10.5		17	3456		
GRID	104	17	1.6	10.5		17	3456		
GRID	105	17	1.8	10.5		17	3456		

- A blank in field 1 indicates immediate continuation entry replication. The default continuation entry increment is 1. Example:

```
BSET1,123,1,2,3,4,5,6,7
,,*7,*7,*7,*7,*7,*7,*7
=(3)
```

Generated entries:

BSET1	123	1	2	3	4	5	6	7	+00001
++00001		8	9	10	11	12	13	14	+00002
++00002		15	16	17	18	19	20	21	+00003
++00003		22	23	24	25	26	27	28	+00004
++00004		29	30	31	32	33	34	35	+00005

- A “=(D)” in field 1 indicates delayed continuation entry replication. A maximum of 9 entries may be replicated as a group. The default continuation entry increment is 10. Example:

Entered entries:

```
CTRIA3,10,1,1,10,11/+C1
=(D),*(1),=,*(1),*(1)/(20)
+C1,,,2.0,1.0,1.0
=(2),==
```

Generated entries:

CTRIA3	10	1	1	10	11				+C1
+C1			2.0	1.0	1.0				
CTRIA3	11	1	1	11	12				+C21
+C21			2.0	1.0	1.0				
CTRIA3	12	1	1	12	13				+C41
+C41			2.0	1.0	1.0				

- Parentheses are optional on replication entries and an equal sign may replace an asterisk.

The following is an example of the use of replication, automatic continuation field generation, and the free field format:

```
GRID, 101, 17, 1.0, 10.5,,17,3456
=,*1,=,*0.2, *(0.1), == $ COMMENTS MAY APPEAR AFTER $
=3
EIGR,13,GIV,,30.
,MASS
CBAR,1 ,1 ,101 ,102,0.,0.,1.,,+0
=,*1,=,*1,*1====*1
+0,56
*1,=$
```

The above free-field entries will generate the following Bulk Data in the 8-column format, as seen in the SORTED BULK DATA ECHO:

Note: A “,” should always be used after the “\*1” for the continuation increment even if fixed field format is being used.

CBAR	1	1	101	102	0.	0.	1.		+0
+0	56								

CBAR	2	1	102	103	0.	0.	1.		+1
+1	56								
EIGR	13	GIV		30.					+000001
++000001	MASS								
GRID	101	17	1.0	10.5		17	3456		
GRID	102	17	1.2	10.6		17	3456		
GRID	103	17	1.4	10.7		17	3456		
GRID	104	17	1.6	10.8		17	3456		
GRID	105	17	1.8	10.9		17	3456		

The automatically generated continuation entries start with the number 1, are incremented by 1, and are padded with zeros and plus signs as shown above. If this feature is used, it is the user's responsibility not to enter continuation entries that also use this convention. In particular, data generated on another run and then written to the PUNCH file with the ECHO=PUNCH, will cause problems when introduced into other data with blank continuation fields.

## Identifiers

MSC Nastran is designed to use Identifiers for many quantities, the most common include:

ID	Grid Identification number
EID	Element Identification number
PID	Property Identification number
MID	Material Identification number
CID	Coordinate System number

When these identifications are given they must be unique in their class. All IDs defined on GRID, GRIDB, GRIDF, GRIDS, SPOINT and EPOINT must be unique.

In the case of Element Identification (EID), elements are generally given by "C" entries, such as CBAR, CBEAM, CQUAD, CHEXA, but rigid elements such as RBAR, RBE1, RBE2 are also treated as elements with respect to the EID, and should also be part of this class. All EID must be unique.

All Identification numbers must be greater than zero ( example EID > 0)

Furthermore Element Identification and Grid Identification must be less than 100,000,000 to insure data integrity.

There are two types of Property entries, primary ones and secondary ones. The property id on the primary property entries must be unique.

Referenced by	Primary Property Names
CHBDYP	BDYOR
CHBDYG	BDYOR
CHBDYE	BDYOR
CAABSF	PAABSF
CACINF3	PACINF
CACINF4	PACINF
CAERO1	PAERO1
CAERO2	PAERO2
CAERO3	PAERO3
CAERO4	PAERO4
CAERO5	PAERO5

## Bulk Data Entry Summary

This section contains a summary of all Bulk Data entries. The entries are categorized as Geometry, Elements, Material Properties, Constraints, Loads, Solution Control, and Miscellaneous. Entries that are exclusive to SOL 600 have been grouped together at the end of the summary. Entries that are exclusive to Explicit Nonlinear analysis (SOL 700) have also been grouped together at the end of the summary.

## Constraints and Partitioning

### Component Mode Boundary Conditions

<b>BNDFIX</b>	Defines analysis set (a-set) degrees-of-freedom to be fixed (b-set) during generalized dynamic reduction or component mode synthesis calculations.
<b>BNDFIX1</b>	Defines analysis set (a-set) degrees-of-freedom to be fixed (b-set) during generalized dynamic reduction or component mode synthesis calculations.
<b>BNDFREE</b>	Defines analysis set (a-set) degrees-of-freedom to be free (c-set) during generalized dynamic reduction or component modes calculations.
<b>BNDFREE1</b>	Defines analysis set (a-set) degrees-of-freedom to be free (c-set) during generalized dynamic reduction or component modes calculations.
<b>BSET</b>	Defines analysis set (a-set) degrees-of-freedom to be fixed (b-set) during component mode synthesis calculations.
<b>BSET1</b>	Defines analysis set (a-set) degrees-of-freedom to be fixed (b-set) during component mode synthesis calculations.
<b>CSET</b>	Defines analysis set (a-set) degrees-of-freedom to be free (c-set) during component modes calculations.
<b>CSET1</b>	Defines analysis set (a-set) degrees-of-freedom to be free (c-set) during component modes calculations.
<b>QSET</b>	Defines generalized degrees-of-freedom (q-set) to be used for component mode synthesis.
<b>QSET1</b>	Defines generalized degrees-of-freedom (q-set) to be used for component mode synthesis.
<b>SEBSET</b>	Defines boundary degrees-of-freedom to be fixed (b-set) during component mode synthesis calculations.
<b>SEBSET1</b>	Defines fixed boundary points for superelement.
<b>SECSET</b>	Defines boundary degrees-of-freedom to be free (c-set) during component mode synthesis calculations.
<b>SECSET1</b>	Defines boundary degrees-of-freedom to be free (c-set) during component mode synthesis calculations.
<b>SENQSET</b>	Defines number of internally generated scalar points for superelement dynamic reduction.
<b>SEQSET</b>	Defines the generalized degrees-of-freedom of the superelement to be used in component mode synthesis.
<b>SEQSET1</b>	Defines the generalized degrees-of-freedom of the superelement to be used in component mode synthesis.
<b>SESUP</b>	Defines determinate reaction superelement degrees-of-freedom in a free-body analysis.

## Free Body Supports

CYSUP	Defines fictitious supports for cyclic symmetry analysis.
SUPAX	Defines determinate reaction degrees-of-freedom in free bodies for conical shell analysis.
SUPPORTi	Defines degrees-of-freedom for determinate reactions.

## Multipoint Constraints

MONSUM	Defines a new monitor result that is the weighted sum of existing monitor results.
MPC	Defines a linear relationship for two or more degrees-of-freedom.
MPCADD	Defines a multipoint constraint set as a union of multipoint constraint sets defined via MPC entries.
MPCD	Defines a load selectable value for nonhomogeneous multi-point constraint.
MPCY	Defines a linear nonhomogeneous relationship for two or more degrees-of-freedom.
MPCAX	Defines multipoint constraints for conical shell problems.
POINTAX	Defines multipoint constraints for point on conical shell.
RBAR	Defines multipoint constraints for rigid bar.
RBEi	Defines multipoint constraints for RBE1, RBE2, RBE3.
RROD	Defines multipoint constraints for rigid rod.
RSPLINE	Defines multipoint constraints for spline element.
RTRPLT	Defines multipoint constraints for rigid triangular plate.

## Partitioning

ASET	Defines degrees-of-freedom in the analysis set (a-set).
ASET1	Defines degrees-of-freedom in the analysis set (a-set).
CSUPEXT	Assigns exterior points to a superelement.
GRID	Defines interior points for a superelement.
OMIT	Defines degrees-of-freedom to be excluded (o-set) from the analysis set (a-set).
OMIT1	Defines degrees-of-freedom to be excluded (o-set) from the analysis set (a-set).
OMITAX	Defines degrees-of-freedom to be excluded (o-set) from the analysis set (a-set).
RELEASE	Defines degrees-of-freedom for superelement exterior grid points that are not connected to the superelement.
SEELT	Reassigns superelement boundary elements to an upstream superelement.
SESET	Defines interior grid points for a superelement.

## Single Point Constraints

FLSYM	Symmetry control for boundary in axisymmetric fluid problem.
GRID	Includes single point constraint definition.
GRIDB	Includes single point constraint definition.
GRDSET	Includes default for single point constraints.
SPC	Defines a set of single-point constraints and enforced motion (enforced displacements in static analysis and enforced displacements, velocities or acceleration in dynamic analysis).
SPC1	Defines a set of single point constraints.
SPCADD	Defines a single-point constraint set as a union of single-point constraint sets defined on SPC or SPC1 entries.
SPCAX	Defines a set of single-point constraints or enforced displacements for conical shell coordinates.
SPCOFF	Defines degrees-of-freedom to be excluded from the AUTOSPC operation.
SPCOFF1	Defines a set of degrees-of-freedom to be excluded from the AUTOSPC operation.

## User Sets

DEFUSET	Defines new names for degree-of-freedom sets.
SEUSET	Defines a degree-of-freedom set for a superelement.
SEUSET1	Defines a degree-of-freedom set for a superelement.
USET	Defines a degree-of-freedom set.
USET1	Defines a degrees-of-freedom set.

## Elements

A summary of the capabilities and characteristics of the small strain elements is available in [Element Summary](#) -- [Conventional MSC Nastran Elements](#) in the *MSC Nastran Reference Guide*.

## Aerodynamic Elements

AEFACT	Defines real numbers for aeroelastic analysis.
AELINK	Defines relationships between or among AESTAT and AESURF entries.
AELIST	Defines a list of aerodynamic elements to undergo the motion prescribed with the AESURF Bulk Data entry for static aeroelasticity. Also defines server specific integer data for external spline methods.
AEQUAD4	Defines the connectivity of a quadrilateral aerodynamic element.
AESTAT	Specifies rigid body motions to be used as trim variables in static aeroelasticity.
AESURF	Specifies an aerodynamic control surface as a member of the set of aerodynamic extra points.

<b>AESURFS</b>	Optional specification of the structural nodes associated with an aerodynamic control surface that has been defined on an AESURF entry.
<b>AETRIA3</b>	Defines the connectivity of a triangular aerodynamic element.
<b>CAERO1</b>	Defines an aerodynamic macro element (panel) in terms of two leading edge locations and side chords.
<b>CAERO2</b>	Defines aerodynamic slender body and interference elements for Doublet-Lattice aerodynamics.
<b>CAERO3</b>	Defines the aerodynamic edges of a Mach Box lifting surface. If no cranks are present, this entry defines the aerodynamic Mach Box lifting surface.
<b>CAERO4</b>	Defines an aerodynamic macro element for Strip theory.
<b>CAERO5</b>	Defines an aerodynamic macro element for Piston theory.
<b>CSSCHD</b>	Defines a scheduled control surface deflection as a function of Mach number and angle of attack.
<b>PAERO1</b>	Defines associated bodies for the panels in the Doublet-Lattice method.
<b>PAERO2</b>	Defines the cross-sectional properties of aerodynamic bodies.
<b>PAERO3</b>	Defines the number of Mach boxes in the flow direction and the location of cranks and control surfaces of a Mach box lifting surface.
<b>PAERO4</b>	Defines properties of each strip element for Strip theory.
<b>PAERO5</b>	Defines properties of each strip element for Piston theory.

### **Aerodynamic to Structure Interconnection**

<b>AELISTC</b>	Defines a list of 8-character strings.
<b>SET1</b>	Defines a list of structural grid points.
<b>SET2</b>	Defines a list of structural grid points in terms of aerodynamic macro elements.
<b>SET3</b>	Defines a list of grids, elements or points.
<b>SPBLND1</b>	Defines a strip based blending of two splines.
<b>SPBLND2</b>	Defines a curve based blending of two splines.
<b>SPLINE1</b>	Defines a surface spline for interpolating motion and/or forces for aeroelastic problems on aerodynamic geometries defined by regular arrays of aerodynamic points.
<b>SPLINE2</b>	Defines a beam spline for interpolating motion and/or forces for aeroelastic problems on aerodynamic geometries defined by regular arrays of aerodynamic points.
<b>SPLINE3</b>	Defines a constraint equation for aeroelastic problems. Useful for control surface constraints.
<b>SPLINE4</b>	Defines a curved surface spline for interpolating motion and/or forces for aeroelastic problems on general aerodynamic geometries using either the Infinite Plate, Thin Plate or Finite Plate splining method.

<a href="#">SPLINE5</a>	Defines a 1D beam spline for interpolating motion and/or forces for aeroelastic problems on aerodynamic geometries defined by irregular arrays of aerodynamic points.
<a href="#">SPLINE6</a>	Defines a 6DOF or 3DOF finite surface spline for interpolating motion and/or forces between two meshes.
<a href="#">SPLINE7</a>	Defines a 6DOF finite beam spline for interpolating motion and/or forces between two meshes.
<a href="#">SPLINEX</a>	Defines the input for a spline that will be evaluated with a user-supplied procedure.
<a href="#">SPLINRB</a>	Defines a rigid body spline for interpolating motion or forces for aeroelastic problems on general aerodynamic geometries.
<a href="#">SPRELAX</a>	Defines relaxation of a spline based on an adjacent spline.

### Axisymmetric Elements

<a href="#">CAXISYM</a>	Defines an axisymmetric shell.
<a href="#">CCONEAX</a>	Defines a conical shell element.
<a href="#">CQUADX</a>	Defines an axisymmetric quadrilateral element with up to nine grid points for use in fully nonlinear (i.e., large strain and large rotations) hyperelastic analysis.
<a href="#">CTRIAX</a>	Defines an axisymmetric triangular element with up to 6 grid points for use in fully nonlinear (i.e., large strain and large rotations) hyperelastic analysis.
<a href="#">CTRIAX6</a>	Defines an isoparametric and axisymmetric triangular cross section ring element with midside grid points.
<a href="#">MREVERS</a>	Defines which elements, if any, required node numbering to be reversed in SOL 600.
<a href="#">PCONEAX</a>	Defines the properties of a conical shell element described on a CCONEAX entry.

### Cohesive Zone Modeling Elements

<a href="#">CIFHEX</a>	Defines a solid interface cohesive zone modeling element in SOL 400.
<a href="#">CIFPENT</a>	Defines a solid interface cohesive zone modeling element in SOL 400.
<a href="#">CIFQDX</a>	Defines an axisymmetric interface cohesive zone modeling element in SOL 400.
<a href="#">CIFQUAD</a>	Defines a planar interface element for cohesive zone modeling element in SOL 400.
<a href="#">MCOHE</a>	Defines damage and cohesive energy for interface zone modeling elements in SOL 400.
<a href="#">PCOHE</a>	Defines the properties of a cohesive interface zone modeling elements in SOL 400.

### Connector Elements

<a href="#">CFAST</a>	Defines a fastener with material orientation connecting two surface patches.
<a href="#">CSEAM</a>	Defines a seam-line connecting two surfaces.
<a href="#">CSLOT3</a>	Defines an element connecting three points that solve the wave equation in two dimensions.

<a href="#">CSLOT4</a>	Defines an element connecting four points that solve the wave equation in two dimensions.
<a href="#">CWELD</a>	Defines a weld or fastener connecting two surface patches or points.
<a href="#">PFAST</a>	Defines the CFAST fastener property values.
<a href="#">PSEAM</a>	Defines the CSEAM fastener property values.
<a href="#">PWELD</a>	Defines the property of connector (CWELD) elements.
<a href="#">SWLDPRM</a>	Overrides default values of parameters for connector search.

### Slidelines Contact (SOL 106, 129)

<a href="#">BCONP</a>	Defines the parameters for a contact region and its properties.
<a href="#">BFRIC</a>	Defines frictional properties between two bodies in contact.
<a href="#">BLSEG</a>	Defines a curve that consists of a number of line segments via grid numbers that may come in contact with another body.
<a href="#">BWIDTH</a>	Defines widths or thicknesses for line segments in 3-D or 2-D slideline contact defined in the corresponding BLSEG Bulk Data entry.

### Gap Elements

<a href="#">CGAP</a>	Defines a gap or friction element.
<a href="#">PGAP</a>	Defines the properties of the gap element (CGAP entry).

### Crack Tip Elements

<a href="#">CRAC2D</a>	Defines a two-dimensional crack tip element.
<a href="#">CRAC3D</a>	Defines a three-dimensional crack tip element.
<a href="#">PRAC2D</a>	Defines the properties and stress evaluation techniques to be used with the CRAC2D structural element.
<a href="#">PRAC3D</a>	Defines the properties of the CRAC3D structural element.

### Damping Elements

<a href="#">CBUSH1D</a>	See line elements.
<a href="#">CDAMP1</a>	Defines a scalar damper element.
<a href="#">CVISC</a>	Defines a viscous damper element.
<a href="#">DAMPING</a>	Specifies the values for parameter damping and/or selects optional HYBRID damping.
<a href="#">HYBDAMP</a>	Specifies hybrid damping parameters.
<a href="#">PBUSH1D</a>	See line elements.
<a href="#">PDAMP</a>	Specifies the damping value of a scalar damper element using defined CDAMP1 or CDAMP3 entries.

PDAMP5	Defines the damping multiplier and references the material properties for damping. CDAMP5 is intended for heat transfer analysis only.
PDAMPT	Defines the frequency-dependent properties for a PDAMP Bulk Data entry.
PVISC	Defines properties of a one-dimensional viscous damping element (CVISC entry).
ROTHYBD	Defines Hybrid damping for rotordynamics.

### Dummy Elements

ADUMi	Defines attributes of the dummy elements ( $1 \leq i \leq 9$ )
CDUMi	Defines a dummy element ( $1 \leq i \leq 9$ )
PDUMi	Defines the properties of a dummy element ( $1 \leq i \leq 9$ ). Referenced by the CDUMi entry.
PLOTEL	Defines a one-dimensional dummy element for use in plotting.

### Fluid and Acoustic Elements

CAABSF	Defines a frequency-dependent acoustic absorber element in coupled fluid-structural analysis.
CACINFi	Defines few types of acoustic infinite elements.
CAXIFi	Defines an axisymmetric fluid element that connects $i = 2, 3,$ or $4$ fluid points.
CAXISYM	Defines two or three node axisymmetric thick shell elements.
CFLUIDi	Defines three types of fluid elements for an axisymmetric fluid model.
CHACAB	Defines the acoustic absorber element in coupled fluid-structural analysis.
CHACBR	Defines the acoustic barrier element.
CHEXA	Connection definition for a pentahedron element in coupled fluid-structural analysis.
CPENTA	Connection definition for a tetrahedron element in coupled fluid-structural analysis.
CSLOTi	Defines slot element for acoustic cavity analysis.
CTETRA	Defines the connections of the four-sided solid element with four to ten grid points.
ELIST	Defines a list of structural elements for virtual fluid mass.
MAT10	Fluid Material Property Definition.
PAABSF	Defines the properties of a frequency-dependent acoustic absorber element.
PACABS	Defines the properties of the acoustic absorber element.
PACBAR	Defines the properties of the acoustic barrier element.
PACINF	Defines the properties of acoustic infinite elements.
PANEL	Selects the set of structural grid points that define one or more panels.

- PSOLID** Defines the fluid properties of solid elements (CHEXA, CPENTA, and CTETRA entries).
- SET1** Defines a list of structural grid points for aerodynamic analysis, XY-plots for SORT1 output, and the PANEL entry.

**Equivalent Radiated Power**

- ERPPNL** Equivalent Radiated Power Definition

**Poroelasticity (PEM)**

- ACTRIM** ACTRAN Trimmed Material Matrices for SOL 108/111
- ACLOAD** ACTRAN Acoustic Pressure Load Matrices for SOL 108/111
- MATPEI** Isotropic Poroelastic Material Property definition
- MATF1** Frequency Dependent Isotropic Material Definition

**Heat Transfer Elements**

- BDYOR** Defines default values for the CHBDYP, CHBDYG, and CHBDYE entries.
- CHBDYi** Connection definition for surface element (CHBDYE, CHBDYG, CHBDYP).
- CONTRLT** Thermal control element for heat transfer analysis.
- PHBDY** A property entry referenced by CHBDYP entries to give auxiliary geometric information for boundary condition surface elements.

The PRODN1, PSHLN1, PSHLN2, PSLDN1, PSHEARN, PLCOMP, and PCOMPLS may be used to extend the nonlinear capabilities of heat transfer elements in SOL 400. PCOMPLS may also be used to extend the nonlinear capabilities of heat transfer elements in all linear solutions between SOL101 and SOL112.

The following elastic elements may also be used as heat conduction elements:

- Linear:           CBAR, CROD, CONROD, CTUBE, CBEAM, CBEND.
- Membrane:       CTRIA3, CTRIA6, CQUAD4, CQUAD8.
- Axisymmetric:   CTRIAX6.
- Solid:            CTETRA, CHEXA, CPENTA.

**Line Elements**

- BAROR** Default for orientation and property for CBAR.
- BEAMOR** Defines default vlaues for field 3 and fields 6 through 8 of the CBEAM entry.
- CBAR** Defines a simple beam element.
- CBEAM** Defines a beam element.

<a href="#">CBEAM3</a>	Defines a three-node beam element.
<a href="#">CBEND</a>	Defines a curved beam, curved pipe, or elbow element.
<a href="#">CBUSH1D</a>	Defines the connectivity of a one-dimensional spring and viscous damper element.
<a href="#">CFAST</a>	Defines a fastener with material orientation connecting two surface patches.
<a href="#">CINTC</a>	Defines a line interface element with specified boundaries.
<a href="#">CMREBAI</a>	Defines Rebar elements and matching “Matrix” solid element using the Marc REBAR with INSERT Method. (SOL 600)
<a href="#">CMREBAR</a>	Defines Rebar elements with matching “Matrix” solid elements using the Marc REBAR without INSERT Method. (SOL 600)
<a href="#">CONROD</a>	Defines a rod element without reference to a property entry.
<a href="#">CROD</a>	Defines a tension-compression-torsion element.
<a href="#">CTUBE</a>	Defines a tension-compression-torsion tube element.
<a href="#">CWELD</a>	Defines a weld or fastener connecting two surface patches or points.
<a href="#">PBAR</a>	Defines the properties of a simple beam element (CBAR entry).
<a href="#">PBARL</a>	Defines the properties of a simple beam element (CBAR entry) by cross-sectional dimensions.
<a href="#">PBARN1</a>	Specifies additional nonlinear properties for elements that point to a PBAR or PBARL entry.
<a href="#">PBCOMP</a>	Alternate form of the PBEAM entry to define properties of a uniform cross-sectional beam referenced by a CBEAM entry.
<a href="#">PBEAM</a>	Defines the properties of a beam element (CBEAM entry). This element may be used to model tapered beams.
<a href="#">PBEAM3</a>	Defines the properties of a three-node beam element (CBEAM3 entry).
<a href="#">PBEAML</a>	Defines the properties of a beam element by cross-sectional dimensions.
<a href="#">PBEMN1</a>	Specifies additional nonlinear properties for elements that point to a PBEAM or PBEAML entry.
<a href="#">PBEND</a>	Defines the properties of a curved beam, curved pipe, or elbow element (CBEND entry).
<a href="#">PFAST</a>	Defines the CFAST fastener property values.
<a href="#">PBMSECT</a>	Defines the shape of arbitrary cross-section for CBEAM element.
<a href="#">PBRSECT</a>	Defines the shape of arbitrary cross-section for CBAR element.
<a href="#">PBUSH1D</a>	Defines linear and nonlinear properties of a one-dimensional spring and damper element (CBUSH1D entry).
<a href="#">PBUSH2D</a>	Defines linear and nonlinear properties of a two-dimensional element (CBUSH2D entry).
<a href="#">PMREBAI</a>	Defines Rebar property information for CMREBAI elements. (SOL 600)
<a href="#">PMREBAR</a>	Defines Rebar property information for CMREBAR elements. (SOL 600)

<a href="#">PROD</a>	Defines the properties of a rod element (CROD entry).
<a href="#">PRODN1</a>	Defines nonlinear property extensions for the PROD in SOL 400.
<a href="#">PTUBE</a>	Defines the properties of a thin-walled cylindrical tube element (CTUBE entry).
<a href="#">PWELD</a>	Defines the properties of connector (CWELD) elements.

## Mass Elements

<a href="#">CMASSi</a>	Connection definition for scalar mass, also property definition for i=2 or 4.
<a href="#">CONM1</a>	Defines a 6 x 6 symmetric mass matrix at a geometric grid point.
<a href="#">CONM2</a>	Defines concentrated mass at a grid point.
<a href="#">PMASS</a>	Specifies the mass value of a scalar mass element (CMASS1 or CMASS3 entries).
<a href="#">NSM</a>	Non Structural Mass by ID.
<a href="#">NSM1</a>	Non Structural Mass (alternate form).
<a href="#">NSMADD</a>	Non Structural Mass Set Combination.
<a href="#">NSML</a>	Lumped Non Structural Mass by ID.
<a href="#">NSML1</a>	Lumped Non Structural Mass (alternate form).

## Rigid Elements

<a href="#">RBAR</a>	Defines a rigid bar with six degrees-of-freedom at each end.
<a href="#">RBAR1</a>	Alternative format for RBAR.
<a href="#">RBE1</a>	Defines a rigid body connected to an arbitrary number of grid points.
<a href="#">RBE2</a>	Defines a rigid body with independent degrees-of-freedom that are specified at a single grid point and with dependent degrees-of-freedom that are specified at an arbitrary number of grid points.
<a href="#">RBE3</a>	Defines the motion at a reference grid point as the weighted average of the motions at a set of other grid points.
<a href="#">RJOINT</a>	Defines a rigid joint element connecting two coinciding grid points.
<a href="#">RROD</a>	Defines a pin-ended element that is rigid in translation.
<a href="#">RSPLINE</a>	Defines multipoint constraints for the interpolation of displacements at grid points.
<a href="#">RSSCON</a>	Defines multipoint constraints to model clamped connections of shell-to-solid elements.
<a href="#">RTRPLT</a>	Defines a rigid triangular plate.
<a href="#">RTRPLT1</a>	Defines a rigid triangular plate (alternate).

### Scalar and Bushing Elements

CBUSH	Defines a generalized spring-and-damper structural element that may be nonlinear or frequency dependent.
CBUSH1D	Defines the connectivity of a one-dimensional spring and viscous damper element.
CBUSH2D	Defines the connectivity of a two-dimensional Linear-Nonlinear element.
CELASi	Connection definition for scalar spring, also property definition for i=2 or 4.
GENEL	Defines a general element.
MGRSPR	Defines grids to add soft spring to ground. (SOL 600)
PBUSH	Defines the nominal property values for a generalized spring-and-damper structural element.
PBUSHT	Defines the frequency dependent properties or the stress dependent properties for a generalized spring and damper structural element.
PBUSH1D	Defines linear and nonlinear properties of a one-dimensional spring and damper element (CBUSH1D entry).
PELAS	Specifies the stiffness, damping coefficient, and stress coefficient of a scalar elastic (spring) element (CELAS1 or CELAS3 entry).
PELAST	Defines the frequency dependent properties for a PELAS Bulk Data entry.

### Solid Elements

CHEXA	Defines the connections of the six-sided solid element with eight to twenty grid points.
CPENTA	Defines the connections of a five-sided solid element with six to fifteen grid points.
CTETRA	Defines the connections of the four-sided solid element with four to ten grid points.
PCOMPLS	Defines the linear/nonlinear properties of an n-ply composite material laminate for a layered solid (CHEXA) element in SOL 400 and all linear solution sequences between SOL101 and SOL112.
PLSOLID	Defines a fully nonlinear (i.e., large strain and large rotation) hyperelastic solid element.
PSLDN1	Defines the nonlinear property extensions for a PSOLID entry in SOL 400.
PSOLID	Defines the properties of solid elements (CHEXA, CPENTA, and CTETRA entries).

### Surface Elements

CQUAD	Defines a plane strain quadrilateral element with up to nine grid points for use in fully nonlinear (i.e., large strain and large rotation) hyperelastic analysis.
CQUAD4	Defines an isoparametric membrane-bending or plane strain quadrilateral plate element.
CQUAD8	Defines a curved quadrilateral shell or plane strain element with eight grid points.
CQUADR	Defines an isoparametric membrane and bending quadrilateral plate element.
CSHEAR	Defines the properties of a shear panel (CSHEAR entry).

<a href="#">CTRIA3</a>	Defines an isoparametric membrane-bending or plane strain triangular plate element.
<a href="#">CTRIA6</a>	Defines a curved triangular shell element or plane strain with six grid points.
<a href="#">CTRIAR</a>	Defines an isoparametric membrane-bending triangular plate element. However, this element does not include membrane-bending coupling. It is a companion to the CQUADR element.
<a href="#">PCOMP</a>	Defines the properties of an n-ply composite material laminate.
<a href="#">PCOMPF</a>	Defines the integration procedure for through the thickness integration of composite shells. (SOLs 400/600 only)
<a href="#">PCOMPG</a>	Defines global (external) ply IDs and properties for a composite material laminate.
<a href="#">PLCOMP</a>	Defines the linear/nonlinear properties of an n-ply composite material laminate of a plane stress, plane strain, or axisymmetric (CQUAD or CQUADX entry) element in SOL 400.
<a href="#">PLPLANE</a>	Defines the properties of a fully nonlinear (i.e., large strain and large rotation) hyperelastic plane strain or axisymmetric element.
<a href="#">PSHELL</a>	Defines the membrane, bending, transverse shear, and coupling properties of thin shell elements.
<a href="#">PSHLN1</a>	Defines nonlinear property extensions for a PSHELL or PCOMP or PCOMPG entry in SOL 400.
<a href="#">PSHLN2</a>	Defines nonlinear property extensions for a PLPLANE entry in SOL 400.
<a href="#">PSHEAR</a>	Defines the properties of a shear panel (CSHEAR entry).
<a href="#">PSHEARN</a>	Defines nonlinear property extensions for a PSHEAR in SOL 400.
<a href="#">SNORM</a>	Defines a surface normal vector at a grid point for CQUAD4, CQUADR, CTRIA3, and CTRIAR shell elements.

## Geometry

### Adaptive Meshing

<a href="#">HADACRI</a>	Specifies Mesh adaptivity criterion and corresponding parameters.
<a href="#">HADAPTL</a>	Specifies local adaptive Mesh refinement control parameters.

### Axisymmetry

<a href="#">AXIC</a>	Defines the existence of an axisymmetric conical shell problem.
<a href="#">AXIF</a>	Defines basic parameters and the existence of an axisymmetric fluid analysis.
<a href="#">AXSLOT</a>	Defines the harmonic index and the default values for acoustic analysis entries.
<a href="#">FLSYM</a>	Defines the relationship between the axisymmetric fluid and a structural boundary having symmetric constraints. The purpose is to allow fluid boundary matrices to conform to structural symmetry definitions.

- POINTAX** Defines the location of a point on an axisymmetric shell ring at which loads may be applied via the FORCE or MOMENT entries and at which displacements may be requested. These points are not subject to constraints via MPCAX, SPCAX, or OMITAX entries.
- RINGAX** Defines a ring for conical shell problem.
- SECTAX** Defines a sector of a conical shell.

### Coordinate Systems

- BAROR** Defines default values for field 3 and fields 6 through 8 of the CBAR entry.
- BEAMOR** Defines default values for field 3 and fields 6 through 8 of the CBEAM entry.
- CORD1C** Cylindrical coordinate system definition.
- CORD1R** Rectangular coordinate system definition.
- CORD1S** Spherical coordinate system definition.
- CORD3G** Defines a general coordinate system using three rotational angles as functions of coordinate values in the reference coordinate system.

### Cyclic Symmetry

- CYAX** Lists grid points that lie on the axis of symmetry in cyclic symmetry analysis.
- CYJOIN** Defines the boundary points of a segment in cyclic symmetry problems.
- NLCYSYM** Defines information to perform nonlinear cyclic symmetry analysis using SOL 600

### Fluid Points

- ACMODL** Defines modeling parameters for the Fluid-Structure Interface.
- FREEPT** Defines the location of points on the surface of a fluid for recovery of surface displacements in a gravity field.
- FSLIST** Defines the fluid points (RINGFL entry) that lie on a free surface boundary.
- GRID** Defines fluid points in coupled fluid-structural analysis.
- GRIDB** Grid point location on RINGFL.
- GRIDF** Defines a scalar degree-of-freedom for harmonic analysis of a fluid.
- GRIDS** Defines a scalar degree-of-freedom with a two-dimensional location. Used in defining pressure in slotted acoustic cavities.
- PRESPT** Defines the location of pressure points in the fluid for recovery of pressure data.
- RINGFL** Defines a circle (fluid point) in an axisymmetric fluid model.
- SLBDY** Defines a list of slot points that lie on an interface between an axisymmetric fluid and a set of evenly spaced radial slots.

## Geometric Points and Spline Grids

- GMBNDC** Defines a geometric boundary consisting of edges along a curve interface. The boundary may consist of edges of shell, beam, solid elements
- POINT** Defines the X, Y, Z coordinates of a geometric point (See **PBMSECT**)

## Grid Points

- AERGRID** Defines the location of an aerodynamic grid point.
- GRID** Defines the location of a geometric grid point, the directions of its displacement, and its permanent single-point constraints.
- GRIDB** Defines the location of a geometric grid point on a fluid point (**RINGFL** entry) for an axisymmetric fluid model and/or axisymmetric structure. Also defines the boundary of the fluid.
- GRDSET** Defines default options for fields 3, 7, 8, and 9 of all **GRID** entries.
- SEQGP** Used to manually order the grid points and scalar points of the problem. This entry is used to redefine the sequence of grid and scalar points to optimize bandwidth.

## Scalar Points

- EPOINT** Defines extra points for use in dynamic problems.
- SEQGP** Grid and scalar point number resequencing.
- SPOINT** Defines scalar points.

## Superelement Analysis

- CSUPER** Defines the grid or scalar point connections for identical or mirror image superelements or superelements from an external source. These are all known as secondary superelements.
- CSUPEXT** Assigns exterior points to a superelement.
- EXTRN** Defines a boundary connection for an external superelement.
- GRID** Defines interior points for a superelement.
- RELEASE** Defines degrees-of-freedom for superelement exterior grid points that are not connected to the superelement.
- SEBNDRY** Defines a list of grid points in a partitioned superelement for the automatic boundary search between a specified superelement or between all other superelements in the model.
- SEBULK** Defines superelement boundary search options and a repeated, mirrored, or collector superelement.
- SECONCT** Explicitly defines grid and scalar point connection procedures for a partitioned superelement.
- SEDLINK** Relates one design variable of a **PART SE** to one or more other design variables from other **PART SEs**.

SEDRSP2	Defines equation responses that are used in the design, either as constraints or as an objective with quantities from multiple PART SEs.
SEDRSP3	Defines constituents from multiple PART SE for an external response using user-supplied routine(s).
SEELT	Reassigns superelement boundary elements to an upstream superelement.
SEEXCLD	Defines grid points that will be excluded during the attachment of a partitioned superelement.
SELABEL	Defines a label or name to be printed in the superelement output headings.
SELOAD	Selects and/or scales external superelement loads
SELOC	Defines a partitioned superelement relocation by listing three noncolinear points in the superelement and three corresponding points not belonging to the superelement.
SEMPLN	Defines a mirror plane for mirroring a partitioned superelement.
SEQSEP	Used with the CSUPER entry to define the correspondence of the exterior grid points between an identical or mirror-image superelement and its primary superelement.
SESET	Defines interior grid points for a superelement.
SETREE	Specifies superelement reduction order.

## Module Analysis

<a href="#">EXCLUDE</a>	Specifies Bulk Data entries in the primary Module to be ignored in the secondary (or copied) Module.
<a href="#">MDBCNCT</a>	Defines the Touching and Touched Contact Bodies in Different Modules.
<a href="#">MDBCTB1</a>	Defines a Contact Table for Bodies in Different Modules.
<a href="#">MDBNDRY</a>	Module to Module Boundary Point Definitions.
<a href="#">MDBOLT</a>	Defines the Multi-Point Constraints for a Bolt Between Two Modules.
<a href="#">MDBULK</a>	Module Type Definitions.
<a href="#">MDCONCT</a>	Module Boundary Point Connections.
<a href="#">MDDMIG</a>	Direct Matrix Input at Points Defined in Two or More Modules.
<a href="#">MDEXCLD</a>	Module to Module Excluded Boundary Point Definitions.
<a href="#">MDFAST</a>	A Shell Patch Fastener Connection Between Two Modules.
<a href="#">MDFSET</a>	Set Definition for Fluid Elements or Grid Points in Modules.
<a href="#">MDLABEL</a>	Module Output Label.
<a href="#">MDLOC</a>	Module Reposition by Translation and/or Rotation.
<a href="#">MDMIR1</a>	Defines a Module mirror by three non-collinear points on the mirror plane.
<a href="#">MDMIR2</a>	Defines a Module mirror by specifying a pair of coordinate system axes on the mirror plane.
<a href="#">MDMOVE</a>	Defines a Module repositioning sequence. References MDMIRi, MDROT <sub>i</sub> , and MDTRAN entries.
<a href="#">MDMPC</a>	Multipoint Constraint Between Two or More Modules.
<a href="#">MDMPLN</a>	Module Reposition by Mirroring.
<a href="#">MDRBE3</a>	Rigid Body Element Between Two or More Modules, Form 2.
<a href="#">MDRBE3</a>	Interpolation Constraint Element Between Two or More Modules.
<a href="#">MDRJNT</a>	Rigid Joint Between Two Modules.
<a href="#">MDROT1</a>	Defines a Module rotation by specifying a rotation vector and reference point.
<a href="#">MDROT2</a>	Defines a Module rotation by specifying a coordinate system axis for the rotation vector.
<a href="#">MDRRD</a>	Rigid Pin-Ended Element Connection Between Two Modules.
<a href="#">MDSEAM</a>	A Shell Patch SEAM Connection Between Two Modules.
<a href="#">MDSSET</a>	Set Definition for Structural Elements or Grid Points in Modules.
<a href="#">MDTRAN</a>	Defines a Module translation by specifying a vector.
<a href="#">MDWELD</a>	Weld or Fastener Element Connection Between Two Modules.

## Loads

### Dynamic Loads

ACSRCE	Defines acoustic source as a function of power vs. frequency.
DAREA	Defines scale (area) factors for static and dynamic loads. In dynamic analysis, DAREA is used in conjunction with RLOADi and TLOADi entries.
DELAY	Defines the time delay term $\tau$ in the equations of the dynamic loading function.
DLOAD	Defines a dynamic loading condition for frequency response or transient response problems as a linear combination of load sets defined via RLOAD1 or RLOAD2 entries for frequency response or TLOAD1 or TLOAD2 entries for transient response.
DPHASE	Defines the phase lead term $\theta$ in the equation of the dynamic loading function.
LOADCYH	Defines the harmonic coefficients of a static or dynamic load for use in cyclic symmetry analysis.
LOADCYN	Defines a physical static or dynamic load for use in cyclic symmetry analysis.
LSEQ	Defines a sequence of static load sets.
NOLINI	Nonlinear transient load definition.
NLRGAP	Defines a nonlinear transient radial (circular) gap.
RBE3U	Defines methods to distribute applied loads to a surface. (SOL 600)
RLOAD1	Frequency dependent excitation definition.
TABLED1	Tabular functions for generating dynamic loads.
TLOAD1	Time dependent excitation definition.

### Heat Transfer Loads

CONV	Specifies a free convection boundary condition for heat transfer analysis through connection to a surface element (CHBDYi entry).
CONVM	Specifies a forced convection boundary condition for heat transfer analysis through connection to a surface element (CHBDYi entry).
PCONV	Specifies the free convection boundary condition properties of a boundary condition surface element used for heat transfer analysis.
PCONVM	Specifies the forced convection boundary condition properties of a boundary condition surface element used for heat transfer analysis.
QBDY1	Defines a uniform heat flux into CHBDYj elements.
QBDY2	Defines grid point heat flux into CHBDYj elements.
QBDY3	Defines a uniform heat flux load for a boundary surface.
QHBDY	Defines a uniform heat flux into a set of grid points.
QVECT	Defines thermal vector flux from a distant source into a face of one or more CHBDYi boundary condition surface elements.

QVOL	Defines a rate of volumetric heat addition in a conduction element.
RADBC	Specifies an CHBDYi element face for application of radiation boundary conditions.
RADBND	Specifies Planck's second radiation constant and the wavelength breakpoints used for radiation exchange problems.
RADCAV	Identifies the characteristics of each radiant enclosure.
RADLST	Identifies the individual CHBDYi surface elements that comprise the entire radiation enclosure.
RADMTX	Provides the $F_{ji} = A_j f_{ji}$ exchange factors for all the faces of a radiation enclosure specified in the corresponding RADLST entry.
RADSET	Specifies which radiation cavities are to be included for radiation enclosure analysis.
SLOAD	Defines concentrated static loads on scalar or grid points.
SLOADN1	Describes TOP/BOT/MID Scalar Load for Heat Shell Element in SOL 400
TEMP	Defines temperature at grid points for determination of thermal loading, temperature-dependent material properties, or stress recovery.
TEMPB3	Defines a temperature field for the three-node beam element (CBEAM3 entry).
TEMPBC	Defines the temperature boundary conditions for heat transfer analysis. Applies to steady-state and transient conditions.
TEMPD	Specifies default initial temperature at grid points.
TEMPN1	TOP/BOT/MID Grid Point Temperature Field for Heat Shell Element in SOL 400
VIEW	Defines radiation cavity and shadowing for radiation view factor calculations.
VIEW3D	Defines parameters to control and/or request the Gaussian Integration method of view factor calculation for a specified cavity.

### Static Loads

ACCEL	Defines static acceleration loads, which may vary over a region of the structural model. The load variation is based upon the tabular input defined on this Bulk Data entry.
ACCEL1	Defines static acceleration loads at individual GRID points.
CLOAD	Defines a static load as a linear combination of previously calculated superelement loads defined by the LSEQ entry in nonlinear static analysis (SOL 106 or 153).
DEFORM	Defines enforced axial deformation for one-dimensional elements for use in statics problems.
FORCE	Defines a static concentrated force at a grid point by specifying a vector.
FORCE1	Defines a static concentrated force at a grid point by specification of a magnitude and two grid points that determine the direction.
FORCE2	Defines a static concentrated force at a grid point by specification of a magnitude and four grid points that determine the direction.
FORCEAX	Defines a concentrated force on a conical shell ring.

FORCEi	Defines concentrated load at grid point.
GRAV	Defines acceleration vectors for gravity or other acceleration loading.
GRIDA	Defines an associative GRID point to be used in the COMBINE step of PAA.
LOAD	Defines a static load as a linear combination of load sets defined via FORCE, MOMENT, FORCE1, MOMENT1, FORCE2, MOMENT2, PLOAD, PLOAD1, PLOAD2, PLOAD4, PLOADB3, PLOADX1, SLOAD, RFORCE, and GRAV, ACCEL and ACCEL1 entries.
LOADCLID	Defines a loading combination in PAA using the Load ID from SUBCASEs of the Parts
LOADCNAM	Used only in PAA to define a loading combination using the LOADNAMEs used in Case Control for Parts
LOADCSUB	Defines a loading combination in PAA using the SUBCASE IDs from the Parts
LOADCYH	Defines the harmonic coefficients of a static or dynamic load for use in cyclic symmetry analysis.
LOADCYN	Defines a physical static or dynamic load for use in cyclic symmetry analysis.
LOADCYT	Specifies loads as a function of azimuth angle by references to tables that define scale factors of loads versus azimuth angles. This entry is used only when STYPE = "AXI" on the CYSYM entry.
LOADOF	Specifies table IDs for individual degrees of freedom for the static loads with tables described using LOADT entries for SOL 600 only.
LOADT	Specifies static loads that will use a table to describe their variation with pseudo-time.
LSEQ	Defines a sequence of static load sets.
MOMAX	Defines a static concentrated moment load on a ring of a conical shell.
MOMENT	Defines a static concentrated moment at a grid point by specifying a scale factor and a vector that determines the direction.
MOMENTi	Defines moment at grid point.
PLOAD	Defines a uniform static pressure load on a triangular or quadrilateral surface comprised of surface elements and/or the faces of solid elements.
PLOAD1	Defines concentrated, uniformly distributed, or linearly distributed applied loads to the CBAR or CBEAM elements at user-chosen points along the axis. For the CBEND element, only distributed loads over an entire length may be defined.
PLOAD2	Defines a uniform static pressure load applied to CQUAD4, CSHEAR, or CTRIA3 two-dimensional elements.
PLOAD4	Defines a pressure load on a face of a CHEXA, CPENTA, CTETRA, CTRIA3, CTRIA6, CTRIAR, CQUAD4, CQUAD8, or CQUADR element.
PLOADB3	Defines a distributed load to a CBEAM3 element over entire length of the beam axis.
PLOADX1	Defines surface traction to be used with the CQUADX, CTRIAX, and CTRIAX6 axisymmetric element.
PRESAX	Defines the static pressure loading on a conical shell element.

RBE3U	Defines methods to distribute applied loads to a surface. (SOL 600)
RFORCE	Defines a static loading condition due to an angular velocity and/or acceleration.
SLOAD	Defines concentrated static loads on scalar or grid points.
SPCD	Defines an enforced displacement value for static analysis and an enforced motion value (displacement, velocity or acceleration) in dynamic analysis.
SPCR	Defines an enforced relative displacement value for a load step in SOL 400.
TEMP	Defines temperature at grid points for determination of thermal loading, temperature-dependent material properties, or stress recovery.
TEMPD	Defines a temperature value for all grid points of the structural model that have not been given a temperature on a TEMP entry.
TEMPP1	Defines temperature field for surface elements.
TEMPRB	Defines a temperature field for the CBAR, CBEAM, CBEND, CROD, CTUBE, and CONROD elements for determination of thermal loading, temperature-dependent material properties, or stress recovery.
TEMPAX	Defines temperature sets for conical shell problems.

## Materials

### Anisotropic

MAT2	Defines the material properties for linear anisotropic materials for two-dimensional elements.
MAT3	Defines the material properties for linear orthotropic materials used by the CTRIAX6 element entry. It also is allowed with orthotropic materials on the PSHLN2 and PLCOMP entries.
MAT5	Defines the thermal material properties for anisotropic materials.
MAT8	Defines the material property for an orthotropic material for isoparametric shell elements.
MAT9	Defines the material properties for linear, temperature-independent, anisotropic materials for solid isoparametric elements (see PSOLID entry description).
MATORT	Define elastic 3D Orthotropic Material (SOL 400, 600. Also all linear solutions between SOL101 and 112 in conjunction with PCOMPLS.

### Fatigue

MATFTG	Defines cyclic material properties (S-N + $\epsilon$ -N) for use in fatigue analysis.
--------	---

**Fluid**

AXIF	Includes default values for mass density and bulk modulus.
AXSLOT	Includes default values for mass density and bulk modulus.
CFLUIDi	Includes mass density and bulk modulus.
FSLIST	Includes mass density at free surface.
MAT10	Defines material properties for fluid elements in coupled fluid-structural analysis.
MFLUID	Defines the properties of an incompressible fluid volume for the purpose of generating a virtual mass matrix.
SLBDY	Includes mass density at interface between fluid and radial slots.

**Isotropic**

MAT1	Defines the material properties for linear isotropic materials.
MAT4	Defines the constant or temperature-dependent thermal material properties for conductivity, heat capacity, density, dynamic viscosity, heat generation, reference enthalpy, and latent heat associated with a single-phase change.
MATHP	Specifies material properties for use in fully nonlinear (i.e., large strain and large rotation) hyperelastic analysis of rubber-like materials (elastomers).
RADM	Defines the radiation properties of a boundary element for heat transfer analysis.

**Stress Dependent**

CREEP	Defines creep characteristics based on experimental data or known empirical creep law.
MATS1	Specifies stress-dependent material properties for use in applications involving nonlinear materials.
NLMOPTS	Defines nonlinear material option control for SOL 400.
TABLES1	Defines a tabular function for stress-dependent material properties such as the stress-strain curve (MATS1 entry), creep parameters (CREEP entry) and hyperelastic material parameters (MATHP entry).

**Temperature Dependent**

MATTi	Table references for temperature-dependent MATi materials.
RADMT	Specifies table references for temperature dependent RADM entry radiation boundary properties.
TABLEM1	Tabular functions for generating temperature-dependent material properties.
TABLEST	Table references for temperature dependent MATS1 materials.
TEMP	Defines temperature at grid points for determination of thermal loading, temperature-dependent material properties, or stress recovery.
TEMPAX	Defines temperature sets for conical shell problems.

<b>TEMPD</b>	Defines a temperature value for all grid points of the structural model that have not been given a temperature on a TEMP entry.
<b>TEMPP1</b>	Defines temperature field for surface elements.
<b>TEMPRB</b>	Defines a temperature field for the CBAR, CBEAM, CBEND, CROD, CTUBE, and CONROD elements for determination of thermal loading, temperature-dependent material properties, or stress recovery.

## Miscellaneous

### Brake Squeal (SOL 400)

<b>BSQUEAL</b>	Specifies data for brake squeal analysis using Implicit Nonlinear (SOL 400).
----------------	--

### Comments

<b>\$</b>	Used to insert comments into the input file. Comment statements may appear anywhere within the input file.
-----------	--

### Delete

<b>/</b>	Control Input Stream
----------	----------------------

### Direct Matrix Input

<b>CONM1</b>	Defines a 6x6 mass matrix at a geometric grid point.
<b>DMI</b>	Defines matrix data blocks.
<b>DMIG</b>	Defines direct input matrices related to grid, extra, and/or scalar points.
<b>DMIG,UACCEL</b>	Defines rigid body accelerations in the basic coordinate system.
<b>DMIAX</b>	Defines axisymmetric (fluid or structure) related direct input matrix terms.
<b>TF</b>	Defines a dynamic transfer function.

### Direct Matrix Input for Aeroelasticity

<b>DMIJ</b>	Defines direct input matrices related to collation degrees-of-freedom (js-set) of aerodynamic mesh points for CAERO1, CAERO3, CAERO4 and CAERO5 and for the slender body elements of CAERO2. These include W2GJ, FA2J and input pressures and downwashes associated with AEPRESS and AEDW entries.
<b>DMIJI</b>	Defines direct input matrices related to collation degrees-of-freedom (js-set) of aerodynamic mesh points for the interference elements of CAERO2.
<b>DMIK</b>	Defines direct input matrices related to physical (displacement) degrees-of-freedom (ks-set) of aerodynamic grid points.

**End of Input**

**ENDDATA** Designates the end of the Bulk Data Section.

**Include File**

**INCLUDE** Inserts an external file into the input file. The INCLUDE statement may appear anywhere within the input data file.

**VCCT** Virtual Crack Closure Technique - SOL 400, SOL 600

**LORENZI** Contour Integral Approach for stress intensity calculation - SOL 600

**Materials (SOLs 400/600)**

**COHESIV** Defines data for cohesive materials. (SOL 600)

**MATDIGI** e-XstreamDigimat material interface (SOL 400)

**MATEP** Elasto-plastic material properties.

**MATF** Specifies material failure model. Also maybe used in all linear solutions between SOL101 and 112 in conjunction with PCOMPLS.)

**MATG** Gasket material properties.

**MATHE** Hyperelastic material properties.

**MATHED** Damage model properties for hyperelastic materials. (SOL 600)

**MATNLE** The MATNLEx entries specify advanced forms of nonlinear elastic materials. (SOL 600)

**MATORT** Elastic 3D orthotropic material properties. Also maybe used in all linear solutions between SOL101 and 112 in conjunction with PCOMPLS.

**MATTEP** Thermoelastic-Plastic material properties.

**MATTF** Material Failure Model Temperature Variation

**MATTG** Temperature variation of interlaminar materials.

**MATTHE** Thermo hyperelastic material.

**MATTORT** Thermoelastic orthotropic material

**MATS3** Specifies NLELAST option for advanced orthotropic, nonlinear elastic materials at axisymmetric conditions. SOL 400 only.

**MATS8** Specifies NLELAST option for advanced orthotropic, nonlinear elastic material for plane stress and shell elements SOL 400 only.

**MATSMA** Material properties for shape memory alloys.

**MATSORT** Specifies NLELAST option for advanced 3D orthotropic, nonlinear elastic materials. SOL 400)

**MATTVE** Thermo-visco-elastic material properties

**MATVE** Viscoelastic material properties

**MATVP** Viscoplastic or creep material properties

MCOHE	Cohesive materials (SOL 400)
MDELAM	Defines materials for which delamination may occur.

### Non-Structural Mass Distribution Selection

NSM	Non Structural Mass entry by property or element ID, value.
NSMI	Non Structural Mass entry by property or element ID, value.
NSMADD	Non Structural Mass as sum of listed sets.
NSML	Lumped non structural mass entry by property or element ID, value.
NSML1	Lumped non structural mass entry by property or element ID, value.

### OpenFSI (SOL 400)

FSICTRL	Defines the analysis type for OpenFSI fluid structure analysis simulations.
WETELME	Defines a wetted element used in OpenFSI fluid structure interaction simulations.
WETELMG	Defines a wetted element used in OpenFSI fluid structure interaction simulations.
WETLOAD	Defines the load set and associated wetted surface for OpenFSI fluid structure interaction simulations.
WETSURF	Defines a wetted surface used in OpenFSI fluid structure interaction simulations.

### Output Control

BOUTPUT	Defines secondary nodes at which output is requested.
CBARAO	Defines a series of points along the axis of a bar element (CBAR entry) for stress and force recovery output.
ECHOOFF	Marks the point or points in the input file to deactivate printed echo of the Bulk Data.
ECHOON	Marks the point or points in the input file to activate printed echo of the Bulk Data.
FREEPT	Surface point location for data recovery in hydroelastic problems.
MARPRN	Defines “print” options for SOL 600.
MLAYOUT	Selects layered composite shell output to be placed in Marc’s t16 and/or t19 files and (if requested) to be transferred from Marc to the Nastran Database. (SOL 600)
PLOTEL	Defines a one-dimensional dummy element for use in plotting.
POINTAX	Defines the location of a point on an axisymmetric shell ring at which loads may be applied via the FORCE or MOMENT entries and at which displacements may be requested.
PRESPT	Defines the location of pressure points in the fluid for recovery of pressure data in hydroelastic problems.
SET1	Defines a set of grid points.

- TSTEP** Specifies time step intervals for data recovery in transient response.
- TSTEPNL** Specifies time step intervals for data recovery in nonlinear transient response.

### Monitor Points

- AECOMP** Defines a component for use in aeroelastic monitor point definition or external splines.
- AECOMPL** Defines a component for use in aeroelastic monitor point definition or external splines as a union of other components.
- MONPNT1** Defines an integrated load monitor point at a point (x,y,z) in a user defined coordinate system.
- MONPNT2** Element Monitor Output Results Item.
- MONPNT3** Sums select Grid Point Forces to a user chosen monitor point.
- MONCNC** Stripwise aerodynamic lift and pitching moment coefficients.
- M**
- MONSUM** Linear combination of monitor point components.
- MONSUM1** Linear combination of two or more monitor points.
- MONSUMT** Linear combination of two or more monitor points with moment transfer.

### Parameters

- CAMPBLL** Specifies the parameters for Campbell diagram generation.
- PARAM** Specifies values for parameters used in solution sequences or user-written DMAP programs.
- MDLPRM** Specifies parameters which affect the solution of the structural model.

### Solution Control

- ITER** Defines options for the iterative solver in SOLs 101, 106, 108, 111 and 153.
- RVDOF** Degrees-of-freedom specification for residual vector computations.
- RVDOF1** Degrees-of-freedom specification for residual vector computations (alternate form).

### Tabular Input

- DTI** Defines table data blocks.
- DTI,ESTDATA** Provides override data for time and space estimation for superelement processing operations.
- DTI,INDTA** Specifies or overrides default item codes for the sorting and filtering of element stresses, strains, and forces.
- DTI,SETREE** Defines a superelement tree that determines the superelement processing order.
- DTI,SPECSEL** Correlates spectra lines specified on TABLED1 entries with damping values.

DTI,SPSEL	Correlates output requests with frequency and damping ranges.
DTI,UNITS	Defines units necessary for conversion during the analysis for the Nastran/ADAMS interface and Nastran fatigue analysis.
TABDMP1	Defines modal damping as a tabular function of natural frequency.
TABLED1	Tabular functions for generating dynamic loads.
TABLEL1	Specifies a table of amplitude vs pseudo-time for static loads specified in LDFTABL entries SOL 600 only.
TABLEM1	Tabular functions for generating temperature-dependent material properties.
TABLES1	Defines a tabular function for stress-dependent material properties such as the stress-strain curve (MATS1 entry), creep parameters (CREEP entry) and hyperelastic material parameters (MATHP entry).
TABL3D	Specifies a table where an entry can be a function of up to 4 variables such as strain, temperature, strain rate, etc. (SOLs 400/600).
TABLE3D	Specify a function of three variables for the CORD3G entry only.
TABLFTG	Defines cyclic load variation for use in fatigue analysis.
TABLRPC	Tabular functions for generating dynamic loads by reading the tabular data from an external channel data file.
TABRND1	Defines power spectral density as a tabular function of frequency for use in random analysis. Referenced by the RANDPS entry.

### 3D Contact Region

BCBMRAD	Allows the equivalent radius in beam-to-beam contact to be different for each beam cross section. (SOLs 400/600)
BCBOX	Defines a 3D contact region.
BCHANGE	Changes definitions of contact bodies.
BCMATL	Defines a 3D contact region by element material.
BCMOVE	Defines movement of bodies in contact.
BCPARA	Defines contact parameters.
BCPROP	Defines a 3D contact region by element properties.
BSURF	Defines a contact body or surface by element IDs.
GMNURB	3D contact region made up of NURBS.

#### Old Contact Format

BCTABLE	Defines a contact table.
BCBODY	Defines a flexible rigid contact body in 2D or 3D.

#### New Contact Format

BCTABL1	Defines a contact table.
---------	--------------------------

BCONNECT	Defines the Touching and Touched Contact Bodies
BCONPRG	Geometric Contact Parameters of Touching Bodies
BCONPRP	Physical Contact Parameters of Touching Bodies in SOL 101 and 400
BCBODY1	Flexible or Rigid Contact Body in 2D and 3D
BCBDPRP	Contact Body Parameters in SOLs 101 and 400
BCRIGID	Defines a Rigid Contact Body in SOLs 101 and 400
BCRGSRF	Rigid Contact Surface List in SOLs 101 and 400
BCPATCH	Defines a Rigid Contact Body Made up of Quadrilateral Patches in SOLs 101 and 400
BCBZIER	Defines a Rigid Contact Body Made up of Bezier Surfaces in SOLs 101 and 400
BCNURB2	Defines a 2D Rigid Contact Body Made up of NURBS in SOLs 101 and 400
BCNURBS	Defines a Rigid Contact Body Made up of NURBS in SOLs 101 and 400
BCTRIM	Defines the Geometry of a Trimming Curve

### User-Defined Subroutines and Services

BCONUDS	Allows the user to provide contact routines for use with enhanced MSC Nastran contact analysis. (SOL 600 and SOL 400)
GENUDS	User Data for Notify User Defined Service or Subroutine
MATUDS	Allows the user to provide material routines for use with enhanced MSC Nastran material models. (SOL 600 and SOL 400)
MATTUSR	Specifies table variation of user defined generic materials in SOL 600 and SOL 400 only.
MATUSR	Specifies user-defined, generic material properties for hypoelastic material models in SOL 600 and user defined material models in SOL 400 only.
UDSESV	Define the number and names of user state variables for material user subroutines (SOL 400)

## Nastran Implicit Nonlinear (SOL 600)

### 3D Contact Region (SOL 600)

BCBMRAD	Allows the equivalent radius in beam-to-beam contact to be different for each beam cross section. (SOL 600)
SANGLE	Defines automatic analytical contact threshold angle for multiple subcases.
UNGLUE	Defines grids that should be eliminated from glued contact for SOL 600 and SOL 400.
WEAR	Specifies values for modeling mechanical wear in deformable contact bodies for SOL 600 only.

### Analysis Termination Options (SOL 600)

**TERMIN** Control to terminate a SOL 600 analysis under certain conditions

### Bolts (SOL 600)

**MBOLT** Defines a bolt for use in countries outside the USA.

**MBOLTUS** Defines a bolt for use in the USA and all other countries.

### Brake Squeal (SOL 600)

**BRKSQL** Specifies data for brake squeal calculations using SOL 600.

### Composite Integration Options (SOL 600)

**MIXTURE** Defines constituents of “composite” material on original and potentially damaged state.

**PCOMP** Defines the integration procedure for through the thickness integration of composite shells.

### Creep Analysis (SOL 600)

**MACREEP** Controls a transient creep analysis.

**MPCREEP** Specifies input values for Marc’s creep parameter when creep analysis is performed using SOL 600.

**MTCREEP** Controls a transient thermal creep analysis. This entry or the MACREEP entry is required if ITYPE is not zero on the MPCREEP entry.

### Element Birth and Death (SOL 600)

**ACTIVAT** This entry allows the user to re-activate certain elements that were previously deactivated in a previous subcase.

**DEACTEL** This entry allows the user to deactivate elements that have failed or are no longer necessary in a particular subcase.

### Elements (SOL 600)

**ALIASM** Allows selected elements which normally use a default formulation to be aliased to a different formulation.

**CSSL** Defines a connection for a Solid Shell with 6 or 8 grid points.

**CSSLH** Defines conversion of CHEXA elements to Solid Shell elements.

**CSSLM** Defines conversion of CHEXA or CPENTA elements described by material ID to Solid Shell elements.

- CSSHLP** Defines conversion of CPENTA elements to Solid Shell elements.
- MISLAND** Defines an island of connected elements that will be completely removed if the number of elements within the island becomes smaller than a specified value.

#### Element Properties (SOL 600)

- NTHICK** Defines nodal thickness values for beams, plates, and/or shells.
- PSSHL** Defines the properties for Solid Shell (CSSHL) elements.

#### Fatigue, Fracture and Crack Propagation (SOL 600)

- LORENZI** This option gives an estimation of the J-Integral for a crack configuration using the domain integration method.
- VCCT** Virtual crack closure technique

#### General Tables (SOL 600)

- MTABRV** Defines a list of tables to reverse positive and negative values and/or add points at the lower and upper end of tables.
- TABD1MD** Defines how TABLED1 entries are internally modified in SOL 600.
- TABL3D** Specifies a table where an entry can be a function of up to 4 variables such as strain, temperature, strain rate, etc.

#### Heat Transfer (SOL 600)

- MPHEAT** Maps to Marc's HEAT parameter for SOL 600 heat transfer analysis.
- MOTHERM** Iteration control for automatic thermal loading for structural analysis following a heat transfer analysis.
- NLHEATC** Defines numerical analysis parameters for SOL 600 heat transfer analysis

#### Inertia Relief (SOL 600)

- SUPPORT6** Inertia relief used in Nastran Implicit Nonlinear (SOL 600 only).

#### Initial Conditions (SOL 600)

- IPSTRN** Defines initial plastic strain values.
- ISTRESS** Defines initial stress values.

#### Input/Output (SOL 600)

- MARCIN** Inserts a text string in Marc.
- MARCOUT** Selects data recovery output.

### Matrix Input/Output (SOL 600)

DMIGOUT	Defines DMIG matrices to be output from the Marc Portion of SOL 600.
DMIGROT	Defines large rotation and other characteristics of a matrix entered using DMIG..
MDMIAUX	Specifies the DOMAINSOLVER command to be used in conjunction with secondary spawned jobs when MDMIOUT is used. SOL 600 only.
MDMIOUT	Defines full or reduced stiffness and mass matrices to be output from the Marc portion of SOL 600.
MESUPER	Defines external superelement DMIG input for SOL 600 residual analyses
MNF600	Defines auxiliary data for MSC Adams MNF files.

### Solid Composites (SOL 600)

MSTACK	Defines the direction in which 3D solid composites are stacked.
--------	---

### Solution Control (SOL 600)

MPROCS	Provides additional control for parallel processing
NLAUTO	Parameters for automatic load/time stepping.
NLHEATC	Defines Numerical Analysis Parameters for Heat Transfer Analysis.
NLSTRAT	Strategy parameters for nonlinear structural analysis.
PARAMARC	Parallel domain decomposition.
RESTART	Restart data.

### Structural Analysis Following a Heat Transfer Analysis (SOL 600)

MINSTAT	This option is used to enter initial (stress free) temperatures calculated from a previous heat transfer analysis and saved on a t16 or t19 file.
---------	---

### t16 Output Control (SOL 600)

MT16SEL	Limits elements and/or grid results to selected elements or grids for t16 and t19 file results.
MT16SPL	Determines how to split a Marc t16 file into one or more smaller t16 files.

### User Subroutine Control (SOL 600)

USRSUB6	Defines user subroutines used in SOL 600 only.
---------	--

## Explicit Nonlinear (SOL 700)

### Air Bags (SOL 700)

GBAG	Defines the pressure within an enclosed volume.
------	---

**ATB Models (SOL 700)**

ATBACC	Defines an acceleration field that will be applied to ATB segments.
ATBJNT	This entry can only be used together with the ATBSEG entries that this joint connects. The ATBSEG entries overwrite the position and orientation of the ATB segments as specified in the ATB input file. The ATBJNT entry can be used to create a Bulk Data file containing elements and grid points to visualize the ATB segment together with its joints. This visualization of the joints makes it possible to position the ATB model in any available preprocessor.
ATBSEG	Defines the position and orientation of the ATB segments.
RELEX	Defines a rigid ellipsoid whose properties and motion are defined by either ATB.

**Contact (SOL 700)**

BCBODY	Defines a flexible or rigid contact body in 2D or 3D.
BCBODY1	Defines a flexible or rigid contact body in 2D or 3D.
BCBOX	Defines a 3D contact region - all elements within the region define a contact body.
BCELIPS	Defines a list of ellipsoid names (character strings) for use of contact analysis.
BCGRID (SOL 700 only)	Grids to be included in contact analyses.
BCMATL	Defines a 3D contact region by element material. All elements with the specified materials define a contact body.
BCONNECT	Defines the touching and touched contact bodies used for general contact.
BCONPRG-700	Defines geometric contact parameters of touching bodies.
BCONPRP-700	Defines physical contact parameters of touching bodies.
BCSEG	Grids which are part of an element to be used in contact analyses.
BCTABLE	Defines a contact table (old format).
BCTABL1	Defines a contact table (new format).
BSURF	Defines a contact body or surface by Element IDs.

**Coordinate Systems (SOL 700)**

CORD3R	Defines a moving rectangular coordinate system using three points (SOL 700 only).
--------	---

**Dampers/Springs (SOL 700)**

CDAMP1D	Defines a scalar damper connection for use in SOL 700 only.
CDAMP2D	Defines a scalar damper connection for use in SOL 700 only.
CELAS1D	Defines a scalar spring connection for use in SOL 700 only.
CELAS2D	Defines a scalar spring connection for use in SOL 700 only.

### Direct Text Input (SOL 700)

ENDDYNA	Defines the end of direct text to Dytran.
TODYNA	Defines the start of direct text to Dytran.

### Element Properties (SOL 700)

PBELT	Defines the properties of a belt element referenced by a CROD entry.
PELASI	Defines a spring property designated by a force-deflection curve for SOL 700.
PSHELL1	Defines the properties of SOL 700 shell elements that are much more complicated than the shell elements defined using the PSHELL entry.
PVISC1	Defines the properties of a nonlinear damper where the damping constant varies with the velocity.

### Eulerian Boundary (SOL 700)

BARRIER	Defines a barrier for transport in a Eulerian mesh.
FLOW	Defines the properties of a material for the boundaries of an Eulerian mesh.
FLOWC	Defines the properties of a material for the boundaries of a Eulerian mesh.
FLOWDEF	Definition of default Eulerian flow boundary condition.
FLOWT	Defines the material properties for the in- or outflow of material through the boundary of an Euler mesh.
HYDSTAT	Initializes the Euler element densities in accordance to a hydrostatic pressure profile.

### Eulerian Initial Conditions (SOL 700)

CYLINDR	Cylindrical shape used in the initial condition definition on the TICEUL entry.
SPHERE	Spherical shape used in the initial condition definition on the TICEUL entry.
SURFINI	Defines a surface that is used for initialization of regions of an Eulerian mesh.
TICEL	Defines the initial values of element variables at the beginning of the analysis.
TICEUL1	Defines the initial values sets for Eulerian regions. The Eulerian regions are defined by geometric shapes.
TICREG	Defines the initial values sets for Eulerian regions. The Eulerian regions are defined by geometric shapes.
TICVAL	Defines the initial values of an Eulerian geometric region.

**Eulerian Materials (SOL 700)**

EOSDEF	EOSDEF defines the properties of the deflagration equation of state, and the reaction rate to model the burning of solid propellants. The burning of the solid propellant produces hot gas.
EOSGAM	Defines the properties of a Gamma Law equation of state where the pressure $p$ is defined.
EOSIG	Defines the properties of Ignition and Growth equation of state and the reaction rate equation used to model high explosives.
EOSJWL	Defines the properties of a JWL equation of state commonly used to calculate the pressure of the detonation products of high explosives.
EOSMG	Defines the properties of a Mie-Gruneisen equation of state commonly used to calculate the pressure $p$ in high strain rate processes.
EOSNA	Defines the properties of Noble-Abel equation of state.
EOSPOL	Defines the properties of a polynomial equation of state where the pressure $p$ is defined.
FAILJC	Defines the properties of the Johnson-Cook failure model.
FAILMPS	Defines the properties of a failure model where failure occurs when the equivalent plastic strain exceeds the specified value.
MATDEUL	Defines a complete constitutive model as a combination of an equation of state, a shear model, a yield model, a failure model, a spall model (PMIN), and corotational frame.
PMINC	Defines a spallation model where the minimum pressure is constant.
SHREL	Defines an elastic shear model with a constant shear modulus.
SHRPOL	Defines an elastic shear model with a polynomial shear modulus.
YLDHY	Defines a yield model with zero yield stress.
YLDJC	Defines a Johnson-Cook yield model where the yield stress is a function of effective plastic strain, strain rate, and temperature.
YLDMSS	Defines the yield model for snow material. This entry must be used in combination with MATDEUL, EOSPOL and SHREL.
YLDPOL	Defines a polynomial yield model where the yield stress is a function of effective plastic strain.
YLDRPL	Defines a rate power law yield model where the yield stress is a function of effective plastic strain and strain rate.
YLD SG	Defines the Steinberg-Guinan yield model where the yield stress is a function of effective plastic strain, pressure and temperature.
YLD TM	Defines the Tanimura-Mimura yield model where the yield stress is a function of effective plastic strain, strain rate and temperature.

YLDVM	Defines a bilinear or piecewise-linear yield model with isotropic hardening, using the von Mises yield criterion.
YLDZA	Defines the Zerilli-Armstrong yield model where the yield stress is a function of effective plastic strain, strain rate and temperature.

### Eulerian Solid Elements (SOL 700)

PEULER	Defines the properties of Eulerian element.
PEULER1	Eulerian element properties.

### Euler/Lagrange Coupling (SOL 700)

ABINFL	Defines an inflator model suited for airbag analyses.
COUCOHF	Defines a cohesive friction model suited for Euler Coupled analyses. The friction model is defined as part of the coupling surface.
COHFRIC	Allows friction and sticking during tensile conditions at the coupling surface.
COUOPT	Defines the interaction factor and a pressure load from the covered side acting on a BSURE.
COUPIFL	Defines the surrounding variables when a segment of a coupling surface fails.
COUPINT	Defines the surrounding variables when a segment of a coupling surface fails.
COUPLE	Defines a coupling surface that acts as the interface between an Eulerian (finite volume) and a Lagrangian (finite element) domain.
INFLCG	Defines the cold gas-inflator characteristics of a COUPLE and/or GBAG subsurface.
INFLFRC	Defines the gas fractions as a function of time for hybrid inflators.
INFLGAS	Defines a thermally ideal gas to be used with a standard or hybrid inflator.
INFLHB	Defines the hybrid-inflator characteristics of a COUPLE and/or GBAG subsurface.
INFLTNK	Defines the Tanktest-inflator characteristics of a COUPLE and/or GBAG subsurface.
INFLTR	Defines the inflator characteristics of a COUPLE and/or GBAG subsurface.
INITGAS	Specifies the initial gas composition inside a gasbag or Euler coupling surface.
LEAKAGE	Defines the porosity model to be used with GBAG or COUPLE.
PERMEAB	Defines the permeability of a COUPLE and/or GBAG (sub)surface.
PERMGBG	Defines a permeable area of a COUPLE and/or GBAG surface, connected to another GBAG.
PORFCPL	Defines an interaction between two coupling surfaces through a hole.
PORFLOW	Defines the material properties for the in- or outflow of an Eulerian mesh through a porous area of the couple surface.

PORFLWT	Defines a time dependent flow trough a porous area of the couple surface.
PORFGBG	Defines a hole in a couple and/or GBAG (sub)surface, connected to another GBAG.
PORHOLE	Defines a hole in a COUPLE and/or GBAG surface.
PORHYDS	Prescribes a hydrostatic pressure profile on a porous BSURE.

### Hourglass Control (SOL 700)

HGSUPPR	Defines the hourglass suppression method and the corresponding hourglass damping coefficients.
---------	--

### Initial Conditions (SOL 700)

TIC3	Allows for the definition of a velocity field of grid points consisting of a rotation and a translation specification. Used in Explicit Nonlinear (SOL 700) only.
------	---

### Materials (SOL 700)

MAT1	Defines the material properties for linear isotropic materials.
MAT2	Defines the material properties for linear anisotropic materials for two-dimensional elements.
MAT8	Defines the material property for an orthotropic material for isoparametric shell elements.
MATBV	Defines the bulk viscosity for materials.
MATEP	Elasto-plastic material properties for SOL 700 only.
MATF	Specifies failure model properties.
MATFAB	Defines the properties of a bi-directional woven fabric material for shell elements.
MATHE	Specifies hyperelastic (rubber-like) material properties for nonlinear analysis.
MATORT	Specifies elastic orthotropic material properties for 3-dimensional and plane strain and shell behavior for linear and nonlinear analyses.
MATRIG	Defines the properties of a rigid body.
MATVE	Specifies isotropic visco-elastic material properties to be used for quasi-static or dynamic analysis

### Miscellaneous (SOL 700)

BIAS	Specifies a variation of the mesh-size in one direction for use in the MESH entry.
CMARKB2	Defines a 2-noded marker beam element by means of connecting two grid points.
CMARKN1	Defines a 1-noded marker element on a grid point.
DETSPPH	Defines the ignition point from which a spherical detonation wave travels, causing the reaction of high explosive materials.

DYFSISW	Allows activating or deactivating Fluid Structure Interaction and Eulerian solver.
EULFOR	Defines a body force loading (acceleration) on Euler elements per unit mass.
EULFOR1	Alternative way to define an acceleration within a geometric region of the Euler model regions are defined by geometric shapes which are defined by EULFREG entries.
EULFREG	Defines the acceleration field for sets of Eulerian regions, The Eulerian regions are defined by geometric shapes. For each coordinate direction a time-dependent acceleration can be defined.
FFCONTR	Defines the pressure within a closed volume. Intended for the use in (partially) filled containers, where dynamic fluid effects are negligible, e.g. top loading and hot filling.
MESH	Defines a mesh.
PMARKER	Defines the behavior of the marker element in the FV domain.

#### Multi-Variable Parameters (SOL 700)

DYPARAM, ATBAOUT	Defines the frequency at which output is written to the main output file of ATB.
DYPARAM, ATBHOUT	A time-history file is created containing the output as requested in the ATB input file on cards H.1 to H.11.
DYPARAM, ATBTOUT	Defines the frequency at which output is written to the time-history files of ATB.
DYPARAM,AUTOCOUP	Defines the automatic coupling algorithm.
DYPARAM,AXIALSYM	Axial symmetric analysis.
DYPARAM,AXREMAP	Allows import of a 2D axial symmetric Euler archive into a 3D simulation.
DYPARAM,BULKL	Defines the default value of the linear bulk viscosity coefficient.
DYPARAM,BULKQ	Defines the default value of the quadratic bulk viscosity coefficient.
DYPARAM,BULKTYP	Defines the default type of bulk viscosity.
DYPARAM,CFULLRIG	Converts all 123456 constraints to the FULLRIG option on all entries.
DYPARAM,CLUFLIM	This DYPARAM activates a limiter that scales down the volume strain rate for clumps with a small average uncovered fraction. It can keep an instable airbag run stable, just like PARAM, VELMAX can keep runs stable.
DYPARAM,CLUMPENR	Sets the definition of the kinetic energy calculation method for Eulerian blended clumps.
DYPARAM,COHESION	Cohesion for Coulomb Friction

DYPARAM,CONM2OUT	Determines if a summary of concentrated masses and their energy and momentum is written to the output file.
DYPARAM,CONTACT	Defines certain defaults for the contact definitions.
DYPARAM,COSUBMXT	Defines the maximum number of subcycles that can occur in Euler/Lagrange coupling. During a subcycle, the geometry of the coupling surface is not updated. This number can vary in time and is given by a table.
DYPARAM,COUFRIC	Defines the Coulomb friction scheme.
DYPARAM,ELDLTH	Print initial time step sizes for elements in the first cycle.
DYPARAM,EULERCB	Divides a Euler domain into several cubes.
DYPARAM,EULTRAN	Sets the definition of the face velocity used in the transport scheme of the Multi-material solver and the single material strength solver.
DYPARAM,EUSUBCYC	Controls the growth of the subcycling interval in Euler computations.
DYPARAM,EUSUBMAX	Defines the maximum number of subcycles that can occur in the Euler solver. During a subcycle, the Euler computations are skipped.
DYPARAM,FAILDT	Defines the property of a failure model where element failure occurs when the element's time step falls below the specified limit.
DYPARAM,FAILOUT	Defines whether failed elements are written to the output file (ARCHIVES).
DYPARAM,FASTCOUP	Defines the fast coupling algorithm.
DYPARAM,FLOWMETH	Defines the method for simulating material flow between two Euler domains across open areas in coupling surfaces.
DYPARAM,GEOCHECK	This parameter forces a check of the geometry for consistent connectivity of the defined hexagonal elements and correction if needed.
DYPARAM,HGCMEM	Defines the default membrane damping coefficient for shell elements.
DYPARAM,HGCOEFF	Defines the global default hourglass damping coefficient.
DYPARAM,HGCSOL	Define the default damping coefficient for solid elements.
DYPARAM,HGCTWS	Defines the default twisting damping coefficient for shell elements.
DYPARAM,HGCWRP	Defines the default warping damping coefficient for shell elements.
DYPARAM,HGSHELL	Defines the default hourglass suppression method for shell elements.

DYPARAM,HGSOLID	Defines the default hourglass suppression method for solid elements.
DYPARAM,HGTYPE	Defines the default type of hourglass suppression method.
DYPARAM,HICGRAV	Defines the value of the gravity to be used by the HIC calculations.
DYPARAM,HVLFAIL	Defines element failure on the hydrodynamic volume limit
DYPARAM,HYDROBOD	Defines a body force for single hydro material in Euler.
DYPARAM,IMM	The option allows to specify the IMM method to be used.
DYPARAM,INFOBJ	Additional information about the BJOIN and spotweld connectivity will be listed in the output file.
DYPARAM,INISTEP	Defines the time step used at the start of the analysis.
DYPARAM,JWLDET	Specifies whether the blast wave of one explosive can ignite another explosive. Here it assumed that the explosives are modeled by a combination of EOSJWL and DETSPH entries.
DYPARAM,LIMCUB	Defines the maximum number of cubes used to sort the grid points in a contact definition.
DYPARAM,LIMITER	Defines the type and the spatial accuracy of scheme used in the Euler solver based on the ideas of Prof. Philip Roe.
DYPARAM,MATRMERG	Merges MATRIG and/or RBE2-FULLRIG rigid bodies into a new FULLRIG assembly.
DYPARAM,MATRMRG1	Merges MATRIG and/or RBE2-FULLRIG rigid bodies into one existing MATRIG or RBE2-FULLRIG assembly with predefined properties.
DYPARAM,MAXSTEP	Defines the maximum allowable time step.
DYPARAM,MESHPLN	Defines Mesh density for covering rigid planes.
DYPARAM,MINSTEP	Defines the minimum time step that causes the analysis to terminate.
DYPARAM,MIXGAS	Specifies whether the gas constants of the Euler material or of gas bags are updated based on the gas composition and temperature.
DYPARAM,NZEROVEL	Set the velocity of a node to zero in case all attached elements have failed.
DYPARAM,OLDLAGT	Activate the collapsed hexahedron scheme as default for lagrangian CTETRA elements.
DYPARAM,PARALLEL	The option allows you to gather information on the parallel section.
DYPARAM,PLCOVCUT	Defines time when PLCOVER is cut off.
DYPARAM,PMINFAIL	Defines Lagrangian solid element failure on reaching the spall limit.

DYPARAM,RBE2INFO	The grid points attached to MATRIG and RBE2assemblies are listed to the output file.
DYPARAM,RHOCUT	Defines the minimum density for all Eulerian elements.
DYPARAM,RJSTIFF	Defines the stiffness of a rigid joint.
DYPARAM,SHELLFRM	Sets the default for the shell formulation for quadrilateral elements.
DYPARAM,SHELMSYS	Defines the shell element system for the BLT shells.
DYPARAM,SHPLAST	Specifies the type of calculation used to determine the plane stress plasticity method for shells.
DYPARAM,SHSTRDEF	Specifies the default coordinate system for the stress and strain output of composite shells.
DYPARAM,SHTHICK	Specifies whether or not the thickness of the shell changes with membrane straining.
DYPARAM,SLELM	Defines whether shell sublayer variables are to be stored in the element arrays.
DYPARAM,SMP,BATCHSIZ	Define batch size and number of CPU loops, per entity type.
DYPARAM,SMP,CPUINFO	Define the CPU information per entity type.
DYPARAM,SNDLIM	Defines the minimum value for the speed of sound.
DYPARAM,SPHERSYM	Enables an efficient and accurate 1D spherical symmetric solution for Euleran materials
DYPARAM,STRNOUT	Saves the total strains and equivalent effective stress (von Mises stress) at shell sublayers for output.
DYPARAM,TOLCHK	To check the direction of an Euler face, the face normal vector is projected onto the closest coordinate direction. If this projection is 1, the normal is exactly in the coordinate direction. When this projection is within a sufficient small tolerance of 1, the face can be handled by fast coupling. The tolerance used is TOLCHK. If the projection is smaller than 1-TOLCHK, the face cannot be handled by fast coupling and the analysis terminates. Options are then to slightly increase TOLCHK, write out double precision format in PATRAN, use general coupling, or use the MESH entry. Increasing TOLCHK too much can make the coupling surface computation less accurate. To keep the computation accurate, the maximal allowed value of TOLCHK is 1e-6. If DYPARAM,TOLCHK is not used, the tolerance used is 1e-14.
DYPARAM,VDAMP	Controls the global damping in the dynamic relaxation.
DYPARAM,VELMAX	Defines the maximum velocity in Eulerian meshes.

DYPARAM,VELMAX1	Defines the maximum translational and angular velocity in Eulerian and Lagrangian meshes
DYPARAM,VISCPLAS	Activate the overstress formula to update strain-rate dependent plasticity. This formula is normally used for viscous-plastic material.

### Rigid Elements (SOL 700)

BJOIN	Defines (multiple) pairs of grid points of one-dimensional and/or shell elements to be joined during the analysis.
RBJOINT	Defines a joint between two rigid bodies.
WALL	Defines a rigid plane through which specified Lagrangian grid points cannot penetrate. Used in Explicit Nonlinear (SOL 700) only.

### Time Step Control (SOL 700)

TSTEPNL	Defines parametric controls and data for nonlinear transient structural or heat transfer analysis.
---------	--

### User Defined Subroutines (SOL 700)

COMPUDS	Defines an orthotropic failure model for shell composites specified by a user subroutine.
EOSUDS	Defines the frequency dependent properties for an isotropic poroelastic material.
FAILUDS	User defined simple failure of Eulerian materials.
FLOWUDS	Defines a flow boundary on an Eulerian mesh specified by a user subroutine.
FORCUDS	Defines enforced motion at grid points specified by a user subroutine.
NLOUTUD	User defined output requests for elements or Lagrangian grid points.
PORUDS	Defines a porosity model of a COUPLE surface through a user-written subroutine.
SHRUDS	Specifies that a user subroutine is being used to define the shear modulus.
TABLUDS	Specifies that a user routine is being used to define an arbitrary function.
TICEUDS	User defined simple failure of Eulerian materials.
YLDUDS	Specifies that a user subroutine is being used to define a simple yield model.

## Solution Control

### Aerodynamic Matrix Generation

- MKAERO1** Provides a table of Mach numbers (m) and reduced frequencies (k) for aerodynamic matrix calculation.
- MKAERO2** Provides a list of Mach numbers (m) and reduced frequencies (k) for aerodynamic matrix calculation.

### Aerodynamic Parameters

- AERO** Gives basic aerodynamic parameters for unsteady aerodynamics.
- AEROS** Defines basic parameters for static aeroelasticity.

### Aeroelastic Response Analysis

- AEDW** Defines a downwash vector associated with a particular control vector of the associated aerodynamic configuration (AECONFIG).
- AEFORCE** Defines a vector of absolute or “per unit dynamic pressure” forces associated with a particular control vector.
- AEPARM** Defines a general aerodynamic trim variable degree-of-freedom (aerodynamic extra point).
- AEPRESS** Defines a vector of pressure/unit dynamic pressure associated with a particular control vector.
- AESCALE** Defines reference lengths to scale aerodynamic grid points.
- GUST** Defines a stationary vertical gust for use in aeroelastic response analysis.
- TABRNDG** Defines the power spectral density (PSD) of a gust for aeroelastic response analysis.
- TRIM** Specifies constraints for aeroelastic trim variables. The SPLINE1 and SPLINE4 entries need to be here for the finite plate spline.
- UXVEC** Specification of a vector of aerodynamic control point values.

### Aeroelastic Stability Analysis

- DIVERG** Defines Mach numbers (m) for a static aeroelastic divergence analysis.
- FLFACT** Used to specify density ratios, Mach numbers, reduced frequencies, and velocities for flutter analysis.
- FLUTTER** Defines data needed to perform flutter analysis.

### Buckling Analysis

- EIGB** Defines data needed to perform buckling analysis.
- EIGRL** Defines data needed to perform real eigenvalue (vibration or buckling) analysis with the Lanczos method.

## Cyclic Symmetry

**CYSYM** Defines parameters for cyclic symmetry analysis.

## Eigenvalue Analysis

**EIGC** Defines data needed to perform complex eigenvalue analysis.

**EIGR** Defines data needed to perform real eigenvalue analysis.

**EIGRL** Defines data needed to perform real eigenvalue (vibration or buckling) analysis with the Lanczos method.

**EIGP** Defines poles that are used in complex eigenvalue extraction by the Determinant method.

**RVDOF,**  
**RVDOF1** Degrees-of-freedom specification for residual vector calculation.

## Monte-Carlo simulation

**MONCARL** Defines the parameters for Monte-Carlo simulations.

## Fatigue Analysis

**DTI,UNITS** Defines units necessary for conversion during the analysis for the Nastran/ADAMS interface and Nastran fatigue analysis.

**FTGDEF** Defines elements and their associated fatigue properties to be considered for fatigue analysis.

**FTGPARM** Defines parameters for a fatigue analysis

**FTGSEQ** Defines the loading sequence for pseudo-static fatigue analysis using SOL 101 or modal transient fatigue analysis using SOL 103 or SOL 112 or random vibration fatigue analysis using SOL 108 or SOL 111.

**FTGEVNT** Groups simultaneously applied loads into loading events for pseudo-static fatigue analysis using SOL 101 or modal transient fatigue analysis using SOL 103 or random vibration fatigue analysis using SOL 108 or SOL 111 by referencing FTGLOAD entries.

**FTGLOAD** Defines cyclic loading variation for pseudo-static fatigue analysis using SOL 101 or modal transient fatigue analysis using SOL 103 or random vibration fatigue analysis using SOL 108 or SOL 111.

**MATFTG** Defines fatigue material properties.

**PFTG** Defines fatigue elemental properties.

**RANDPS** Defines PSDs and cross PSDs for frequency domain fatigue (random vibration) analysis using SOL 108 or SOL 111.

**TABLFTG** Defines tabular data for specifying fatigue cyclic loading variation for time domain fatigue analysis using SOL 101 or SOL 103.

TABLRPC	Tabular functions for generating dynamic loads by reading the tabular data from an external channel data file.
TABRND1	Defines tabular data for specifying PSD random vibration loading for frequency domain fatigue (random vibration) analysis using SOL 108 or SOL 111.
TIM2PSD	Defines parameters and triggers conversion of time history channel data into corresponding Power Spectral Density (PSD) functions for use in random vibration fatigue analysis using SOL 108 or SOL 111.
UDNAME	Provides the name of a file that can be referenced from other bulk data entries such as FTGLOAD.

### Frequency Response

FREQ	Defines a set of frequencies to be used in the solution of frequency response problems.
FREQ1	Defines a set of frequencies for problem solution.
TABDMP1	Defines modal damping as a tabular function of natural frequency.

### Nonlinear Static Analysis

ITER	Defines options for the iterative solver in SOLs 101, 106, 108, 111, 153, 200 and 400.
NLADAPT	Defines additional parameters for automatic load or time stepping used with enhanced nonlinear in SOL 400.
NLPARAM	Defines a set of parameters for nonlinear static analysis iteration strategy.
NLPCI	Defines a set of parameters for the arc-length incremental solution strategies in nonlinear static analysis (SOL 106).
NLSTEP	Describes the Control Parameters for Mechanical, Thermal and Coupled Analysis in SOL 400 and for Contact Analysis in SOL 101.

### Optimization (SOL 200 Only)

BEADVAR	Defines design region for topography (bead or stamp) optimization.
BNDGRID	Specifies a list of grid point identification numbers on design boundaries or surfaces for shape optimization (SOL 200).
DCONADD	Defines the design constraints for a subcase as a union of DCONSTR entries.
DCONSTR	Defines design constraints.
DDVAL	Define real, discrete design variable values for discrete variable optimization.
DEQATN	Defines a design variable for design optimization.
DESVAR	Defines a design variable for design optimization.
DLINK	Relates one design variable to one or more other design variables.
DOPTPRM	Overrides default values of parameters used in design optimization.

DRESP1	Defines a set of structural responses that is used in the design either as constraints or as an objective.
DRESP2	Defines equation responses that are used in the design, either as constraints or as an objective.
DRESP3	Defines an external response using user-supplied routine.
DSCREEN	Defines screening data for constraint deletion.
DTABLE	Defines a table of real constants that are used in equations (see DEQATN entry).
DTABLE2	Defines real constants from a field of property, material or connections bulk data entries which can then be invoked by a DVxREL2, DRESP2, or DRESP3 entry.
DVBSHAP	Associates a design variable identification number to a linear combination of boundary shape vectors from a particular auxiliary model.
DVCREL1	Defines the relation between a connectivity property and design variables.
DVCREL2	Defines the relation between a connectivity property and design variables with a user-supplied equation.
DVGRID	Defines the relationship between design variables and grid point locations.
DVLR1	Defines the linear relation between analysis model loading and design variables
DVMREL1	Defines the relation between a material property and design variables.
DVMREL2	Defines the relation between a material property and design variables with a user-supplied equation.
DVPREL1	Defines the relation between an analysis model property and design variables.
DVPREL2	Defines the relation between an analysis model property and design variables with a user-supplied equation.
DVPSURF	Design Variable to Control Surface Setting Relation
DVSHAP	Defines a shape basis vector by relating a design variable identification number (DVID) to columns of a displacement matrix.
MODTRAK	Specifies parameters for mode tracking in design optimization (SOL 200).
SEDLINK	Multiple Design Variable Linking Across PART SE Boundary
SEDRSP2	Design Sensitivity Equation Response Quantities for PART SE
SEDRSP3	Defines External Response with User-Supplied Routines
STOCHAS	Randomization of Model Parameters
TOMVAR	Defines a design region for topometry optimization (element-by-element optimization).
TOPVAR	Defines a topology design region for topology optimization.

## Random Response

<a href="#">RANDPS</a>	Defines load set power spectral density factors for use in random analysis.
<a href="#">RANDT1</a>	Defines time lag constants for use in random analysis autocorrelation function calculation.
<a href="#">RCROSS</a>	Cross-power spectral density and cross-correlation function output.
<a href="#">TABRND1</a>	Defines power spectral density as a tabular function of frequency for use in random analysis. Referenced by the RANDPS entry.

## Rotordynamics

<a href="#">RGYRO</a>	Specifies synchronous or asynchronous analysis, reference rotor, and rotation speed of the reference rotor.
<a href="#">ROTBENT</a>	Define kinks and offsets to be applied on a rotor, pull the rotor on to its bearing and then carry out rotordynamic analysis (SOL 400 only).
<a href="#">ROTHYBD</a>	Hybrid damping for rotors
<a href="#">ROTOR</a>	Rotor Model Definition
<a href="#">ROTORAX</a>	Axisymmetric Model Rotor Definition
<a href="#">ROTORG</a>	Specifies grids that compose the rotor line model.
<a href="#">ROTORSE</a>	Specifies grids that compose the rotor line model.
<a href="#">RSPINR</a>	Specifies the relative spin rates between rotors for complex eigenvalue, frequency response, and static analysis.
<a href="#">RSPINT</a>	Specifies rotor spin rates for nonlinear transient analysis.
<a href="#">UNBALNC</a>	Specifies an unbalanced load for transient analysis in terms of a cylindrical system with the rotor rotation axis as the z-axis.

## Transient Response

<a href="#">TIC</a>	Defines values for the initial conditions of variables used in structural transient analysis.
<a href="#">TSTEP</a>	Defines time step intervals at which a solution will be generated and output in transient analysis.
<a href="#">TSTEPNL</a>	Defines parametric controls and data for nonlinear transient structural or heat transfer analysis. Is intended for SOLs 129, 159, and 99.

## Entries A - B

\$ Comment

Used to insert comments into the input file. Comment statements may appear anywhere within the input file.

Format:

\$ followed by any characters out to column 80.

Example:

```
$ TEST FIXTURE-THIRD MODE
```

Remarks:

1. Comments are ignored by the program.
2. Comments will appear only in the unsorted echo of the Bulk Data.
3. For free field entries (See Format of Bulk Data Entries above), a \$ can be used to terminate the field entries and any required remaining fields will be modulo replicated as blank.
4. For the default NASTRAN SYSTEM (IFPSTAR) = YES, input using FIXED field, a \$ can be used to terminate the field entries and any required remaining fields will be modulo replicated as blank. The OLD IFP (NASTRAN SYSTEM (IFPSTAR) = NO) will fail with this option.

/ Control Input Stream

Allows the user control over field width, and on restart entry deletion, insert and update, and process control. (This entry's execution is dependent on whether NASTRAN SYSTEM(444)= 0 or 1.)

Format:

1	2	3	4	5	6	7	8	9	10
/	Alpha numeric text as described below								

Examples:

/	0	12
/delete all		
/ Delete FORCE1,PARAM MATVP		

Describer	Meaning
/	Must be first character and occur somewhere in fields one through 8. (Character)
<i>If NASTRAN SYSTEM(444)=0, then the n1, n2 directive below is the only valid form:</i>	
n1,n2	Two integers indicating following number of lines of previous input are to be deleted. (Integer. n1 ≥ 10, n2 > n1). /, n1,n2 directive must be entered before any new data is added to the input stream.
<i>If NASTRAN SYSTEM(444)=1, then the above n1, n2 directive will not work and only the following forms are valid:</i>	
DELETE	Keyword indicating following listed items are to be deleted. (Character) /DELETE directive must be entered before any new data is added to the input stream.
ALL	Keyword indicating following a /DELETE directive. All previous input items will be deleted on RESTART. (Character)
List of names	A list of Bulk Data names to be deleted following a /DELETE directive. All previous input Bulk entries with the names indicated will be deleted on RESTART. (Character)
SFW	A Keyword that is used for fixed field entries and allows the user to define the field width of single field entries for Field 2 thru Field 9. See Remark 1. (Character)
n	Single Field Width value n used with SFW. This is used for fixed field entries and allows the user to define the field width of single field entries for Field 2 thru Field 9 to the value n.(Integer 8 ≤ n ≤ 14, Default = 8). If double field is selected by use of the * option, then Field 2 thru Field 9 are of 2n width. (Field 1 and Field 10 always remain of width 8). See Remark 1.

Describer	Meaning
SKIPON	Input data following this keyword would not be processed in the current execution. (Character). This command is terminated by one of three methods: 1) The occurrence of a SKIPOFF. 2) The occurrence of a BEGIN (Such as BEGIN SUPER=10) 3) The occurrence of an ENDDATA.
SKIPOFF	Keyword turning off the SKIPON command. (Character)
INSERT	Keyword that implies that entries when placed into the input stream must not be previously present. See Remark 1. (Character; Default for INITIAL runs.)
UPDATE	Keyword that implies that entries when placed into the input stream are new or are to replace existing entries. See Remark 1. (Character; Default for RESTART runs.)
DUPMETH	Keyword that allows reversion to the original IFP, DUPTOL tolerance selection. /DUPMETH=OLD selects original IFP tolerance selection. See the DPBLKTOL(402) system cell description and Remark 1. (Character; Default NEW for IFPSTAR tolerance selection).
DUPTOL	Keyword that allows a closeness tolerance value when searching for removal of duplicate entries. (Character)
v	Tolerance value, used with DUPTOL, when searching for removal of duplicate entries. See Remark 1. (Real $\geq 0.$ ; Default 1.0-5.)
LISTON	Keyword to indicate a "list of data to follow" See Remark 10. (Character)
LISTOFF	Keyword to indicate a "list of data is terminated" See Remark 10. (Character)

#### Remarks:

1. If the SFW, INSERT, UPDATE, DUPMETH, DUPTOL Keywords and any associated value (n, v) occur in the first BEGIN BULK Section the values set will carry forward to any other BEGIN section included. If a user wishes to have some later BEGIN have different control values, then the BEGIN BULK values can be overridden for that particular BEGIN Section by the inclusion of / entries particular to that specific BEGIN Section. The DUPMETH must come before the DUPTOL entry. Currently IFPSTAR will not recognize the settings from the command line or RC file due to default usage issues at the application state and real value passing through the component level. When DUPMETH is OLD and DPBLKTOL or DUPTOL is zero or positive, remove grids with duplicated id without checking CP, CD, PS ,SE fields and distance tolerance.

#### Example:

```

/DUPMETH=OLD
/DUPTOL=0.1
With the following NASTRAN entry required:
NASTRAN SYSTEM(402)=0.1

```

2. The input stream into Nastran is now part of a Common Data Model component and entries are committed to a data base as soon as they are interpreted in a single unsorted pass. When the user requests a sorted ECHO, the ECHO represents a binary value converted back into a column character location. It does not represent the actual binary entry value! Unsorted ECHO respects the request list of the ECHO command.
3. If an improperly formatted bulk data entry is encountered, the true file line number of the error is printed along with reference to the Parent entry. If the offending entry is in an include file the file is identified.
4. Usage of the continuation mnemonic is no longer needed and its usage is not recommended.
5. Default Fixed Fields are 80 characters (see SFW). Free field supports 128 characters.
6. Because the Common Data Model component entries are committed to a data base as soon as they are interpreted in a single unsorted pass, the /DELETE syntax is now required to be used on restart.
7. If an /INSERT is present on RESTART the Common Data Model component will signal an error condition EXCEPT when certain objects such as GRID entries have been classified as Remove Duplicate or when objects such as SPC that allow superposition are encountered.
8. Entries that allow superposition are always in /INSERT.
9. If NASTRAN SYSTEM(444)=1, then the Nastran Replication feature is not recommended.
10. For convenience in entering an ordered list of elements (tuples) data or, such as table value inputs, the following is allowed for example:

```

tabled1,111
  /liston
  1.0 1.0
  2.0 1.0
  3.0 2.0
  4.0 2.0
  5.0 1.0
  6.0 1.0
  /listoff
,endt

```

or for example if user likes commas:

```

tabled1,112
  /liston
  1.0, 1.0
  2.0, 1.0
  3.0, 2.0
  4.0, 2.0

```

5.0, 1.0

6.0, 1.0

/listoff

,endt

**ABINFL**

**Inflator Model to be Used With GBAG or COUPLE Entries**

Defines an inflator model suited for airbag analyses. The inflator model is defined as part of the GBAG or COUPLE surface. Used in SOL 700 only.

Format:

1	2	3	4	5	6	7	8	9	10
ABINFL	CID	INFID	SUBID	INFTYPE	INFTYPID	COEFF	COEFFV		

Example:

ABINFL	201	1	120	INFLHB	11		0.012		
--------	-----	---	-----	--------	----	--	-------	--	--

Describer	Meaning
CID	Unique number of a ABINFL entry. (Integer > 0; Required)
INFID	Number of a set of ABINFL entries NFID must be referenced from a GBAG or COUPLE entry. (Integer > 0; Required)
SUBID	Number of a BSURE, BCBOX, BCPROP, BCMATL or BCSEG, which must be a part of the as defined on the GBAG or COUPLE entry. (Integer > 0; Required)
INFTYPE	Defines the type of inflator. (Character; Required)
	INFLTR      The INFLTR logic is used to model inflators in an air bag.
	INFLHB      The INFLHB logic is used to model hybrid inflators in an air bag.
	INFLCG      The INFLCG logic models a cold gas inflator.
	INFLTNK     The INFLTNK logic models the inflator properties (mass flow rate and inflator gas temperature) calculated from the empirical results.
INFTYPID	Number of the entry selected under INFTYPE, for example, INFLTR,INFTYPID. (Integer > 0; Required)
COEFF	Method of defining the area coefficient. (Character, CONSTANT)
	CONSTANT    The area coefficient is constant and specified on COEFFV.
	TABLE        The area coefficient varies with time. COEFFV is the number of a TABLED1 entry giving the variation with time.
COEFFV	The area coefficient or the number of a TABLED1 entry depending on the COEFF entry. (0.0 < Real < 1.0 or 1 > 0)

Remarks:

1. The INFLTR or INFLHB inflator geometry and location is defined by a BSURF, BCBOX, BCPROP, BCMATL or BCSEG. The area of the hole through which the gas enters is equal to the area of the subsurface multiplied by COEFFV. A value of COEFFV = 1.0 will open up the complete subsurface area, while a value of COEFFV = 0.0 will result in a closed inflator area with no inflow.

2. This allows for setting up the exact same model for either a uniform pressure model or an Euler Coupled model. This makes it possible to set up the model using the switch from full gas dynamics to uniform pressure (GBAGCOU).

## ABSNMVB

### Meta data group Boolean name/value pairs

Associate Boolean Name/Value pairs to meta data collectors (ABSTRACT)

Format:

1	2	3	4	5	6	7	8	9	10
ABSNMVB	ABSTID		NAME1	VAL1	NAME2	VAL2	-etc.-	...	

Example:

1	2	3	4	5	6	7	8	9	10
ABSNMVB	50		STIFFNER	TRUE	VARSECT	FALSE			

Describer	Meaning
ABSTID	Unique identification number for meta data group (ABSTRACT). (Integer>0).
NAME <sub>i</sub>	Up to eight characters defining the name of this Name/Value pair. (Character).
VAL <sub>i</sub>	Value of this Name/Value pair -Boolean- data (Character) TRUE or FALSE.

Remarks:

1. This entry has no impact on the solution.
2. The only allowed character values are “TRUE” or “FALSE”.

## ABSNMVI

## Meta data group Integer name/value pairs

Associate Integer Name/Value pairs to meta data collectors (ABSTRCT).

Format:

1	2	3	4	5	6	7	8	9	10
ABSNMVI	ABSTID		NAME1	VAL1	NAME2	VAL2	-etc.-		

Example:

1	2	3	4	5	6	7	8	9	10
ABSNMVI	50		SPANS	12					

Describer	Meaning
ABSTID	Unique identification number for meta data group (ABSTRCT). (Integer>0).
NAMEi	Up to eight characters defining the name of this Name/Value pair. (Character).
VALi	Value of this Name/Value pair (Integer).

Remarks:

1. This entry has no impact on the solution.

## ABSNMVR

### Meta data group Real Name/Value pairs

Associate Real Name/Value pairs to meta data collectors (ABSTRCT).

Format:

1	2	3	4	5	6	7	8	9	10
ABSNMVR	ABSTID		NAME1	VAL1	NAME2	VAL2	-etc.-		

Example:

1	2	3	4	5	6	7	8	9	10
ABSNMVR	50		ANGLEA	15.0	ANGLEB	45.0			

Describer	Meaning
ABSTID	Unique identification number for meta data group (ABSTRCT). (Integer>0)
NAMEi	Up to eight characters defining the name of this Name/Value pair. (Character)
VALi	Value of this Name/Value pair (Real)

Remarks;

1. This entry has no impact on the solution.

## ABSNMVS

### Meta data group String name/value pairs

Associate String Name/Value pairs with meta data collectors (ABSTRCT).

Format:

1	2	3	4	5	6	7	8	9	10	
ABSNMVS	ABSTID									
	NAME1	VAL1								
	NAME2	VAL2								
	-etc.-									

Example:

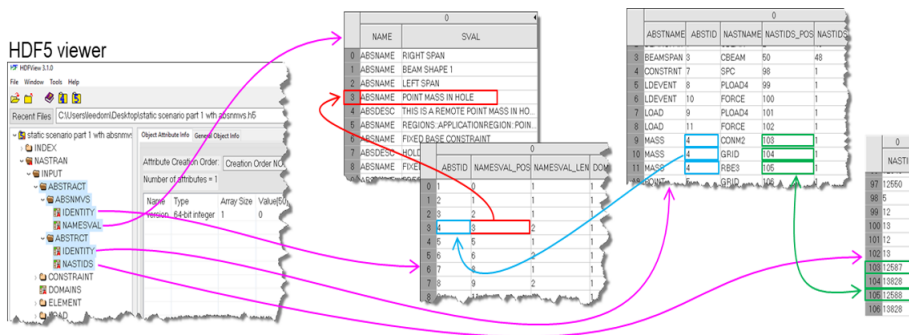

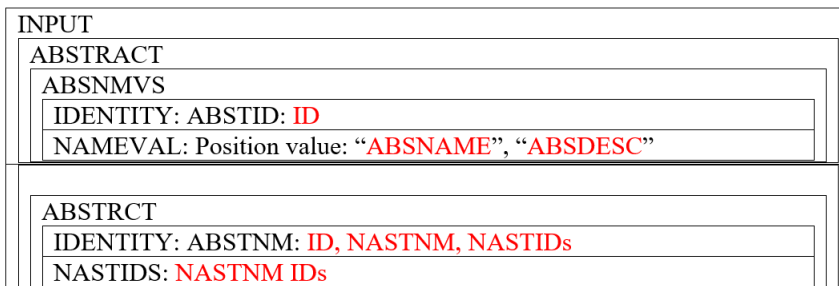

1	2	3	4	5	6	7	8	9	10	
ABSNMVS	50									
	ABSNAME	B pillar model year 2020								
	ABSDESC	B pillar including locking bushing								

Describer	Meaning
ABSTID	Unique identification number for meta data group (ABSTRCT). (Integer>0)
NAMEi	Up to eight characters defining the name of this Name/Value pair. (Character).
VALi	Value of this Name/Value pair. May consist of any Character A-Z, or numbers, and underscore or dash. Limited to 56 characters. (Character).

Remarks:

1. This entry has no impact on the solution.
2. The name/value pair entries may be specified in any order.

3. In the HDF5 viewer

4. In the above Example, the following SET3 entries might include:

```

$ CBEAM elements for B pillar
SET3, 10, ELEM, 7701, THRU, 7799
$ CBUSH elements for locking

## ABSTRCT

## Meta Data Collector for HDF5 output and post processing

Allows the user to define an arbitrary group of Nastran entities (ABSTRACTion), using any Nastran keyword type including elements, grids, materials, etc. and associate a name and description for the group.

Format:

1	2	3	4	5	6	7	8	9	10
ABSTRCT	ABSTNM	ABSTID	NASTNM	NASTID1	NASTID2	NASTID3	-etc.-		

Example:

1	2	3	4	5	6	7	8	9	10
ABSTRCT	PILLAR	50	CBEAM	10					
ABSTRCT	PILLAR	50	CBUSH	30					
ABSTRCT	PILLAR	50	RBE3	90					

Describer	Meaning
ABSTNM	Up to eight characters for the name of the meta data group. (Character).
ABSTID	Unique identification number for the meta data group. (Integer>0).
NASTNM	Up to eight characters for the name of the Nastran entity being added to the meta data group. (Character).
NASTIDi	ID referencing a Nastran entity of the specified type or a set of such entities.

Remarks:

1. The group definition is transmitted from the input file to the .op2 and/or .h5 results file with no impact on the solution.
2. The group definition can subsequently be recovered from either the .op2 or .h5 file by a post-processor.
3. Associated with this entry are the entries: [ABSNMVS](#), [ABSNMVB](#), [ABSNMVI](#), [ABSNMVR](#).

## ACCEL Acceleration Load

Defines static acceleration loads, which may vary over a region of the structural model. The load variation is based upon the tabular input defined on this Bulk Data entry.

Format:

1	2	3	4	5	6	7	8	9	10
ACCEL	SID	CID	N1	N2	N3	DIR			
	LOC1	VAL1	LOC2	VAL2	Continues in Groups of 2				

Example(s):

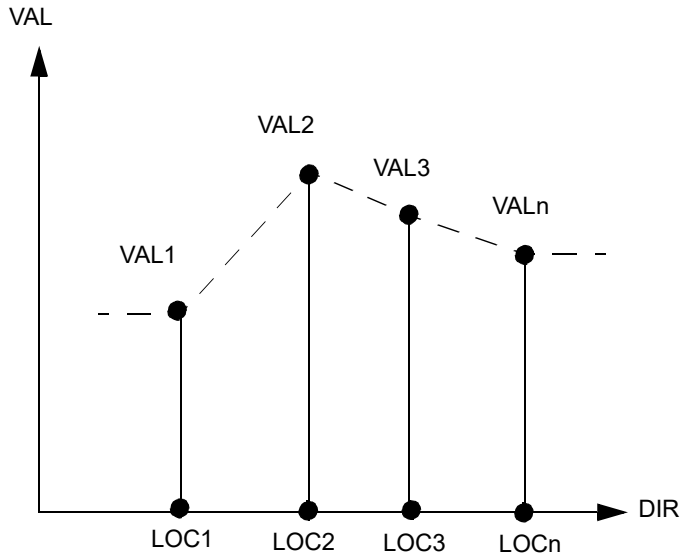

ACCEL	100	2	0.0	1.0	2.0	X			
	0.0	1.0	1000.0	3.0					

Descriptor	Meaning
SID	Load set identification number (Integer > 0)
CID	Coordinate system identification number. (Integer ≥ 0; Default = 0)
Ni	Components of the acceleration vector measured in coordinate system CID. (Real; at least one Ni ≠ 0.0)
DIR	Component direction of acceleration variation. (Character; one of X, Y, and Z)
LOCi	Location along direction DIR in coordinate system CID for specification of a load scale factor. (Real)
VALi	The load scale factor associated with location LOCi. (Real)

Remarks:

- For all grids of the model, the acceleration vector is defined by  $\vec{a} = VAL \cdot \vec{N}$ , where  $\vec{N}$  is the vector defined by (N1, N2, N3). The magnitude of  $\vec{a}$  is equal to VAL times the magnitude of  $\vec{N}$ . The scale factor VAL for each grid is found linearly interpolating the DIR coordinate of the grid between table values  $LOCi/VALi$ . If the GRID point coordinate in coordinate system CID is outside the range of the table, VAL is determined either from VAL1 or VALn (the last value, see the following figure).
- This type of acceleration load may be combined with other loads, such as FORCE, MOMENT, GRAV, and ACCEL1 loads, by specification on a LOAD entry. The SID on an ACCEL entry may not be the same as that of any other load entry.
- This acceleration load does not include effects due to mass on scalar points.
- A CID of zero references the basic coordinate system.
- The DIR field must contain one of the characters X, Y, or Z. The DIR direction defines the direction of acceleration load variation along direction 1, 2, or 3 respectively of coordinate system CID.

- A minimum of two pairs of {LOC<sub>i</sub>, VAL<sub>i</sub>} data must be specified.

Definition of Load Scale Factor vs Location

- If Modules are present then this entry may only be specified in the main Bulk Data section.
- In the static solution sequences, SID must be selected by the LOAD Case Control command. In the dynamic solution sequences, if there is a LOADSET Case Control command, then SID must be referenced in the LID field of a selected LSEQ entry. If there is no LOADSET Case Control command, then SID must be referenced in the EXCITEID field of an RLOAD<sub>i</sub> or TLOAD<sub>i</sub> entry.

## ACCEL1 Acceleration Load

Defines static acceleration loads at individual GRID points.

Format:

1	2	3	4	5	6	7	8	9	10
ACCEL1	SID	CID	A	N1	N2	N3			
	GRIDID1	GRIDID2	-etc.-						

Example(s):

ACCEL1	100	2	10.0	1.0	2.0	0.0			
	1	2	3	4	THRU	10	BY	2	
	20	21	THRU	30	40	52	69	70	
	82	90	100						

Descriptor	Meaning
SID	Load set identification number (Integer > 0)
CID	Coordinate system identification number. (Integer ≥ 0; Default = 0)
A	Acceleration vector scale factor. (Real)
Ni	Components of the acceleration vector measured in coordinate system CID. (Real; at least one Ni ≠ 0.0)
GRIDIDi	List of one or more GRID point identification numbers. Key words “THRU” and “BY” can be used to assist the listing. (Integer > 0)

Remarks:

- The acceleration vector is defined by  $\vec{a} = A \cdot \vec{N}$ , where  $\vec{N}$  is the vector defined by (N1, N2, N3).  
The magnitude of  $\vec{a}$  is equal to  $A$  times the magnitude of  $\vec{N}$ .
- This type of acceleration load may be combined with other loads, such as FORCE, MOMENT, GRAV, and ACCEL loads, by specification on a LOAD entry. The SID on an ACCEL1 entry may not be the same as that of any other load entry.
- This acceleration load does not include effects due to mass on scalar points.
- A CID of zero references the basic coordinate system.
- ACCEL1 loads are not supported with super elements.
- In the static solution sequences, SID must be selected by the LOAD Case Control command. In the dynamic solution sequences, if there is a LOADSET Case Control command, then SID must be referenced in the LID field of a selected LSEQ entry. If there is no LOADSET Case Control command, then SID must be referenced in the EXCITEID field of an RLOADi or TLOADi entry.

## ACCSSPT

## Access Point Definition

Defines a grid interior to an external superelement whose motion will be retained in the residual structure of the assembled superelement model. This entry is used during the external superelement creation run and is valid only in external superelements.

Format:

1	2	3	4	5	6	7	8	9	10
ACCSSPT	GID1	GID2	GIDi	etc					

Example:

ACCSSPT	117	119							
---------	-----	-----	--	--	--	--	--	--	--

Describer	Meaning
GIDi	Identification number of a grid point designated as an access point (Integer>0)

Remarks:

1. An access point may only be defined in an external superelement.
2. Access point IDs must be unique across all external superelements.
3. Access points must be interior points in the external superelement.
4. Access points will be automatically placed in the m-set of the residual structure of the assembly and will have the same displacements in the residual structure as it does in the external superelement.
5. If the user needs the access points to be in the a-set, or if user needs to connect access points from different superelements via MPCs, the following two parameters are required:  
PARAM, SEP1XOVR, 128  
PARAM, AUTOMSET, YES
6. If Modules are present then this entry may only be specified in the main Bulk Data section.

**ACLOAD****ACTRAN Acoustic Pressure Load Matrices for SOL 108/111**

Defines ACTRAN acoustic pressure load matrices.

Format:

1	2	3	4	5	6	7	8	9	10
ACLOAD	SID	UNIT1	UNIT2	SCLR	SCLI	LSQID			

Example(s):

ACLOAD	101	41	42	1.5					
--------	-----	----	----	-----	--	--	--	--	--

Field	Contents
SID	Set identification number. See Remark 1. (Integer > 0)
UNIT1	Fortran unit number of mapped data from ACTRAN. See Remark 2. (Integer > 0)
UNIT2	Fortran unit number of property matrices from ACTRAN. See Remark 2. (Integer > 0)
SCLR	The real part of complex scale factor to be multiplied to ACTRAN matrices. (Real; Default = 1.0)
SCLI	The imaginary part of complex scale factor to be multiplied to ACTRAN matrices. (Real; Default = 0.0)
LSQID	Load SeQuence IDentification number on an ACTRAN file with multiple load cases. (Integer > 0, default=1).

Remarks:

1. Dynamic excitation sets must be selected with the Case Control command `DLOAD = SID` for frequency response analysis.
2. The following type of `ASSIGN` should be specified in the FMS section with the vacant unit number (see `ASSIGN` statements). The unit number cannot be selected doubly.  
`ASSIGN INPUTT2='ACTRAN_pressure.f70' UNIT=41`  
`ASSIGN INPUTT4='ACTRAN_pressure.op4' UNIT=42`
3. `SID` must be unique for all `RLOAD1`, `RLOAD2`, `ACSRCE` and `ACLOAD` entries.
4. Refer the ACTRAN manual for the details of exportation of the acoustic pressure load matrix data for Nastran.
5. The residual vectors for `ACLOAD` will not be computed.
6. Value of `LSQID` that is greater than the actual load cases in the ACTRAN file is a fatal error.

**ACMODL**

**Fluid-Structure Interface Parameters**

Optional entry to define modeling parameters for Fluid-Structure Interface.

Format:

(If METHOD="BW")

<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>
ACMODL	INTER	INFOR	FSET	SSET	NORMAL	METHOD	SKNEPS	DSKNEPS	
	INTOL	ALLSSET	SRCHUNIT						

(If METHOD="CP")

ACMODL	INTER	INFOR	FSET	SSET	NORMAL	METHOD			
--------	-------	-------	------	------	--------	--------	--	--	--

Example(s):

ACMODL	IDENT				NORMAL				
--------	-------	--	--	--	--------	--	--	--	--

Describer	Meaning
INTER	Type of structure-fluid interface. (Character = "IDENT" or "DIFF"; Default = "DIFF")
INFOR	For METHOD = "BW" and INTER = "DIFF", indicates if FSET and SSET are used to define the fluid-structure interface, "NONE" if not used, and whether they contain grids or elements. (Character = "GRIDS", "ELEMENTS", "ALL", or "NONE", Default = "NONE")  For METHOD = "CP" and INTER = "DIFF", indicates if FSET and SSET are used to define the fluid-structure interface, "NONE" if not used. See Remark 10. (Character = "ALL", or "NONE", Default = "NONE")
FSET	Optional identification of a SET1 entry that contains a list of fluid elements or grids on the fluid "skin". See Remark 2. If Modules are present and the MDFSET entry is to be used instead of SET1 then set FSET to -1. (Integer -1 or >0 or blank).
SSET	Optional identification of a SET1 entry that contains a list of structural elements or grids on the structure-fluid interface. See Remark 2. If Modules are present and the MDSSET entry is to be used instead of SET1 then set SSET to -1. (Integer -1 or >0 or blank).
NORMAL	Fluid normal tolerance. See Remark 5. (Real; Default = 1.0 (Real; .001 for IDENT)
METHOD	Default = "BW" "BW" = Body in White method "CP" = Closed Pressure Vessel Method See Remarks 10. and 11.
SKNEPS	Fluid skin growth tolerance. (Real; Default 0.5)

Describer	Meaning
DSKNEPS	Secondary fluid skin growth tolerance (Real; Default .75)
INTOL	Tolerance of inward normal. (Real; Default .5)
ALLSSET	If “NO” then SSET structure is searched and coupled if found. If ‘YES’ then all the structure given by SSET is coupled. (Character = ‘YES’, or ‘NO’; Default = ‘NO’)
SRCHUNIT	Search units. (Character=‘ABS’ for absolute model units or ‘REL’ for relative model units based on element size; Default = ‘REL’)

#### Remarks:

1. Only one ACMODL entry is allowed. In general, for large irregular models, it is recommended that, initially, this entry not be used, so the defaults will be applied.
2. For METHOD = “BW” and INTER = “DIFF” (Default), FSET and SSET refer to either grids or elements as selected below. For INTER = “IDENT”, FSET and SSET refer to grids.
  - a. For INTER = “DIFF”, INFOR = “ELEMENTS”, for FSET, the search algorithm is restricted to elements referenced by FSET. For SSET, the search algorithm is restricted to elements referenced by SSET. This allows the user to de-select specific structural faces of a solid structural element. Both these sets are optional and the user can have one without the other.
  - b. For INTER = “DIFF”, INFOR = “GRIDS”, for FSET, the search algorithm is restricted to grids referenced by FSET. This allows the user to deselect fluid grids. Fluid grid selection is the only way to deselect specific fluid faces. For SSET, the search algorithm is restricted to grids referenced by SSET. This allows the user to de-select structural grids. Both these sets are optional and the user can have one without the other.
  - c. For INTER = “IDENT”, INFOR = “ALL”, the points referenced by FSET and SSET must lie exactly on the fluid-structure interface. These sets are optional, but if used, both must be present or no fluid interface is calculated.
3. For INTER = “DIFF”, a .PCH file is created with a SET1 representing the fluid “skin” and a SET1 representing the structure interface. This file is useful for graphic post-processing for viewing the interface. It also produces the sets that can be used as FSET and SSET.
4. For ALLSSET = ‘NO’ (default) the elements and grids determined by the couplings algorithm are written to the .PCH file. The user can then deselect elements or grids as defined by the .PCH file by editing them out of the SET1 entries defined in the file and referencing the edited SET1 with the SSET. To add structural elements that the coupling algorithm did not include in the .PCH file, it is not sufficient to just include them on the SET1 entry referenced by SSET. In addition, ALLSSET = ‘YES’ must be specified.
5. NORMAL determines the height of the fluid box in the outward normal direction to the fluid surface. The fluid box is used to locate the structural elements used in defining the fluid-structure coupling matrix. If L is the smallest edge of the fluid element surface, then the height of the box is  $L \times \text{NORMAL}$ .

For INTER = “IDENT”, NORMAL = .001 is the default and represents a tolerance, in units of length, used in determining the fluid-structure interface.

- SKNEPS represents the enlargement of the plane of the fluid surface used to define the search box. The diagonal distance from the center of the fluid surface to each surface grid is pushed out (diagonal  $\times (1. + SKNEPS)$ ).

- DSKNEPS represents a secondary enlargement of the plane of the fluid surface used to define the search box if SKNEPS fails to find ANY structural elements. The diagonal distance from the center of the fluid surface to each surface grid is pushed out (diagonal  $\times (1. + DSKNEPS)$ ).
- INTOL represents a normal direction into the fluid for the case when the fluid protrudes past the structural interface. It is defined as  $L \times INTOL$  where L is the smallest edge of the fluid element surface.
- The BW method is summarized in the following table:

Table of Fluid/Structure Search Control and Override METHOD=BW	
INFOR	Indicates the types of FSET and SSET entered
	ELEMENTS      Element sets are used to select element fluid and structure faces.
	GRIDS            Grid sets are used to select element fluid and structure faces.
FSET	Fluid Set ID to delete or add fluid faces to fluid/structure interface
	ALLSET=NO      Delete fluid element faces

Table of Fluid/Structure Search Control and Override METHOD=BW

	ALLSET=YES	Add fluid element faces
SSET		Structure Set ID to delete or add structure faces to fluid/structure interface
	ALLSET=NO	Delete structural element faces
	ALLSET=YES	Add structural element faces
		A SET specification will for the specified set given override any search parameters.  Caution: When deleting items from a set, especially structural element sets an element ID may occur more than once and ALL must be removed.
SRCHUNIT	REL	Units are in the units of smallest fluid edge of current fluid face being searched.  L = smallest fluid surface edge of element being searched.  D = Diagonal from center of fluid surface to each grid  NORMAL = Value_input * L, Height of box +normal to plane of fluid.  SKNEPS = D * (1.0 + Value_input), Search plane diagonals.  DSKNEPS = D * (1.0 + Value_input) Secondary search plane diagonals  DSKNEPS is only used when SKNEPS < DSKNEPS  INTOL = Value_input * L, Height of box -normal to plane of fluid.
	ABS	Normal units are in the UNITS of the STRUCTURE. Use when distance between the structure interface and the fluid interface is same constant everywhere.  NORMAL = Value_input  SKNEPS = As defined above but projected using ABS normal units  DSKNEPS = As defined above but projected using ABS normal units  INTOL = Value_input
ALLSSET	NO	Designed to take a modified PARAM SKINOUT PUNCH set and DELETE elements from either the FLUID element set or the STRUCTURE element set or BOTH. Note if the FLUID set has some deleted elements and the STRUCTURE set has added elements this option may result in some change of structure elements in the set and not keep the structural set UNMODIFIED or vice versa. This is because not all of the UNMODIFIED structure elements of the set project with the reduced set of Fluid elements or vice versa.  Recommended for DELETE only.

Table of Fluid/Structure Search Control and Override METHOD=BW		
	YES	<p>Designed to take a modified PARAM SKINOUT PUNCH set and ADD elements to either the FLUID element set or the STRUCTURE element set or BOTH. If some previously found FLUID and STRUCTURE are also deleted the algorithm keeps all the added set elements but will of course recomputed the interface for the deleted boundary so that a sensible set intersection is computed.</p> <p>Recommended for DELETE ADD.</p>
		<p>Do NOT use ALLSET =YES when no SETs are specified or one SET is specified and the search algorithm is being used for the other unspecified SET as ALLSET means USE ALL and all of the elements of the unspecified SET may be used.</p>
Coupling Algorithm		<ol style="list-style-type: none"> <li>1. Use the search box algorithm to locate the fluid free faces and the corresponding structural element faces.</li> </ol>
		<ol style="list-style-type: none"> <li>2. For a fluid free face and its list of structural element faces (that were determined by boxing normal to the fluid element) do as follows:             <ol style="list-style-type: none"> <li>a. For each fluid free face establish a face coordinate system.</li> <li>b. Determine the resultant pressure force for each grid on the fluid element.</li> <li>c. Resolve this resultant pressure force for a unit grid pressure to the grids of the fluid element. (Determined by principal virtual work).</li> <li>d. Using the origin of the free fluid face, determine the center of pressure.</li> <li>e. Using rigid body motion consider only a unit motion normal to the fluid face with the appropriate moment relationships, determine the resulting load distribution at the grids of each of the structural elements. The area of each structural element projected normal to the fluid element is used as a weighting function.</li> <li>f. Loop over each grid of the fluid element and accumulate the forces at the structural grids.</li> <li>g. The algorithm always maintains of rigid body equilibrium.</li> </ol> </li> <li>3. Repeat for the next fluid element and its associated group of structural elements. Accumulate the forces at the structural grids.</li> </ol>
Guidelines		<ol style="list-style-type: none"> <li>1. Run default ACMODL with PARAM , SKINOUT, PUNCH</li> <li>2. View SETS both FLUID and STRUCTURE.</li> <li>3. Adjust ACMODL search parameters until close to desired interface is obtained.</li> <li>4. Modify the FSET, or SSET, or both to include and exclude Grids or Elements as seems appropriate to get final coupling elements.</li> </ol>

Table of Fluid/Structure Search Control and Override METHOD=BW

	5. Run acoustic analysis with ACMODL using final FSET, SSET sets with ALLSET=YES if sets contain both deleted and added elements. Or ALLSET=NO (default) if sets only delete.
	6. The ABS option IS NOT RECOMMENDED for complex acoustic models such as body in white models with multi contouring surfaces.
Parallel Structural Element Meshes in the Search Box	When there are "parallel" overlapping structural meshes, the search algorithm will pick an element of the closest mesh to the fluid face. All elements connected to this first element are then checked to see if they are in the search box. Once an element, such as the elements of the outer parallel mesh, are found not to connect to the inner patch it is eliminated from the search. Thus outer patch elements tend to be excluded from the search unless some connectivity to the inner patch is detected. The ALLSET=YES is to force an interface between the listed structural elements and the nearest fluid faces.

10. The default METHOD is the new "BW" searching algorithm that requires a special license.

The pre-Version 2004 method is selected with METHOD = "CP" in which:

- The search box is not used so the SKNEPS, DSKNEPS, INTOL, ALLSET, SRCHUNIT fields are ignored.
- If INFOR = 'ALL' (METH = 'CP' only), then both FSET and SSET must be specified and matching is checked at only those grid points referenced by FSET and SSET.
- FSET and SSET refer to grids.
- NORMAL = blank is the default (recommended),  $1. \leq \text{NORMAL} \leq 10.$  gets acceptable results. In this case, NORMAL represents a maximum cutoff value measured in physical units. When NORMAL = 'blank', Nastran will compute the cutoff value.

This field replaces the pre-Version 2004 FSTOL field. Different units are also used so pre-Version 2004 FSTOL values may need to be changed to obtain the same results.

11. METH = 'CP' is not recommended when complex acoustic cavities (such as body in white automotive models) exist in the model.
12. If Modules are present then this entry may only be specified in the main Bulk Data section.

## ACPEMCP

## Trim Component Interface Coupling and Constraints Definition

Defines the interface coupling conditions and constraints of a trim component.

Format:

1	2	3	4	5	6	7	8	9	10
ACPEMCP	TID	SGLUED	SSLIDE	SOPEN	SIMPER	OOO	SPM	SAIRGAP	
	SCUX	SCUY	SCUZ	SCRX	SCRY	SCRZ	SCFP	RID	

Example:

ACPEMCP	1		1002		1004				
---------	---	--	------	--	------	--	--	--	--

Describer	Meaning
TID	Identification number of trim component. (Integer>0; Required)
SGLUED	Identification number of SET1/SET3 entry of grids belonging to the solid-phase and/or structure volume elements in the trim component, which are glued to a structure; see Remark 2. (Integer≥0 or Blank)
SSLIDE	Identification number of SET1/SET3 entry with grids belonging to the solid-phase and/or structure volume elements in the trim component, which are in the sliding-contact to a structure; see Remark 3. (Integer0 or Blank)
SOPEN	Identification number of SET1/SET3 entry of grids belonging to the fluid-phase elements in the trim component, which has an open interface with the cavities; see Remark 4. (Integer≥0 or Blank)
SIMPER	Identification number of SET1/SET3 entry of grids of the solid-phase and/or structure volume elements in the trim component, which has an impervious interface with the cavities; see Remark 5. (Integer≥0 or Blank)
OOO	Number of blocks for Out-Of-Core solver, see remark 8. (Integer>1, Default=1)
SPM	Flag for selecting single precision MUMPS for computing reduced impedance matrix, see Remark 9. (Integer=>=0, default=0)
SAIRGAP	Identification number of SET1/SET3 entry with grids belonging to the solid-phase and/or structure volume elements in the trim component, which are in contact with structure via air gap. See Remark 10. (Integer = 0 or Blank)
SCUX	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in translation X direction of output coordinate system.
SCUY	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in translation Y direction of output coordinate system.
SCUZ	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in translation Z direction of output coordinate system.

Describer	Meaning
SCRX	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in rotation X direction of output coordinate system.
SCRY	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in rotation Y direction of output coordinate system.
SCRZ	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in rotation Z direction of output coordinate system.
SCFP	ID of SET1/SET3 with which grid IDs in the trim component TID is zero-constrained in fluid pressure.
RID	ID of a region of a TRMC. (Blank or Integer>0, Default=0).

#### Remarks:

1. ACPEMCP is a required entry for each trim component that is referenced by TRIMGRP. It must be put in the main Bulk Data section or BEGIN BULK. It specifies the boundary coupling conditions as well as the coupling degrees of freedom for computing the reduced boundary impedance matrices of the trim component.
2. A glued interface means that the trim component is completely constrained on to the structure, such as a car body. There is no relative movement between the trim component and the structure at the interface.
3. A sliding interface means that the trim component is laid on the surface of structure, such as a car body. There is no relative movement in the normal direction of the interface between the trim component and the structure. Relative sliding movement is allowed in the contact surface.
4. An open interface means that the free flow of fluid between the fluid-phase and cavities occurs at the interface.
5. An impervious or closed interface means that the fluid flow between the trim component and cavities is prohibited at the interface. This can happen when the porous material is covered by a thin film which stops the fluid flow or the cavity is in touch with a structure part of the trim component.
6. The SET1/SET3 entries must reside in the Bulk Data section introduced by Case Control, BEGIN BULK TRMC.
7. Under current PEM implementation, only 3D elements are allowed for trim components. Hence, SCRX, SCRY and SCRZ fields of ACPEMCP are not processed.
8. OOC is intended for large trim component. The number of OOC field defines the number of blocks to be used for the Schur complement evaluation which reduces the memory requirement. A side effect of OOC>1 is full RIM is generated, instead of lower triangular RIM, which is similar to PARAM,PEMFRIM,1.
9. SPM is a flag for selecting single precision MUMPS in ACTRAN. With default value of 0, double precision MUMPS is utilized. Single precision MUMPS will be used with SPM field having value greater 0. Single precision MUMPS has the benefits of reduced memory requirement and better performance. However, single precision MUMPS may suffer minor degradation on accuracy.

10. An air gap interface means the trim component is assumed to be coupled to the structure through a very thin air layer. The thin air layer is taken into the analysis without being modeled (not being defined in the trim model file).
11. A TRMC can have many ACPEMCP entries. However, an ACPEMCP of a TRMC with blank RID field is a must before ACPEMCP with non-blank RID can show up.

ACSRCE

Acoustic Source Specification

Defines acoustic source as a function of power vs. frequency.

$$\text{Source Strength} = \{A\} \cdot \left[ \frac{1}{2\pi f \sqrt{\rho}} \sqrt{8\pi CP(f)} \right] e^{i(\theta + 2\pi f\tau)}$$

$$C = \sqrt{B/\rho}$$

Format:

1	2	3	4	5	6	7	8	9	10
ACSRCE	SID	EXCITEID	DELAYI/ DELAYR	DPHASEI/ DPHASER	TP/RP	RHO	B		

Example:

ACSRCE	103	11	20	5.0	12	1.0	15.0		
--------	-----	----	----	-----	----	-----	------	--	--

Describer	Meaning
SID	Load set identification number. See Remarks 1. and 3. (Integer > 0)
EXCITEID	Identification number of DAREA, FBALOAD (in FRF Based Assembly or FBA process) or SLOAD entry set the defines {A}. See Remark 6. (Integer > 0)
DELAYI	Identification number of DELAY or FBADLAY (in FRF Based Assembly or FBA process) Bulk Data entry that defines time delay τ. See Remarks 4. and 5. (Integer > 0 or blank)
DELAYR	Value of time delay τ that will be used for all fluid degrees-of-freedom that are excited by this dynamic load entry. See Remark 5. (Real or blank)
DPHASEI	Identification number of DPHASE or FBAPHAS (in FRF Based Assembly or FBA process) Bulk Data entry that defines phase angle θ. (See Remarks 4. and 5. (Integer > 0 or blank)
DPHASER	Value of phase angle θ (in degrees) that will be used for all fluid degrees-of-freedom that are excited by this dynamic load entry. See Remark 5. (Real or blank)
TP	Identification number of a TABLEDi entry that defines power versus frequency, P(f). (Integer > 0)
RP	Value of power P to be used for all frequencies (Real, non-zero)
RHO	Density of the fluid. (Real > 0.0)
B	Bulk modulus of the fluid. (Real > 0.0)

Remarks:

1. Acoustic sources must be selected in the Case Control Section with DLOAD = SID.
2. For additional remarks, see the RLOAD1 entry description.

3. SID need not be unique for all ACSRCE, RLOAD1, RLOAD2, TLOAD1 and TLOAD2 dynamic load entries. The DLOAD = SID Case Control command will select all dynamic load entries with the set identification of SID.
4. The referenced EXCITEID, DELAY, and DPHASE entries must specify fluid points only.
5. If any of the DELAYI/DELAYR or DPHASEI/DPHASER fields are blank or zero, the corresponding  $\tau$  or  $\theta$  will be zero.
6. If there is no LOADSET Case Control command, then EXCITEID may reference DAREA and SLOAD entries. If there is a LOADSET Case Control command, then EXCITEID may reference DAREA entries as well as SLOAD entries specified by the LID field in the selected LSEQ entry corresponding to EXCITEID.
7. If Modules are present then this entry may only be specified in the main Bulk Data section.

## ACTIVAT Defines Elements That Were Previously Deactivated and Should Be Reactivated for a Particular Subcase in SOL 600

This entry allows the user to re-activate certain elements that were previously deactivated in a previous subcase in SOL 600.

### Format:

1	2	3	4	5	6	7	8	9	10
ACTIVAT	ID	IGEOM	ISET						

### Example:

ACTIVAT	3	0	300						
---------	---	---	-----	--	--	--	--	--	--

Describer	Meaning
ID	Identification number of a matching Case Control ACTIVAT command defining the subcase to which these elements should be activated. (Integer; no Default)
IGEOM	Flag to control whether to update the geometry on the post file. (Integer; Default = 0) 0        Update the geometry. 1        Do not update the geometry.
ISET	ID of a list of elements described by SET3 is ID=ISET to be activated. (Integer; no Default)

### Remark:

1. This entry maps to Marc's ACTIVATE History definition option.

## ACTRIM

## ACTRAN Trimmed Material Matrices for SOL 108/111

Defines ACTRAN trimmed material matrices.

Format:

1	2	3	4	5	6	7	8	9	10
ACTRIM	NAME	UNIT1	UNIT2	SCLR	SCLI				

Example(s):

ACTRIM	FLOOR	31	32	2.0	0.5				
--------	-------	----	----	-----	-----	--	--	--	--

Field	Context
NAME	Name of the ACTRAN trimmed material matrices. See Remark 1. (One to eight alphanumeric characters, the first of which is alphabetic)
UNIT1	Fortran unit number of mapped data from ACTRAN. See Remark 2. (Integer > 0)
UNIT2	Fortran unit number of property matrices from ACTRAN. See Remark 2. (Integer > 0)
SCLR	The real part of complex scale factor to be multiplied to ACTRAN matrices. (Real; Default = 1.0)
SCLI	The imaginary part of complex scale factor to be multiplied to ACTRAN matrices. (Real; Default = 0.0)

Remarks:

1. ACTRAN trimmed material matrices defined by this entry will be used for frequency response analysis if it is selected via the Case Control ACTRIM = NAME.
2. The following type of ASSIGN should be specified in the FMS section with the vacant unit number (see ASSIGN statements). The unit number cannot be selected doubly.  
 ASSIGN INPUTT2='ACTRAN\_trimmed.f70' UNIT=31  
 ASSIGN INPUTT4='ACTRAN\_trimmed.op4' UNIT=32
3. Refer the ACTRAN manual for the details of exportation of the trimmed material matrix data for Nastran.

## ADUMi Dummy Element Attributes

Defines attributes of the dummy elements ( $3 \leq i \leq 9$ ).

Format:

1	2	3	4	5	6	7	8	9	10
ADUMi	NG	NC	NP	ND	ELNM				

Example:

ADUM8	18	0	5	0	CRAC2D				
-------	----	---	---	---	--------	--	--	--	--

Describer	Meaning
NG	Maximum number of grid points that may be connected by DUMi dummy element (Integer>0.)
NC	Number of additional fields (Ai) on the CDUMi connection entry. (Integer $\geq 0$ )
NP	Number of additional fields (Ai) on the PDUMi property entry. ( $24 \geq \text{Integer} \geq 0$ )
ND	Number of displacement components at each grid point used in generation of the differential stiffness matrix. Zero implies no differential stiffness. (Integer 3 or 6)
ELNM	The name of the element connection and property entry. In the example above, the connection entry is named "CRAC2D" and the property entry is named "PRAC2D".

Remarks:

ADUM8 and ADUM9 are used exclusively for the CRAC2D and CRAC3D entries respectively.

## AECOMP

## Component for an Integrated Load Monitor Point

Defines a component for use in monitor point definition or external splines.

Format:

1	2	3	4	5	6	7	8	9	10
AECOMP	NAME	LISTTYPE	LISTID1	LISTID2	LISTID3	LISTID4	LISTID5	LISTID6	
	LISTID7	-etc.-							

Example:

AECOMP	WING	AELIST	1001	1002					
--------	------	--------	------	------	--	--	--	--	--

Describer	Meaning
NAME	A character string of up to eight characters identifying the component. (Character)
LISTTYPE	One of CAERO, AELIST or CMPID for aerodynamic components and SET1 for structural components. Aerodynamic components are defined on the aerodynamic ks-set mesh while the structural components are defined on the g-set mesh. See Remarks 2. and 4.
LISTID <sub>i</sub>	The identification number of either SET1, AELIST or CAERO <sub>i</sub> entries that define the set of grid points that comprise the component. See Remarks 2. and 4.

Remarks:

1. The Identification name must be unique among all AECOMP and AECOMPL entries.
2. If the component is defined on the structure, LISTIDs must refer to SET1 entry(ies) that define the list of associated GRID points. For the AELIST or CAERO option, the LISTIDs must refer to AELIST or CAERO *i* entries, respectively. Note that, for DLM models (CAERO1/2), the set of points defined by the AELIST are the box identification numbers. For example, if the control surface's grids are desired, the same AELIST used for the AESURF can be referred to here. An AECOMP component must be defined as either an aerodynamic mesh component or a structural component. The two mesh classes cannot be combined into a single component.
3. The AECOMPL entry can be used to combine AECOMP entries into new components. When combining components, the structural and aerodynamic classes must be kept separate.
4. If LISTTYPE = CMPID, LISTID1 identifies the associated set of AEQUAD4, AETRIA3 elements that define the aero component.

**AECOMPL****Component for an Integrated Load Monitor Point**

Defines a component for use in aeroelastic monitor point definition or external splines as a union of other components.

Format:

1	2	3	4	5	6	7	8	9	10
AECOMPL	NAME	LABEL1	LABEL2	LABEL3	LABEL4	LABEL5	LABEL6	LABEL7	
	LABEL8	-etc.-							

Example:

AECOMPL	HORIZ	STAB	ELEV	BALANCE					
---------	-------	------	------	---------	--	--	--	--	--

Describer	Meaning
NAME	A character string of up to eight characters Identifying the component. (Character)
LABELi	A string of 8 characters referring to the names of other components defined by either AECOMP or other AECOMPL entries.

Remarks:

1. The Identification name must be unique among all AECOMP and AECOMPL entries.
2. The AECOMPL entry can be used to combine AECOMP entries into new components. When combining components, the structural and aerodynamic classes must be kept separate.

## AEDW

## Parametric Normal Wash Loading for Aerodynamics

Defines a downwash vector associated with a particular control vector of the associated aerodynamic configuration (AECONFIG). From this downwash vector, a force vector on the aerodynamic grids will be defined for use in nonlinear static aeroelastic trim.

Format:

1	2	3	4	5	6	7	8	9	10
AEDW	MACH	SYMXZ	SYMXY	UXID	DMIJ	DMIJI			

Example:

AEDW	0.90	SYMM	ASYMM	101	ALP1				
------	------	------	-------	-----	------	--	--	--	--

Describer	Meaning
MACH	The Mach number for this force, see Remark 2. (Real $\geq 0.0$ , $\neq 1.0$ )
SYMXZ,SYMXY	The symmetry of this force vector. One of SYMM, ASYMM or ANTI (Character).
UXID	The identification number of a UXVEC entry that defines the control parameter vector associated with this downwash vector.
DMIJ	The name of a DMI or DMIJ entry that defines the downwash.
DMIJI	The name of a DMIJI entry that defines the CAERO2 interference element “downwashes”.

Remarks:

1. The AEDW, AEFORCE and AEPRESS are associated with the current AECONFIG using either Case Control (if in the main Bulk Data Section) or using the BEGIN AECONFIG=<config> if in a partition of the Bulk Data.
2. The DMIJ field refers to either a DMI or a DMIJ entry. The DMIJI is only applicable to CAERO2 and is only required if nonzero “downwash” (j-set) input is needed on the interference body elements.
3. Mach numbers > 1.0 require that the supersonic aerodynamic option be available.

## AEFACT Aerodynamic Lists

Defines real numbers for aeroelastic analysis.

Format:

<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>
AEFACT	SID	D1	D2	D3	D4	D5	D6	D7	
	D8	D9	-etc.-						

Example:

AEFACT	97	.3	.7	1.0					
--------	----	----	----	-----	--	--	--	--	--

Describer	Meaning
SID	Set identification number. (Unique Integer > 0)
Di	Number. (Real)

Remarks:

1. AEFACT entries must be selected by a CAEROi, PAEROi or SPLINEX entry.
2. Embedded blank fields are not allowed.
3. To specify division points, there must be one more division point than the number of divisions.
4. When referenced by the CAERO3 entry, AEFACT defines the aerodynamic grid points. The ID number of the first point defined by each AEFACT entry is the value of the CAERO3 ID that selected the AEFACT entry. The ID of each following point defined on the AEFACT is incremented by 1.

## AEFORCE

## Parametric Force for Aerodynamics

Defines a vector of absolute or “per unit dynamic pressure” forces associated with a particular control vector. This force vector may be defined on either the aerodynamic mesh (ks-set) or the structural mesh (g-set). The force vector will be used in static aeroelastic trim.

Format:

1	2	3	4	5	6	7	8	9	10
AEFORCE	MACH	SYMXZ	SYMXY	UXID	MESH	LSET	DMIK	PERQ	

Example:

AEFORCE	0.90	SYMM	ASYMM	101	AERO		BETA		
---------	------	------	-------	-----	------	--	------	--	--

Descriptor	Meaning
MACH	The Mach number for this force. (Real $\geq 0.0$ , $\neq 1.0$ )
SYMXZ,SYMXY	The symmetry conditions for this force vector. One of SYMM, ASYMM or ANTI. (Character)
UXID	The identification number of a UXVEC entry that defines the control parameter vector associated with this force vector.
MESH	One of AERO or STRUCT that declares whether the force vector is defined on the aerodynamic ks-set mesh or the structural g-set mesh.
LSET	SID of a load set that defines the vector. See Remark 2. (Integer $> 0$ if MESH=STRUCT)
DMIK	The name of a DMIK entry that defines the aerodynamic force vector. See Remark 3. (Character; Required if MESH=AERO)
PERQ	The string PERQ or blank. If PERQ and MESH=STRUCT, the input FORCE set is multiplied by the dynamic pressure. (Default = blank; see Remark 4.)

Remarks:

1. The AEFORCE is associated with the current AECONFIG and must be entered for the appropriate Mach numbers and aerodynamic symmetries.
2. For the STRUCT mesh option, the LSET can refer to any existing load type (e.g., FORCE1, PLOAD4 or LOAD) that is available to define static loads.
3. For the AERO mesh option, the DMIK Bulk Data are used. Any forces associated with the aerodynamic model’s permanently SPC’d degrees-of-freedom (which are dependent on the type of aerodynamic model being used) will be ignored.
4. For the AERO mesh option, the PERQ field is not used. The FORCE data input on the DMIK entry is always multiplied by dynamic pressure.

## AERGRID

## Aerodynamic Grid Point

Defines the location of an aerodynamic grid point.

Format:

1	2	3	4	5	6	7	8	9	10
AERGRID	GID	CP	X1	X2	X3	CD	ASID		

Example:

AERGRID	1	1	2.1	3.2	2.0	3	4		
---------	---	---	-----	-----	-----	---	---	--	--

Describer	Meaning
GID	Grid Point Identification Number ( $0 < \text{Integer} < 100,000,000$ )
CP	Identification number of a coordinate system in which the location of the grid point is defined. ( $\text{Integer} \geq 0$ or blank)
X1, X2, X3	Location of the grid point in the coordinate system CP.
CD	Identification number of coordinate system in which the degrees-of-freedom of the grid point are defined. ( $\text{Integer} \geq 0$ or blank)
ASID	Identification number of an AESCALE Bulk Data entry. ( $\text{Integer} > 0$ or blank)

Remarks:

1. All grid point identification numbers must be unique with respect to all other aerodynamic grid point identification numbers.
2. If both CP and ASID are defined, coordinates are first scaled and subsequently transformed to the basic coordinate system.
3. The meaning of X1, X2 and X3 depends on the type of coordinate system CP. (See Remark 2 of the GRID entry).
4. A zero or blank in the CP and CD fields refers to the basic coordinate system.
5. The AERGRID, AETRIA3, AEQUAD4, and AESCALE entries provide an aerodynamic mesh in a readable, portable format. There are no internal aerodynamics created on this mesh.

## AELINK Links Aeroelastic Variables

Defines relationships between or among AESTAT and AESURF entries, such that:

$$u^D + \sum_{i=1}^n C_i u_i^I = 0.0$$

Where:

$u^D$  = dependent variable  
 $u_i^I$  = independent variable

Format:

1	2	3	4	5	6	7	8	9	10
AELINK	ID	LABLD	LABL1	C1	LABL2	C2	LABL3	C3	
	LABL4	C4	-etc.-						

Example:

AELINK	10	INBDA	OTBDA	-2.0					
--------	----	-------	-------	------	--	--	--	--	--

Describer	Meaning
ID	If an integer > 0 is specified, this is the TRIM set ID selected in Case Control and the AELINK only applies to that subcase. If an integer value of 0 or the character string "ALWAYS" is specified, this AELINK is applicable to all subcases. (Integer $\geq 0$ or the "ALWAYS" character string.)
LABLD	Character string to identify the dependent aerodynamic variable. (Character)
LABLi	Character string to identify the i-th independent aerodynamic variable. (Character)
Ci	Linking coefficient for the i-th variable. (Real)

Remarks:

1. If the ID is a positive integer, the AELINK entry (or entries) is selected by the TRIM=ID in Case Control.
2. If the ID is 0 or the character string ALWAYS, the linking relationship applies to all subcases.
3. The entry constrains the dependent variable to be a linear combination of the independent variables.
4. LABLD data must be unique for a given ID or if ID=0 or ALWAYS is being used (i.e., the variable cannot be constrained more than once).
5. LABLD and LABLi refer to AEPARM, AESTAT or AESURF Bulk Data entries.

## AELIST

## Aerodynamic List

Defines a list of aerodynamic elements or grid ID's.

Format:

1	2	3	4	5	6	7	8	9	10
AELIST	SID	E1	E2	E3	E4	E5	E6	E7	
	E8	-etc.-							

Example:

AELIST	75	1001	THRU	1075	1101	THRU	1109	1201	
	1202								

Describer	Meaning
SID	Set identification number. (Integer > 0)
Ei	List of aerodynamic box ID's or aerodynamic grid ID's (Integer>0 or "THRU")

Remarks:

1. The AELIST entry can be referenced by AESURF, AECOMP, SPLINEi, SPLINRB, SPBLND2 and SPRELAX entries. Refer to these entries for the meaning of the data provided.
2. When the "THRU" option is used, all intermediate grid points must exist. The word "THRU" may not appear in field 3 or 9 (2 or 9 for continuations).
3. Intervening blank fields are not allowed.

## AELISTC

## Character Item List

Defines a list of 8-character strings.

Format:

1	2	3	4	5	6	7	8	9	10
AELISTC	SID	C1	C2	C3	C4	C5	C6	C7	
	C8	-etc.-							

Example:

AELISTC	101	FBS	STRING12						
---------	-----	-----	----------	--	--	--	--	--	--

Describer	Meaning
SID	Set identification number. (Integer > 0)
Ci	List of 8-character strings.

Remark:

1. Intervening blank fields are not allowed.

## AEPARM

### General Controller for Use in Trim

Defines a general aerodynamic trim variable degree-of-freedom (aerodynamic extra point). The forces associated with this controller will be derived from AEDW, AEFORCE and AEPRESS input data.

Format:

1	2	3	4	5	6	7	8	9	10
AEPARM	ID	LABEL	UNITS						

Example:

AEPARM	5	THRUST	LBS						
--------	---	--------	-----	--	--	--	--	--	--

Describer	Meaning
ID	Controller identification number. (Integer > 0)
LABEL	Controller name. See Remark 1. (Character)
UNITS	Label used to describe the units of the controller values. (Character)

Remarks:

1. Controller LABELs that comprise the unique set relative to all the AESURF, AESTAT and AEPARM entries will define the set of trim variable degrees-of-freedom for the aeroelastic model.
2. Unit labels are optional and are only used to label outputs. No units will be associated with the controller if left blank.

## AEPRESS

## Parametric Pressure Loading for Aerodynamics

Defines a vector of pressure/unit dynamic pressure associated with a particular control vector. From this pressure vector, a force vector on the aerodynamic grids will be defined for use in nonlinear static aeroelastic trim.

Format:

1	2	3	4	5	6	7	8	9	10
AEPRESS	MACH	SYMXZ	SYMXY	UXID	DMIJ	DMIJI			

Example:

AEPRESS	0.90	SYMM	ASYMM	101	ALP1				
---------	------	------	-------	-----	------	--	--	--	--

Descriptor	Meaning
MACH	The Mach number for this force, see Remark 2. (Real $\geq 0.0$ , $\neq 1.0$ )
SYMXZ,SYMXY	The symmetry of this force vector. One of SYMM, ASYMM or ANTI. (Character)
UXID	The identification number of a UXVEC entry that defines the control parameter vector associated with this pressure vector.
DMIJ	The name of a DMI or DMIJ entry that defines the pressure per unit dynamic pressure.
DMIJI	The name of a DMIJI entry that defines the CAERO2 interference element “downwashes”.

Remarks:

1. The AEDW, AEFORCE, and AEPRESS are associated with the current AECONFIG using Case Control.
2. Mach numbers  $> 1.0$  require that the supersonic aerodynamic option be available.
3. The DMIJ field refers to either a DMI or a DMIJ entry. The DMIJI is only applicable to CAERO2 and is only required if nonzero “downwash” (j-set) input is needed on the interference body elements.

## AEQUAD4 Quadrilateral Aerodynamic Element Connection

Defines the connectivity of a quadrilateral aerodynamic element.

Format:

1	2	3	4	5	6	7	8	9	10
AEQUAD4	EID	CMPID	G1	G2	G3	G4			

Example:

AEQUAD4	100	2	12	32	41	50			
---------	-----	---	----	----	----	----	--	--	--

Describer	Meaning
EID	Element Identification Number. (0 < Integer < 100,000,000)
CMPID	Aerodynamic Component Identification Number. (Integer > 0)
Gi	Grid Point Identification Numbers of Connection Points. (Integer > 0)

Remarks:

1. The geometry of a quadrilateral aerodynamic element may collapse to a triangle, i.e., two connection points may have the same geometric location. However, all four grid point identification numbers must be different.
2. The AEGRID, AETRIA3, AEQUAD4, and AESCALE entries provide an aerodynamic mesh in a readable, portable format. There are no internal aerodynamics created on this mesh.

## AERO Aerodynamic Physical Data

Gives basic aerodynamic parameters for unsteady aerodynamics.

Format:

1	2	3	4	5	6	7	8	9	10
AERO	ACSID	VELOCITY	REFC	RHOREF	SYMZX	SYMXY			

Example:

AERO	3	1.3+4	100.	1.-5	1	-1			
------	---	-------	------	------	---	----	--	--	--

Describer	Meaning
ACSID	Aerodynamic coordinate system identification. See Remark 2. (Integer $\geq 0$ ; Default is the basic coordinate system)
VELOCITY	Velocity for aerodynamic force data recovery and to calculate the BOV parameter. See Remark 5. (Real $> 0.0$ or blank)
REFC	Reference length for reduced frequency. (Real $> 0.0$ )
RHOREF	Reference density. (Real $> 0.0$ )
SYMZX	Symmetry key for the aero coordinate x-z plane. See Remark 6. (Integer = +1 for symmetry, 0 for no symmetry, and -1 for antisymmetry; Default = 0)
SYMXY	The symmetry key for the aero coordinate x-y plane can be used to simulate ground effect. (Integer = -1 for symmetry, 0 for no symmetry, and +1 for antisymmetry; Default = 0)

Remarks:

1. This entry is required for aerodynamic problems. Only one AERO entry is allowed.
2. The ACSID must be a rectangular coordinate system. Flow is in the positive x-direction.
3. Set SYMXY = -1 to simulate ground effect.
4. PARAM,WTMASS does not affect aerodynamic matrices. RHOREF must be input in mass units.
5. VELOCITY is used only in aeroelastic response analysis, and it must be equal to V on the GUST Bulk Data entry.
6. The symmetry fields on this entry are only used if neither of the Case Control commands (AESYMX, AESYMXZ) are supplied. If either Case Control command is supplied, even the defaults from Case will override these Bulk Data entries. The Case Control symmetry is the preferred means of declaring the flow and geometric symmetry for aeroelastic analysis.

## AEROS

### Static Aeroelasticity Physical Data

Defines basic parameters for static aeroelasticity.

Format:

1	2	3	4	5	6	7	8	9	10
AEROS	ACSID	RCSID	REFC	REFB	REFS	SYMXZ	SYMXY		

Example:

AEROS	10	20	10.	100.	1000.	1			
-------	----	----	-----	------	-------	---	--	--	--

Describer	Meaning
ACSID	Aerodynamic coordinate system identification. See Remark 2. (Integer $\geq 0$ ; Default is the basic coordinate system)
RCSID	Reference coordinate system identification for rigid body motions. (Integer $\geq 0$ ; Default is the basic coordinate system)
REFC	Reference chord length. (Real $> 0.0$ )
REFB	Reference span. (Real $> 0.0$ )
REFS	Reference wing area. (Real $> 0.0$ )
SYMXZ	Symmetry key for the aero coordinate x-z plane. See Remark 6. (Integer = +1 for symmetry, 0 for no symmetry, and -1 for antisymmetry; Default = 0)
SYMXY	The symmetry key for the aero coordinate x-y plane can be used to simulate ground effects. (Integer = +1 for antisymmetry, 0 for no symmetry, and -1 for symmetry; Default = 0)

Remarks:

1. This entry is required for static aeroelasticity problems. Only one AEROS entry is allowed.
2. The ACSID must be a rectangular coordinate system. Flow is in the positive x-direction (T1).
3. The RCSID must be a rectangular coordinate system. All AESTAT degrees-of-freedom defining trim variables will be defined in this coordinate system.
4. REFB should be full span, even on half-span models.
5. REFS should be half area on half-span models.
6. The symmetry fields on this entry are only used if neither of the Case Control commands (AESYMY, AESYMXZ) are supplied. If either Case Control command is supplied, even the defaults from Case will override these Bulk Data entries. The Case Control symmetry is the preferred means of declaring the flow and geometric symmetry for aeroelastic analysis.

## AESCALE

## Aerodynamic Grid Point Scaling

Defines reference lengths to scale aerodynamic grid points.

Format:

1	2	3	4	5	6	7	8	9	10
AESCALE	ASID	X1REF	X2REF	X3REF					

Example:

AESCALE	100	1	1	1					
---------	-----	---	---	---	--	--	--	--	--

Describer	Meaning
ASID	Identification Number called out on an AEGRID entry. ( $0 < \text{Integer} < 100,000,000$ )
X1REF	Reference length to scale X1. (Real or blank; Default = 1.0)
X2REF	Reference length to scale X2. (Real or blank; Default = 1.0)
X3REF	Reference length to scale X3. (Real or blank; Default = 1.0)

Remark:

1. The scaled coordinates are computed from  $X_iS = X_i \cdot X_iREF$ .
2. The AEGRID, AETRIA3, AEQUAD4, and AESCALE entries provide an aerodynamic mesh in a readable, portable format. There are no internal aerodynamics created on this mesh.

## AESTAT

## Static Aeroelasticity Trim Variables

Specifies rigid body motions to be used as trim variables in static aeroelasticity.

Format:

1	2	3	4	5	6	7	8	9	10
AESTAT	ID	LABEL							

Example:

AESTAT	5001	ANGLEA							
--------	------	--------	--	--	--	--	--	--	--

Describer	Meaning
ID	Identification number of an aerodynamic trim variable degree-of-freedom. See Remark 1. (Integer > 0)
LABEL	An alphanumeric string of up to eight characters used to identify the degree-of-freedom. See Remark 1. (Character)

Remarks:

- The degrees-of-freedom defined with this entry represent rigid body motion in the reference coordinate system defined on the AEROS entry. The standard labels that define the various rigid body motions are as follows:

**Table 1      Standard Labels Defining Rigid Body Motions**

LABEL	Degree-of-Freedom Motion	Description
ANGLEA	$u_r$ (R2)	Angle of Attack
SIDES	$u_r$ (R3)	Angle of Sideslip
ROLL	$\dot{u}_r$ (R1)	Roll Rate = pb/2V
PITCH	$\dot{u}_r$ (R2)	Pitch Rate = qc/2V
YAW	$\dot{u}_r$ (R3)	Yaw Rate = rb/2V
URDD1	$\ddot{u}_r$ (T1)	Longitudinal (See Remark 3.)
URDD2	$\ddot{u}_r$ (T2)	Lateral
URDD3	$\ddot{u}_r$ (T3)	Vertical
URDD4	$\ddot{u}_r$ (R1)	Roll
URDD5	$\ddot{u}_r$ (R2)	Pitch
URDD6	$\ddot{u}_r$ (R3)	Yaw

These reserved names may be defined on the AEPARM entry instead, in which case the incremental load due to the unit perturbation of the rigid body degree-of-freedom (as it will with AESTAT). See the AEPARM, AEPRESS, and AEFORCE entries.

2. The degrees-of-freedom defined with this entry are variables in the static aeroelastic trim solution, unless they are constrained by referencing them with a TRIM Bulk Data entry.
3. If a label other than those above is specified, then the user must either generate the corresponding forces with an AELINK or via a DMI Bulk Data entry along with a DMAP alter that includes the DMIIN module and additional statements to merge into the appropriate matrices. Or, using AEPARM and the AEDW, AEPRESS, and/or AEFORCE, you can accomplish this purpose without the need for any alters.

## AESURF

## Aerodynamic Control Surface

Specifies an aerodynamic control surface as a member of the set of aerodynamic extra points. The forces associated with this controller will be derived from rigid rotation of the aerodynamic model about the hinge line(s) and from AEDW, AEFORCE and AEPRESS input data. The mass properties of the control surface can be specified using an AESURFS entry.

Format:

1	2	3	4	5	6	7	8	9	10
AESURF	ID	LABEL	CID1	ALID1	CID2	ALID2	EFF	LDW	
	CREFC	CREFS	PLLIM	PULIM	HMLLIM	HMULIM	TQLLIM	TQULIM	

Example:

AESURF	6001	ELEV	100	100	200	200			
	10.0	180.0			-1.4E4	1.2E4	20	30	

Describer	Meaning
ID	Controller identification number. (Integer > 0)
LABEL	Controller name. (Character)
CIDi	Identification number of a rectangular coordinate system with a y-axis that defines the hinge line of the control surface component. (Integer > 0)
ALIDi	Identification of an AELIST Bulk Data entry that identifies all aerodynamic elements that make up the control surface component. (Integer > 0)
EFF	Control surface effectiveness. See Remark 4. (Real ≠ 0.0; Default = 1.0)
LDW	Linear downwash flag. See Remark 2. (Character, one of LDW or NOLDW; Default = LDW).
CREFC	Reference chord length for the control surface. (Real > 0.0; Default = 1.0)
CREFS	Reference surface area for the control surface. (Real > 0.0; Default = 1.0)
PLLIM,PULIM	Lower and upper deflection limits for the control surface in radians. (Real, Default = ± π/2)
HMLLIM,HMULIM	Lower and upper hinge moment limits for the control surface in force-length units. (Real; Default = no limit)
TQLLIM,TQULIM	Set identification numbers of TABLEDi entries that provide the lower and upper deflection limits for the control surface as a function of the dynamic pressure. (Integer > 0; Default = no limit)

**Remarks:**

1. The ID on AESURF, AESTAT, and AEPARM entries are ignored. AESURFS can be used to define mass properties of the control surface.
2. The degrees-of-freedom defined on this entry represent a rigid body rotation of the control surface components about their hinge lines. In the default LDW (Linear DownWash) case, the downwash due to a unit perturbation of the control surface will be computed as part of the database. In the NOLDW case, the user must prescribe the controller's effects by direct definition of the induced forces using the AEPRESS, AEDW and/or AEFORCE entries.
3. Either one or two control surface components may be defined.
4. If EFF is specified, then the forces produced by this surface are modified by EFF (e.g., to achieve a 40% reduction, specify EFF=0.60).
5. The continuation is not required.
6. The CREFC and CREFS values are only used in computing the nondimensional hinge moment coefficients.
7. Position limits may be specified using either PiLIM or TQiLIM, but not both.
8. Position and hinge moment limits are not required.

## AESURFS

### Structural Grids on an Aerodynamic Control Surface

Optional specification of the structural nodes associated with an aerodynamic control surface that has been defined on an AESURF entry. The mass associated with these structural nodes define the control surface moment(s) of inertia about the hinge line(s).

Format:

1	2	3	4	5	6	7	8	9	10
AESURFS	ID	LABEL		LIST1		LIST2			

Example:

AESURFS	6001	ELEV		6002		6003			
---------	------	------	--	------	--	------	--	--	--

Describer	Meaning
ID	Controller identification number, see Remark 1. (Integer > 0)
LABEL	Controller name, see Remark 1. (Character)
LISTi	Identification number of a SET1 entry that lists the structural grid points that are associated with this component of this control surface. (Integer > 0)

Remarks:

1. The LABEL on the AESURFS entry must match one on an AESURF entry. The ID is ignored.
2. The mass of the GRID points listed on the SETi entries is used to compute the mass moment of inertia of the control surface about its i-th hinge line. The presence of these data will allow the hinge moments to include the inertial forces in the computations. These data are optional, and, if omitted, result in hinge moments which include only the applied, aeroelastically corrected, forces.
3. These data will be associated to a structural superelement by grid list or partitioned SUPER=<seid> if the AESURFS is defined in the main bulk data section.

**AETRIA3**

## Triangular Aerodynamic Element Connection

Defines the connectivity of a triangular aerodynamic element.

Format:

1	2	3	4	5	6	7	8	9	10
AETRIA3	EID	CMPID	G1	G2	G3				

Example:

AETRIA3	3768	8	368	872	999				
---------	------	---	-----	-----	-----	--	--	--	--

Describer	Meaning
EID	Element Identification Number. (0 < Integer < 100,000,000)
CMPID	Aerodynamic Component Identification Number. (Integer > 0)
Gi	Grid Point Identification Numbers of Connection Points. (Integer > 0)

Remarks:

1. The AEGRID, AETRIA3, AEQUAD4, and AESCALE entries provide an aerodynamic mesh in a readable, portable format. There are no internal aerodynamics created on this mesh.

## ALIASM

## Alias Element Formulation in SOL 600

Allows selected elements which normally use a default formulation to be aliased to a different formulation in SOL 600.

Format:

1	2	3	4	5	6	7	8	9	10
ALIASM	TYPE	ID1	THRU	ID2	BY	ID			

Example:

ALIASM	139	101	THRU	300	BY	2			
	138	501	THRU	600					

Describer	Meaning
ITYPE	Desired element formulation type. (Integer; no Default.) See Marc Vol B for a list of element types in the example, type 139 is a bilinear 3-node thin shell. ITYPE = -1 means to use the companion reduced integration element formulation (if it exists) default full integration formulation. (See Note 4)
ID1	Starting element number to be aliased. (Integer; no Default)
THRU	Enter "THRU" if a range of elements is to be specified. (Character; no Default)
ID2	Ending element number to be aliased. (Integer; no Default)
BY	Enter "BY" if the range of elements is not to be incremented by one.
ID3	Element "increment by" value. (Integer; Default = 1; must be positive)

Remarks:

1. This entry should only be used if the Marc GEOMETRY entries are identical for the original and new element types.
2. This entry may be repeated as often as desired to identify all elements requiring aliases.
3. ITYPE and ID1 are required fields. All other data fields may be blank.
4. This entry may not be combined with parameters MRALIAS, MALIAS02, MALIAS03, etc.
5. If all elements of a particular type should have alias values, it may be easier to use parameters MRALIAS, MALIAS02, MALIAS03, etc. than this entry.
6. For ITYPE = -1, the following reduced integration element types will be used:

Original Type	Reduced Integration Type	Description
26	53	Plane stress 8-node quad
27	54	Plane strain 8-node quad
28	55	Axisymmetric 8-node quad
29	56	Generalized plane strain 8+2 node quad
21	57	20-node brick
32	58	Plane strain Herrmann quad
33	59	Axisymmetric Herrmann 8-node quad
34	60	Plane strain Herrmann 8+2 node quad
35	61	Herrmann 20-node brick
62	73	Axisymmetric 8-node quad, arbitrary
63	74	Axisymmetric Herrman 8-node quad
3	114	Plane stress quad
11	115	Plane strain quad
10, 20	116	Axisymmetric ring (quad)
7	117	8-node brick
80	118	Plane strain incompressible quad
82, 83	119	Axisymmetric incompressible ring
84	120	8-node incompressible brick
75	140	4-node quad

## ASET Degrees-of-Freedom for the a-set

Defines degrees-of-freedom in the analysis set (a-set).

Format:

1	2	3	4	5	6	7	8	9	10
ASET	ID1	C1	ID2	C2	ID3	C3	ID4	C4	

Example:

ASET	16	2	23	3516	1	4			
------	----	---	----	------	---	---	--	--	--

Describer	Meaning
IDi	Grid or scalar point identification number. (Integer > 0)
Ci	Component numbers. (Integer zero or blank for scalar points, or any unique combinations of the Integers 1 through 6 for grid points with no embedded blanks.)

Remarks:

1. Degrees-of-freedom specified on this entry form members of the mutually exclusive a-set. They may not be specified on other entries that define mutually exclusive sets. See [Degree-of-Freedom Sets](#) for a list of these entries.
2. When ASET, ASET1, QSET, and/or QSET1 entries are present, all degrees-of-freedom not otherwise constrained (e.g., SPCi or MPC entries) will be placed in the omitted set (o-set).
3. In nonlinear analysis, all degrees-of-freedom attached to nonlinear elements must be placed in the a-set. In other words, if the ASET or ASET1 entry is specified then all nonlinear degrees-of-freedom must be specified on the ASET or ASET1 entry.
4. SOL 400 does not support ASETi, OMITi, BSETi, CSETi, SUPORTi, and QSETi except in the following situations:
  - a. Multidisciplinary (linear) analysis. See Remark 3-e. under the ANALYSIS Case Control command regarding “Standard linear physics”. This means there are no subcases for nonlinear analysis using ANALYSIS=NLSTATICS, NLTRAN, HSTAT or HTRAN.
  - b. Linear perturbation with:
    - i. EXTSEOUT Case Control command for external superelement creation. This includes runs with AVLEXB Case Control command.
    - ii. ADAMSMNF Case Control command. These entries must be specified in the BEGIN BULK FLXBDY section. See Remark 21. under the ADAMSMNF Case Control command.
  - c. Superelements defined with BEGIN SUPER may contain ASETi, OMITi, BSETi, CSETi, and QSETi entries.

## ASET1 Degrees-of-Freedom For the a-set, Alternate Form of ASET Entry

Defines degrees-of-freedom in the analysis set (a-set).

Format:

1	2	3	4	5	6	7	8	9	10
ASET1	C	ID1	ID2	ID3	ID4	ID5	ID6	ID7	
	ID8	ID9	ID10	-etc.-					

Example:

ASET1	345	2	1	3	10	9	6	5	
	7	8							

Alternate Format and Example:

ASET1	C	ID1	“THRU”	ID2					
ASET1	123456	7	THRU	109					

Describer	Meaning
C	Component number. (Integer zero or blank for scalar points, or any unique combinations of the Integers 1 through 6 for grid points with no embedded blanks.)
IDi	Grid or scalar point identification numbers. (Integer > 0; for THRU option, ID1 < ID2)

Remarks:

1. Degrees-of-freedom specified on this entry form members of the a-set that is exclusive from other sets defined by Bulk Data entries. See [Degree-of-Freedom Sets](#) for a list of these entries.
2. When ASET, ASET1, QSET, and/or QSET1 entries are present, all degrees-of-freedom not otherwise constrained (e.g., SPCi or MPC entries) will be placed in the omitted set (o-set).
3. If the alternate format is used, all points in the sequence ID1 through ID2 are not required to exist, but there must be at least one degree-of-freedom in the a-set for the model, or a fatal error will result. Any points implied in the THRU that do not exist will collectively produce a warning message but will otherwise be ignored.
4. In nonlinear analysis, all degrees-of-freedom attached to nonlinear elements must be placed in the a-set. In other words, if the ASET or ASET1 entry is specified then all nonlinear degrees-of-freedom must be specified on the ASET or ASET1 entry.
5. SOL 400 does not support ASETi, OMITi, BSETi, CSETi, SUPORTi, and QSETi except in the following situations:

- a. Multidisciplinary (linear) analysis. See Remark 3-e. under the ANALYSIS Case Control command regarding “Standard linear physics”. This means there are no subcases for nonlinear analysis using ANALYSIS=NLSTATICS, NLTRAN, HSTAT or HTRAN.
- b. Linear perturbation with:
  - i. EXTSEOUT Case Control command for external superelement creation. This includes runs with AVLEXB Case Control command.
  - ii. ADAMSMNF Case Control command. These entries must be specified in the BEGIN BULK FLXBDY section. See Remark 21. under the ADAMSMNF Case Control command.
- c. Superelements defined with BEGIN SUPER may contain ASETi, OMITi, BSETi, CSETi, and QSETi entries.

## ATBACC

## Acceleration Field applied to ATB Segments- SOL 700

Defines an acceleration field that will be applied to ATB segments. Used in SOL700 only.

Format:

1	2	3	4	5	6	7	8	9	10
ATBACC	LID		SCALE	NX	NY	NZ			
+	NAME1	NAME2	NAME3	NAME4	NAME5	NAME6	NAME7	NAMEi	

Example:

ATBACC	32		386.088	1.0	0.0	0.0	0	0	
+	LT	MT	UT	N	H	RUL	RLL		

Field	Content
LID	Number of a set of loads. (Integer > 0; required)
SCALE	ATBACC scale factor. (Real ≥ 0.0; default=1.0)
NX, NY, NZ	Components of gravity vector. At least one component must be nonzero. (Real; default=0.0)
NAMEi	Name of an ATB segment as given in the first field of a B.2 entry in the ATB input file. (Character; required)

Remarks:

- The acceleration is defined as:  

$$\alpha(t) = T(t).SCALE. N$$

where SCALE is the acceleration scale factor; is the vector defined by NX, NY, and NZ; is the value interpolated at time from the table referenced by the TLOADn entry.
- LID must be referenced by a TLOADn entry.
- The type field on the TLOADn entry must be set to zero.
- More than one ATBACC acceleration field can be defined per problem.
- This acceleration field is intended to apply a crash pulse to ATB segments that define a crash dummy. The acceleration is multiplied by the mass of the segment and the resulting force is added as an external force.
- To compare the accelerations of the ATB segments to experiments, the crash pulse needs to be subtracted from the total acceleration. The acceleration of the segments as defined on the H1 entries in the ATB input file are automatically corrected.

## ATBJNT Interface to ATB Joints- SOL 700

This entry can only be used together with the ATBSEG entries that this joint connects. The ATBSEG entries overwrite the position and orientation of the ATB segments as specified in the ATB input file. The ATBJNT entry can be used to create a Bulk Data file containing elements and grid points to visualize the ATB segment together with its joints. This visualization of the joints makes it possible to position the ATB model in any available preprocessor. Used in SOL700 only.

### Format:

1	2	3	4	5	6	7	8	9	10
ATBJNT	ID	NAME							
+	G0	G1	G2	G3	EID1	EID2	EID3		
+	G4	G5	G6	G7	EID4	EID5	EID6		

### Example:

ATBJNT	1	HN							
+	1010	1011	1012	1013	1004	1005	1006		
+	2010	2011	2012	2013	2004	2005	2006		

Field	Content
LID	Unique ATBJNT number. (Integer > 0; required)
NAME	Name of an ATB joint as given in the first field of a B.3 entry in the ATB input file. (Character; required)
G0-G7	An ATB joint connects two segments. A local joint coordinate system is attached to each of these two segments. The position and orientation of these two coordinate systems relative to the segment coordinate systems is given on entry B.3 in the ATB input file. For each joint (J = 1, NJNT) a B.3 entry is defined in the ATB input file. The joint J connects the segment JNT(J) as given on the B.3 entry and the segment J + 1. SOL700 finds the two segments that are connected by the joint with name = NAME. The grid points G0-G3 and G4-G7 define the joint coordinate systems for the segments JNT(J) and J + 1, respectively. (Integer > 0; required)
	G0 located at the origin of the joint coordinate system for the ATB segment JNT (J)
	G1 located on the local x-axis.
	G2 located on the local y-axis.
	G3 located on the local z-axis.
	G4 located at the origin of the joint coordinate system for the ATB segment J + 1.

Field	Content
G5	located on the local x-axis.
G6	located on the local y-axis.
G7	located on the local z-axis.

**Remarks:**

All elements related to an ATB segment refer to the same material number. This material number is defined on the ATBSEG entry. If the material is defined to be rigid by means of a MATRIG entry, all elements can be easily connected to the contact ellipsoid of the ATB segment by means of METHOD=RELLIPS in BCTABLE or BCONPRG entry referencing the MATRIG entry. In this way, all elements related to an ATB segment move together with the ATB segment during the analyses and can be postprocessed.

**ATBSEG**

Interface to ATB Segments- SOL 700

Defines the position and orientation of the ATB segments. The position and orientation as specified on the G.2 and G.3 entries in the ATB input file will be overruled by the definitions given here.

This entry can be used to create a Bulk Data file containing elements and grid points to visualize the ATB segment, together with the contact ellipsoid and the joints it is connected by. See also ATBJNT and DYPARAM, ATBSEG. Used in SOL700 only.

**Format:**

1	2	3	4	5	6	7	8	9	10
ATBSEG	ID	NAME	COVER	NUMELM	GSTART	ESTART	MID	PIDCOV	
+	G0	G1	G2	G3	EID1	EID2	EID3	PIDCG	

**Example:**

ATBSEG	1	HEAD	YES	100	1000	1000	1000		
+	1010	1011	1012	1013	1001	1002	1003	1001	

Field	Content
ID	Unique ATBSEG number. (Integer > 0; required)
NAME	Name of an ATB segment as given in the first field of a B.2 entry in the ATB input file. (Character; required)
G0-G3	The grid points span the local coordinate system of the ATB segment. G0-G3 are used by SOL700 to overwrite the initial position and orientation of the segments as specified in the ATB input file. EID1-EID3 are about how to generate the grid points for an existing ATB input file. (Integer > 0; required)
G0	located at the origin of the ATB segment.
G1	located on the local x-axis.
G2	located on the local y-axis.
G3	located on the local z-axis.

## AXIC Conical Shell Problem Flag

Defines the existence of an axisymmetric conical shell problem.

Format:

1	2	3	4	5	6	7	8	9	10
AXIC	H								

Example:

AXIC	15								
------	----	--	--	--	--	--	--	--	--

Describer	Meaning
H	Highest harmonic defined for the problem. ( $0 \leq \text{Integer} < 998$ )

Remarks:

- Only one AXIC entry is allowed. When the AXIC entry is present, most other entries are not allowed. The types that are allowed with the AXIC entry are listed below:

CCONEAX	MATT1	SPCADD
DAREA	MOMAX	SPCAX
DELAY	MOMENT	SUPAX
DLOAD	MPCADD	TABDMP1
DMI	MPCAX	TABLED1
DMIG	NOLIN1	TABLED2
DPHASE	NOLIN2	TABLED3
EIGB	NOLIN3	TABLED4
EIGC	NOLIN4	TABLE11
EIGP	NSM	TABLEM2
EIGR	NSM1	TABLEM3
EIGRL	NSMADD	TABLEM4
EPOINT	OMITAX	TEMPAX
FORCE	PARAM	TF
FORCEAX	PCONEAX	TIC
FREQ	POINTAX	TLOAD1
FREQ1	PRESAX	TLOAD2
FREQ2	RINGAX	TSTEP

GRAV	RFORCE
LOAD	RLOAD1
MAT1	RLOAD2
MAT2	SECTAX

2. For a discussion of the conical shell element, see the [Conical Shell Element \(RINGAX\)](#) in the *MSC Nastran Reference Guide*.

## AXIF

## Fluid Related Axisymmetric Parameters

Defines basic parameters and the existence of an axisymmetric fluid analysis.

Format:

1	2	3	4	5	6	7	8	9	10
AXIF	CID	G	DRHO	DB	NOSYM	F			
	N1	N2	N3	N4	N5	-etc.-			

Example:

AXIF	2	32.2	0.12	2.4+5	YES				
	1	2	3		4		7	10	

Alternate Formats and Examples of Continuation Data:

	N1	"THRU"	Ni						
	0	THRU	10						

	N1	"THRU"	Ni	"STEP"	NS				
	0	THRU	9	STEP	3				

AXIF	100	-386.0		0.0	NO				
	0	THRU	50	STEP	5				
	52								
	54	THRU	57						
	61	THRU	65						
	68		71		72	75			
	81	92							

Describer	Meaning
CID	Fluid coordinate system identification number. (Integer > 0)
G	Value of gravity for fluid elements in the axial direction. (Real)
DRHO	Default mass density for fluid elements. (Real > 0.0 or blank)
DB	Default bulk modulus for fluid elements. (Real)
NOSYM	Request for nonsymmetric (sine) terms of series. (Character: "YES" or "NO")
F	Flag specifying harmonics. (Blank if harmonic is specified, or Character: "NONE")

Describer	Meaning
Ni	Harmonic numbers for the solution, represented by an increasing sequence of integers. On continuation entries, without the “THRU” option, blank fields are ignored. “THRU” implies all numbers including upper and lower harmonics. (0 ≤ Integer < 100, or Character: “THRU”, “STEP” or blank)
NS	Every NSt <sup>h</sup> step of the harmonic numbers specified in the “THRU” range is used for solution. If field 5 is “STEP”, Ni = i*NS+N1 where i is the number of harmonics. (Integer)

Remarks:

1. Only one AXIF entry is allowed.
2. CID must reference a cylindrical or spherical coordinate system.
3. Positive gravity (+G) implies that the direction of free fall is in the -Z direction of the fluid coordinate system.
4. The DRHO value replaces blank values of RHO on the FSLIST, BDYLIST and CFLUIDi entries.
5. The DB value replaces blank values of B on the CFLUIDi entries. If the CFLUIDi entry is blank and DB is zero or blank, the fluid is incompressible.
6. IfNOSYM = “YES”, both sine and cosine terms are specified. IfNOSYM = “NO”, only cosine terms are specified.
7. If F = “NONE”, no harmonics are specified, no fluid elements are necessary, and no continuations may be present. In this case, AXIS = “FLUID” should not be specified in the Case Control Section.
8. Superelements cannot be used.

## AXSLOT

## Axisymmetric Slot Analysis Parameters

Defines the harmonic index and the default values for acoustic analysis entries.

Format:

1	2	3	4	5	6	7	8	9	10
AXSLOT	RHOD	BD	N	WD	MD				

Example:

AXSLOT	0.003	1.5+2	3	0.75	6				
--------	-------	-------	---	------	---	--	--	--	--

Descriptor	Meaning
RHOD	Default density of fluid in units of mass/volume. (Real > 0.0 or blank)
BD	Default bulk modulus of fluid in units of force/volume ratio change. (Real ≥ 0.0 or blank)
N	Harmonic index number. (Integer ≥ 0 or blank)
WD	Default slot width. (Real > 0.0 or blank)
MD	Default number of slots. (Integer ≥ 0 or blank)

Remarks:

1. Only one AXSLOT entry is allowed.
2. If any of the RHO, B, W, and M fields on the GRID, SLBDY, CAXIFi, and CSLOTi entries are blank, then values must be specified for the RHOD, BD and MD fields.
3. If the number of slots (M) is different in different regions of the cavity, this fact may be indicated on the CSLOTi and SLBDY entries. If the number of slots is zero, no matrices for CSLOTi elements are generated.
4. BD = 0.0 implies the fluid is incompressible.

## BAROR      CBAR Entry Default Values

Defines default values for field 3 and fields 6 through 8 of the CBAR entry.

Format:

1	2	3	4	5	6	7	8	9	10
BAROR		PID			X1	X2	X3	OFFT	

Example:

BAROR		39			0.6	2.9	-5.87	GOG	
-------	--	----	--	--	-----	-----	-------	-----	--

Alternate Format and Example:

BAROR		PID			G0			OFFT	
-------	--	-----	--	--	----	--	--	------	--

BAROR		39			18			GOG	
-------	--	----	--	--	----	--	--	-----	--

Describer	Meaning
PID	Property identification number of the PBAR entry. (Integer > 0 or blank)
X1, X2, X3	Components of orientation vector $\vec{v}$ , from GA, in the displacement coordinate system at GA (default), or in the basic coordinate system. See Remark 5. (Real)
G0	Alternate method to supply the orientation vector $\vec{v}$ , using grid point G0. The direction of $\vec{v}$ is from GA to G0. $\vec{v}$ is then translated to End A. (Integer > 0; G0 ≠ GA or GB on CBAR entry)
OFFT	Offset vector interpretation flag. See Remark 5. (Character or blank)

Remarks:

1. The contents of fields on this entry will be assumed for any CBAR entry whose corresponding fields are blank.
2. Only one BAROR entry is allowed.
3. For an explanation of bar element geometry, see the [Three-Node Beam Element \(CBEAM3\)](#) in the *MSC Nastran Reference Guide*.
4. If field 6 is an integer, then G0 is used to define the orientation vector and X2 and X3 must be blank. If field 6 is real or blank, then X1, X2, and X3 are used.
5. OFFT is a character string code that describes how the offset and orientation vector components are to be interpreted. By default (string input is GGG or blank), the offset vectors are measured in the displacement coordinate systems at grid points A and B and the orientation vector is measured in the displacement coordinate system of grid point A. At user option, the offset vectors can be measured in an offset coordinate system relative to grid points A and B, and the orientation vector can be measured in the basic system as indicated in the following table:

String	Orientation Vector	End A Offset	End B Offset
GGG	Global	Global	Global
BGG	Basic	Global	Global
GGO	Global	Global	Offset
BGO	Basic	Global	Offset
GOG	Global	Offset	Global
BOG	Basic	Offset	Global
GOO	Global	Offset	Offset
BOO	Basic	Offset	Offset

Any attempt to specify invalid combinations results in a bulk data entry input error message. For example, a value of OOO (indicating offset and orientation vectors are specified in an offset reference system) results in a fatal error since the orientation vector cannot be specified in an offset system. The offset system x-axis is defined from GA to GB. The orientation vector  $\hat{v}$  and the offset system x-axis are then used to define the z and y axes of the offset system. (Note: The character “O” in the table replaces the obsolete character “E”.)

## BARRIER

## Barrier for Eulerian Transport

Defines a barrier for transport in a Eulerian mesh. Used in SOL 700 only.

Format:

1	2	3	4	5	6	7	8	9	10
BARRIER	BID	BCID	MESH	DIR	SKFRIC				
	XMIN	XMAX	YMIN	YMAX	ZMIN	ZMAX			

Example:

BARRIER	100	20							

Describer	Meaning
BID	Unique barrier number. (Integer > 0; Required)
BCID	Number of a set of BCSEG entries that define the element faces that are barriers to Eulerian transport. See Remark 4. (Integer $\geq 0$ )
MESH	Denotes the ID of the Euler mesh to which the boundary condition has to be applied. See Remark 5. (Integer $\geq 0$ )
DIR	Allowed values are NEGX, POSX, NEGY, POSY, NEGZ and POSZ. See Remark 6. (Character)
SKFRIC	Skin friction value. See Remark 8. (Real $\geq 0.0, 0.0$ )
XMIN-ZMAX	Defines a square by specifying the ranges of the x,y,z coordinates. For a square in for example the x-plane it is required that either XMIN = XMAX or that XMAX is left blank. See Remark 7. (Real)

Remarks:

1. Material cannot pass through any of the faces referenced.
2. Barriers can be modeled on the edge as well as the inside of an Eulerian mesh.
3. BARRIER overrules FLOW and FLOWT definition.
4. BCID is optional. If used, all other inputs are ignored. If not used, the barrier can be defined by either using DIR or by using XMIN, XMAX, YMIN, etc.
5. The MESH-ID is only used when multiple Euler domains have been defined and when BCID is blank. If multiple Euler domains have been defined but if the MESH-ID is blank all Euler domains will be considered in assigning the boundary condition.
6. DIR is optional. It will only be used when BCID is blank. When DIR is used XMIN, XMAX, YMIN etc. are ignored.

7. XMIN, XMAX, YMIN, etc are only used when both BCID and DIR are blank. The XMIN,YMIN option defines an area on the MESH BOX boundary as shown in Figure 9-1. If neither the MIN nor MAX value has been set the default value is respectively -1E+20 and 1e+20 for the MIN and MAX value. If the MIN value has been set the default value of the MAX value is the MIN value.
8. The skin friction is defined as:

$$C_f = \frac{\tau_w}{0.5 \cdot \rho u^2}$$

Here  $\tau_w$  denotes the shear friction in an Euler element adjacent to a couple surface segment where  $\rho$  is the density and  $u$  is the tangential relative velocity in the Euler element that is adjacent to a couple surface segment. SKFRIC will only be used when VISC has been set on either an EOSGAM or an EOSPOL entry. If VISC has been set and if SKFRIC has not been set then a no slip condition will be prescribed at the interface between fluid and structure.

9. Internal barriers can only be defined on existing Euler element faces using the BCID option. They cannot be defined by using the XMIN,YMIN option.

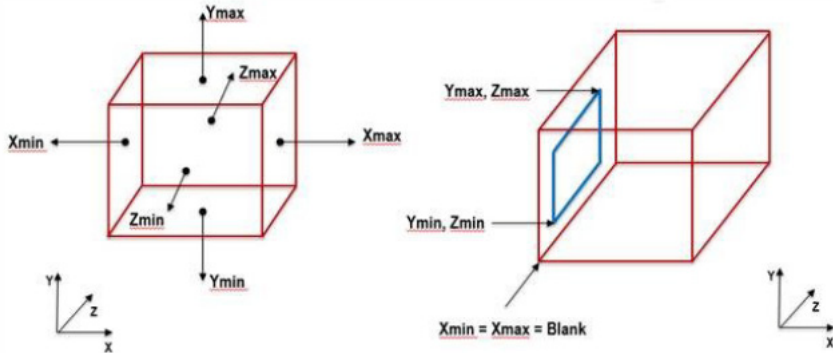

Figure 9-1 MESH BOX boundary

## BCAUTOP

## Automatic contact generation property.

Specifies parameters for automatic contact generation (ACG). With ACG, the code automatically generates the contact bodies based on the grids and elements given, then establishes the contact pairs in which two contact bodies are in contact or may come into contact potentially based on the DISTANCE tolerance. Please refer to the section of [Chapter 9: Contact](#), SOL 400 User's Guide for details.

### Format:

1	2	3	4	5	6	7	8	9	10
BCAUTOP	PID		Param1	Value1	Param2	Value2	Param3	Value3	
	Param4	Value4	etc						

### Example:

BCAUTOP			CTYPE	PGLUE	DISTANCE	0.1			
---------	--	--	-------	-------	----------	-----	--	--	--

Describer	Meaning
PID	Reserved for future use (integer >=0, default is 0)
Param(i)	Name of a parameter. Allowable names are given below (Character).
Value(i)	Value of the parameter. See below (Real, Integer or character). See Remark 3.

### Remarks:

1. Only one entry of BCAUTOP is allowed for non-modules model. If there are modules, only one BCAUTOP per module is allowed, and multiple modules can have BCAUTOP.
2. This entry does not have effect if BCONTACT=AUTO is not present in case control section.
3. The parameters in this entry may be divided into two types – primary parameters and secondary parameters. The primary parameters are the most important parameters for build of contact bodies, match of contact pairs. The secondary parameters are helpful for user to provide the more detail and further requirement for contact model establishment and contact analysis with automatic contact generation. The primary and secondary parameters are listed in the tables as follows.
4. When modules are present, contact data is generated for the module if there is a BCAUTOP exists in the module, otherwise no contact data will be generated for the module, in this case, user supplied contact data can be used if there is a BCTABL1 ID=1 and/or ID=0 exists.

Table 9-1 Primary Parameters in BCAUTOP

Describer	Meaning
CTYPE	Characters, one of TOUCH(default), PGLUE, SGLUE and GGLUE. If CTYPE is specified in both BCAUTOP entry and Case Control Command BCONTACT=AUTO, the specification in BCAUTOP entry will be used.
DISTANCE	Distance tolerance of contact pair. If the distance between any two points which are belonging to two different contact bodies is less than this value, these two contact bodies are recognized to be a contact pair. Default value of DISTANCE is 100 times of contact ERROR tolerance. ERROR may be defined in either BCAUTOP or left blank.  With default of ERROR, the code calculates ERROR as the smallest one of the following values: <ol style="list-style-type: none"> <li>1. 1/20 of the smallest nonzero element dimension (plates or solids) in the contact body;</li> <li>2. 1/4 of the thinnest shell thickness in the contact body.</li> </ol> Please see BCPARA for ERROR definition in detail.
ESET	ID of SET1 to specify element ids consisting contact bodies. If it is not specified, all elements in the model will be used. Only one of ESET, SeedESet, SeedGSet and PropSet can be specified in the same entry.
SeedESet	ID of SET1 to specify element ids as seeds of contact bodies. The program searches elements as contact bodies from the seed elements. Only one of ESET,SeedESet, SeedGSet and PropSet can be specified.
SeedGSet	ID of SET1 to specify grids ids as seeds of contact bodies. The program searches elements as contact bodies from the elements connecting to the seed grid ids. Only one of ESET,SeedESet, SeedGSet and PropSet can be specified.
PropSet	ID of SET1 to specify property ids to construct contact bodies. Only one of ESET,SeedESet, SeedGSet and PropSet can be specified.
RigidSet	ID of SET1 to specify IDs of rigid bodies to be in contact

Table 9-2      Secondary Parameters in BCAUTOP

Describer	Meaning
BEAMCNT	<p>Characters, YES or NO (default). Determining if beam is included in contact definition.</p> <p>YES: BEAMs are included in the contact description.</p> <p>NO: No BEAM is included in the contact description.</p>
BEAMCAP	<p>Characters, FREEEND(default) or NO. If set to FREEEND(default), BCSCAP entries will be added to free end of beam elements, if NO, no BCSCAP will be added. It is mainly used for contact pair detection where the contact occurs at free beam end.</p>
DIMENS	<p>Characters, 2D or 3D (default), dimension of contact bodies.</p>
EDGECONT	<p>Characters, YES or NO (default). Determining if shell edge is included in contact description.</p> <p>YES: The free and hard shell edges are included in the contact definition</p> <p>NO: No shell edges are included in the contact definition.</p>
FTYPE	<p>Characters, BLCOUL/BLSHEAR; or Integer, 6 / 7. BLCOUL or 6 is Bilinear Coulomb friction. BLSHEAR or 7 is Bilinear Shear friction. Default is No Friction.</p>
FRIC	<p>Friction coefficient. If the value is an integer, it represents the ID of a TABLEM1, TABLEM2 or TABL3D, i.e., a temperature-dependent or multi-dimensional table. (Real <math>\geq 0.0</math> or Integer <math>&gt; 0</math>; Default = 0.0)</p>
IGNTHK	<p>Character, YES or NO (default), Ignore thickness of shell for contact</p> <p>YES: ignore the thickness of the shell</p> <p>NO: include the thickness of the shell.</p>
INISTF	<p>Character, YES or NO (default). Set the option of initial stress free.</p> <p>Yes: initial stress free contact</p> <p>No: general contact without implementation of initial stress free.</p>
SelfCont	<p>Characters, YES or NO (default). Option of self-contact.</p>

**Note:** Note that the parameters defined in BCAUTOP are applied only for BONATCT=AUTO. Their default values are defined only when BCONTACT=AUTO is applied. All the parameters in BCPARA, BCONPRP, BCONPRG and BCBDPRP entries may be used in BCAUTOP directly. For the detailed list of these parameters, please refer to BCPARA, BCONPRP, BCONPRG and BCBDPRP.

## BCBDPRP Contact Body Parameters in SOLs 101 and 400

Defines contact body parameters used in SOLs 101 and 400 only. The parameters defined here are referenced by the BCBODY1 entry.

Format:

1	2	3	4	5	6	7	8	9	10
BCBDPRP	PID		PARAM1	VAL1	PARAM2	VAL2	PARAM3	VAL3	
	PARAM4	VAL4	PARAM5	VAL5	-etc.-				

Example:

BCBDPRP	90		FRIC	0.05	ISTYP	0			
---------	----	--	------	------	-------	---	--	--	--

Describer      Meaning

PID              Parameter identification number (Integer > 0).

PARAMi        Name of a parameter. Allowable names are given in [Table 9-3](#) (Character).

VALi            Value of a parameter. See [Table 9-3](#) (Real or Integer).

Table 9-3 Contact Body Parameters in SOLs 101 and 400

Name	Description, Type and Value (Default is 0 for integer, 0.0 for Real Unless Otherwise Indicated)
BNC	Exponent associated with the natural convective heat flow for near field behavior. (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the near field natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 OR TABLEM2 entry specifying the exponent associated with the near field natural convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the near field natural convection coefficient vs temperature and possibly other variables.
BNCE	Exponent associated with natural convection heat flow to the environment. (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the environment natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the exponent associated with the environment natural convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the environment natural convection coefficient vs temperature and possibly other variables.
BNL	Exponent associated with the nonlinear convective heat flow for near field behavior. (Real or Integer; Default = 1.0) If Real, the value entered is the exponent associated with the near field nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 OR TABLEM2 entry specifying the exponent associated with the near field nonlinear convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the near field nonlinear convection coefficient vs temperature and possibly other variables.
BNLE	Exponent associated with the nonlinear convective heat flow to the environment. (Real or Integer; Default = 1.0) If Real, the value entered is the exponent associated with the environment nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the exponent associated with the environment nonlinear convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the environment nonlinear convection coefficient vs temperature and possibly other variables.
CFILM	Heat transfer coefficient (film) to environment. (Real or Integer, Default = 0.0) If Real, the value entered is the film coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the heat transfer coefficient vs temperature or a TABL3D entry specifying the film coefficient vs temperature and possibly other variables.
CMB	Heat capacity of the rigid body, when entered as a geometric entity with an associated scalar point. (Real $\geq 0.0$ ; Default = 0.0) For nonzero values, a grounded CDAMP4 element with the scalar point on its first side is generated internally which obtains this capacity.
CMS	Heat capacity of the environment, when associated with a scalar point. (Real $\geq 0.0$ ; Default = 0.0) For nonzero values a grounded CDAMP4 element with the scalar point on its first side is generated internally which obtains this capacity.
COPTB	Flag to indicate how body surfaces may contact. See Remark 2. on the BCONPRG entry. (Integer; Default = 0)

EMISS	Emissivity for radiation to the environment or near thermal radiation. (Real or Integer; Default = 0.0) If real, the value entered is the emissivity. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the emissivity vs temperature or a TABL3D entry specifying the emissivity vs temperature and possibly other variables.
FRIC	Friction coefficient. If the value is an integer, it represents the ID of a TABLEM1, TABLEM2 or TABL3D, i.e., a temperature-dependent or multi-dimensional table. (Real $\geq 0.0$ or Integer $> 0$ ; Default = 0.0)  When a grid point contacts a rigid body, the coefficient of friction associated with the rigid body is used. When a grid point contacts a deformable body, the average of the coefficients for the two bodies are used.  In general, entering the friction coefficient for a contact body pair via a BCTABLE and BCONNECT/BCONPRP is strongly recommended.
HBL	Separation distance dependent thermal convection coefficient. (Real or Integer; Default = 0.0) If Real, the value entered is the separation distance dependent thermal convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the convection coefficient vs temperature or a TABL3D entry specifying the convection coefficient vs temperature and possibly other variables.
HCT	Contact heat transfer coefficient. (Real or Integer; Default = 0.0) If Real, the value entered is the contact heat transfer coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the contact heat transfer coefficient vs temperature or a TABL3D entry specifying the contact heat transfer coefficient vs temperature and possibly other variables. See Remark 3.
HCV	Convection coefficient for near field behavior. (Real or Integer; Default = 0.0) If Real, the value entered is the near field convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field convection coefficient vs temperature or a TABL3D entry specifying the near field convection coefficient vs temperature and possibly other variables.
HNC	Natural convection coefficient for near field behavior. (Real or Integer; Default = 0.0) If Real, the value entered is the near field natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field natural convection coefficient vs temperature or a TABL3D entry specifying the near field natural convection coefficient vs temperature and possibly other variables.
HNCE	Natural convection coefficient for heat flow to the environment. (Real or Integer, Default = 0.0) If Real, the value entered is the environment natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the environment natural convection coefficient vs temperature or a TABL3D entry specifying the environment natural convection coefficient vs temperature and possibly other variables.
HNL	Heat transfer coefficient for nonlinear convective heat flow for near field behavior. (Real or Integer; Default = 0.0) If Real, the value entered is the near field nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field nonlinear convection coefficient vs temperature or a TABL3D entry specifying the near field nonlinear convection coefficient vs temperature and possibly other variables.

HNLE	Heat transfer coefficient for nonlinear convective heat flow to the environment. (Real $\geq 0.0$ or Integer; Default = 0.0) If Real, the value entered is the environment nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the environment nonlinear convection coefficient vs temperature or a TABL3D entry specifying the environment nonlinear convection coefficient vs temperature and possibly other variables.
IDSPL	Controls geometric smoothing of boundary of deformable body option. (Integer; Default = 0) =0 or blank, discrete geometric representation. >0 the surface of the body is smoothed out with splines (2D) or Coons surfaces (3D) and discontinuity edges/corners are being defined by using abs (IDSPL) as the ID of the BLSEG entries. If BLSEG with ID=abs(IDSPL) does not exist, the whole body is smoothed and there are no user-defined discontinuity corners(2D) or edges(3D). (See Remark 1. <0 Same as IDSPL>0. Furthermore, additional discontinuity edges are being generated automatically if the difference in patch normals exceeds the value of SANGLE.
ISTYP	<a href="#">Check</a> of contact conditions. (Integer $\geq 0$ ; Default = 0 for all solutions) ISTYP is not necessary in segment-to-segment contact. For a deformable body: =0 check each body, versus the other. =2 double-sided contact with automatic optimization of contact constraint equations (this option is known as “optimized contact”).  Note that ISTYP is supported with ISEARCH=0 in <a href="#">BCTABLE</a> or <a href="#">BCONPRG</a> only.
ITYPE	An option entry for heat transfer only (Integer; no Default) 1 - Heat sink (rigid body) 2 - Deformable body (with heat conduction) 4 - Heat conduction body (heat-rigid body) (Not supported in SOL 400 coupled thermal-mechanical analysis, i.e. the same contact body with ITYPE=4 cannot be used in mechanical analysis of SOL 400.)

MIDNOD	Mid-side node projection flag. (Integer $\geq 0$ ; Default = 0) When MIDNOD > 0 and IDSPL $\neq 0$ , the mid-side grid of quadratic elements are projected onto the selected spline surfaces. This operation is performed before the contact process starts and it may change the location of grids in contact bodies. It may operate in combination with the initial stress-free contact. Only used if IDSPL is not zero.
SANGLE	<b>Threshold</b> for automatic discontinuity detection in degrees. (Real; Default = 60.0) Used for geometric smoothing option in SOL 400 only. SANGLE is not used and is always set to 0.0 when IDSPL $\geq 0$ .
TBODY	Body temperature. (Real or Integer; Default = 0.0) If Real, the value entered is the body temperature. If Integer, the value entered is the ID of a TABLED1 or TABLED2 entry specifying the body temperature vs time or a TABL3D entry specifying the body temperature vs time and possibly other variables. When entered as a negative integer, its absolute value is a scalar point identification number. If a scalar point is specified on this entry, it need not be defined on an SPOINT entry. See Remark 8.
TSINK	Environment sink temperature. (Real or Integer, Default = 0.0) If Real, the value entered is the sink temperature. If Integer, the value entered is the ID of a TABLED1 or TABLED2 entry specifying temperature vs time or a TABL3D entry specifying the sink temperature vs time and possibly other variables. When entered as a negative integer its absolute value is a scalar point identification number. If a scalar point is specified on this entry, it need not be defined on an SPOINT entry. See Remark 8.

Remarks:

1. When IDSPL is greater than 1, these nodes are entered in pairs. For a quad surface (for example, CQUAD4 or edge of a CHEXA) usually 4 sets of nodal pairs are needed to describe the surface. For example, a CQUAD4 with grid numbering 1,2,4,3 would need pairs of nodes, 1,2 2,4 4,3 3,1. The nodal pairs may be entered in any order. See *MSC Nastran Nonlinear User's Guide*, Chapter 9, Contact for more details.
2. For hard contact, with HGLUE=1 (see BCONPRP for the meaning of HGLUE):
  - a. The temperature of the contacting grid is tied to the temperatures of the contacted element face or the temperature of the rigid geometry when it has a scalar point associated with it.
  - b. The temperature of the contacting grid is set to the rigid geometry temperature when it has no scalar point associated with it.

**Note:** "Glued" thermal contact can result in overshoot of the temperatures at the interface, in particular, if two bodies that have non-uniform initial temperatures are placed in contact. The overshoot effect may be damped somewhat if one uses a near contact distance with some convective heat transfer.

3. For hard contact, with HGLUE=0:  
The convective heat flow per unit area over the two interfaces is given by:

$$q = HCT \cdot (T_A - T_B)$$

where  $T_A$  is the contacting grid temperature and  $T_B$  is the face temperature in the contact point in case of a meshed body or the  $T_{\text{BODY}}$  temperature in case of a rigid geometry.

It is recommended to enter the HCT value on the BCONPRP Bulk Data entry, since it generally applies to body pairs and is not a property of a single body.

4. For near contact:

$$q = HCV \cdot (T_A - T_B) +$$

$$HNC \cdot (T_A - T_B)^{BNC} +$$

$$HNL \cdot (T_A^{BNL} - T_B^{BNL}) +$$

$$\sigma \cdot \text{EMISS} \cdot (T_A^A - T_B^A) +$$

$$\left[ HCT \cdot \left( 1 - \frac{\text{dist}}{DQNEAR} \right) + HBL \cdot \frac{\text{dist}}{DQNEAR} \right] (T_A - T_B)$$

where the last term is only activated when  $HBL \neq 0$ ,  $T_A$  is the contacting grid temperature and  $T_B$  is the face temperature in the contact point in case of a meshed body or the  $T_{\text{BODY}}$  temperature in case of a rigid geometry.

It is recommended to enter the near contact heat transfer coefficients and the corresponding exponents on the BCONPRP Bulk Data entry, since they generally apply to body pairs and are not properties of a single body.

5. For no contact:

$$q = CFILM \cdot (T_A - T_{\text{SINK}}) +$$

$$HNCE \cdot (T_A - T_{\text{SINK}})^{BNCE} +$$

$$HNLE \cdot (T_A^{BNLE} - T_{\text{SINK}}^{BNLE}) +$$

$$\sigma \cdot \text{EMISS} \cdot (T_A^A - T_{\text{SINK}}^A)$$

6. The heat transfer coefficients and associated exponents can all be temperature dependent, when they are entered as an integer value. This integer value is the table ID of a TABLEM1, TABLEM2 or TABL3D entry (formulas are not supported on TABL3D).
7. The  $T_{\text{SINK}}$  and  $T_{\text{BODY}}$  temperatures can be time dependent when they are entered as a positive integer value. This integer value is the table ID of a TABLED1, TABLED2 or TABL3D entry (formulas are not supported on TABL3D).

8. **TBODY** entries only apply to rigid bodies (i.e., **RIGID** as the **BEHAV** value in **BCBODY1** entry). **TSINK** entries only apply to deformable bodies (meshed regions with **DEFORM** or **HEAT** as the **BEHAV** value in **BCBODY1** entry).

## BCBMRAD

### Modify Equivalent Radius for Beam-to-Beam Contact

Allows the equivalent radius in beam-to-beam contact to be different for each beam cross section in SOL 101, SOL 400 and SOL 600. The BCBMRAD entry is only used for node-to-segment beam-to-beam contact. For segment-to-segment beam contact, the beam cross section geometry is defined via PBARL or PBEAML

Format:

1	2	3	4	5	6	7	8	9	10
BCBMRAD	RADIUS	TYPE	ID1	ID2	THRU	ID3	BY	N	
	ID4	THRU	ID5	ID6	ID7	ID8	ID9		

Example 1:

BCBMRAD	2.5	EID	100	20	THRU	300	BY	2	
	200	3457	8456	4712	1000	THRU	2000		
	3.0		4112	THRU	4700				
	2.8	BODY	502	517	3459				

Example 2:

BCBMRAD	2.5	ALL							
	2.8	EID	2567	1240	THRU	1760			

Describer	Meaning	
RADIUS	Equivalent radius to be used for beam-beam contact problems. See Remark 6. (Real; no Default)	
TYPE	The attribute of all following ID's. (Character; Default = "EID")	
	EID	Defines all the following entries are the IDs of beam-type elements.
	BODY	Defines all the following entries are the IDs of BCBODYs.
	ALL	Defines the default RADIUS for all beam-type elements.
ID <sub>i</sub>	ID of a beam-type element, CROD, CBAR, CBEAM and CBEAM3, or a BCBODY with the specified radius. (Integer; no Default)	

Remarks:

1. Multiple BCBMRAD Bulk Data entries, which are open-ended are allowed in one file.
2. In each entry of BCBMRAD, there is only one RADIUS input allows, on the field 2. From the field 4 to the rest fields, including all continuation entries, user can input all ID's in any combination of the following 3 basic formats
  - ID1 ID2 ID3 ID4 ...
  - ID1 THRU ID2

- ID1 THRU ID2 BY N

Note that blank fields are allowed for readability.

- When all beam contact radii are the same, user can put "ALL" on the field 3 following a RADIUS value on the BCBMRAD Bulk Data entry. This value of RADIUS will be applied to all beam-type elements (See the previous Example 2). User can also use this way to give default radius of all beam-type elements.
- The RADIUS value of the other BCBMRAD's (TYPE=BODY or EID) can override the default value (TYPE=ALL) in the following order:
  - When any BCBODY is selected on BCBMRAD with TYPE=BODY, the specified RADIUS will be applied to all beam-type elements in this BCBODY. This value always overrides the default (TYPE=ALL).
  - The RADIUS with TYPE=EID always overrides the value from TYPE=BODY and ALL.
- When TYPE=ALL, then all IDi must be blank.
- For tubes or round bars, enter the outer radius. For beam, enter an equivalent radius calculated as follows:

$$I = 0.5 \cdot (I_x + I_y)$$

$$R = \sqrt{\left(\frac{A}{\pi} + 2 \cdot \frac{I}{A}\right)}$$

- SOL 600 does not support the TYPE=ALL option.
- This is only used for node-to-segment contact.

## BCBODY

## Flexible or Rigid Contact Body in 2D and 3D

Defines a flexible or rigid contact body in 2D or 3D used in SOLs 101, 400, and 700 only. The BCBODY1 option is the preferred method to defining contact bodies for SOL 400.

Use only as many forms (i.e. HEAT, PATCH3D, BEZIER, POLY, CYLIND, SPHERE, NURBS2, or NURBS) as necessary to describe the body (if rigid). Deformable bodies are described using as many standard elements as necessary and are specified by the BSID field with BEHAV=DEFORM (only the first line should be entered for deformable bodies). Unless shrink fit its being analyzed, deformable bodies should not be inside other deformable bodies when the thickness of each body is taken into account.

The "RIGID" header may be used with any of the other rigid entries but only once per body. Also, only one of the character entries after RIGID (HEAT, PATCH3D, NURBS, etc.) should be entered for any particular body. See Remark 4. for an important note regarding how to define the outward direction of rigid bodies (which must point towards a flexible body for contact to occur).

Format: (SOLs 101 and 400 only)

BCBODY	2		RIGID	102	0	.08			
	PATCH3D	1							
		1	101	102	103	104			

Describer	Meaning
BID	Contact body identification number referenced by BCTABLE, BCHANGE, or BCMOVE. (Integer > 0; Required)
DIM	Dimension of body. (Character; Default= 3D) (Ignored by SOL 700) DIM=2D planar body in x-y plane of the basic coordinate system, composed of 2D elements or curves. DIM=3D any 3D body composed of rigid surfaces, shell elements or solid elements.
BEHAV	Behavior of curve or surface (Character; Default = DEFORM) (Ignored by SOL 700) DEFORM body is deformable, RIGID body is rigid, SYMM body is a symmetry body, HEAT indicates body is a heat-rigid body. <i>See Remark 4. for Rigid Bodies.</i>
BSID	Identification number of a BSURF or BCPROP entry if BEHAV=DEFORM. For SOL 700 the BSID may also be the identification number of a BCBOX, BCMATL, BCSEG, BCGRID or BCELIPS entry. (Integer > 0)
ISTYP	Check of contact conditions. (Integer $\geq$ 0; Default = 0 for all solutions) ISTYP is not necessary in segment-to-segment contact. For a deformable body: =0 check each body, versus the other . =2 double-sided contact with automatic optimization of contact constraint equations (this option is known as “optimized contact”).  Note that ISTYP is supported with ISEARCH=0 in <a href="#">BCTABLE</a> or <a href="#">BCONPRG</a> only.
FRIC	Friction coefficient. If the value is an integer, it represents the ID of a TABLEM1, TABLEM2 or TABL3D, i.e., a temperature-dependent or multi-dimensional table. (Real $\geq$ 0.0 or Integer > 0; Default = 0.0)  When a grid point contacts a rigid body, the coefficient of friction associated with the rigid body is used. When a grid point contacts a deformable body, the average of the coefficients for the two bodies are used.  In general, entering the friction coefficient for a contact body pair via a BCTABLE and BCONNECT/BCONPRP is strongly recommended.
IDSPL	Controls geometric smoothing of boundary of deformable body. (Integer; Default = 0) =0 or blank, discrete geometric representation >0 the surface of the body is smoothed out with splines (2D) or Coons surfaces (3D) and discontinuity edges/corners are being defined by using abs (IDSPL) as the ID of the BLSEG entries. If BLSEG with ID=abs(IDSPL) does not exist, the whole body is smoothed and there are no user-defined discontinuity corners(2D) or edges(3D). (See Remark 7.) <0 Same as IDSPL>0. Furthermore, additional discontinuity edges are being generated automatically if the difference in patch normals exceeds the value of SANGLE.

Descriptor	Meaning
CONTROL	<p>= -1 for position control. The coordinates of the final position of GRID Point defined in CGID is given in VELRB<sub>i</sub> in the following line.</p> <p>= 0 for velocity control (default).</p> <p>= positive number for "load control". The positive number entered is the grid number defined in CGID at which translational forces or SPCD are applied. (Note: The rotation in this case is defined by NLOAD in the following line.)</p>
NLOAD	<p>Enter a positive number if "load controlled" and rotations are allowed (Integer). The positive number is the grid number where the moments or rotations are applied. The rotations are specified using SPCD at grid ID NLOAD and can be specified using dof's 1-3 (for rotation about x, y, z respectively), or by dof's 4-6 (for rotation about x, y, z respectively).</p> <p>Note: This rotation takes the position of the grid point defined in CGID field as the center of rotation.</p>
ANGVEL	Angular velocity or angular position about local axis through center of rotation. If the value is an integer it represents the ID of a TABLED1, TABLED2 or TABL3D, i.e., a time-dependent or multi-dimensional table; however, no log scales, only linear scales. (Real or Integer; Default = 0.0)
DCOS <sub>i</sub>	Components of direction cosine of local axis if ANGVEL is nonzero. If the value is an integer, it represents the ID of a TABLED1, TABLED2 or TABL3D, i.e., a time-dependent or multi-dimensional table; however, no log scales, only linear scales. (Real or Integer; Default=0.0) In 2D contact only DCOS3 is used and the Default is 1.0.
VELRB <sub>i</sub>	Translation velocity or final position (depending on the value of CONTROL) of rigid body at the grid point defined in CGID field. For velocity control only, if the value is an integer, it represents the ID of TABLED1, TABLED2 or TABL3D, i.e., a time-dependent or multi-dimensional table; however, no log scales, only linear scales. Only VELRB1 and VELRB2 are used in 2D contact. (Real or Integer; Default = 0.0)
"ADVANCE"	The entries for this continuation line are for advanced options starting with MD Nastran R2.
SANGLE	Threshold for automatic discontinuity detection in degrees. (Real; Default = 60.0) Used for SPLINE option in SOL 400 only. SANGLE is not used when IDSPL ≥ 0.
COPTB	Flag to indicate how body surfaces may contact. See Remark 9. on the BCTABLE entry. (Integer; Default = 0)
MIDNOD	Mid-side node projection flag. (Integer ≥ 0; Default = 0) When MIDNOD > 0 and IDSPL ≠ 0, the mid-side grid of quadratic elements are projected onto the selected spline surfaces. This operation is performed before the contact process starts and it may change the location of grids in contact bodies. It may operate in combination with the initial stress-free contact.
"RIGID"	The entries of this continuation line are for the rigid body description. See Remark 4.

Describer	Meaning
CGID (5,i) i=1,2,3	Grid point identification number defining the initial position of the reference point of the rigid body or the point where a concentrated force or moment is applied
NENT	Number of geometric entities to describe this rigid surface. A rigid surface can be described by multiple sets of patches, nurbs, etc. For example, if it takes 3 sets of PATCH3D entries to describe a rigid surface, then set NENT=3. (Integer > 0; Default = 1)
Rigid Body Name	Name associated with the rigid body. (Default is blank, 24-characters maximum)
“APPROV”	The entries of this continuation line are for approaching velocity to establish initial contact.
A	Angular velocity about local axis through center of rotation. (Real, Default = 0.0)
Ni	Components of direction cosines of local axis of the angular velocity. The N1, N2, N3 define the axis through the point defined in the “RIGID”, CGID entry. Only N1 and N2 are used in 2D contact. (Real, Default = 0.0)
Vi	V1, V2 and V3 define the three components of the approaching velocity. Only V1 and V2 are used in 2D contact. (Real; Default = 0.0)
“GROW”	The entries of this continuation line are for rigid body growth. If tables are used for growth, they should either be TABLED1, TABLED2(growth vs time) or TABL3D (growth vs one or more variables).
GFi	Components of Growth factor of rigid body in the coordinate system of the “RIGID”, CGID entry. (Real, Default = 1.0)
TAB-GFi	Tabled IDs for growth factor of rigid body in the coordinate system of the “RIGID”, CGID entry. (Integer > 0 or blank, Default is blank)
“HEAT”	The entries of this continuation line(s) are for contact in heat transfer in a pure thermal analysis or in a coupled thermal/structural analysis. In a pure structural analysis they are ignored.
CFILM (9,1)/(10,1)	Heat transfer coefficient (film) to environment. (Real or Integer, Default = 0.0) If Real, the value entered is the film coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the heat transfer coefficient vs temperature or a TABL3D entry specifying the film coefficient vs temperature and possibly other variables.
TSINK (9,2)/(10,2)	Environment sink temperature. (Real or Integer, Default = 0.0). If Real, the value entered is the sink temperature. If Integer, the value entered is the ID of a TABLED1 or TABLED2 entry specifying temperature vs time or a TABL3D entry specifying the sink temperature vs time and possibly other variables. When entered as a negative integer its absolute value is a scalar point identification number. If a scalar point is specified on this entry it need not be defined on an SPOINT entry.

Descriptor	Meaning
CHEAT (9,3)/(10,3)	Contact heat transfer coefficient. (Real or Integer; Default = 0.0). If Real, the value entered is the contact heat transfer coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the contact heat transfer coefficient vs temperature or a TABL3D entry specifying the contact heat transfer coefficient vs temperature and possibly other variables.
TBODY (9,4)/(10,4)	Body temperature. (Real or Integer; Default = 0.0). If Real, the value entered is the body temperature. If Integer, the value entered is the ID of a TABLED1 or TABLED2 entry specifying the body temperature vs time or a TABL3D entry specifying the body temperature vs time and possibly other variables. When entered as a negative integer its absolute value is a scalar point identification number. If a scalar point is specified on this entry it need not be defined on an SPOINT entry.
HCV (9,5)/(10,5)	Convection coefficient for near field behavior (Real or Integer; Default = 0.0). If Real the value entered is the near field convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field convection coefficient vs temperature or a TABL3D entry specifying the near field convection coefficient vs temperature and possibly other variables.
HNC (9,6)/(10,6)	Natural convection coefficient for near field behavior (Real or Integer; Default = 0.0). If Real, the value entered is the near field natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field natural convection coefficient vs temperature or a TABL3D entry specifying the near field natural convection coefficient vs temperature and possibly other variables.
ITYPE [4,8]	An option entry for heat transfer only (Integer; no Default) 1 - Heat sink (rigid body) 2 - Deformable body (with heat conduction) 4 - Heat conduction body (heat-rigid body) (Not supported in SOL 400 coupled thermal-mechanical analysis)
BNC (9,7)/(10,7)	Exponent associated with the natural convection coefficient for near field behavior (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the near field natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the exponent associated with the near field natural convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the near field natural convection coefficient vs temperature and possibly other variables.
EMISS (9,8)/(10,8)	Emissivity for radiation to the environment or near thermal radiation (Real or Integer; Default = 0.0). If real, the value entered is the emissivity. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the emissivity vs temperature or a TABL3D entry specifying the emissivity vs temperature and possibly other variables.

Describer	Meaning
HBL (7,6)/(8,6)	Separation distance dependent thermal convection coefficient (Real or Integer; Default = 0.0). If Real, the value entered is the separation distance dependent thermal a convection coefficient. If Integer, the value entered is the ID of a TABLEM1 entry specifying the convection coefficient vs temperature or a TABL3D entry specifying the convection coefficient vs temperature and possibly other variables.
HNL	Heat transfer coefficient for nonlinear convective heat flow for near field behavior. (Real or Integer; Default = 0.0). If Real, the value entered is the near field nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the near field nonlinear convection coefficient vs temperature or a TABL3D entry specifying the near field nonlinear convection coefficient vs temperature and possibly other variables.
BNL	Exponent associated with the nonlinear convective heat flow for near field behavior. (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the near field nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 OR TABLEM2 entry specifying the exponent associated with the near field nonlinear convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the near field nonlinear convection coefficient vs temperature and possibly other variables.
HNLE	Heat transfer coefficient for nonlinear convective heat flow to the environment. (Real $\geq 0.0$ or Integer; Default = 0.0). If Real, the value entered is the environment nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the environment nonlinear convection coefficient vs temperature or a TABL3D entry specifying the environment nonlinear convection coefficient vs temperature and possibly other variables.
BNLE	Exponent associated with the nonlinear convective heat flow to the environment (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the environment nonlinear convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the exponent associated with the environment nonlinear convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the environment nonlinear convection coefficient vs temperature and possibly other variables.
HNCE	Natural convection coefficient for heat flow to the environment. (Real or Integer, Default = 0.0). If Real the value entered is the environment natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the environment natural convection coefficient vs temperature or a TABL3D entry specifying the environment natural convection coefficient vs temperature and possibly other variables.

Descriptor	Meaning
BNCE	Exponent associated with natural convection heat flow to the environment. (Real or Integer; Default = 1.0). If Real, the value entered is the exponent associated with the environment natural convection coefficient. If Integer, the value entered is the ID of a TABLEM1 or TABLEM2 entry specifying the exponent associated with the environment natural convection coefficient vs temperature or a TABL3D entry specifying the exponent associated with the environment natural convection coefficient vs temperature and possibly other variables.
CMB	Heat capacity of the rigid body, when entered as a geometric entity with an associated scalar point. (Real $\geq 0.0$ ; Default = 0.0). For nonzero values a grounded CDAMP4 element with the scalar point on its first side is generated internally which obtains this capacity.
CMS	Heat capacity of the environment, when associated with a scalar point. (Real $\geq 0.0$ ; Default = 0.0). For nonzero values a grounded CDAMP4 element with the scalar point on its first side is generated internally which obtains this capacity.
“PATCH3D”	Entries for this continuation line describe a rigid body made up of as many 4-node patches as desired. (Triangular patches are not available.)
IDP	ID of the patch (Integer number 1 through highest value).
G1, G2, G3, G4	Grid numbers for each of the 4 nodes of the patch (see Note 5).
“BEZIER”	Entries for this continuation line describe a rigid body made up of Bezier Surfaces.
NP1	Number of points in 1st direction. (Integer > 0)
NP2	Number of points in 2nd direction. (Integer > 0)
NSUB1	Number of subdivisions in 1st direction. (Integer > 0)
NSUB2	Number of subdivisions in 2nd direction. (Integer > 0)
G1, G2, G3, etc	Grid numbers of each point (must be in order). There must be NP1*NP2 grid points defined. Enter NP1 points for NP2=1, then NP2 points for NP2=2, etc. (Integer)
“NURBS2D”	Entries for this continuation line describe a 2D rigid body made up of nurbs.
NPTU	Number of control points. If the control points are entered as coordinates rather than grid IDs NPTU may be set to a negative value whose absolute value is the number of xyz coordinates, but that is not required. (Integer, no Default)
NORU	Order
NSUB	Number of subdivisions
G1, G2, G3, G4	Grid numbers for each of the NPTU control points
X1, Y1, X2, Y2, etc.	Alternate method to define control points without using GRID points. There must be abs(NPTU)*NPTV (x,y,z) entries.
Homo1, Homo2, Homo3, etc.	Homogeneous coordinates (0.0 to 1.0) (Real). There must be NPTU entries.

Describer	Meaning
Knot1, Knot2, Knot3, etc.	Knot vectors (0.0 to 1.0) (Real). There must be (NPTU+NORU) entries.
“NURBS”	Entries for this continuation line describe a rigid body made up of nurbs.
NPTU	Number of control points in U direction. If the control points are entered as coordinates rather than grid IDs NPTU may be set to a negative value whose absolute value is the number of xyz coordinates, but that is not required. (Integer > 0; Required)
NPTV	Number of control points in V direction. (Integer > 0; Required)
NORU	Order along U direction. (Integer > 0; Required)
NORV	Order along V direction (Integer > 0; Required)
NSUBU	Number of subdivisions in U direction (Integer > 0; Required)
NSUBV	Number of subdivisions in V direction (Integer > 0; Required)
NTRIM	Number of trimming curves (Integer ≥ 0 or blank)
G1, G2, G3, etc.	Grid point IDs defining control points (Integer > 0). There must be NPTU*NPTV entries.
X1, Y1, Z1, X2, Y2, Z2, etc.	Alternate method to define control points without using GRID points. There must be abs(NPTU)*NPTV (x,y,z) entries.
Homo1, Homo2, Homo3, etc	Homogeneous coordinates (0.0 to 1.0). There must be NPTU*NPTV entries. (Real)
Knot1, Knot2, Knot3, etc	Knot vectors (0.0 to 1.0). There must be (NPTU+NORU)+(NPTV+NORV) entries. (Real)
IDtrim	ID of trimming vector. There must NTRIM of these entries and those entries that follow. (Integer > 0)
NPUTrim	Number of control points for this trimming vector. (Integer > 0)
NORUtrim	Order for this trimming vector. (Integer > 0)
NSUBtrim	Number of subdivisions for this trimming vector. (Integer > 0)
Xisoparam	First coordinate of point in isoparametric space. (Real)
Ysoparam	Second coordinate of point in isoparametric space. (Real)
Homo1, Homo2, Homo3, etc	Homogeneous coordinates (0.0 to 1.0) of this trimming vector. There must be NPTUtrim entries. (Real)
